Form 51-102F3

Material Change Report

Name and Address of Company

Kenrich-Eskay Mining Corporation
C206 – 9801 King George Hwy
Surrey, BC
V3T 5H5

Date of Material Change

May 24, 2006

News Release

The news release was disseminated through TSX, BC Securities Commission, Alberta Securities Commission, Market News and Stockwatch.

Summary of Material Change

KENRICH-ESKAY MINING CORPORATION (the "Company") provides an update on the initiation of its 2006 exploration program on its two major projects: the Coastal Copper Project in the Anyox mining camp south of Stewart, B.C. and the Corey Project in the Eskay Creek mining camp north of Stewart.

Full Description of Material Change

Vancouver, BC – KENRICH-ESKAY MINING CORPORATION (the "Company") is pleased to provide an update on the initiation of its 2006 exploration program. As per the announcement of April 17, 2006 exploration has commenced on the company's two major projects: the Coastal Copper Project in the Anyox mining camp south of Stewart, B.C. and the Corey Project in the Eskay Creek mining camp north of Stewart.

Drilling commences at Double Ed massive sulphide deposit

Diamond drilling at the Coastal Copper Project commenced on May 18, 2006. Initial drilling is focusing on the Double Ed deposit. Previous exploration programs outlined a resource of about 2 million tonnes grading 1.3% Cu and 0.6% Zn at Double Ed (these historical calculations predate National Instrument 43-101 and cannot yet be verified by Kenrich geologists).

The Company's intends to verify this past work and to determine the geological characteristics of the deposit. In combination with the expected airborne geophysical results, drilling and geological mapping will target extensions to the massive sulphide mineralization.

This initial phase of exploration at Double Ed is expected to last one month and will comprise at least 2000 metres of drilling.

Geological Setting of the Coastal Copper project

The main focus of mining and exploration in the Anyox pendant is the contact horizon that lies between basaltic volcanic rocks and overlying sedimentary rocks. The contact horizon is host to numerous copper (-zinc-gold-silver) bearing massive sulphide deposits, including the past producing mines at the Hidden Creek and Bonanza Creek claims. The past producers lie on a closely adjacent property.

Exploration targets lie within that contact horizon and extend along 20 km of strike length that is held under option by the Company. The Double Ed is the first of the targets to be tested. Additional targets for drilling during the 2006 campaign are currently being assessed by Company geologists.
