

FORM 51-102F3

Material Change Report

ITEM 1. NAME AND ADDRESS OF COMPANY

Goldrea Resources Corp.
2A 15782 Marine Drive
White Rock, BC,
V4B 1E6

ITEM 2. DATE OF MATERIAL CHANGE

October 13, 2006

ITEM 3. PRESS RELEASE

A News Release dated and issued October 13, 2006 disseminated through Stock Watch and Market News.

ITEM 4. SUMMARY OF MATERIAL CHANGE

See attached news release.

ITEM 5. FULL DESCRIPTION OF MATERIAL CHANGE

See attached news release.

ITEM 6. RELIANCE ON SUBSECTION 7.1(3) OF NATIONAL INSTRUMENT 51-102

Not applicable.

ITEM 7. OMITTED INFORMATION

Not applicable.

ITEM 8. EXECUTIVE OFFICER

Contact: Larry Reaugh, President
Telephone: (604) 531-9639

ITEM 9. DATE OF REPORT

DATED at White Rock, British Columbia, this 13th day of October, 2006.

FOR IMMEDIATE RELEASE

DEFINITION DRILLING CONTINUES TO EXTEND THE JINGKOU ZONE TO THE SOUTH - FIVE (5) COMPARTMENT SHAFT REACHES HALF-WAY MARK

October 13, 2006 - Vancouver, British Columbia

Definition drilling continues to extend the Jingkou zone to the south, with an intersections in hole GZK734, 200 meters south of the previously known mineralization. The Jingkou Zone now has eight drill holes, three surface trenches, and a shallow exploration shaft confirming the existence of a definable mineralized zone. The Jingkou Zone is expected to add considerably to the mineral resource of the property.

The assay results for the mineralized sections in three recent holes are as follows:

Hole	Depth (m)		Interval (m)	Au gpt	Averages (m)
	from	To			
JINGKOU ZONE					
GZK734	256.12	256.99	0.87	0.63	
GZK734	256.99	257.79	0.80	1.04	
GZK734	257.79	258.59	0.80	2.09	
GZK734	258.59	259.39	0.80	1.48	1.30gpt/3.27m.
SHANXI ZONE					
GZK733	192.88	194.05	1.17	1.14	1.14gpt/1.17m.
DAYE MAIN ZONE					
GZK851	399.43	400.23	0.80	2.94	
GZK851	400.23	401.13	0.90	0.98	
GZK851	401.13	401.98	0.85	1.54	
GZK851	401.98	403.08	1.10	0.98	1.54gpt/3.65m.

The assaying was conducted at the Daye Mine assay lab on site. These assays are routinely checked when total metal assays are conducted at the National Engineering Center of Geo-exploration Technology in Langfang, Hebei, Peoples Republic of China, and Chemex Labs in N. Vancouver B.C.

Work is just beginning on the Shanxi Zone at the eastern end of the Daye structure. Earlier work by the Chinese operator had drill two holes into this zone, Holes ZK26 and ZK86. Drill hole ZK86 intersected two mineralized sections 3.98 gpt/1.2m. at 46.8 m. and 3.47 gpt/1.5 m. at 55.02 and drill hole ZK26 intersected 1.71 gpt/1.00 m. These results are reported by the Chinese but the core is no longer available and while these results are believed to be accurate they could not be checked by Goldrea. Goldrea has added six more drill holes to the drill pattern at Shanxi and two of these have intersected significant mineralization. The latest of these is Hole GZK833 (See Table.) which was drilled 250 meters down dip from Hole ZK86. Although the development of this zone is in a preliminary stage the results to date are considered encouraging.

Hole GZK851 was drilled 100 meters to the west of GZK808 which did not intersect mineralization and 100 meters to the south of hole GZK813 which intersected 1.46gpt/4.0m (*Reported earlier*). Hole GZK851 intersected 1.54 gpt gold over 3.65 meters and is thought to be the downward extension of the Daye Main Zone. More holes are planned to the south and the west of this hole.

The shaft sinking towards the deeper part of the South Shijia Zone has reached the 150 meter mark and is progressing on schedule. A new mineralized zone has been encountered at 147 meters.

Field mapping on the Majiakuang License some 10 km to the east of Daye has been completed and the mapping contractor has prepared the drawings and report. This work is under study and will be reported on when analysis of the data is complete. This mapping is expected to define structures identified by the I.P. surveys done last winter.

Mapping on the Langiazhoung License, 40 km to the south, is now completed and the reports and drawings are being studied by the company at this time. Conclusions on these results will be available when analysis is complete.

Geochemistry surveys are finished at the Nantangia License 60 km. south of Daye where I.P. surveys indicate the presence of sulphides. Results were presented last week and these are under study at this time.

This press release was prepared by Norm Tribe, P.Eng., a Qualified Person pursuant to National Instrument 43-101 and is the engineer supervising the ongoing exploration and development in China.
