**ALDEVER RETURNS TO LAC VILLEBON
TO FURTHER EXAMINE ALTERATION ZONE**

July 12, 2016

Aldever Resources Inc. (ALD—TSXV) (ALDVF—OTCQB) (17G1—Frankfurt) is pleased to announce that it has redeployed its field crew to the Lac Villebon Gold Project in the Val D’Or mining camp to test the contact regions of the LV Zone, first discovered earlier this year during the Spring exploration program.

Preliminary investigative drilling from that program intersected mafic to intermediate volcanics hosting 5% to 50% pyrite and pyrrhotite as disseminations, stringers or semi-massive to massive bands. Assay results from the program returned trace to 43 ppb Au with an average of 8.43 ppb Au. Drill holes of note included:

LV16-004: 1.33m of 31.9ppb Au and 0.94 g/t Ag;
LV16-013: 0.93m of 23.6 ppb Au and 0.47 g/t Ag and
LV16-014: 0.9m of 36 ppb Au with trace Ag.

All the above drill holes targeted silicified and altered structures with common sulphide mineralization. Quartz, sericite, tourmaline, ankerite and epidote alteration of varying intensities was identified in nearly all drill holes.

The goal of this follow-up program will be to specifically explore the contact between the country rocks and the intrusive rocks, as such regions have traditionally been where gold bearing mineralization has been discovered in Val d’Or. The program will consist of up to 20 inspection holes utilizing Shaw pack sack drills, which have an effective depth of penetration of up to 10m.

Regarding the redeployment, President Clive Massey commented, “Given the anomalous mineralization discovered earlier this year, the Company was compelled to dispatch its short-hole crew to further examine the contact. The Company is in the process of assessing the potential of both of its Quebec gold projects, Lac Villebon and Urban Barry, for long hole diamond drilling.”
