FORM 27

THE SECURITIES ACT

MATERIAL CHANGE REPORT UNDER SECTION (75)2

Item 1. **Reporting Issuer**

MCK Mining Corp., 4th Floor, 56 Temperance Street, Toronto, Ontario, M5H 3V5.

Item 2. **Date of Material Change**

June 20th, 2001.

Item 3. **Press Release**

The Press Release was sent on June 20th, 2001 via Canada NewsWire Ltd. (CNW) -- Toronto, Ontario.

Item 4. **Summary of Material Change**

For further information, attached hereto as **SCHEDULE "A"** is a copy of the Press Release.

Item 5. **Full Description of Material Change**

No information other than that provided in Item 4 above is presently available.

Item 6. **Reliance on Section 75(3) of the Act**

Confidentiality is not requested.

Item 7. **Omitted Information**

No information has been omitted in respect to the material change.

Item 8. **Senior Officer**

Mr. Stephen D. Case, President [416] 363-1613.

Item 9. **Statement of Senior Officer**

The foregoing accurately discloses the material changes referred to herein.

DATED at Toronto, this 20th day of June, 2001.

MCK MINING CORP.

"Stephen D. Case"

Per: ____________________________
Stephen D. Case, President.

SCHEDULE “A”

MCK MINING CORP. ANNOUNCES DRILL PROGRAM RESULTS

Toronto, Ontario
June 20, 2001

MCK Mining Corp. (CDNX - YMK) announced today the results of its recent winter drill program carried out on the Martison Phosphate Project, located near Hearst, Ontario, and approximately 110 kms. north of Agrium Inc’s Kapuskasing phosphate mine.

The Martison phosphate resources are hosted by a deeply weathered carbonatite complex of phosphate-rich igneous rocks forming pipe-like bodies. Due to significant amounts of contained magnetite, the complex has been clearly defined by aeromagnetic surveys which show that the complex occupies an area exceeding 28 square kms and is comprised of various sub-complexes called "anomalies". Most of the drilling to date has focused on Anomaly A. As previously reported, a geological resource of 113 million tonnes averaging 21.4% P_2O_5, using a cut-off of 10% P_2O_5, has been identified within anomaly A. This resource is open along strike to the northwest and southeast and at depth in certain areas. Anomaly B, lying 4 kms south of Anomaly A, was the focus of the 2001 drill program. Unlike previous drill programs, which were in-fill drilling of a defined resource, the 2001 program focused on exploration designed to provide initial testing of Anomaly B. This secondary target was explored in 1981 when just two holes were drilled. These holes are over 700 metres apart and lie on the north edge of the anomaly. Both intersected phosphate, 54 metres of 23% P_2O_5 in hole 81-01and 60 metres of 19% P_2O_5 in 81-02, using a 10% P_2O_5 cut-off.

This winter, eleven drill holes, no closer than 200 metres apart, were completed for a total of 1250 metres. Ten of the holes intersected apatite-rich phosphatic residuum of varying thicknesses and are summarized in the accompanying table. Excluding the barren hole, the average intersection of the apatite horizon was 22 metres averaging 22% P_2O_5. These results, in an area that previously had only been tested by two holes, are considered encouraging and indicative that further drilling will result in additions to the existing phosphate resources.

The intersections have been calculated using a 10% P_2O_5 cut-off grade and exclude samples in which the phosphate is contained in minerals other than apatite. Core analyses was carried out by Swastika Laboratories. After preparation by lithium metaborate fusion, all samples were assayed using an ICP Whole Rock method.
