ALDEVER BEGINS SHORT-HOLE DRILLING AT MILLER'S PLAYA LITHIUM PROJECT

June 14, 2016—Aldever Resources Inc. (**ALD**—TSXV) (**ALDVF**—OTCQB) (**17G1**—Frankfurt) ("Aldever" or "the Company") is pleased to announce that it has commenced drilling at its 100% owned Miller's Playa Lithium Project in the South Big Smoky Valley, Nevada. The Company intends on completing up to 18 holes, utilizing NQ rods (47.6mm core diameter) as well as AQ rods (27.0mm core diameter) for superior sample recovery and is expected to reach depths of up to 50m, depending on ground conditions. The purpose of the drilling will be to test subsurface layers for lithium and other commercial elements.

The Miller's Playa Lithium Project fits well into the playa-type brine deposit model as it shares geological similarities with Clayton Valley, the only lithium producing brine operation in North America. A playa is an internally drained brine deposit, the surface of which is primarily composed of silts and clays in which lithium can accumulate from the surrounding source rocks during successive evaporation and concentration events. Evaluation of regional gravity data has led to the hypothesis that the Big Smoky Valley has been in-filled with an estimated 2000-2500m of alluvial fill and may have the potential to host a significant mineral deposit.

Regarding the commencement of drilling, President Clive Massey commented: "We are very pleased to be drilling at Miller's, for it marks another milestone met in the Company's exploration timeline."

The Company also reports that it has also terminated its earn-in agreement with Unity Energy Corp. for the Carter Lake Project so as to concentrate its uranium exploration on the PNE Project, which lies strategically between the Shea Creek deposit and Nexgen's Arrow discovery.
