

MIDLAND AND SOQUEM DISCOVER IN NUNAVIK SEVERAL NEW MINERALIZED HORIZONS GRADING UP TO 25.6 % CU, 4.9 G/T AU AND 162 G/T AG

Montreal, October 4, 2022. Midland Exploration Inc. (“**Midland**”) (TSX-V: **MD**), in partnership with SOQUEM Inc. (“**SOQUEM**”), is pleased to announce the discovery of several new metric to plurimetric mineralized horizons with high-grade copper and gold. This discovery is a result of the Strategic Alliance between Midland and SOQUEM (the “Alliance”) in the Labrador Trough in Nunavik, Quebec.

During a prospecting campaign carried out in the summer of 2022, the Midland-SOQUEM team discovered, on surface, several **new mineralized horizons with high-grade copper and gold that were observed over an area of at least 160 metres by 170 metres**. Given the vegetative cover, the mineralization remains open in all directions and the dimensions of this new mineralized system have yet to be determined.

Highlights

- Discovery of a high-grade Cu-Au mineralized system, interpreted over an area of at least 160 metres by 170 metres, open in all directions
- Grab samples grading up to **25.6 % Cu, 4.9 g/t Au, 162 g/t Ag (29.97 % CuEq*)** ;
- Channel #1: **1.49% Cu, 0.54 g/t Au and 11.4 g/t Ag (1.93% CuEq*) over 4.0 metres** ;
- Channel #2: **0.90% Cu, 0.45 g/t Au and 6.5 g/t Ag (1.25% CuEq*) over 3.0 metres**.
- New land position following the acquisition of 187 claims (90 sq. km)

The mineralized system was discovered during prospecting work conducted in the area south of Nachicapau Lake. This work followed up on the discovery made by Midland in 2018 of a calcite vein with bornite and malachite mineralization that graded 3.16% Cu, 5.27 g/t Au and 40.7 g/t Ag. The new discovery is located 100 metres from this showing and the surrounding area has seen very little exploration.

Geologically, the mineralized system is hosted in mafic pyroclastic rocks and chlorite-actinolite schists of the Murdoch Formation. It is defined by the presence of disseminated malachite and bornite mineralization in horizons ranging from cm-scale to several metres wide and as cm-scale pods in calcite veins. Gold mineralization is also associated with these veins. At least eight decimetric to plurimetric mineralized horizons have been identified to date.

The next phase of work on this new discovery will focus on improving our geological understanding of this mineralized system and the depositional setting of these mineral occurrences, in order to define the best exploration strategy. More analysis results are pending for this new favorable area in the Labrador Trough.

The following tables display the results of grab and channel samples in different mineralized horizons.

Table 1: Grab samples analysis results

Sample number	Coord UTM E	Coord UTM N	Cu	Au	Ag	Cu Eq*
	m	m	%	g/t	g/t	%

Table 3: Best composites results - Channel 1 and 2

Composite	From	To	Interval	Cu	Au	Ag	Cu Eq*
	m	m	m**	%	g/t	g/t	%
Channel 1	0	4	4	1.49	0.54	11.4	1.93
incl.	0.5	2.5	2	2.13	0.77	15.8	2.93
Channel 2	0	3	3	0.90	0.45	6.5	1.25
incl.	1.5	2.5	1	1.21	0.52	8.7	1.62

**Metal prices used to calculate CuEq. *: Au \$1,500/oz, Cu \$3.25/lb, Ag \$15/oz. Recoveries of 100% of all metals are assumed.*

Cautionary statements

Grab samples are selective by nature and reported values are not necessarily indicative of mineralized zones.

The true thickness of the channels cannot be determined with the information currently available.

Quality control

Rock samples from the project are analyzed by standard fire-assay on 30-gram fractions with atomic absorption finish (Au-AA23) or gravimetric finish (Au-GRA21) at ALS Laboratories in Val-d'Or, Quebec, or Sudbury, Ontario. All samples are also analyzed for multi-elements using the four-acid ICP-MS method. Exploration programs are designed, and results are interpreted by Qualified Persons employing a Quality Assurance/Quality Control program consistent with industry best practices, including the use of standards and blanks for every 20 samples.

About the Strategic Alliance with SOQUEM

The Strategic Alliance enables Midland and SOQUEM to combine their efforts and expertise to jointly explore the excellent potential for gold and strategic minerals of the vast and underexplored Labrador Trough. The area of interest defined under the Alliance is located in Nunavik. Geologically, it covers the Labrador Trough, the Rachel-Laporte Zone and the Kuujuaq Domain. The area of interest extends from Schefferville in the south up to approximately 100 km northwest of Kangirsuk. This new agreement calls for investments in exploration reaching up to \$5 million over a period of four (4) years, with a firm commitment of \$2 million within the first two (2) years of the agreement. For 2022, an annual budget of \$1 million (50% Midland and 50% SOQUEM) has been planned to complete the work program.

About SOQUEM

SOQUEM, a subsidiary of Investissement Québec, is dedicated to promoting the exploration, discovery and development of mining properties in Quebec. SOQUEM also contributes to maintaining strong local economies. A proud partner and ambassador for the development of Quebec's mineral wealth, SOQUEM relies on innovation, research and strategic minerals to be well-positioned for the future.

About Midland

Midland targets the excellent mineral potential of Quebec to make the discovery of new world-class deposits of gold, platinum group elements and base metals. Midland is proud to count on reputable partners such as SOQUEM inc., BHP Canada Inc., Rio Tinto Exploration Canada Inc., Probe Metals

Inc., Wallbridge Mining Company Ltd, Agnico Eagle Mines Limited, Osisko Development Corp., Nunavik Mineral Exploration Fund, and Abcourt Mines Inc. Midland prefers to work in partnership and intends to quickly conclude additional agreements in regard to newly acquired properties. Management is currently reviewing other opportunities and projects to build up the Corporation portfolio and generate shareholder value.

Midland-SOQUEM Alliance in the Labrador Trough

New Copper-Gold Discovery in Nachicapau Area

Nachicapau – Malachite & Bornite Discovery

Nachicapau : 2022 Rock Sampling Work

(a) Outcrop showing a large malachite mineralization

(b) #C879209 – carbonate and bornite, malachite vein
25.60 % Cu, 4.90 g/t Au, 162.0 g/t Ag

(c) #C878500 – 3% malachite and bornite mineralization in a mafic schist

Nachicapau : 2022 Rock Sampling Work

(a) Outcrop showing malachite – bornite veins

(b) malachite – bornite veins at surface

Nachicapau : 2022 Channel Sampling

(b) channel 1, #C879212 :
**3.56 % Cu, 1.55 g/t Au,
25.0 g/t Ag over 0.5 metres**

(c) channel 2, #C879224 :
1.17 % Cu, 0.56 g/t Au, 8.8 g/t Ag over 0.5 metres

Nachicapau : 2022 Rock Sampling Work

Quartz, carbonate, biotite, bornite and malachite vein in a boulder located 300 metres eastward of the mineralized horizons
#C878990 – 2.95% Cu, 0.27 g/t Au, 30.0 g/t Ag
