Form 51-102F3
Material Change Report
Under Subsection 7.1(1) of National Instrument 51-102

Item 1 <u>Reporting Issuer</u>

Goldstrike Resources Ltd.
1300 – 1111 West Georgia Street
Vancouver, BC V6E 4M3
(the "Company")

Item 2 <u>Date of Material Change</u>

April 30, 2018

Item 3 <u>News Release</u>

A news release was issued on April 30, 2018 through Marketwired.

Item 4 <u>Summary of Material Change</u>

The Company provided details of the 2018 exploration plans for its Plateau Property in Canada's Yukon.

Item 5 <u>Full Description of Material Change</u>

5.1 Full Description of Material Change

The Company announced that the 2018 program at Plateau will be fully funded by Newmont Mining Corporation (NYSE: NEM) through its Canadian mining division. The program, agreed at the April 24, 2018 JV meeting between Goldstrike and Newmont, will include up to 10,000 meters of diamond drilling focused on multiple high quality targets identified in 2017 utilizing Newmont's proprietary technologies. Based on the 2017 data, follow-up exploration is also planned for areas that indicate significant exploration potential on both newly staked claims and extensive areas of the original property that remain under-explored. The 2018 diamond drill program is anticipated to be the largest to date, and is expected to exceed all historical drilling meters combined. Details of the strategic alliance between Goldstrike and Newmont can be found in the Company's March 6, 2017 news release.

Diamond drilling will take place on up to nine target zones along the 70 km long, district-scale property. Primary targets include Goldstack, Gold Dome, Gold Rush, Big Bang and Devils Gate. See attached Plateau Showings map.

Goldstack:
Previous drill results at Goldstack include 13.25 g/t Au over 17.5 metres (September 9, 2015 news release). Over 3,600 metres have been drilled in the zone since 2012. Drilling in 2018 will focus on extending the mineralization that remains open along strike to the west and down dip.

Gold Dome:
Previous drill results at Gold Dome include 7.60 g/t Au over 9.03m (September 9, 2013 news release). Over 1,200 metres have been drilled at the zone since 2013. Drilling in 2018 will have two objectives:

- extending known mineralization discovered in previous drill programs that remains open; and
- exploring a previously untested area approximately 500 metres to the south, characterized by anomalous gold and arsenic soil geochemistry.

Gold Rush (Plateau North):
The Gold Rush area was the primary focus of exploration in 2012. Since then, discoveries made on Plateau South shifted the company's focus away from this area. The 2017 program marked the first time since 2012 the Plateau North was drilled. Extensive soil sampling was completed in the area, extending previously known anomalies and defining new ones. Of the approximately 1,400 soil samples collected in and around the Goldrush area, 22 samples contained greater than one gram of gold per tonne. One highly anomalous soil sample contained 26 grams of gold per tonne. A two kilometre long trend has been tightly defined by soil samples with anomalous gold, arsenic and antimony. Reconnaissance soil sampling in the area indicated other, loosely defined trends. Rock grab samples have assayed up to nine grams of gold per tonne. The 2017 airborne EM and LiDAR surveys also defined multiple structures along the Gold Rush trend. Diamond drilling in 2018 will focus on drilling these geochemical and geophysical anomalies within the Gold Rush trend.

Other potential 2018 drill targets include:

- Big Bang East
- Goldbank area
- Devil's Gate area (Plateau North)
- Gold Rush West
- Bonanza North
- Goldback (south of Goldstack)

Goldstrike will continue with update news releases as the Plateau program commences.

White Gold Properties

Thanks to the strategic partnership with Newmont, Goldstrike now has the ability to proceed to unlock value from its 100 percent owned properties located in the

White Gold District. Exploration plans in 2018 for those properties include drilling the Lucky Strike Property, which is located in the heart of the White Gold District. Highlights from the discovery hole on Lucky Strike include 5.36 g/t Au over 22.0m (see November 20, 2017 news release). More details on the 100 percent owned White Gold assets and the upcoming, fully funded 2018 advanced exploration and drill programs are planned to be released in the near future. Please refer the accompanying Yukon map for the locations of Goldstrike's five White Gold properties.

OTHER

Sample analysis and assaying for all of Goldstrike's projects has been conducted by Bureau Veritas in Vancouver, BC, which is ISO 9001 accredited. Soil samples are dried at 60C and 100 grams are sieved to -80 mesh. A 15 gram sample split is then leached in aqua regia at 95 degrees C and analyzed by a 36-element ICP package that includes semi-quantitative gold. Rock and drill core samples are crushed to 80% - 10 mesh and a 500 gram sample split is pulverized to 85% -200 mesh. 50 gram charges are then assayed for gold using fire assay fusion and ICP-ES finish with a lower detection limit of 2 ppb and an upper detection limit of 10 ppm Au. In addition, 0.5 mg charges are digested by modified 1:1:1 aqua regia (HCl-HNO3-H20) and analyzed by 36-element ICP-MS that also includes semi-quantitative gold with a lower detection limit of 0.5 ppb Au and an upper detection limit of 100 ppm Au. Selected samples are subjected to 500 gram metallic fire assays, for which the plus fraction is finished gravimetrically and the minus fraction is finished with AA. Rigorous procedures are in place regarding sample collection, chain of custody, and data entry. Certified assay standards, duplicate samples and blanks are routinely inserted into the sample stream to ensure integrity of the assay process. The reader is cautioned that grab samples are spot samples which are typically, but not exclusively, constrained to mineralization. Grab samples are selective in nature and collected to determine the presence or absence of mineralization and are not intended to be representative of the material sampled.

Stefan Kruse, Ph.D., P.Geo., Chief Geologist, is a qualified person as defined by National Instrument 43-101 for Goldstrike's Yukon exploration projects, and supervised the preparation of, and reviewed and approved, the technical information in the release.

5.2 Disclosure for Restructuring Transactions

Not Applicable

Item 6 Reliance on subsection 7.1(2) or (3) of National Instrument 51-102

This report is not being filed on a confidential basis

Item 7 **Omitted Information**

No information has been intentionally omitted from this form.

Item 8 **Senior Officers**

For further information, contact Lucy Zhang, CFO and Director of the Company at 604-681-1820

Item 9 **Statement of Senior Officer**

The foregoing accurately discloses the material change referred to herein.

DATED at Vancouver, British Columbia, on April 30, 2018.
