

Form 51-102F3
Material Change Report

Item 1 Name and Address of Company

Canplats Resources Corporation
#1180 – 999 West Hastings Street
Vancouver, BC V6C 2W2

Item 2 Date of Material Change

November 5, 2007

Item 3 News Release

The news release dated November 5, 2007 was disseminated through Marketwire.

Item 4 Summary of Material Change

Canplats Resources Corporation reported that drilling has commenced at its wholly-owned Camino Rojo project in Mexico. The initial phase of the reverse circulation drill program is expected to total approximately 1,700 meters and, subject to results, will be followed by diamond drilling.

Item 5 Full Description of Material Change

5.1 Full Description of Material Change

See attached news release dated November 5, 2007.

5.2 Disclosure for Restructuring Transactions

Not applicable.

Item 6 Reliance on subsection 7.1(2) or (3) of National Instrument 51-102

Not applicable.

Item 7 Omitted Information

Not applicable.

Item 8 Executive Officer

Joseph J. Ovsenek, Assistant Corporate Secretary
604.689.3846

Item 9 Date of Report

Dated at Vancouver, BC, this 6th day of November, 2007.

NEWS RELEASE

CANPLATS COMMENCES DRILLING AT CAMINO ROJO

Vancouver, B.C. – Canplats Resources Corporation (TSX Venture: CPQ) is pleased to report that drilling has commenced at its wholly-owned Camino Rojo project in Mexico. The initial phase of the reverse circulation drill program is expected to total approximately 1,700 meters and, subject to results, will be followed by diamond drilling.

Canplats recently reported the discovery of significant gold, silver and base metal mineralization over a widespread area known as the Represa Zone within the recently staked Camino Rojo property, located in Zacatecas State.

The Camino Rojo property consists of two claims covering approximately 100,000 hectares (~385 square miles) that are located about 50 kilometers southeast of Goldcorp Inc.'s Peñasquito mine in the State of Zacatecas. Canplats' wholly-owned claims are underlain by sub-horizontal, calcareous siltstones and sandstones of the Caracol Formation. Although most of the claims are covered by overburden, several small volcanic centers are located along a structural lineament 8 to 10 kilometers southeast of the Represa Zone.

The Represa Zone's mineralization is hosted in weak to moderately brecciated siltstones and sandstones which have been flooded with hematite, manganese and isolated fine quartz veinlets. The area is generally covered with overburden ranging from 0.25 meters to in excess of three meters in thickness. The Represa Zone is open to the east, west and south where test pitting could not reach bedrock.

The drill program now underway will be accompanied by an expanded ground geophysical program consisting of 26 line-kilometers of induced polarization (IP) survey work and over 50 line-kilometers of ground magnetic surveys. Results from this work will be used as the basis for regional exploration.

All work is being supervised by Ken McNaughton, vice-president, exploration, and a qualified person as defined by Canada's National Instrument 43-101.

** All assays were submitted for preparation by ALS Chemex at its facilities in Chihuahua, Mexico and analysis in Vancouver, B.C. Trace element analysis was completed using three acid digestion with ICP finish. Gold analysis was completed using fire assay with an atomic absorption finish. Samples containing over 10 grams of gold per tonne were re-assayed using standard fire assay with gravimetric techniques.*
