

Interim Management Discussion & Analysis¹
for
EASTFIELD RESOURCES LTD.

Containing information up to and including July 27, 2018

Description of Business

Eastfield Resources Ltd. (the “Company” or “Eastfield”) is an exploration stage company engaged in the acquisition and exploration of prospective copper, gold, nickel and molybdenum properties in Western Canada. The Company trades as a Tier One company on the TSX Venture Exchange (“Exchange”) under the symbol “ETF”. The Company’s head office is located at Suite 110 – 325 Howe Street, Vancouver, BC.

OVERALL PERFORMANCE

Summary:

- On June 20, 2018, the Company entered into an option agreement with GK Resources Ltd. whereby GK Resources may earn a 60% interest in the Iron Lake.
- On June 20, 2018, the Company entered into an option agreement with Prophecy Potash Corp. whereby Prophecy Potash may earn a 60% interest in the Indata property.

RESULTS OF OPERATIONS

Three Months Ended May 31, 2018

The Company’s net loss of \$6,908 for the three months ended May 31, 2018 (“Current Period”) was slightly less than the net loss for the three months ended May 31, 2017 (“Comparative Period”) of \$16,647 due to the increased legal and consulting costs associated with the sale of the Nevada properties in the Comparative Period.

Exploration Expenditures

The following table discloses changes in Exploration and Evaluation Assets for the three months ended May 28, 2018 and 2017.

	<u>2018</u>	<u>2017</u>
ACQUISITION COSTS - Incurred during year	\$ 1,030	\$ -
EXPLORATION EXPENDITURES		
Professional fees and field crews	24,400	43,520
Rental of vehicles and equipment	672	2,463
Transport and fuel		1,393
Field equipment		616
Communications		421
Food and accommodation		950
Other	31	62

Net Increase in Exploration and Evaluation Assets	\$ 26,133	\$ 49,425

¹ Note to Reader

This Interim Management Discussion and Analysis (“Interim MD&A”) should be read in conjunction with the Company’s interim consolidated financial statements for the three months ended May 31, 2018.

Forward-Looking Information

When used in this document, words like "anticipate", "believe", "estimate" and "expect" and similar expressions are intended to identify forward-looking statements. Such statements are used to describe management’s future plans, objects and goals for the Company, and therefore, involve inherent risks and uncertainties. The reader is cautioned that actual results, performance or achievements may be materially different from those implied or expressed in such statements.

Currency - Unless otherwise stated, all currency amounts are stated in Canadian dollars.

EASTFIELD RESOURCES LTD.

Management Discussion and Analysis

Containing Information up to and Including July 27, 2018

MINERAL PROPERTIES

Iron Lake Property, Clinton Mining Division, British Columbia

The 100% owned Iron Lake Project, located in south-central British Columbia, is a regionally distinct copper, gold, platinum group elements and nickel project hosted in an ultramafic-mafic intrusion within the Quesnel Terrane. The project, encompassing an area of 8,035 ha (19,854 acres), is located 45 km northeast of 100 Mile House.

Project Summary

The Iron Lake Complex hosts disseminated and massive sulphide mineralization of a probable magmatic source that is significant for its copper, gold, platinum, palladium and to a lesser extent nickel content. The occurrence of a prominent aeromagnetic high covering several square km centered on the complex resulted in several exploration stages starting in the mid-1970's directed at porphyry copper.

Two styles of magmatic sulphide mineralization present opportunities for discovery at Iron Lake. The first being disseminated sulphide with economically significant values of copper, gold, platinum and palladium; and the second being massive sulphide with economically significant values in copper, nickel and cobalt. A hybrid of the two styles of mineralization with the full suite of elements is also possible. Sulphide minerals in the disseminated style of mineralization are accompanied with 10% to 40% magnetite.

New claims were added to the project in 2015 and 2016 to cover an area where wide spread occurrences of gold and arsenic occur in volcanic and intrusive rocks. In 2016 ten kilometers of soil grid lines were completed in an area where historic work identified a gold-arsenic association with select bedrock samples reaching 74.90 grams per tonne gold and soil samples reaching 12.00 grams per tonne gold. The 2016 work returned select rock samples grading up to 31.22 grams per tonne gold and soil anomalies up to 5,023 ppm arsenic with 1,213 ppb gold (with many samples with much lower values). Associated elements to gold-silver mineralization include lead, zinc, arsenic, antimony, bismuth and tellurium. Anomalous concentrations of these elements are widespread. A large area of pyritic monzonite to quartz monzonite appears to be the underlying bedrock to much of this area.

Recent Activity

In 2017 the company completed further geochemical soil sampling in the area of the southern gold target before being forced to suspend exploration because of forest fires. In total, 94 rock samples and 135 soil samples were collected and analysed and approximately \$60,000 was spent.

On June 20, 2018, the Company entered into an option agreement with GK Resources Ltd. ("GK Resources") whereby GK Resources may earn a 60% interest in the Iron Lake property by making \$400,000 in cash payments, issuing \$250,000 in shares and completing \$3,000,000 in exploration work over a five-year period ending June 20, 2023. \$20,000 was received upon signing the option agreement.

Indata Property, Omineca Mining Division, British Columbia

The Company has a 91.3% interest in the Indata property. Imperial Metals Corporation ("Imperial Metals"), owns the remaining 8.7% interest. This interest will be reduced if Imperial Metals fails to make its proportionate share of exploration and other payments on the property.

Project Summary

The Indata property is located approximately 130 km to the northwest of Fort St. James in central British Columbia and consists of 18 claims encompassing 3,189 ha and is situated in an active geological setting adjacent to the Pinchi Fault, a major structure separating the oceanic derived Cache Creek Terrane and mafic volcanic island arc derived Quesnel Terrane.

Two types of mineralization have historically been explored for on the property; mesothermal gold-silver veins and porphyry style copper mineralization hosted in volcanic rocks and granodiorite dominant intrusions (drill intercepts have included results up to 47.26 g/t gold over 4 m and 0.20% copper over 145.4 m). The property includes a porphyry copper target measuring 500 to

EASTFIELD RESOURCES LTD.

Management Discussion and Analysis

Containing Information up to and Including July 27, 2018

1,000 m in width along strike for at least 6,000 m paralleling a volcanic intrusive contact. This target is also well outlined by coincident IP chargeability and soil geochemical anomalies.

Approximately \$2.6 million has been spent exploring the Indata property since 1986, with the most recent work completed in 2013. Exploration has included the analysis of 4,700 soil samples, the completion of over 70 km of ground geophysics, including magnetics, VLF and induced polarization, the completion of a high resolution airborne magnetic survey (595 line km), more than three km of mechanical trenching, 21 km of road construction and the completion of 73 diamond drill holes (7,377 m).

Exploration programs, starting in 2010 and continuing through 2013, deployed a reconnaissance process versus what had for the previous twenty or so years been an expanding grid-based approach. The reconnaissance work resulted in the definition of a number of geophysical anomalies which constitute new targets. In 2012, 3.2 km of road construction was completed to access proposed drill sites constructed (but still undrilled) on targets developed during this work with additional rock sampling completed in 2013.

One of the most noteworthy features of the Indata prospect is the size and strength of the soil geochemical copper anomaly located northeast of Albert Lake where values exceeding 500 ppm Cu are common and attain a maximum value of 7,771 ppm in soil over an area of approximately 600 by 2,000 m within a larger conceptual target extending 6,000 m in length.

Also an area of high grade copper and copper-gold mineralization was identified in the northeastern sector of the property in 1989 but never followed up. Here, a cluster of select grab samples from mineralized basaltic to andesitic flows, flow breccias and tuffs returned a number of high grade results from an open-ended area of approximately 250 m in a north-south orientation (east-west width unknown). The average of ten samples from this area is 1.60% copper and 0.19 g/t gold including results as high as 3.3% copper with 575 ppb gold. It is thought that an as yet unidentified porphyry entity may be responsible for this mineralization.

Recent Activity

On June 20, 2018, the Company entered into an option agreement with Prophecy Potash Corp. ("Prophecy Potash") whereby Prophecy Potash may earn a 60% interest in the Indata property by making \$250,000 in cash payments, issuing \$150,000 in shares and completing \$2,000,000 in exploration work over a five-year period ending June 20, 2023. \$20,000 was received upon signing the option agreement.

Zymo Property, Skeena Mining Division, British Columbia

The Zymo property is located approximately 45 km west of the town of Smithers in west-central British Columbia and encompasses several porphyry copper-gold targets and occurrences. The property is comprised of 33 claims and fractions totaling 12,897 ha. The Zymo Property is 100% owned by Eastfield Resources Ltd. subject only to a net smelter return interest.

The Zymo property lies south of the middle Jurassic to late Cretaceous Bowser Basin in late Cretaceous intrusive rocks belonging to the Bulkley Group which hosts several large copper-gold deposits including the Red-Chris Mine and Galore Creek.

Since Eastfield became involved in the property over \$4 million has been spent on exploration. This work has resulted in the outline of an 8 km by 2 km IP chargeability anomaly within which four large copper-gold soil geochemical anomalies have been defined. In addition to the early drilling, 9,294.47 m of drilling in 29 holes have been completed since 2008. Most of this drilling has been on the Hobbes Zone where a mineralized body has been traced for 800 m along strike and is open-ended to the west where the zone is in excess of 500 m wide.

Several other geochemical anomalies have seen little follow-up exploration to date including the RD Zone where two holes were completed within an 800 m by 1,000 m copper-gold in soil anomaly. The soil geochemistry indicated that the area may be high in the mineralizing system and the drilling intersected long intervals of phyllic alteration and narrow intercepts of sulphide-rich veins indicative of high-level zonation of mineralization.

The company is seeking a venture partner to participate in the further discovery potential on the Zymo Property.

Naggie Property, Clinton Mining Division, British Columbia

In 2013 Eastfield staked the Naggie claims (2,544 ha) located on the south side of the Chilcotin River near its confluence with the Fraser River approximately 50 km southwest of the City of Williams Lake. The claims occupy the steep breaks of the Chilcotin River in a grassland setting at elevations ranging from 360 m to 1,120 m.

EASTFIELD RESOURCES LTD.

Management Discussion and Analysis

Containing Information up to and Including July 27, 2018

The claims are centered on a prominent orange to yellow gossan that is exposed in a few road cuts. The gossan is associated with intensely sericitized and pyritized rocks with significant alteration-derived gypsum. The mapped age of the rocks is enigmatic and includes Triassic diorite intruding possible Cache Creek lithologies. The gossan bears a striking resemblance to the Maggie porphyry occurrence located north of Cache Creek. The gossans are in fact two parallel features each at least 200 m wide and 500 m or greater in length with a northwest trend. A contact with limestone occurs north of the gossan. An anomalous soil copper anomaly (roughly circular and 250 m in diameter) occurs with sporadic anomalous spikes in zinc, lead and silver content (zinc values to 1,866 ppm, copper values to 325 ppm and silver values to 3.7 ppm). Very little work has been undertaken on this prospect which is largely located on privately-owned ranch land.

No work was completed on the Naggie property in 2017/2018 and current plans are to let these claims expire.

Big Valley Project, Cariboo Mining Division, British Columbia

The Big Valley project involves the exploration and development of three mineral properties in an area north of the historic mining towns of Wells and Barkerville, BC. The 2014 exploration program involved the completion of soil and stream sediment sampling and IP/Mag geophysical surveying on all three properties, and it expanded on reconnaissance field work completed in 2013. The 2014 program included further data review, prospecting, soil sampling and 14.9 line km of induced polarization (IP) and magnetic surveying

The historical gold production in the nearby Barkerville and Wells area in addition to the occurrence of numerous boulders of massive sulphide mineralization located on parts of the properties underpin the targeting objectives for the development of the project. While Barkerville-style mineralization is believed to be the most likely analogue for targets so far generated, volcanic hosted massive sulphide style mineralization (VMS) cannot be ruled out. Boulders sampled by the Company and by previous parties have included values as high as 24.3% copper and 19.6 g/t silver.

Three claim groups have now been acquired which are named Hedge Hog, Antler and CR. Highlights of the exploration of these properties to date includes:

CR Property:

CR was acquired by staking by Eastfield in 2014 and consists of 1 mineral tenure covering an area of 1,333 hectares (3,294 acres). At CR (1988 and 1989) Noranda Exploration followed up on anomalous gold in heavy mineral anomalies in the vicinity of a drainage they named Arsenic Creek, and established a 2.3 km by 1.5 km soil sampling grid that resulted in outlining a 1.0 km by 0.5 km arsenic anomaly oriented north-south. Two anomalous gold values of 40 and 90 ppb were associated with arsenic values of 2,100 and 400 ppm. These gold-arsenic bearing samples occur at the southernmost and highest elevation end of the arsenic anomaly.

A 4.8 km IP and magnetic geophysical survey was completed in 2014 along four lines of the old grid and resulted in the outline of an approximately 800 m long by 200 m wide IP chargeability anomaly coincident with the upslope southern end of the geochemical anomaly. The IP anomaly trends northwesterly and is open to the northwest.

Prospecting on the property discovered two separate arsenical quartz vein occurrences carrying anomalous gold. These occurrences are to the north and east of the grid area but indicate that quartz vein systems exist in the area and verify the likelihood of the IP anomaly being sourced by sulphide-bearing quartz vein systems. This new target will require further grid work to define the limits of the anomaly and possibly trench or drill testing as there are few bedrock exposures in the grid area.

Antler Property:

Antler was acquired by staking by Eastfield in 2014 and consists of 4 mineral tenures covering an area of 1,042 hectares (2,796 acres). The target on the Antler property was outlined by exploration work by Esso in 1981, later by a prospector in 1993 and then in 1997 by Eureka Resources. Several soil geochemical anomalies were outlined, up to 500 m long with some coincident gold values. Esso sampled a quartz-carbonate stockwork zone that returned 11.2 g/t gold across 1.0 m. In an area 1.5 km to the northwest, massive sulphide boulders were sampled in 1993 that returned 4.8 g/t gold with 1.9% copper and 4.7 g/t gold with 6.96% copper. Also in this area a quartz-carbonate stockwork was sampled and yielded values up to 0.23 g/t gold across 1.0 m.

Five widely-spaced reconnaissance grid lines were placed in 2014 across these areas and 5.4 km of IP and magnetic geophysical surveys were completed. Weak IP chargeability responses were noted in the areas of the showings, but no definitive anomaly was

EASTFIELD RESOURCES LTD.

Management Discussion and Analysis

Containing Information up to and Including July 27, 2018

outlined. Further prospecting will be required to locate the source of the massive sulphide boulders and the extent and controls on the gold bearing showings.

Hedge Hog Property:

Project Summary

Hedge Hog was acquired by staking by Eastfield beginning in 2013 and consists of 8 mineral tenures covering an area of 2,785 hectares (7,712 acres). It primarily targets Besshi style copper rich massive sulfide mineralization occurring in Paleozoic aged Antler formation rocks and secondly quartz carbonate lode gold mineralization hosted in slightly older Barkerville-Kootenay Terrane rocks similar to what occurs in the historic gold mines of the Barkerville-Wells area.

Historical exploration in the area of the current claims started in 1998 with the discovery of an angular boulder of mineralized chert grading 24.3% copper and 19.6 g/t silver. Excavator trenching completed in 2000 by Hudson Bay Exploration and Development discovered several boulders of similarly styled mineralization with the average of all samples (seven) being 8.7% copper, 9.59 g/t silver and 145 ppb gold. Subsequent drilling, 6 holes (684 meters) and mechanical trenching failed to find the bedrock source of this mineralization and Hudson Bay withdrew in 2001 and the claims were re-staked by Eastfield.

Follow-up work in 2014 included the placement of a soil grid on the Golden Sky target where fault controlled quartz veins have been discovered. Soil sampling defined a gold-arsenic-antimony anomaly coincident with the vein occurrence. Rock sampling of the occurrence returned 0.67 g/t gold across 3.0m. Additionally, two copper-nickel soil anomalies over 800 m in length were outlined in an area where no outcrop has been found. Further work will be required to determine the source of these anomalies.

A 4.7 km reconnaissance IP and magnetic geophysical survey was completed in 2014 along logging roads to assess the Lottie target. Extensive strong IP chargeability anomalies were defined, most of which are interpreted to reflect locally occurring graphitic shales that also contain bedded syngenetic pyrite, pyrite veinlets and silicification. Massive sulphide occurrences could be hosted in the vicinity of the IP anomalies in proximity to the shale units. A separate anomaly west of the main feature suggests a different source. In 2015 further reconnaissance prospecting and mechanical test pitting and trenching was completed in which forty-seven pits were dug with an excavator. Forty-two of the pits encountered bedrock while five did not reach bedrock. Further work in this area is required to determine the sources of both the IP anomalies and the massive sulphide boulders.

Recent Activity

In November 2017 the Company entered into an option agreement with Copper Creek Gold Corp., granting Copper Creek an option to earn a 60-per-cent interest in its Hedge Hog project, located 15 kilometers north of Barkerville, B.C. Terms of the agreement require Copper Creek to make payments totaling \$350,000, make share issuances or pay cash valued at an additional \$150,000, and complete \$2.5-million in exploration by the fifth anniversary of the agreement.

Quality Control

Information in this Annual MD&A is being prepared under the direction of J. William Morton, P. Geo., President and CEO, and Glen L. Garratt, P. Geo., Vice President and Qualified Persons as defined by National Instrument (NI) 43-101. They are responsible for the design and conduct of the exploration programs and the verification and quality assurance of analytical results.

RISKS AND UNCERTAINTIES

The risks and uncertainties faced by the Company are substantially unchanged from those disclosed in the Company's Annual MD&A dated June 27, 2018.

FORWARD-LOOKING STATEMENTS

This MD&A contains forward-looking statements about the Company's future prospects, and the Company provides no assurance that actual results will meet management's expectations. All statements in this MD&A, other than statements of historical fact, that address exploration drilling, exploitation activities and events or developments that the Company expects to occur in the future, are forward looking statements. Forward looking statements are not guarantees of future performance and

EASTFIELD RESOURCES LTD.

Management Discussion and Analysis

Containing Information up to and Including July 27, 2018

actual results may differ materially. Forward-looking statements included or incorporated by reference in this document include, without limitation, statements with respect to:

- The Company's assumptions and estimates used in its drill results, as well as the potential resource estimates and interpretations from those results;
- The progress, potential and uncertainties of the Company's drill programs;
- Expectations regarding the ability to raise capital and to continue its exploration and development plans on its properties; and

Forward-looking statements are necessarily based upon a number of estimates and assumptions that, while considered reasonable by the Company, are inherently subject to significant business, economic and competitive uncertainties and contingencies. Known and unknown factors could cause actual results to differ materially from those projected in the forward-looking statements. Such factors include, but are not limited to:

- fluctuations in the currency markets;
- fluctuations in the prices of minerals and other commodities;
- changes in government legislation, taxation, controls, regulations and political or economic developments in Canada or other countries in which the Company may carry on business in the future;
- risks associated with mining activities;
- the speculative nature of exploration, including the risk of obtaining necessary licenses and permits, and quantities or grades of reserves;
- the nature of mineral exploration and mining and the uncertain commercial viability of certain mineral deposits;
- the Company's lack of operating revenues; and
- the Company's ability to obtain necessary financing to fund the development of its mineral properties or the completion of further exploration programs.

This is not an exhaustive list of the factors that may affect the Company's forward-looking statements. Many of these uncertainties and contingencies can affect the Company's actual results and could cause actual results to differ materially from those expressed or implied in any forward-looking statements made by, or on behalf of, the Company. Readers are cautioned that forward-looking statements are not guarantees of future performance.

SUMMARY OF QUARTERLY RESULTS

The following table sets out selected unaudited quarterly financial information of Eastfield and is derived from unaudited quarterly financial statements prepared by management. Eastfield's interim financial statements are prepared in accordance with IFRS.

	Revenue	Net (Income) Loss	(Income) Loss per share
May 31, 2018	\$ Nil	\$ 6,908	\$ 0.000
February 28, 2018	Nil	(60,794)	(0.001)
November 30, 2017	Nil	34,298	0.000
August 31, 2017	Nil	39,045	0.002
May 31, 2017	Nil	16,647	0.001
February 28, 2017	Nil	30,672	0.001
November 30, 2016	Nil	20,362	0.000
August 31, 2016	Nil	22,186	0.001

Quarterly results will vary in accordance with the Company's exploration and financing activities.

Mineral exploration is typically a seasonal business, and accordingly, the Company's administrative expenses and cash requirements will fluctuate depending upon the season. The Company's primary source of funding is through the issuance of share capital and the receipt of option proceeds from property agreements. When the capital markets are depressed, the Company's activity level normally declines accordingly. As capital markets strengthen and the Company is able to secure equity financing with favourable terms subsequent activity levels will increase.

EASTFIELD RESOURCES LTD.

Management Discussion and Analysis

Containing Information up to and Including July 27, 2018

Another factor that affects the Company's reported quarterly results are write-downs of capitalized mineral property interests. At the end of each reporting period, the Company reviews the carrying amounts of its mineral property costs to determine whether those assets have suffered an impairment. The size and timing of these impairments cannot typically be predicted.

LIQUIDITY

The Company had working capital of \$1,331,005 on May 31, 2018 (February 28, 2018 – \$1,391,112).

CAPITAL RESOURCES

The Company has no operations that generate cash flow and its long term financial success is dependent on management's ability to discover and develop economically viable mineral deposits. The mineral exploration process can take many years and is subject to factors that are beyond the Company's control.

In order to finance the Company's exploration and development programs and to cover administrative and overhead expenses, the Company raises money through equity sales and from the exercise of convertible securities. Although the Company has been successful in the past in obtaining financing, there can be no assurance that it will be able to obtain adequate financing in the future or that the terms of such financing will be favourable. Many factors influence the Company's ability to raise funds, including the health of the resource market, the climate for mineral exploration investment, the company's track record and the experience and calibre of its management.

TRANSACTIONS WITH RELATED PARTIES

Related party transactions are recorded at the exchange amount agreed to by the parties.

The Company is related to Cariboo Rose Resources Ltd. ("Cariboo Rose"), Lorraine Copper Corp. ("Lorraine"), and Consolidated Woodjam Copper Corp. ("Woodjam") through common directors and officers. In the normal course of business, the Company will enter into transactions with Cariboo Rose, Lorraine and Woodjam for the use of equipment, services and rental of office space. During the three months ended May 31, 2018, recoveries of rent, salaries, telephone, office, consulting, convention and travel costs were \$15,965 from Cariboo Rose, \$16,020 from Lorraine and \$16,633 from Woodjam. At February 28, 2018, accounts receivable included \$5,503 (February 28, 2018 - \$5,033) receivable from Cariboo Rose, \$8,281 (May 28, 2018 - \$8,281) receivable from Lorraine and \$46,326 (February 28, 2018 - \$29,693) receivable from Woodjam.

During the three months ended May 31, 2018, geological services amounting to \$23,108 were provided to the Company by Mincord Exploration Consultants Ltd. ("Mincord"), a geological service company owned by two directors of the Company. Mincord's relationship with the Company is non-exclusive and without retainer and on a project-by-project basis. Services provided include the hiring of field and professional personnel, rental of vehicular, camp and technical equipment, transportation and mobilization costs. At May 31, 2018, accounts payable included \$8,752 (February 28, 2017 - \$7,402) payable to Mincord.

During the three months ended May 31, 2018 payments totaling \$1,700 (2017 – nil\$) were made to the Chief Financial Officer for accounting and administration services.

On December 17, 2014, the Company advanced \$50,000 to Woodjam as an unsecured promissory note. The promissory note had a term of 18 months and bore interest at 10% per annum, due and repayable at the end of the term together with the principal. The Company has extended the term of the unsecured promissory note to June 17, 2018. On July 28, 2015, August 31, 2015 and November 29, 2016, the Company also advanced \$100,000, \$10,000 and \$60,000, respectively, to Woodjam as unsecured promissory notes. These promissory notes have a term of 36 months and bear interest at a rate of 10% per annum, due and repayable at the end of the term together with the principal. As at May 31, 2018, the total principal and accrued and unpaid interest receivable on these unsecured promissory notes is \$279,011 (February 28, 2018 - \$273,011). During the three months ended May 31, 2018, the Company earned \$6,000 of interest income related to these unsecured promissory notes.

During the year ended February 28, 2017, the Company completed the sale of its 40% interest in the Okeover property to Lorraine for consideration of \$40,000 and 20% of any future option payments resulting from 3rd party agreements on the property made by Lorraine for a period of three years. In addition, during the year ended February 28, 2017, Lorraine purchased Prophecy Development Corp.'s 60% interest in the Okeover property, which includes a \$6,500 receivable from the Company. As at May 31, 2018, project deposit payable to a related party includes \$6,500 owing to Lorraine for a project deposit on the Okeover property.

FINANCIAL AND OTHER INSTRUMENTS

At present, the Company's most significant financial instruments are cash, accounts receivable, marketable securities, promissory notes receivable and accounts payable. The recorded amount of these financial instruments approximate their fair value. The Company does not consider its financial instruments exposed to significant liquidity, credit, or price risks.

Marketable Securities/ Investments

As at May 31, 2018 the Company has the following investments.

	May 31, 2018			February 28, 2018
