- for contracts relating to the traditional life business (separate management) or multi-line business, the investment portfolio of separate management to which the product is linked is used.

[168] The Group's elections, both for the interest rate liquidity analysis component, the CRA adjustment and the extrapolation of long-term rates, are in line with the provisions of IFRS 17 on the definition of the risk free rate structure and the insurance practice.

After identifying the reference asset portfolio, the Group calculates the average liquidity premium of the assets in the portfolio, equal to the difference between the spread observable at the measurement date for each asset and its probability of default. The default component is deducted in line with the provisions of IFRS 17 on credit risk correction.

Estimates of future cash flows for the performance of insurance contracts
Future cash flows represent future liabilities that the insurance company posts to cover its commitments regarding insurance business. These include cash flows to insured parties weighted by their probability of occurrence, including forward-looking returns on insurance products and expenses to be incurred to support the business in force.

Life business cash flows are calculated using the actuarial engine, based on future cash flow projection methods similar to those defined under Solvency II, with a higher level of granularity compared to the Unit of Account, in order to achieve an estimation level as close to reality as possible. 200 scenarios were used for stochastic processing.
Management of the assets belonging to separate management schemes, used for projection purposes and implemented in the actuarial engine, is defined as Future Management Measures (FMG). These include, inter alia: the target return of the separate management scheme, strategic asset allocation, reinvestment/disposal policies, risk mitigation strategies and commercial actions.

With respect to the Non-Life business, the future cash flows relating to the liability for incurred claims (LIC) are calculated without distinguishing between the different components included in the calculation (i.e., there is no need for a break down into the different components relating to claims, incurred but not reported, external settlement costs, etc.).
With respect to the future cash flows relating to the liability for remaining coverage (LRC) measured using the General Model, the calculation is based on the definition of future cash flows under Solvency II, duly adjusted to reflect any differences with respect to the scope of the future cash flows to be considered (i.e., contract boundary) and the granularity required by IFRS 17.
The calculation of the liability for remaining coverage measured using the Premium Allocation Approach does not require future projections and is based on the simplified method envisaged by the standard.

To estimate the expected future cash flows within the scope of each group of contracts, the Group applies the following criteria:
- incorporating all available information obtained in a reasonable and justifiable manner, without superfluous costs or efforts, with regard to the amount, timing and uncertainty of the cash flows;
- maintaining consistency of the estimate of any market variables with the corresponding values observable on the market for those variables;
- reflecting the conditions existing at each measurement date, i.e. the estimate is based on current information, updated for each reporting period.

Specifically, the accounting standard defines non-financial variables (so-called operational assumptions) as all variables that cannot be observed or derived directly from markets.
The operational assumptions mainly affect:
- the exercise by the insured parties of contractual options that modify the nature of the terms of the contract and the resulting cash flows (such as the conversion option);
- the frequency and amount of insured events (such as the operational mortality factor);
- the technical assumptions relating to non-life business (such as the definition of the loss ratio, the expense ratio, early termination rates with and without premium reimbursement, claim run-off rates).

Where cash flows contain financial guarantees and contractual options (which do not change symmetrically with market charges), the methodology adopted by the Intesa Sanpaolo Group provides for appropriate modelling of the impact of financial guarantees and contractual options, using stochastic financial scenarios within the actuarial platform.
The companies belonging to the Insurance Division maintain and regularly update a list of all operational factors that may affect future liabilities.
For each operational factor selected and deemed material, the most appropriate, comprehensive and accurate data set (internal or external, or a combination of the two) is identified and will be used as an objective, stable and robust basis to define Best Estimate assumptions. For each of the selected operational factors, the most reliable, objective, appropriate and stable method is identified to derive Best Estimate assumptions, appropriately using the available information and possibly considering the impact of outliers and potential future trends. Finally, the validity is checked and the adequacy of the methods used to derive the Best Estimate assumptions is actively and regularly monitored.
With respect to the most significant operating assumptions, the companies belonging to the Insurance Division perform appropriate sensitivity analyses.

To identify the amount of expenses included in the scope of IFRS 17, reference is made to the expense captions, net of several expenses (e.g. training expenses, donations and fines etc…), in line with the provisions of the standard. Specifically, the expenses include those directly attributable to groups of contracts, including the allocation of fixed and variable general overhead costs. Moreover, under several methods used to measure claims incurred for Non-Life/Accident contracts, the estimate of future payments of claims are adjusted to take account of inflation. The Insurance Acquisition Cash Flows incurred in a lump-sum on issuing new contracts are not part of future cash flows, but are included in the measurement of the Contractual Service Margin of New Business, as a decrease thereto, by virtue of the fact that those costs were paid against the payment of the premium.
In defining projected cash flows, the Intesa Sanpaolo Group projects the real costs incurred to third parties, eliminating the intragroup costs incurred by the insurance companies.

With regard to the assumptions on mortality rates, the Italian national mortality tables published by ISTAT are considered. A survey on the Group's experience in the last ten years is conducted, and statistical methods are used to adjust the mortality tables in order to generate the expected mortality rates differentiated by macro-type of product (credit protection insurance, temporary life policies, savings/investment/pension) and by age and gender classes.

The other technical assumptions are also obtained starting with the historical data taken from ERP/management applications. Specifically, for redemption rates, a statistical analysis is conducted by claim duration of the historical frequencies recorded by the single insurance companies, suitably adjusted based on expert judgement, specifically regarding the claim durations not yet subject to observation.

To measure the future cash flows relating to the liability for incurred claims, the Group uses the most commonly used methods in the sector, also based on the availability of data and time series on claims. The estimate of liabilities for claims occurred includes the estimate of reimbursements and direct costs for claims occurred and reported, occurred but not yet reported, direct liquidation fees and management and liquidation fees allocated.

Methods used to measure the adjustment for non-financial risk

The non-financial risk adjustment is the compensation required to support the uncertainty on the amount and timing of cash flows deriving from non-financial risk at the time of performance of the insurance contract. As the risk adjustment compensates for uncertainty, estimates are made both on a proportionate approach to calculating the risk adjustment as the product of an average percentage applied to the expected contractual cash flows, where the percentage is obtained by leveraging an ex-ante VaR approach on a quarterly basis, based on the 75th percentile of the specific distribution of each risk considered. The analysis of the requirements of the standard entailed the selection, for the purposes of calculating the risk adjustment for the Life Business and the Non-Life Business, of the following underwriting risks:
- for the Life business, reference is made to the following risks: Mortality, Longevity, Expenses and the higher of the Lapse Up risk and Lapse Down risk;
- for the Non-Life business, reference is made to the following risks: Premium and Reserve and Lapse.

Both for the Life business and the Non-Life business, Catastrophic risk is excluded.
The *ex-ante* VaR is calculated at the overall company level, benefiting from diversification effects between risks and portfolios. This measure is subsequently "re-allocated" to each Macro-Portfolio (for the Life business: Separate Management, Multi-line, Unit Linked, Pension Funds and pure risk products; for the Non-life business, the Macro-Portfolios correspond to the Solvency 2 Business Lines) on a pro rata basis according to each Macro-Portfolio's individual contribution to the *ex-ante* Var.

17. Other information

Own shares

Any own shares held are directly deducted from equity. Similarly, their original cost and the profits or losses deriving from their subsequent sale are recorded in equity.

Accruals, prepayments and deferrals

Accruals, prepayments and deferrals for the year that include income and charges for the year, accrued on assets and liabilities, are shown in the financial statements as an increase or decrease of the assets and liabilities to which they are related.

Leasehold improvements

The costs sustained for restructuring property belonging to third parties are capitalised in consideration of the fact that for the duration of the rental contract the using company has control of the assets and may receive their future economic benefits. These costs, recorded in Other assets as provided for by the instructions of the Bank of Italy, are amortised over a period which must not exceed the duration of the rental contract.

Employee termination indemnities

Employee termination indemnities qualify as a "post-employment benefit" classified as:
- a "defined contribution plan" to the extent of the portions accruing from 1 January 2007 (the date the reform of the supplementary pension schemes came into force pursuant to Legislative Decree 252 of 5 December 2005) when the employee opted for the complementary pension scheme or decided to allocate such portions to the INPS (the Italian Social Security Institute) Treasury fund. Therefore, the amounts, recorded under personnel expenses, are determined on the basis of amounts due without the application of actuarial calculation;
- a "defined benefit plan" to the extent of the portions of employee termination indemnities accrued until 31 December 2006. These amounts are recognised at their actuarial value determined using the "Projected Unit Credit Method", without applying the pro-rata of the service rendered. Indeed, the current service cost of employee termination indemnities is almost entirely accrued and its revaluation in the years to come is not expected to generate significant benefits for employees.

For the purposes of discounting, the rate used is the market yield of high-quality corporate bonds taking into account the average remaining life of the liability, weighted based on the percentage amount paid and advanced, for each maturity, with respect to the total to be paid and advanced until the expiry of the entire obligation.
The plan's costs are recorded under personnel expenses, while actuarial profits and losses are recognised in the statement of comprehensive income.

Share-based payments

Share-based payments are recorded in the income statement, with a corresponding increase in shareholders' equity, on the basis of the fair value of financial instruments attributed at assignment date, dividing the charge over the period set forth by the plan.

In the case of options, the fair value is calculated using a model which considers, in addition to information such as strike price and expiry date of the option, spot price of the shares and their expected volatility, expected dividends and the risk-free interest rate, as well as the specific characteristics of the plan. The pricing model values the option and the probability of realisation of the condition on the basis of which the options have been assigned.

The combination of the two values supplies the fair value of the assigned instrument.

Any decrease in the number of financial instruments granted is accounted for as a cancellation of such instruments.

Employee benefits

Employee benefits are defined as all forms of consideration given by an entity in exchange for service rendered by employees. Employee benefits are divided into:

- short-term benefits (other than termination benefits or equity compensation benefits) that are expected to be paid in full within twelve months after the end of the period in which the employees render the related service and recognised in full through profit or loss when they become due (this category includes, for example, wages, salaries and "extraordinary" benefits);
- post-employment benefits payable after the conclusion of employment that require the entity to provide future benefits to employees. These include employee termination indemnities and pension funds, which are in turn divided into defined contribution plans and defined benefit plans or company pension funds;
- termination benefits, i.e. compensation that the company recognises to the staff members upon termination of the employment agreement, following the company's decision to terminate the employment relationship prior to the normal retirement date;
- long-term benefits, other than those above, that are not expected to be paid in full within twelve months after the end of the period in which the employee rendered their service.

Offsetting of financial instruments

According to IAS 32, paragraph 42, financial assets and financial liabilities are offset and the net amount presented in the financial statements when an entity:

- has a legal enforceable right of set off which is currently exercisable in all circumstances, both in the ordinary course of business or in the event of default, insolvency or bankruptcy of the parties;
- intends to settle the transactions on a net basis or on a gross settlement basis whose substantive effects are equivalent to a net settlement.

For derivative instruments covered by netting agreements that meet the above requirements, Bank of Italy Circular 262 also requires the offsetting to be performed between trading and hedging derivatives, with the mismatches to be presented on a net basis. The net balance is usually allocated to the trading book rather than to the hedging derivatives, based on the actual amount of the mismatch between trading and hedging derivatives.

In compliance with the requirements of IFRS 7, more detailed information is provided in the tables contained in Part B – Other information of these Notes to the financial statements, which present the following:

- the carrying amounts of assets and liabilities that meet the requirements of IAS 32, paragraph 42, before and after offsetting;
- the exposures subject to master netting agreements that have not been offset but have the potential to be offset following specific circumstances;
- the collateral associated with them.

Tax credits related to the "Cura Italia" and "Rilancio" Decree Laws acquired as a result of transfer by direct beneficiaries or previous purchasers (e.g. ecobonus)

Decree Laws no. 18/2020 ("Cura Italia" Decree) and no. 34/2020 ("Rilancio" Decree) introduced tax incentives related to both investment expenditure (e.g. ecobonus and seismicbonus) and current expenditure (e.g. rents for non-residential premises). The government once again intervened on the issue through Decree Law no. 50/2022 ("Decreto Aiuti"), mainly by remodulating the base of potential re-assignees through Decree Law no. 11/2023 which prohibits, although with certain exceptions, the possibility of opting, instead of directly using the deduction, for the discount on invoices or transfer of credit and, finally, through Decree Law no. 39/2024 which mainly refers to qualified parties (financial intermediaries and insurance companies) and limits the possibility of netting social security against contribution liabilities.

These tax incentives apply to households or businesses, are linked to a percentage of the expenditure incurred (in some cases up to 110%) and are granted in the form of tax credits or tax deductions (with option for conversion into tax credits). The main features of these tax credits are: i) the possibility of using them for offsetting; ii) their transferability to third-party purchasers; and iii) their non-refundability by the Treasury.

The accounting for tax credits acquired from a third party (transferee of the tax credit) is not covered by a specific international accounting standard. IAS 8 requires, in cases where there is a circumstance not explicitly addressed by an IAS/IFRS accounting standard, that management develop an accounting policy to ensure relevant and reliable disclosure of such transactions.

To this end, the Intesa Sanpaolo Group, in view of the guidance provided by the Authorities, in the document "Accounting treatment of tax credits connected with the 'Cura Italia' and 'Rilancio' Decree Laws acquired following the assignment by the direct beneficiaries or previous purchasers" published on 5 January 2021 by the Coordination Committee between the Bank of Italy, Consob and IVASS concerning the application of accounting standards IAS/IFRS has adopted an accounting policy that refers to the accounting rules established by IFRS 9, applying the provisions that are consistent with the characteristics of the transaction.

The Group attributes:

– to a Hold to Collect business model the loans that are acquired within the limits of its tax capacity, with the objective of holding and using them for future offsetting. Those loans are recognised at amortised cost, representing the remuneration of net interest income over the time frame of recovery;
– to a Hold to Collect and Sell business model the loans that are acquired within the limits of its tax capacity, which may be further reassigned. Those credits are measured at fair value through other comprehensive income. Given the particular nature of these instruments, their fair value fluctuations are linked to the changes in interest rates. The profitability is recognised on a *pro rata* basis under net interest income in the income statement;
– to an Other business model, the loans acquired for trading, e.g., in the event of purchases above its tax capacity and the signing of related reassignment agreements. Those loans are measured at fair value through profit or loss. Their fair value fluctuations are linked to the changes in interest rates. The profitability is recognised on a pro-rata basis under net interest income in the Income statement.

In all the above cases, the initial recognition value matches the fair value at the date of purchase. Therefore, no day-one profit/loss is recognised.

The accounting framework set out in IFRS 9 for calculating expected credit losses is not deemed applicable to this specific case. The ECL (Expected Credit Loss) need not be calculated on these tax credits, as no refund is expected from the tax authorities, as the extinction of the instrument is linked to the offsetting of the bearer's tax payables. Moreover, in cases where reassignment is planned, the sale will be finalised by collecting the price of the instrument, without recognising a receivable due from the assignee.

Lastly, considering the operating methods implemented by the Group, the risk of non-use of the tax credits, i.e. the risk that the Bank lacks the tax capacity to achieve the benefits associated with the asset, can be reasonably deemed as inexistent. Specifically:

– with regard to the Hold to Collect and Hold to Collect and Sell business models, the amounts acquired are consistent with the overall tax capacity, so that the Bank can offset its payables;
– with regard to the Other business model, for the loans acquired, reassignment agreements were gradually entered into for excess volumes, binding on the customer, with multiple counterparties, whose tax capacity is verified in advance.

As specified in the joint document from the Authorities, as mentioned above, given that the purchased tax credits do not qualify as tax assets, public subsidies, intangible assets or financial assets under the international accounting standards, the most appropriate classification, for their presentation in the financial statements, is the residual classification under Other Assets in the balance sheet.

Treatment of Irrevocable Payment Commitments (IPC) with the Single Resolution Fund (SRF)

Starting from 2016, the banks from all Eurozone countries joined the Single Resolution Mechanism (SRM) under which the Single Resolution Fund (SRF) was established with the aim of having adequate resources to be used in the event of banking crises. The relevant legislation establishes that the initial target level of the fund - to be achieved over 8 years (2016-2023) - is equal to at least 1% of the covered deposits of all credit institution authorised in the banking union. The contribution, which is determined annually by the Single Resolution Board (SRB) and communicated to the member banks, may be paid in cash and, in part, by entering into Irrevocable Payment Commitments (IPCs), not exceeding 30% of the total contribution and fully backed by collateral of low-risk assets. The use of irrevocable payment commitments is at the discretion of each bank. The Intesa Sanpaolo Group decided to use IPCs - against which off-balance sheet commitments have been recognised - by paying, in this respect, cash collateral in the same amount as a deposit, which is remunerated on the basis of the applicable contractual conditions and consistently applied to all European banks that use the IPC mechanism.
The off-balance sheet commitment - which, for prudential purposes, is fully deducted from CET1 in accordance with the ECB provisions covering the SREP measure - is assessed at each reporting date and/or whenever there is evidence indicating that its enforcement is probable. In this respect, the Group has activated a specific monitoring mechanism, with the support of a leading research company, in order to verify the absence of critical indicators in member banks that would deem SRF intervention probable and therefore the recall of the IPC. Based on the analyses performed, the risk that the IPCs be called as at 31 December 2024 is deemed remote. Furthermore, since its establishment in 2016, the Single Resolution Fund has never called the IPCs entered into by the banks, as it did not take any action that involved the use of the funds raised.
Finally, in relation to the contributions requested in the 2016-2023 period, IPCs were entered into by the Intesa Sanpaolo Group for a total of 382 million euro, against which the Group set up the cash collateral recognised under Financial assets measured at amortised cost. In 2024, having achieved the minimum capacity envisaged by Regulation (EU) 806/2014, the SRB did not request any further contributions.

Recognition of revenues and costs

Revenues are gross flows of economic benefits deriving from the performance of the company's ordinary business and are recognised when control of the goods or services is transferred to the customer, at an amount that represents the amount of consideration that the company considers it is entitled to. In particular, revenues are recognised by applying a model that must meet the following criteria:

- identification of the contract, defined as an agreement in which the parties are committed to perform their respective obligations;
- identification of the individual performance obligations contained in the contract;
- determination of the transaction price, i.e. the expected consideration for the transfer of the goods or services to the customer;
- allocation of the transaction price to each performance obligation, based on the sale prices of the individual obligation;
- recognition of revenues when (or as) the performance obligation is satisfied by transferring a promised good or service to a customer.

The transaction price is the amount to which an entity expects to be entitled in exchange for the transfer of goods and services promised. It may include fixed or variable amounts or both. Revenues from variable fees are recognised in the income statement if they can be reliably estimated and only if it is highly likely that all or a significant part of this fee will not need to be reversed from the income statement in future periods. Where there is a high level of uncertainty related to the nature of the consideration, it will be recognised only when this uncertainty is resolved.

Revenues may be recognised:
- at a specific point in time, when the entity satisfies a performance obligation by transferring a promised good or service to the customer, or
- over time, as the entity satisfies a performance obligation by transferring a promised good or service to the customer.

The good is transferred when, or in the period when, the customer acquires control of the good.

In particular:
- interest is recognised on accrual on the basis of the contractual interest rate or the effective interest rate in the case of application of amortised cost. Interest income (or interest expense) includes differentials and positive (or negative) margins accrued up to the reporting date, relating to financial derivatives:
  a) hedging interest-generating assets and liabilities;
  b) classified in the balance sheet in the trading book, though related to financial assets and/or liabilities designated at fair value through profit or loss (fair value option) in management terms;
  c) related in management terms to assets and/or liabilities classified in the trading book and providing for the settlement of differentials or margins with different maturities;
- overdue interest, which may be provided for by the relevant contracts is recorded in the income statement solely at the time of collection;
- dividends are posted in the income statement when their distribution is approved, unless this date is not known or the information is not immediately available, in which case they may be recognised when they are collected;
- commission income from services is recorded, on the basis of the existence of contractual agreements, in the period in which the services have been rendered. Commission income included in the amortised cost for the purposes of determining the effective interest rate is recognised under interest;
- profits and losses from securities trading are recognised in the income statement at the date of sale, on the basis of the difference between the consideration paid or collected and the carrying value of such instruments;
- profits deriving from insurance contracts recorded pursuant to IFRS 17, posted in the balance sheet caption Contractual Service Margin are released to the income statement for the estimated portion of insurance services rendered during the period;
- revenues deriving from the sale of non-financial assets are recorded at the date of sale, or when the performance obligation towards the customer is satisfied.

Costs are recognised in the income statement on an accruals basis. Costs relating to the receipt and performance of contracts with customers are recognised in the income statement in the periods when the related revenues are recognised.

Use of estimates and assumptions in preparing financial reports

The preparation of financial reports requires the use of estimates and assumptions that may have a significant effect on the amounts stated in the balance sheet and income statement, and on the contingent assets and liabilities reported in the financial statements. Estimates are based on available information and subjective evaluations, also founded on past experience, which are used to formulate reasonable assumptions in measuring operating events. Given their nature, the estimates and assumptions used may vary from year to year, and hence it cannot be excluded that current amounts carried in the financial statements may differ significantly in future financial years as a result of changes in the subjective evaluations made.

If there are greater uncertainties and/or the assets being measured are particularly material, the valuation is supported by specific fairness opinions from external appraisers/experts.

The main cases for which subjective evaluations are required to be made by corporate management include:
- the measurement of impairment losses on loans, investments, and, generally, other financial assets;
- the use of measurement models for determining the fair value of financial instruments not listed on active markets;
- the evaluation of the appropriateness of amounts stated for goodwill and other intangible assets;
- the fair value measurement of real estate and valuable art assets;
- the measurement of personnel funds and allowances for risks and charges;
- the estimates and assumptions on the collectability of deferred tax assets;
- the demographic (linked to the estimated mortality of the insured people) and financial (deriving from the possible trend in the financial markets) assumptions used to measure the insurance products in accordance with the provisions of IFRS 17.

For some of the types listed above, the main factors subject to estimates by the Group and which determine the carrying value of assets and liabilities in the financial statements can be identified. The following are noted, by way of example:
- to determine the fair value of financial instruments not listed on active markets, if the use of parameters that cannot be obtained from the market is necessary, the main estimates regard, on one hand, development of future cash flows (or even income flows, in the case of equities), possibly conditional on future events and, on the other, the level of specific input parameters not listed on active markets;
- the estimates for the assignment of loans and debt securities classified as Financial assets measured at amortised cost and Financial assets measured at fair value through other comprehensive income to the three credit risk stages required by IFRS 9 and to calculate the related expected credit losses involve:

- the determination, where applicable, of the parameters for a significant increase in credit risk, essentially based on models for measuring the probability of default (PD) upon origination of the financial assets and at the reporting date;
- the inclusion of forward-looking factors, including macroeconomic factors, for the determination of the PD and LGD (Loss Given Default);
- the determination of the likelihood of sale of impaired financial assets, through the realisation of market positions;

- to determine the future cash flow estimates from non-performing loans, a number of items are considered: the expected recovery times, the presumed realisable value of guarantees and the costs to be sustained for the recovery of credit exposure;
- to determine the value in use of intangible assets with an indefinite life (brand name and goodwill) with regard to the Cash-Generating Units (CGU) comprising the Group, the future cash flows in the forecasting period of the analysis and the flows used to determine the terminal value, generated by the CGU, are subject to estimate, separately and appropriately discounted. Also the cost of capital is among the items subject to estimate;
- to determine the value in use of intangible assets with a finite life with regard to the CGUs comprising the Group, the useful life is subject to estimate, on the one hand, as well as the future cash flows arising from the asset, on the other. The cost of capital is subject to estimate in the case of intangible assets with a finite life as well;
- the fair value measurement of real estate and valuable art assets is based on valuations prepared by qualified independent firms. Lease rentals, selling prices, discount rates and capitalisation rates are estimated in order to conduct the appraisals of the properties, while to conduct the appraisals on the valuable art assets, the estimate of the value is gathered from the performance of the exchanges of similar works (in terms of technique, size, subject) by the same author or regional movements and schools that are close with regard to style and technique;
- to measure post-employment benefits, the present value of the obligations is subject to estimate, taking into account the flows, appropriately discounted, arising from past time-series analyses and the demographic curve;
- to measure allowances for risks and charges, the amount of outflows necessary to fulfil the obligations is estimated, where possible, taking into account the effective probability of having to utilise resources;
- to determine the insurance liabilities, estimates are used to measure the future cash flows for fulfilment of the contracts and to define the technical assumptions on mortality rates and other technical assumptions, and, for example, redemption rates and claims occurred for the measurement of non-life contracts. The assumptions used to determine the discount rates and the methods used to measure the non-financial risk adjustment are of particular importance;
- to determine the value of deferred tax items, the likelihood of an effective future tax burden is estimated (taxable temporary differences) and the level of reasonable certainty – if it exists – of future taxable amounts at the time when the tax deductibility occurs (deductible temporary differences and tax losses carried forward).

Considering that subjective evaluations are also used by management, *inter alia*, to estimate the useful life of property, equipment and intangible assets subject to the periodic amortisation process, such as owner-occupied properties and software subject to valuation by the Intesa Sanpaolo Group, respectively, according to the revaluation model and at cost, the following should be noted in relation to these assets:

- with respect to owner-occupied properties, in accordance with internal rules and the IAS/IFRS, the Group periodically checks the adequacy of the useful life of these assets, also considering the close relationship between the useful life of an asset and the extent of the upgrading and modernisation work aimed at preserving quality and functional levels in line with market standards. The revaluation of the useful life of owner-occupied properties was carried out with the support of independent third-party appraisers and covered, in particular, clusters relating to entire buildings as well as branch buildings which showed suitable conditions for maintaining the original useful life. In consideration of the update of the useful life, a positive impact amounting to approximately 20 million euro due to lower depreciation was recognised in the 2024 income statement under “Net Adjustments to/Recoveries on property and equipment”;
- with respect to software, in the current digital environment, IT resources are becoming an increasingly strategic asset, including in the banking industry, to support corporate business development. Consequently, the investments in digital solutions and/or innovative and transformative information technology systems have become increasingly important in quantitative terms. Based on the above and in line with internal policies and the IAS/IFRS, the estimated useful life of the company’s software applications was revised. As a result of the recent investments made in new functionalities and innovative technological developments, some software applications met the conditions for the revision of their useful life. This led to the recognition of a positive impact of approximately 68 million euro generated by lower amortisation on the 2024 income statement under “Net adjustments to/recoveries on intangible assets”.

The classification drivers for financial assets

The classification of the financial assets into the three categories established by the standard depends on two classification drivers: the business model used to manage the financial instruments and the contractual cash flow characteristics of the financial assets (or SPPI Test).

The classification of the financial assets derives from the combined effect of the two drivers mentioned above, as described below:

- Financial assets measured at amortised cost: assets that pass the SPPI test and come under the Hold to Collect (HTC) business model;
- Financial assets measured at fair value through other comprehensive income (FVOCI): assets that pass the SPPI test and come under the Hold to Collect and Sell (HTCS) business model;
- Financial assets measured at fair value through profit or loss (FVTPL): this is a residual category, which includes financial instruments that cannot be classified in the previous categories based on the results of the business model test or the test of the contractual cash flow characteristics (SPPI test not passed).

SPPI test

For a financial asset to be classified as at amortised cost or at FVOCI – in addition to the analysis of the business model – the contractual terms of the asset must also provide, on specified dates, for cash flows that are solely payments of principal and interest (SPPI). This analysis must be carried out for loans and debt securities in particular.

The SPPI test must be carried out on each individual financial instrument at the time of recognition in the balance sheet. After initial recognition, and as long as it is recognised in the balance sheet, the asset is no longer subject to new assessment for the purposes of the SPPI test. If a financial instrument is derecognised and a new financial asset is recognised, the SPPI test must be performed on the new asset.

For the application of the SPPI test, IFRS 9 provides the following definitions:

- Principal: this is the fair value of the financial asset at initial recognition. This value may change over the life of the financial instrument, for example as a result of repayments of part of the principal;
- Interest: this is the consideration for the time value of money and for the credit risk associated with the principal amount outstanding during a particular period of time. It can also include consideration for other basic lending risks and costs and a profit margin.

In assessing whether the contractual flows of a financial asset can be defined as SPPI, IFRS 9 refers to the general concept of a ‘basic lending arrangement’, which is independent of the legal form of the asset. When contract terms introduce exposure to risks or volatility in the contractual cash flows that is inconsistent with the definition of a basic lending arrangement, such as exposure to changes in share or commodity prices, the contractual cash flows do not meet the definition of SPPI. The application of the classification driver based on contractual cash flows sometimes requires a subjective judgement and, consequently, the establishment of internal application policies.

In cases of modified time value of money – for example, when the interest rate of the financial asset is recalculated periodically, but the frequency of the recalculation or the frequency of payment of the coupons does not reflect the nature of the interest rate (such as when the interest rate is recalculated monthly on the basis of a one-year rate) or when the interest rate is recalculated regularly on the basis of an average of particular short or medium-to-long term rates – an entity should assess, using both quantitative and qualitative information, whether the contractual cash flows still meet the definition of SPPI (benchmark cash flows test). If the test shows that the (undiscounted) contractual cash flows are “significantly different” from the (also undiscounted) cash flows of a benchmark instrument (i.e. without the modified time value element), the contractual cash flows cannot be considered to meet the definition of SPPI.
The standard requires specific analyses (“look through test”) to be performed and these are therefore also conducted on multiple contractually linked instruments (CLIs) that create concentrations of credit risk for debt repayment and on non-recourse assets, for example in cases where the loan can only be enforced on specified assets of the debtor or on the cash flows from specified assets.

The presence of contractual clauses that may change the frequency or amount of the contractual cash flows must also be considered to determine whether those cash flows meet the requirements to be considered as SPPIs (e.g. prepayment options, the possibility of deferring contractually agreed cash flows, embedded derivative instruments, subordinated instruments, etc.).

However, as envisaged by IFRS 9, a contractual cash flow characteristic does not affect the classification of the financial asset if it could have only a de minimis effect on the contractual cash flows of the financial asset (in each year and cumulatively). Similarly, if a cash flow characteristic is not genuine, i.e. if it affects the instrument’s contractual cash flows only on the occurrence of an event that is extremely rare, highly abnormal and very unlikely to occur, it does not affect the classification of the financial asset.

For operations in debt securities, the Intesa Sanpaolo Group uses the services offered by well-known info-providers for the performance of the SPPI Tests. This choice, on one hand, provides front office staff who deal in securities with an immediate result for the performance of the test, enabling the streamlining of purchasing processes, and, on the other hand, provides access to market approaches shared by numerous operators and audit firms. Only in cases where the securities are not managed by info-providers, the test is carried out manually using a proprietary tool based on an internally developed methodology (decision-making trees).

A proprietary tool based on an internally developed methodology (decision-making trees) has also been developed for carrying out the SPPI test for the lending processes. In particular, given the significant differences in characteristics, the procedure differs between products related to a contractual standard (typically the retail loan portfolio) and tailor-made loans (typically the corporate loan portfolio).
For standard products, the SPPI test is carried out during the structuring of the contractual standard, through the “New Product Coordination” process, and the result of the test is applied to all the individual relationships related to the same catalogue product. For tailor-made products, on the other hand, the SPPI test is carried out for each new credit line/relationship submitted to the decision-making body through the use of the proprietary tool.

The decision-making trees – included in the proprietary tool – have been produced internally (both for debt securities and loans) and capture the possible non-SPPI compliant characteristics. They take account of the instructions provided by IFRS 9, as well as the interpretations of the standard made by the Group. The trees are used both for the implementation of the rules of the proprietary tool and for the verification and validation of the methodology adopted by the info-providers.

Business model

With regard to the business models, IFRS 9 identifies three cases relating to the way in which cash flows and sales of financial assets are managed:

- *Hold to Collect (HTC)*: this is a business model whose objective is achieved by collecting the contractual cash flows of the financial assets included in the portfolios associated to it. The inclusion of the portfolio of financial assets in this business model does not necessarily result in the inability to sell the instruments, but the frequency, value and timing of sales in prior periods, the reasons for the sales, and the expectations about future sales, need to be considered;
- *Hold to Collect and Sell (HTCS)*: this is a mixed business model whose objective is achieved by collecting the contractual cash flows of the financial assets in portfolio and (also) through the sale of the financial assets, which is an integral part of the strategy. Both activities (collection of contractual flows and sale) are indispensable for achieving the business model's objective. Accordingly, sales are more frequent and significant than for an HTC business model and are an integral part of the strategies pursued;
- *Other/Trading*: this is a residual category that includes both financial assets held for trading and financial assets managed with a business model that does not come under the previous categories (Hold to Collect and Hold to Collect and Sell). In general, this classification applies to a portfolio of financial assets whose management and performance are measured based on fair value.

The business model reflects the way in which financial assets are managed to generate cash flows for the benefit of the entity and is defined by top management with the appropriate involvement of the business structures. It is observed by considering the way in which financial assets are managed and, as a consequence, the extent to which the portfolio's cash flows derive from the collection of contractual flows, from the sale of the financial assets, or from both. This assessment is not performed on the basis of scenarios that the entity does not reasonably expect to occur, such as 'worst case' or 'stress case' scenarios. For example, if an entity expects that it will sell a particular portfolio of financial assets only in a stress case scenario, that scenario does not affect the entity's assessment of the business model for those assets if the entity reasonably expects that such a scenario will not occur.

The business model does not depend on management's intentions regarding an individual financial instrument, but refers to the way in which groups of financial assets are managed in order to achieve a specific business objective.

In summary, the business model:

- reflects the way in which financial assets are managed to generate cash flows;
- is defined by top management, with the appropriate involvement of the business structures;
- must be observable by considering the way the financial assets are managed.

In operational terms, the assessment of the business model is carried out in line with the company's organisation, the specialisation of the business functions, the risk cascading model, and the assignment of delegated powers (limits). All relevant factors available at the date of the assessment are used in the assessment of the business model. The above information includes the strategy, the risks and their management, the remuneration policies, the reporting, and the amount of the sales. In the analysis of the business model, the elements investigated must be consistent with each other and, in particular, must be consistent with the strategy pursued. Evidence of activities not in line with the strategy must be analysed and duly justified.
In this regard, and in relation to the business models under which the financial assets are held, a specific set of "Business Model Rules" (approved by the competent levels of governance) has been drafted for the Parent Company and Banking Group companies. It defines and sets out the components of the business model in relation to the financial assets included in the portfolios managed as part of the operations of the Intesa Sanpaolo Group's business structures. In further detail, the mapping of the business model adopted by the various structures through which the Group operates, with regard to both loans and receivables and debt securities, takes account of the structure of the division model and the Corporate Centre; this structure has been identified as the relevant level for formulating and representing the various business models applied by the Group's risk-taking centres.

Within the Chief Risk Officer Area, the Market & Financial Risk Management structure of the Parent Company provides high-level supervision of the procedure required for determining the business model within which a given set of assets is held and verifies the need for any updates (to be incorporated, at least annually, in the Business Model Rules document).

Monitoring of the business model

The monitoring of the reference business model of the various structures through which the Group operates is performed by the Market & Financial Risk Management structure, which uses indicators intended to verify the consistency of the declared strategy with that pursued within the business models; these indicators, differentiated for the various business models, have been developed in accordance with IFRS 9 and corporate rules and procedures.

For the Hold to Collect portfolios, the Group has set limits for frequent but not significant sales to be considered eligible (individually or in aggregate), or for infrequent sales even if their amount is significant, and the parameters have also been established for identifying sales as being consistent with that business model because they relate to an increase in credit risk or for securities nearing maturity.
More specifically, within an HTC business model, sales are allowed:

- in the event of an increase in credit risk, i.e., if the exposure deteriorates or moves to stage 2 in accordance with the impairment rules under IFRS 9;
- for securities nearing maturity (i.e., according to the Group rules, in the 6 months preceding maturity), provided that the amount collected is close to the current value of the remaining contractual flows;

- when they are frequent but not significant in terms of value or occasional even if significant in terms of value, subject to authorisation assessment by the competent Control bodies. In order to determine these aspects, thresholds of frequency and significance have been set:
  - frequency is defined as the percentage ratio between the number of positions sold over the year and the number of portfolio positions at the beginning of the period considered;
  - significance is defined as the percentage ratio between the nominal value of the sales during the current year and the nominal value of the instruments held in the portfolio at the beginning of the period considered.

With regard to the determination of the "Risks" and the "Reporting" for the HTCS and Trading business models, the provisions of the RAF and Market Risk Charter and of internal policies in the area of market risk controls apply in principle, and measures are concurrently established for monitoring the consistency of the HTCS and Other/Trading business models.

With regard to the HTCS business model, IFRS 9 does not provide for the need for limits on the frequency or the value of the sales. However, the Group has established indicators for debt securities only in order to ensure that they are properly assigned to the chosen business model over time. These indicators are:
- The holding period, which measures the time for which a certain instrument has been held in portfolio;
- Turnover rate, which measures the speed with which positions in portfolio turn over during a predefined period of time.

Within the framework of the monitoring of the indicators set out above, limits and early-warning thresholds apply according to the overall strategies pursued by the HTCS portfolio.

Finally, with regard to debt or equity securities held for trading, a measure of the consistency of inclusion in the chosen business model applies, represented by the indicator of "expected average permanence" (so-called Vintage) which measures the observed holding period of all securities in portfolio.

The monitoring measures relating to the various business models are subject to regular reporting through technical committees.

Amortised cost measurement

The amortised cost of a financial asset or liability is the amount at which the financial asset or liability is measured at initial recognition net of any principal repayments, plus or minus cumulative amortisation, calculated using the effective interest rate method, of any difference between initial amount and amount at maturity and net of any reduction for impairment.

The effective interest rate is the rate that exactly discounts future cash payments or receipts through the expected life of the financial instrument or through the subsequent date for recalculation of the price to the present value of the financial asset or financial liability. In the calculation of the present value, the effective interest rate is applied to the flow of future cash receipts or payments through the entire useful life of the financial asset or liability or for a shorter period when certain conditions recur (for example review of market interest rates).

After initial recognition, amortised cost enables allocation of revenues and costs directly by decreasing or increasing the value of the instrument over its entire expected life via the amortisation process. The determination of amortised cost is different depending on the fact that financial assets/liabilities have fixed or floating rates and – in this last case – if the volatility of the rate is known or not beforehand. For instruments with fixed rate or fixed rate by time bands, future cash flows are quantified on the basis of the known interest rate (sole or floating) over the life of the loan. For financial assets/liabilities with a floating rate, for which the volatility is not known beforehand (for example because it is linked to an index), the determination of cash flows is carried out based on the last rate available. At every revision of the interest rate, the amortisation plan and the effective interest rate for the entire life of the investment, that is, until maturity, are recalculated. Any changes are recorded in the income statement as income or loss.

Measurement at amortised cost is applied for the financial assets measured at amortised cost and for the financial assets measured at fair value through other comprehensive income, as well as the financial liabilities measured at amortised cost.

Financial assets and liabilities traded at market conditions are initially recognised at fair value, which normally corresponds to the amount disbursed or paid including, for instruments measured at amortised cost, transaction costs and any directly attributable fees.

Transaction costs include internal or external marginal costs and income attributable to the issue, the acquisition or the disposal of a financial instrument which are not debited to the customer. These commissions, which must be directly attributable to the single financial asset or liability, modify the original effective return, thereby the effective interest rate associated to the transaction differs from contractual interest rate. Transaction costs do not include costs/income referred to more than one transaction and the components related to events which may occur during the life of the financial instrument, but which are not certain at the time of the initial agreement, such as for example: commissions for retrocession, for non-use, for advance termination. Furthermore, amortised cost does not include costs which would be sustained independently from the transaction (e.g. administrative and communication costs, stationery expenses), those, which though directly attributable to the transaction are part of standard practice for the management of the financing (e.g. activities related to the loan granting process), as well as commissions for services received following structured finance activities which would in any case have been received independently from the subsequent financing of the transaction (e.g. facility and arrangement fees).
With reference to loans, the following costs are considered directly attributable to the financial instrument: fees paid to distribution networks, fees paid for the origination and/or the participation in syndicated loans and lastly, up-front fees correlated to loans disbursed at rates exceeding market rates. Income considered in the calculation of amortised cost includes: up-front fees correlated to loans disbursed at rates below market rates, income for the participation in syndicated loans and brokerage commissions received.

For debt securities not measured at fair value through profit or loss, the following are considered transaction costs: commissions on contracts with brokers operating on the Italian stock exchange, commissions paid to dealers operating on the Italian and foreign stock and bond markets defined on the basis of the commission tables. Stamp duty is not considered in amortised cost since immaterial.
Regarding securities issued, amortised cost considers placement commissions on bond issues paid to third parties, amounts paid to Exchanges and remuneration paid to Independent auditors for the activities performed for each single issue, while amortised cost does not consider commissions paid to rating agencies, legal and advisory/review expenses for the annual update of prospectuses, the costs for the use of indexes and commissions which originate during the life of the bond issue.

Amortised cost is also applied for the measurement of loss incurred by the financial instruments listed above as well as for the measurement of instruments issued or purchased at a value other than fair value. The latter are measured at fair value, instead of the amount collected or paid, by discounting expected future cash flows at a rate equal to the effective rate of return of similar instruments (in terms of credit rating, contractual expiry, currency, etc.), with the simultaneous recognition in the income statement of a financial charge or income; after initial recognition, these are measured at amortised cost with the registration of higher or lower effective interest with respect to nominal interest. Lastly, structured liabilities that are not measured at fair value through profit or loss, for which the embedded derivative has been separated from the financial instrument, are also measured at amortised cost.

As specified by IFRS 9, in some cases, a financial asset is considered credit-impaired at initial recognition because the credit risk is very high, and in the case of a purchase it is purchased at a deep discount (with respect to the initial disbursement value). If these financial assets, based on the application of the classification drivers (SPPI Test and business model), are classified as assets measured at amortised cost or at fair value through other comprehensive income, they are classed as Purchased or Originated Credit Impaired (POCI) assets and are subject to special treatment for the impairment process. In addition, for the financial assets classed as POCI, the credit-adjusted effective interest rate is calculated, at the initial recognition date, which requires the inclusion of the initial expected credit losses in the cash flow estimates. This credit-adjusted effective interest rate is used for the application of the amortised cost and the consequent calculation of interest.
For non-performing loans arising from business combinations, the difference between the initial recognition amount (the fair value determined in the PPA) of the POCIs and the previous carrying amount at the acquired entity is split into two components: one related to the lower recoverable cash flows estimated at fair value, which therefore include the expected credit losses over their entire remaining life, and the other related to the discounting of those lower recoverable cash flows. Please note that the reversal of discounting (connected with the estimate of recoverable cash flows attributed to non-performing loans at the moment of the PPA) is recognised, on a pro-rata basis, among interest income so as to supplement the contractual interest rate with the higher return resulting from the lower value attributed to the recoverable cash flows, which, as mentioned above, take into account the expected losses over the entire remaining life of the POCI assets.

The amortised cost measurement criterion is not applied to hedged financial assets/liabilities for which fair value changes related to the risk hedged are recorded through profit or loss. The financial instrument is again measured at amortised cost in the case of hedge termination; from that moment the fair value changes recorded before are amortised, calculating a new effective interest rate which considers the value of the loan adjusted by the fair value of the hedged part, until the natural expiry of the hedge. Furthermore, as already mentioned in the paragraphs relating to financial assets and liabilities measured at amortised cost, measurement at amortised cost is not applied to short-term assets/liabilities for which the time value is deemed to be immaterial and to loans without a definite maturity or revocable loans.

Impairment of assets

Impairment of financial assets

At each reporting date, pursuant to IFRS 9, financial assets other than those measured at fair value through profit or loss are subject to an assessment aimed at verifying whether there is any evidence that the carrying value of the assets may not be fully recoverable. A similar analysis is also performed for loan commitments and for guarantees given that must be tested for impairment under IFRS 9.
In preparation for the determination of the impairment losses, at each reporting date the financial instruments must be assigned to the following categories ("Stage Assignment" or "Staging"):
- Stage 1: comprising financial instruments for which, from their initial recognition up to the reporting date, there is no evidence of a significant increase in credit risk;
- Stage 2: it comprises financial assets that have had a significant increase in credit risk since initial recognition;
- Stage 3: if there is evidence of impairment, these financial assets – in line with any other assets pertaining to the same counterparty – are considered impaired and are therefore included in Stage 3.

The non-performing exposures consist of financial assets classified in the categories of bad loans, unlikely-to-pay (UTP) loans and exposures past due by more than ninety days, defined in Bank of Italy Circular 272/2008.

Impairment of performing financial assets

For financial assets for which there is no evidence of impairment (unimpaired financial instruments), it is necessary to check whether there are indicators that the credit risk of the individual transaction has increased significantly since initial recognition. This check, in terms of classification (or, more precisely, staging) and measurement, has the following consequences:
- where these indicators exist, the financial asset is included in stage 2. In this case, in compliance with the IAS/IFRS and despite the absence of an actual impairment, the measurement consists of the recognition of impairment losses equal to the lifetime expected credit losses of the financial instrument. These adjustments are subject to revision at each subsequent reporting date, both to periodically check their consistency with the continuously updated loss estimates and to take account – if the indicators of "significantly increased" credit risk are no longer present – of the change in the forecast period for the calculation of the expected credit loss;

- where these indicators do not exist, the financial asset is included in stage 1. In this case, in compliance with the IAS/IFRS and despite the absence of an actual impairment, the measurement consists of the recognition of the 12-month expected credit losses for the specific financial instrument. These adjustments are subject to revision at each subsequent reporting date both to periodically check their consistency with the continuously updated loss estimates and to take into account – if there are indicators that the credit risk has "significantly increased" – the change in the forecast period for the calculation of the expected loss.

With regard to the measurement of financial assets and, in particular, the identification of the "significant increase" in credit risk (a necessary and sufficient condition for the classification of the asset being measured as stage 2), the following factors constitute the key elements to be taken into account, in accordance with the standard and its operational implementation by the Intesa Sanpaolo Group:
- the variation (beyond set thresholds) of the lifetime probabilities of default compared to the time of initial recognition of the financial instrument. This is therefore an assessment made on a "relative" basis, which constitutes the main driver;
- the presence of a past due position that – subject to the materiality thresholds identified by the regulations – has been in that status for at least 30 days. If these circumstances apply, the credit risk of the exposure is considered to have "significantly increased" and the exposure is therefore transferred to stage 2 (when the exposure was previously included in stage 1);
- the presence of forbearance measures, which – again on a presumption basis – result in the classification of the exposures under those whose credit risk has "significantly increased" since initial recognition. Activating a forbearance measure implies a minimum probation period of 24 months in stage 2;
- some of the indicators from the credit monitoring systems specifically used within the Group are also considered for the purposes of the transfer between "stages". Specifically, reference is made to the following:
  - with respect to the centralised perimeter (main Italian companies and foreign corporate banks), to early warning systems. Where signals of high risk ("traffic light" results) are identified for at least three consecutive months by such systems, a perimeter of potentially riskier counterparties is defined, to be classified in stage 2;
  - with respect to the banks belonging to the international perimeter (International Banks Division), to the watch lists, i.e. the credit monitoring systems that – based on the current credit quality of the borrower – place performing exposures above a certain level of risk within a particular range.

Finally, a staging allocation effect was identified in the in-model adjustment linked to the identification of extreme scenarios (described later in this section). This led to the stage 2 classification of the counterparties deemed most vulnerable to the aforementioned extreme scenarios in relation to the rating assigned.

Focusing on the main trigger out of those referred to above (i.e. the change in the lifetime probability of default), the significant increase in credit risk ("SICR") is determined by comparing the relative change in the lifetime probability of default recorded between the initial recognition date of the relationship and the observation date (lifetime PD Change) with predetermined significance thresholds. The assignment of a lifetime PD to the individual relationships is carried out by allocating the ratings for each segment according to the masterscale at both the initial recognition date and the observation date. Ratings are determined based on internal models, where available, or on business models. If there are no ratings, the Benchmark PDs are assigned to the type of counterparty being assessed.
The significant deterioration is therefore based on the increase in the lifetime PD caused by downgrades of the position from its origination to the reporting (observation) date, as well as the change in the forecast of the future macroeconomic factors.

The above-mentioned "relative" change in lifetime PD is an indicator of the increase or decrease in credit risk during the reporting period. To establish whether, in accordance with IFRS 9, any increase in credit risk can be considered "significant" (and therefore entail a transition between stages), it is necessary to set specific thresholds. Increases in lifetime PD below these thresholds are not considered significant and, consequently, do not result in the transfer of individual credit lines/tranches of debt securities from stage 1 to stage 2. However, this transfer is required if there are relative increases in PD above these thresholds. The thresholds used have been estimated based on a process of simulations and optimisations of forecast performance, carried out using granular historical portfolio data. Specific thresholds are set for the Corporate, Retail, Large Corporate and Retail SME models and extended to the other models based on methodological affinity. The thresholds differ in terms of residual maturity, annual granularity and rating class.
The determination of the thresholds has been calibrated to find a suitable balance between the performance indicators relating to the ability of the thresholds to:
- detect stage 2 positions before their transition to default;
- identify positions for which a return to stage 1 is due to an actual improvement in credit rating.

To complement the above methodology, a "relative" threshold also exists (tripling of lifetime PD at the observation date compared to the lifetime PD at the initial recognition date), which acts on a residual basis compared to the main methodology. Therefore, if this threshold is exceeded, the position is automatically classified to Stage 2. In order to avoid the "sliding" into stage 2 of particularly high credit quality positions, the threshold is only triggered for non-investment grade loans and securities.

Some specific considerations apply for the "staging" of the debt securities. Unlike loans, for this type of exposure, sales and purchases after initial recognition (made using the same ISIN) may form part of the ordinary management of the positions (with the consequent need to identify methods to be adopted for identifying the sales and repayments in order to determine the remaining quantities of the individual transactions that need to be allocated a credit quality/rating upon origination to be compared with that parameter at the reporting date). In this regard, the use of the "first-in-first-out" or "FIFO" method (for the recognition of the recorded ECL in the income statement, in the event of sales or repayments) was considered to help in providing a more transparent management of the portfolio, also for the front office operators, while also enabling the continued updating of the credit rating based on new purchases.

Once the allocation of the exposures to the various credit risk stages has been established, the expected credit losses (ECL) are determined at individual transaction or securities tranche level, using the IRB/Business models, based on the parameters of Probability of Default (PD), Loss Given Default (LGD) and Exposure at Default (EAD), to which appropriate corrections are made to ensure compliance with the specific requirements of IFRS 9.
The following definitions apply for PD, LGD and EAD:
- PD (Probability of Default): likelihood of migrating from performing to non-performing status over the period of one year. In models consistent with supervisory provisions, the PD factor is typically quantified through the rating. In the Intesa Sanpaolo Group, the PD values are derived from internal rating models where available, supplemented by external ratings or segment/portfolio average figures;
- LGD (Loss Given Default): percentage loss in the event of default. In the models consistent with supervisory provisions, it is quantified through the historical experience of discounted recoveries on exposures that have become non-performing;
- EAD (Exposure At Default) or credit equivalent: amount of the exposure at the time of default.

As mentioned above, in order to comply with IFRS 9, specific adjustments had to be made to these factors, including in particular:
- adoption of a Point in Time (PIT) PD compared to the Through the Cycle (TTC) PD used for Basel purposes;
- removal of some additional components from the TTC LGD, such as indirect costs (non-recurring costs) and an additional margin of conservatism specifically introduced for the regulatory models, as well as the component linked to the economic downturn;
- the introduction of specific treatment in relation to the regulatory provisions, in order to estimate the accounting LGD, to include in the modelling (in line with the indications of IFRS 9 on using entity-specific information) the estimates of internal recoveries exceeding the regulatory threshold of the Maximum Recovery Period, i.e., the maximum time limit beyond which the Supervisory Authority assumes that nothing will be recovered;
- the use of PDs and, where necessary, multi-period LGDs, to determine the lifetime expected loss of the financial instrument (stages 2 and 3);
- the use of the effective interest rate of the individual transaction in the discounting of the expected future cash flows, unlike in the regulatory models, where the individual cash flows are discounted using the discounting rates determined in compliance with the prudential regulations.

In relation to the multi-period EAD, in line with IFRS 9 the Intesa Sanpaolo Group refers to the plans at amortised cost for both loans and debt securities, regardless of the measurement method used (amortised cost or fair value through other comprehensive income). For loan commitments (margins), on the other hand, the EAD is assumed to be equal to the nominal amount weighted according to a specific Credit Conversion Factor (CCF).

The measurement of the financial assets also reflects the best estimate of the effects of current and future conditions and in particular the economic conditions that affect the forward-looking PDs and LGDs. IFRS 9, also based on the guidance from the international regulators, gives particular importance to information on future macroeconomic scenarios in which the Bank may find itself and which clearly influence the situation of the debtors, with regard both to the “risk” of migration of exposures to lower quality classes (and therefore concerning the staging) and to the recoverable amounts (and therefore concerning the determination of the expected loss on the exposures). In terms of method, various possible alternative approaches designed to take account of these elements have been analysed. Of the various alternatives considered, the Intesa Sanpaolo Group has decided to adopt the “Most Likely scenario + Add-on” approach. According to this approach, the macroeconomic conditioning of PD and LGD is carried out through a baseline scenario («Most-Likely», in line with the approach used for other business purposes such as, for example, the budget and business plans) and then corrected with an Add-On to include any differences compared to downside and upside scenarios. If the overall impact of the Add-On on the risk parameters is positive, the decision has been made to neutralise the effect for both staging and ECL calculation purposes.

The macroeconomic scenario is determined by the Bank’s Research structure using forecasting models that are disclosed to the market to determine the consensus. Alternative upside and downside scenarios are determined through stress tests of the input variables of the forecasting models.

In particular, the most likely scenario and alternative scenarios are determined using a set of analytical and stand-alone forecasting instruments that determine the forecast path for several blocks of variables, namely:
- national accounts and inflation of the main Eurozone countries, the United States, the United Kingdom and Japan;
- official rates (ECB, Fed, BoJ), EUR and USD swap rate curves, and several points of the government curves;
- exchange rates for EUR, USD, JPY and GBP;
- stock market indices (DJ Eurostoxx 50 and S&P 500);
- Brent price;
- some specific data for the Italian economy (industrial production, real estate prices, employment, public finance balances).

These forecasts are then processed using the Oxford Economics multi-country structural Global Economic Model, where they replace the forecast paths of the baseline scenario provided by the company with the periodic updating of the database. The model is then solved to derive a consistent global forecasting framework, including variables for which no specific models have been developed, and to obtain a simulation environment that can be used to generate alternative scenarios. This step may require some iterations, particularly if the forecasting framework generated internally is significantly different from the one provided by Oxford Economics. If this is the case, further fine-tuning may be needed for specific secondary variables that the analysts consider to be inconsistent with the forecast scenario or that have an unexplainable quarterly volatility.

The alternative paths are selected using external information. In particular:

- average annual GDP growth rates of several countries: this is the key driver for the simulation and the deviations are determined to replicate the dispersion of the growth estimates published by Consensus Economics in the most recent report available at the date of the simulation, considering the minimum and maximum forecasts (after applying a filter to identify and eliminate possible outliers). If there are outliers, these are discarded and the remaining maximum and minimum values are considered. Since consensus estimates are only available for the first two years of the simulation period, an extrapolation of the deviations identified for the first two years is used for the third year;
- stock market indices (DJ Eurostoxx 50, S&P 500) and US residential real estate prices: the minimum and maximum forecasts of the Thomson Reuters panel are used as a reference;
- Italian residential real estate prices: since no consensus estimates are currently available, the alternative paths are based on the distribution of the historical quarterly changes available from 1980 to the current quarter.

The percentile value identified is used, for the Most Likely scenario, to determine the variations corresponding to a probability gap, calculated through statistical analysis of the historical distribution of the observations. The two (positive and negative) changes with respect to the most-likely scenario are then used to calculate the level of the individual identified indices, reconstructing the two alternative paths (one positive and one negative) for each of them that represent the input for the determination of the Add-On. The probability gap used is identified based on the variability characteristics of the series, to obtain a significant deviation from the most-likely scenario.
In addition to defining the alternative paths, a map of possible additional factors is maintained, i.e., adverse idiosyncratic events or scenarios, not explicitly incorporated in the time series used for the construction of the most-likely scenario or in the alternative paths, which can generate further significant effects on expected losses.
The following is assessed for these events/scenarios:

- the possible time frame;
- the degree of inclusion in the most-likely scenario or the alternative paths;
- the potential impact, assessed in qualitative terms.

The map of additional factors also draws on the list of risk factors contained in the forecast reports of the IMF (World Economic Outlook) and the European Commission and may change over time.
Within the assessment of the time frame for the additional factors, note is made if the factor cannot be placed within a specific time period, which makes its incorporation into the most-likely scenario or alternative paths unfeasible.
The assessments made take account of the fact that the consensus estimates may include forecasts that already incorporate the total or partial realisation of one or more risk factors in their estimates, which means that the alternative paths may already incorporate these additional factors to some extent.
Where there is considerable uncertainty in the national and international macroeconomic forecasts, as well as significant deviations in terms of best-case forecasts with respect to the TTC scenario, prudential factors may be introduced in relation to the deviations in the minimum and maximum values of the variables based on the above-mentioned consensus or historical figures.
The above macroeconomic scenarios (Most Likely and alternative scenarios) are used in internal models to determine the point-in-time (PIT) parameters.
Specifically, the time series of default rates acquired from the Bank of Italy are differentiated over the main economic macro-sectors (e.g. consumer households, family businesses, construction) and, for each of these, specific satellite models establish the relationships with the macroeconomic variables in order to obtain the forecast default rates. In turn, these impact the TTC transition matrices between rating classes and thus provide the PIT transition matrices for each scenario (Most Likely and alternative scenarios). These give rise to the lifetime conditional PD.
In particular, the TTC matrices are calculated using internal default rates for the Corporate, Retail SME and Retail segments, whereas the Bank of Italy system rates are used for the Low Default segments, because the internal time series data for those segments is less extensive. The forward-looking point-in-time matrices, on the other hand, are calculated using the system default rates for all the segments.
A similar process is used to determine the PIT LGD grids.

Taking account of the repayment plans of the individual loans, their conditional PD and LGD, residual maturity and staging, the impairment of performing financial assets is determined.

Finally, with reference to the estimation methodologies of impairment of performing financial assets, in certain circumstances, the need may arise to make adjustments (valuation increases) to the results of the models adopted. That need may indicatively arise as a result of external events that are unexpected, which the bank cannot control and have potential consequences, also on a large scale, on the measurement of the ECL of the portfolios as a result of elements that otherwise are not adequately captured within the IFRS 9 framework. It must be noted that the IFRS 9 estimation methodologies are founded on experience-based assumptions, and are strongly anchored to historical observations, which are considered over a congruous time horizon and in a sufficiently stable backdrop. Therefore, in order to fully understand the effects of particular conditions of volatility or of possible significant economic deviations from the expected macroeconomic scenarios, also in relation to “emerging risks”, a specific reference framework was identified to take action - duly approved by the competent Management Bodies - to factor into ECL calculation further elements that are not yet and/or insufficiently covered by the models in use.
Specifically, the measurement of ECL in such situations is adjusted (increasing) via the following two elements:

- a first impact (in-model adjustment) on the performing positions as a whole, in the case of specific economic times characterised by risks of significant deviation from the expected scenarios, estimated through the forward-looking conditioning model, with an impact on the individual risk parameters (PD and LGD), by identifying “extreme” scenarios, characterised by a probability of occurrence considerably contained and typical only of extreme events (therefore outside the consensus ranges) with respect to the long-term macroeconomic scenario. The approach described also triggers a staging allocation effect with stage 2 classification of the counterparties deemed most vulnerable to extreme scenarios in relation to the assigned rating;

- an additional impact (post-model adjustment) related to the effects - on “vulnerable” customers and at the same time belonging to subsectors of the loan portfolio, particularly exposed to the consequences of “emerging” risk factors - of the combination of evolving structural risks and new risks. This enhances the information from credit quality monitoring processes. This latter valuation burden is determined for vulnerable customers belonging to higher-risk subsectors, by increasing the ECL in relation to the estimated greater risk. The approach described also triggers a staging allocation effect with stage 2 classification of the most vulnerable positions.

Impairment of non-performing financial assets

Non-performing loans are represented by bad loans, unlikely to pay and past due positions by more than 90 days.
Non-performing loans classified as bad loans are subject to the following measurement methods:

- analytical-statistical measurement, which is used for exposures of less than 2 million euro and is based on the use of specific LGD grids, plus an Add-On to take account of information linked to the evolution of the current conditions related to management variables highly correlated with the loss performance and forward-looking information relating to the impact of expected future macroeconomic scenarios (as described in the previous paragraphs);
- analytical-specific measurement, which is used for customers with exposures exceeding 2 million euro and is based on the impairment percentages allocated by the manager, following specific analysis and measurements, also based on the evolution of the current conditions, plus an Add-On to take account of forward-looking information, and in particular information relating to the impact of future macroeconomic scenarios (except for bad loans backed by mortgage collateral or relating to property leases for which the impact of future scenarios is included through the method used to determine the haircuts to the value of the properties pledged as collateral).

The measurement of unlikely-to-pay loans (UTPs) is also performed based on different approaches:

- analytical-statistical measurement, for exposures of less than 2 million euro, based on the use of specific LGD grids, plus an Add-On to take account of the already mentioned information linked to the current conditions and the impacts of future macroeconomic scenarios, as well as continuation in the risk status, in order to penalise positions with greater vintage or which have no movements and/or recoveries for a particular period of time;
- analytical-specific measurement, for on-balance sheet exposures of more than 2 million euro, based on the impairment percentages allocated by the manager, following specific analyses and assessments also based on the evolution of the current conditions, plus an Add-On to take account, also in this case, of the impacts of future macroeconomic scenarios and of continuation in the risk status.

For Group companies, the threshold value for analytical-statistical measurement is set by the competent bodies of the individual companies, in coordination with the structures of Intesa Sanpaolo, at a level that is not, in any event, higher than that set by the Parent Company.

Regardless of the division of these exposures between those subject to analytical-statistical measurement and those subject to analytical-specific measurement (as identified above), the add-ons envisaged include the sales scenarios for the disposable non-performing loans if the business plan and the NPL reduction plan envisage sales and those sales do not lead to a reclassification pursuant to IFRS 5. The valuation of the disposable non-performing loans therefore considers the possibility of also realising these loans through their sale.

Non-performing loans classified in the past-due loans category, on the other hand, are subject to analytical measurement based on statistics, regardless of the amount of the exposure. However, also in this case, the adjustment determined based on the LGD statistical grids is supplemented to take account of the Add-On attributable to the effect of the evolution of the current conditions and the future macroeconomic scenarios.

Credit exposures must continue to be carried as non-performing for at least three months after they cease to meet the requirements for being classified as such (the “probation period”). Until the conditions are met for reclassification out of the non-performing category, such exposures are retained in their respective risk classes and measured according to an analytical-statistical or an analytical-specific approach taking account of their lower risk level.

A brief description is provided below of the methods used for the analytical-specific and analytical-statistical measurement:

- the analytical-specific measurement of bad loans and unlikely-to-pay loans above 2 million euro is a measurement performed by the managers of the individual positions based on a qualitative and quantitative analysis of the borrower's financial position, the riskiness of the credit relationship, the targets and strategies for reduction of the non-performing loans, and any mitigating factors (collateral), taking into account the financial impact of the estimated recovery time.

  For bad loans in particular, a series of elements are relevant, which differ according to the characteristics of the positions, and must be thoroughly and prudently assessed, including the following, listed merely as examples:
  - nature of the credit, whether preferential or unsecured;
  - net asset value of the borrowers/third party collateral providers;
  - complexity of existing or potential litigation and/or the underlying legal issues;
  - exposure of the borrowers to the banking system and other creditors;
  - last available financial statements;
  - legal status of the borrowers and any pending insolvency and/or individual proceedings.

  In order to determine the estimated realisable value of loans secured by real estate, and to take into account both the time series of recoveries and the forward-looking information in accordance with IFRS 9, an approach is applied focused on the valuation of real estate based on the expected average auction price and the related reduction in the observed price, with the calculation of average haircuts that differ according to the type of real estate collateral (residential, commercial, industrial and land). Accordingly, to avoid duplications, a macroeconomic Add-On is not used in the

analytical-specific measurement for bad mortgage loans, because the forward-looking component is already taken into account through the haircut.
For real-estate bad loans arising from lease contracts, in view of the particular nature of the product (lack of auctions), the haircut is estimated as the depreciation of the asset with respect to the appraised value observed at the time of classification as non-performing and the actual price of sale.

In addition, for unlikely-to-pay loans, the measurement is based on a qualitative and quantitative analysis of the borrower's financial position and on precise assessment of the risk situation.
The calculation of the impairment loss involves the valuation of the future cash flows that the borrower is considered to be able to generate and that will also be used to service the financial debt. This estimate must be made based on two alternative approaches:

- the going concern approach: the operating cash flows of the borrower (or the beneficial owner) continue to be generated and are used to repay the financial debts contracted. The going concern assumption does not rule out the realisation of collateral, but only to the extent that this can take place without affecting the borrower's ability to generate future cash flows. The going concern approach is also used in cases where the recoverability of the exposure is based on the possible sale of assets by the borrower or on extraordinary transactions. Similarly to the case of bad loans, haircuts are also used in measuring real-estate collateral for unlikely-to-pay positions. For going-concern positions, these haircuts are determined on the basis of the haircuts applied in the liquidation process (gone-concern bad loan or UTP position), while applying a calibration factor equal to the probability of migration of the UTP positions to the bad loan category;
- the gone concern approach: applicable in cases when it is believed that the borrower's cash flows will cease. This is a scenario that can apply to positions that are expected to be classified as bad loans. In this context, assuming that shareholders' interventions and/or extraordinary operations to restructure debt in turnaround situations are not reasonably feasible, recovery of the credit is essentially based on the value of the collateral that secures the Bank's credit claim, net of the application of a haircut (determined as for bad loans) and, alternatively, on the realisable value of the assets, taking into account the liabilities and possible pre-emptive claims;

- the analytical-statistical measurement, performed for bad loans and unlikely-to-pay loans of less than 2 million euro and for past-due loans has specific features according to the type of exposure involved.

  With regard to bad loans, the analytical-statistical measurement is based on the Bad Loan LGD grids, where the LGD Defaulted Asset model is mainly characterised by the differentiation of the loss rates that, in addition to the regulatory segment, is based on the continuation in the risk status ("vintage") and the possible activation of legal recovery proceedings. The grids are also differentiated for the other significant analysis axes used in the model estimation (e.g. product type, type of guarantee, geographical area, exposure band, etc.). The recovery time grids are mainly broken down by regulatory segment and by additional significant analysis axes used in the modelling (e.g. recovery procedures, exposure band, product type).

  For unlikely-to-pay loans, the measurement is performed using statistical LGD grids estimated specifically for positions classified as unlikely-to-pay loans, in line with the estimated LGD grids for bad loans. The estimation model for the LGD grid for unlikely-to-pay loans is similar to the one described above for bad loans and calculates the expected loss rate of the relationship being valued according to its characteristics. The LGD for unlikely-to-pay loans is obtained by recalibrating the bad loan LGD using the Danger Rate module. The Danger Rate is a multiplying correction factor to apply to the bad loan LGD, in order to take into account the loss rates that can be recorded in the various default statuses (Unlikely-to-Pay and/or past due). The Danger Rate is estimated using the probability of migration to bad loans for positions already in default, the loss rates observed in the pre-bad loans phase for positions migrating to bad loans, and the loss rates observed in the pre-bad loans phase for positions that return to performing status or are extinguished.
  In addition, for the two subclasses of the "Unlikely-to-Pay Loans" risk status ("Non-Forborne Unlikely-to-Pay Loans" and "Forborne Unlikely-to-Pay Loans"), differentiated grids are estimated to take into account the characteristics of the Forborne loans, which, in addition to having lower average loss levels due to the effect of the Forbearance Measures, are also affected by the regulatory constraints that prevent their return to performing loan status before 12 months from the date of the renegotiation.

  For past-due loans, the methods used to determine the grids are the same as those described for the unlikely-to-pay loans (Framework Danger Rate). In this case, the vintage factor is captured by the introduction of a differentiation based on the duration of the past-due period (Past Due at 90 days/180 days) which produces a significant variation in the loss rates of the grids, which are also differentiated according to regulatory segment and additional analysis axes (e.g. product type, type of guarantee, geographical area, exposure band, etc.) common to the other non-performing loan categories.

  Also in the LGD estimation models used in the analytical-statistical measurement of non-performing exposures, several additional components specifically included for regulatory models are removed, similar to that illustrated for performing exposures.

With regard to the inclusion of current and forward looking information, it should be noted that, for non-performing exposures, a statistically estimated component (Add-On from macroeconomic scenario) linked to the most-likely and downside scenarios expected over the period of the next three years is also considered, according to the criteria already described.
In fact, as required by IFRS 9, the effects of the forward-looking scenario on LGD estimates must also be considered and the aforementioned component is aimed at capturing the non-linearity of the relationship between the macroeconomic variables and ECL measurement, by analysing the forecast uncertainty of the variables used for the preparation of the most-likely scenario. It is based on the methodological framework that is used for performing loans, but ignores the upside scenario from

a prudential perspective and only considers the average downside and most-likely scenarios over the period of the next three years.
Furthermore, an additional factor is applied to the analytical/statistical measurement firmly based on internal management variables, in particular the level of past and prospective NPL ratio, which, on the basis of long-term observation, is statistically correlated with the loss performance. This factor makes the LGD estimate more sensitive to changes in the current and future economic/management context.
Also in terms of future scenarios, with regard to the unlikely to pay category, which includes positions that are still performing but show signs of difficulty, both for positions with analytical-specific measurement and those with analytical-statistical measurement, when there are no effective forbearance measures, an additional component shall be applied (in addition to the aforementioned add on from the macroeconomic scenario) to reduce the recoverable amount of the positions based on their vintage in the risk status and the absence of movements and/or recoveries in a specific period of time.

With regard to the alternative recovery scenarios, the Intesa Sanpaolo Group, in relation to the objectives of reducing the stock of outstanding non-performing loans, included in its business plans, and the commitments made to the Supervisory Authorities, with specific regard to the NPL Strategy, considers the sale of particular portfolios as the strategy that, in certain conditions, can maximise the cash flow recovery, also considering the recovery times.
Consequently, the “ordinary” scenario, which assumes a recovery strategy based on the collection of credit, typically through legal actions, mandates to credit recovery companies and the realisation of mortgage collateral, is also been accompanied - where applicable and as an alternative recovery strategy - by the scenario of the sale of the loan.
Where company plans and Group strategies identify disposal objectives and, as a result, a portfolio of non-performing loans that may be disposed of, until the disposal objectives are reached, the loans and receivables included in that portfolio shall be measured taking account of both the amount recoverable through operating activities and market valuations (based on external appraisals) and/or sales prices, if already defined.
In particular, where a larger loan portfolio that may be sold represented by Group loans that are disposable (thus, for example, positions that are not involved in disputes, as per precise indication by the management structures and which are not subject to synthetic securitisation), in relation to the sales objectives is identified, the book value of said portfolio is determined by weighting the recoverable amount through operating activities with the amount recoverable through sale.
More specifically, the recoverable amount of disposable non-performing loans is quantified as the average between (i) the value in the event of sale (fair value) and (ii) the collection amount, weighted on the basis of the percentage of the loans eligible for sale - determined as the ratio between the target volume of loans to be sold and the respective non bankruptcy-remote portfolios having the same profile, i.e. as a percentage that reflects the probability of sale of the portfolios whose disposal is considered highly probable. The “collection amount” was determined according to the ordinary methods adopted by the Group for the impairment of non-performing loans, i.e. based on the individual measurement of the exposures exceeding a defined threshold and based on an analytical-statistical measurement for the others. The measurement of the value in the event of sale is carried out by an external expert, based on market valuations.
However, where the positions to be sold are specifically identified, those positions shall be measured exclusively taking account of the market values established by external experts, based on a specific fairness opinion or, if already defined through a binding agreement with the buyer, the sales price. Those loans are also reclassified as assets held for sale.

As already mentioned, the purchased or originated credit-impaired (POCI) financial assets have specific features in terms of impairment. As a result, value adjustments equal to the lifetime ECL must be recognised on these instruments from their initial recognition date and for their entire lifetime. At each subsequent reporting date, the amount of the lifetime ECL must therefore be adjusted, with the recognition through profit or loss of the amount of any change in lifetime expected credit losses as a gain or an impairment loss. In view of the above, POCI financial assets are initially recognised in stage 3, subject to the possibility of being subsequently transferred to the performing loans stage, even if an expected loss equal to the lifetime ECL will continue to be recognised.

Lastly, with regard to non-performing loans, it is highlighted that the Intesa Sanpaolo Group uses the – full or partial – write-off/derecognition of unrecoverable accounting positions and, in the following cases, the consequent allocation to loss of the remainder that has not yet been adjusted:
- uncollectability of the debt, as a result of definite and precise elements (such as, for example, untraceability and indigence of the debtor, lack of recovery from realisation of securities and real estate, negative foreclosures, bankruptcy proceedings closed with no full compensation for the Bank, if there are no further guarantees that can be enforced etc.);
- waiver of the credit claim, due to the unilateral cancellation of the debt or residual amount as a result of settlement agreements;
- no waiver of the credit claim. With regard to the full or partial write-offs without waiver of the credit claim, in order to avoid maintaining loans on the balance sheet that have a very low possibility of recovery, despite continuing to be managed by the recovery structures, they are fully or partially written off due to uncollectability even if the legal proceedings have not been closed. The write-off can only involve the portion of the loan covered by provisions and, therefore, each loan can only be written off up to the amount of its net book value. Therefore, on a periodic basis, the Group identifies the bad loan portfolios to be subject to total or partial write-offs with the following macro-characteristics:
  - percentage cover of 100% and a vintage (understood as the period of time in “bad loan” status) of >1 year;
  - percentage cover of >95% and a vintage (understood as the period of time in “bad loan” status) of >5 years or >8 years, respectively, for non-mortgage and mortgage loans.

  Portfolios to be written off can also be identified that have similar characteristics that are different from those indicated above, but that relate to exposures that have a marginal possibility of recovering the amount of the provision, where the minimum amount of the provision (calculated taking into account the accumulated write-offs on the position, according to the same rule established at prudential level by the calendar provisioning framework) is at least equal to the amount needed to bring the value of the exposures up to their fair value estimated based on the prices recorded in the latest sales of bad loans made by the Group.

Impairment of investments in associates and companies subject to joint control

At each reporting date the investments in associates and companies subject to joint control are subjected to an impairment test to assess whether there is objective evidence to consider that the carrying value of such assets is not fully recoverable.

The process of detection of any impairment involves the verification of the presence of impairment indicators and the determination of any write-down. The impairment indicators are essentially divided into two categories: qualitative and quantitative indicators.

Qualitative indicators include:

- the generation of negative economic results or in any case a significant variance with respect to the targets budgeted or established in the multi-year plans disclosed to the market;
- the announcement/initiation of insolvency proceedings or restructuring plans;
- the downgrading by more than two rating classes;
- failure to discharge payment obligations for debt securities issued fully and in a timely manner;
- use of industrial policy tools aimed at responding to a serious crisis or allowing companies to face restructuring/reorganisation processes.

Quantitative indicators include:

- a reduction in fair value of over 30% below the carrying value or for a period of over 24 months;
- a market capitalisation lower than the company's net book value, in the case of securities listed on active markets, a carrying value of the investment in the Parent Company's financial statements higher than the carrying value in the consolidated financial statements of the investee's net assets and goodwill, or distribution by the investee of a dividend that is higher than its total income.

The presence of impairment indicators results in the recognition of a write-down to the extent that the recoverable amount is lower than the recognition value.

The recoverable amount consists of the higher of the fair value and the value in use, less costs to sell.

For an illustration of the valuation techniques used to determine fair value, see the specific Section A.4 – Information on fair value.

Value in use is the present value of expected future cash flows from the asset; it reflects estimated expected future cash flows from the asset, the estimate of possible changes in the amount and/or timing of cash flows, time value of money, the price able to repay the risk of the asset and other factors, which may affect the appreciation by market participants of expected future cash flows from the asset.

Value in use is determined by discounting future cash flows.

Impairment of non-financial assets

Property, equipment and intangible assets with definite useful life are subject to impairment testing if there is the indication that the book value of the asset may no longer be recovered. The recoverable amount is determined with reference to the fair value of the property and equipment or intangible assets less costs to sell or the value in use, if determinable and if it is higher than fair value.

For property and equipment other than real estate and valuable art assets and intangible assets (other than those recognised following business combinations) it is assumed that the carrying amount normally corresponds to the value in use, since it is determined by a depreciation or amortisation process estimated on the basis of the effective contribution of the asset to the production process and since the determination of fair value is extremely subjective. The two values diverge and lead to impairment in case of damages, exit from the production process or other similar non-recurring circumstances.

As clarified in the discussion of “Property and equipment and intangible assets”, the Group measures owner-occupied properties and valuable art assets according to the revaluation model; in this case, any impairment loss on a revalued asset must be treated as a decrease in the revaluation up to the relevant amount, after which any difference is taken to the income statement.

As described in the Information on fair value – “Fair value of real estate and valuable art assets”, for owner-occupied properties each year a scenario analysis is conducted on trends in the real-estate market to assess whether there are any significant deviations in the value of the assets. If significant changes are identified (+ or - 10%), an updated appraisal is prepared to adjust the fair value of the asset to the valuations of the real estate market. If there are no significant differences, the value is redetermined through a new expert appraisal every two years for “trophy assets” (i.e. particularly prestigious properties used by management functions located in the main cities where the bank is based or properties of particular historical and artistic interest because they are listed by the Ministry of Culture) and every three years for other owner-occupied properties.

For the valuable art assets, the revaluation is carried out by means of a new expert appraisal every three years. However, a scenario analysis is carried out annually to identify any appreciable changes in value in order to bring forward the valuation. If the annual monitoring identifies a possible positive or negative value deviation of more than 15% for individual works of artists in the bank’s collections and comparable on the basis of objective criteria (size, technique, period of production, etc.), new appraisals are commissioned.

Intangible assets recognised following a business combination and in application of IFRS 3 are subjected to an impairment test at each reporting date to assess whether there is objective evidence that the asset may have been impaired. Intangible assets with a finite life, represented by the value of the asset management portfolio, core deposits and the value of the insurance portfolio, in the presence of impairment indicators are subjected to a new valuation process to assess the recoverability of the book values. The recoverable amount is determined on the basis of the value in use, namely the present value estimated using a rate representing the time value of money and the asset’s specific risks, of the income margins generated by the existing relations as at the valuation date over a period which expresses their expected residual life.

Intangible assets with an indefinite life, represented by the valuation of the brand name and goodwill, do not have independent cash flows and therefore annually undergo an assessment of the adequacy of the value recorded under the

assets with reference to the Cash-Generating Unit (CGU) to which the values are attributed at the time of the business combinations. The amount of any impairment is determined on the basis of the difference between the CGU's book value and its recoverable amount represented by the higher of the fair value, less costs to sell, and the value in use.
The book value of the CGUs must be determined in a manner consistent with the criterion used to determine their recoverable amount. For a banking business, the cash flows generated by a CGU cannot be identified without considering the cash flows deriving from financial assets/liabilities, as these form part of the core business.
In other words, the recoverable amount of the CGUs is influenced by the aforementioned cash flows and therefore the CGUs' book value must include financial assets/liabilities in accordance with the scope of the recoverable amount estimate process. Consequently, these assets and liabilities must be properly allocated to the associated CGUs.
On this basis, the book value of Intesa Sanpaolo's CGUs may be determined in terms of contribution to consolidated shareholders' equity including the minority interest.
Thus, the carrying amount of the CGUs consisting of companies that belong to a single operating division or consist of a single legal entity (Asset Management, Private Banking, Insurance and International Banks) is determined by summing the individual carrying amounts of each company in the consolidated financial statements, namely the contribution to consolidated shareholders' equity and corresponding to their net book value, taking into account any goodwill and intangibles recorded upon acquisition (net of subsequent amortisation and any write-downs) and the consolidation entries. With regard to the determination of the carrying value of the other two divisions (Banca dei Territori and IMI Corporate & Investment Banking), given that the Parent Company and other banks contribute to the management of these divisions, and this subdivision is not represented in the accounting information, the overall carrying value of the CGUs cannot be determined on the basis of book values. As a consequence, the use of operational factors is required to make the subdivision following a detailed allocation of the intangibles and goodwill to the two CGUs in accordance with the available accounting information. The operational driver is identified as the "regulatory capital" determined by Market & Financial Risk Management structure for each operating division: it represents the capital absorption necessary to handle the types of risk envisaged by the regulatory supervision rules. The resulting book values already take into account the effects of any impairment of the individual assets, including those relating to intangible assets with a finite life.
For an illustration of the valuation techniques used to determine fair value, see Section A.4 – Information on fair value.

The value in use of a CGU is determined by estimating the present value of future cash flows that may be expected to be generated by the CGU. These cash flows are determined by using the latest publicly available business plan or, in its absence, through the drawing up by management of an internal forecast plan or other external information available. The forecasting period for the analysis usually consists of a maximum of five years. The cash flow of the final year of the forecast is projected in perpetuity, using an appropriate growth rate "g" for the purposes of the so-called Terminal value. The "g" rate is determined by assuming that the growth factor is the lower of the average growth rate for the forecasting period of the analysis and the average rate of increase in the Gross Domestic Product in the countries where the cash flows are generated.
For the determination of the value in use, the cash flows must be discounted at a rate that reflects the present valuations of the time value of money and the asset's specific risks. Specifically, the discount rates used incorporate the risk free component and the premiums for the risk associated with the equity component observed over a sufficiently long time period to reflect different market conditions and economic cycles. In addition, given the diverse risks of the respective operating areas, different Beta coefficients are used for each CGU. All the resulting rates have been adjusted to take into account the "Country Risk".
The cash flows produced by the international subsidiaries are estimated in the currency in which they are generated and translated into euro using the spot exchange rate as at the date of the determination of the value in use.
With regard to the intangible asset represented by the brand name, if the reference CGU does not have any goodwill allocated and, as a result, it is not possible to test the recoverable amount of the specific intangible as part of the impairment test of the goodwill based on total cash flows at the level of the CGU, then an independent and specific valuation is made on the basis of the fair value certified by the appraisal of an independent expert.

Business combinations
Business combinations are governed by IFRS 3.
The transfer of control over a company (or over a group of assets managed together as a single business) is considered a business combination.
To this end, control is deemed to have transferred when the investor is exposed to, or has rights to, variable returns from its involvement with the investee and has the ability to affect those returns by exercising its power over the investee.
IFRS 3 requires that an acquirer be identified in any business combination. The acquirer is identified as the combining entity that obtains control of the other combining entities or businesses. If a controlling entity cannot be identified, following the definition of control described above, as for example in the case of exchange of equity investments, the identification of the acquirer must occur considering other factors such as: the entity which has a significantly higher fair value, the entity which pays a cash consideration, the entity which issues new shares.
The acquisition, and therefore the initial consolidation of the acquired entity, must be recognised in the books on the date in which the acquirer effectively obtains control over the acquired company or businesses. When the combination occurs via an exchange of voting ordinary equity instruments, the date of the exchange usually coincides with the date of the acquisition. However, it is always necessary to verify that there are no agreements which may lead to transfer of control prior to the date of the exchange.
The consideration transferred as part of a business combination is equal to the sum of the fair value, at the exchange date, of the transferred assets, the liabilities incurred or assumed and the equity instruments issued by the acquirer in return for control.
In transactions which entail cash consideration (or when payment occurs via cash-equivalent financial instruments), the purchase price is the agreed consideration. When settlement does not occur in the short-term, the fair value of any deferred component is calculated by discounting the amounts payable to their present value; when payment occurs via an instrument other than cash, therefore via the issue of financial instruments, the price is equal to the fair value of such instruments net of

the costs directly attributable to their issue. For the determination of fair value of financial instruments, see Section A.4 – Information on fair value and note that, in the case of shares quoted on active markets, fair value is represented by Stock Exchange price at acquisition date or, should that not be available, the last price available.
Purchase price at acquisition date includes any adjustments to the cost contingent on future events, if provided for by the combination agreement and only if the adjustment is probable, can be measured reliably and realised within the twelve months subsequent to the date of acquisition of control. Instead, any restoration related to any loss in the value of the assets used as consideration is not included in purchase price since it is already considered either in the fair value of equity instruments or as a reduction in the premium or an increase in the discount on the initial issue of debt instruments.
Acquisition costs refer to the charges incurred by the acquirer to carry out the business combination, including, for example, professional fees paid to independent auditors, experts, legal advisors, costs for legal opinions and audit of accounts, preparation of information documents required by the law, as well as advisory fees sustained to identify potential acquisition targets if the contract provides for the payment of success fees as well as debt securities' or equities' registration and issue costs.
Acquisition costs must be recognised as charges when incurred and when the related services are provided, except for the costs relating to the issue of debt securities or equities which must be recognised in accordance with IAS 32.
Business combinations must be accounted for using the "acquisition method" whereby identifiable assets acquired (including any intangible assets which had not been previously recognised by the acquired company) or liabilities assumed (including contingent liabilities) are recognised at their fair value at acquisition date.
Moreover, as specifically required by IFRS 3, for each business combination, any minority interest in the acquired company can be recognised at fair value (therefore increasing the consideration transferred) or in proportion to the minority investment in the net identifiable assets of the acquired companies.
If control is achieved in stages, the acquirer recalculates its previous interest in the acquired company at the acquisition date fair value. Any difference with respect to the previous carrying value is taken to income statement.
Excess between the consideration transferred (being the fair value of transferred assets, liabilities incurred and equity instruments issued by the acquirer), increased, where present, by minority interests (determined as above) as well as the fair value of the stakes already held by the acquirer, and the fair value of acquired assets and liabilities should be recognised as goodwill. Conversely, such difference is taken to the income statement when the latter exceed the sum of the consideration, minority interests and the fair value of the stakes already held.
The accounting for business combination can be determined provisionally by the end of the year in which the combination is realised and must be completed within twelve months of the acquisition date.
In accordance with IFRS 10, acquisitions of further stakes in companies which are already controlled are accounted for as a capital transaction or as a transaction with shareholders acting in their capacity as shareholders. For this reason, the difference between the cost of the acquisition and the book value of the minority stakes acquired is posted to Group shareholders' equity; in the same way, the sale of minority stakes without ceding control, does not generate gains or losses in the income statement but is posted to Group shareholders' equity.
The following transactions are outside the scope of business combinations: transactions aimed at acquiring control over one or more entities which are not part of the company's business; transactions aimed at acquiring transitory control; transactions conducted for organisational purposes, therefore between two or more companies or businesses which are already part of the Intesa Sanpaolo Group, and which do not entail changes in control, independently of the extent of minority interests in each of the combining entities before and after the business combinations (business combinations involving entities under common control). These transactions are considered immaterial. Therefore, since there are no specific provisions in IAS/IFRS and in compliance with IAS 8 which requires – in the absence of a specific standard – that the reporting entity must use its judgement in applying an accounting policy that results in information that is relevant, reliable, prudent and that reflects the economic substance of the transaction, these are accounted for safeguarding the continuing values in the financial statements of the acquirer.
Mergers are examples of combinations between companies and represent the most complete business combinations, since they imply the legal and economic unification of the merged entities.

Mergers which entail the establishment of a new legal entity and mergers by incorporation (which entail that an entity is absorbed by another existing entity) are treated according to the criteria illustrated above, that is:

- if the transaction leads to the transfer of control of a company, it is accounted for as a business combination as provided for by IFRS 3;
- if the transaction does not lead to the transfer of control, it is accounted for by privileging the continuity of the values.

Criteria for the preparation of segment reporting

The Intesa Sanpaolo Group's segment reporting is based on the elements that the management uses to make its own operating decisions (the "management approach") and is therefore consistent with the disclosure requirements of IFRS 8.
The Intesa Sanpaolo Group's organisational model is structured according to six business segments with specific operational responsibilities and similar characteristics in terms of the type of products and services offered: Banca dei Territori, IMI Corporate & Investment Banking, International Banks, Asset Management, Private Banking and Insurance. In addition to these operating areas there is the Corporate Centre which is responsible for guidance, coordination and control of the whole Group. The Corporate Centre also includes the following support structures: Group Treasury & Capital Management, NPE Head Office Department and the Strategic Asset & Liability Management (ALM) activities.
For the purposes of preparation of the Segment Reporting, the income statement and balance sheet results attributed to the various business sectors were calculated according to the accounting principles used in the preparation and presentation of the consolidated financial statements. Use of the same accounting standards allows segment data and consolidated data to be effectively reconciled. To represent results more effectively and give a better understanding of the components that generated them, the reclassified income statement for each reporting segment is presented with values that express the contribution made by each segment to the Group's results.
The contribution of the various Divisions and of the Corporate Centre to the Group's overall income statement results is determined according to the methods described below:

- application of the contribution model with Internal Fund Transfer Pricing (FTP), differentiated on the basis of the maturity of the individual transaction, for the correct attribution of net interest income;
- application, by virtue of specific contractual agreements between the Group banks/companies, of retrocession rules for economic components relative to transactions which set out the distribution of results between product factories/service units and relationship entities/customer units;
- direct cost debiting to each Business Division and to the Corporate Centre;
- application of the Group business accounting model, for the part within its remit, for the charging of the costs for the services provided by the head-office structures of the Parent Company belonging to the Corporate Centre to the Business Divisions and other Structures of the Corporate Centre, as well as the costs relating to the performance of steering and control activities;
- application of customer portfolio/segmentation logics for the assignment to each Division and to the Corporate Centre of the economic results of operations with customers and of the net adjustments to loans.

Business units' profits are shown net of the tax effect, calculated by applying the main components underlying the effective tax rate, in line with the Group tax policy.
The economic results of the business operational segments are disclosed net of intragroup relations within each segment and gross of intragroup relations between different business operational segments.
For each Division and for the Corporate Centre, the absorbed capital is also calculated on the basis of the Risk Weighted Assets (RWAs) determined in accordance with the applicable regulations and supplemented, where necessary, with management data on "economic" capital to take into account the risks not covered by the regulatory metric.
To complete business operational segment reporting, the most relevant income statement data and balance sheet aggregates referred to the geographical areas in which the Group operates are also given. Geographical areas are defined on the basis of the territorial breakdown of Group activities. Three main geographical areas have been identified, based on the residence of the legal entities making up the Group: Italy, Europe and Rest of the World.

A.3 – INFORMATION ON TRANSFERS BETWEEN FINANCIAL ASSET PORTFOLIOS

Following the adoption of IFRS 9, the Intesa Sanpaolo Group did not make changes to its business model for managing its financial assets and, therefore, no transfers occurred between portfolios of financial assets.
According to the general rules established by IFRS 9 on the reclassification of financial assets (except for equity instruments, for which no reclassification is permitted), reclassifications to other categories of financial assets are not permitted unless the entity changes its business model for those financial assets. Such changes are expected to be extremely rare and must be decided by the management following significant external or internal changes that can be demonstrated to external parties.

A.3.1 Reclassified financial assets: change in business model, book value and interest income

No disclosure is required since there are no reclassified financial assets recognised under balance sheet assets.

A.3.2 Reclassified financial assets: change in business model, fair value and effects on comprehensive income

No disclosure is required since no transfers were carried out between portfolios of financial assets in 2024.

A.3.3 Reclassified financial assets: change in business model and effective interest rate

No disclosure is required since there are no reclassified financial assets recognised under balance sheet assets.

A.4 – INFORMATION ON FAIR VALUE

FAIR VALUE MEASUREMENT OF FINANCIAL ASSETS AND LIABILITIES, INDEPENDENT PRICE VERIFICATION AND PRUDENT VALUATION

FAIR VALUE, INDEPENDENT PRICE VERIFICATION AND PRUDENT VALUE OF FINANCIAL INSTRUMENTS

The framework of financial measurement at fair value is based on three pillars: fair value measurement according to the IAS/IFRS, independent price verification (IPV) and prudent value measurement. The latter two are established by the Capital Requirements Regulation (CRR). The paragraphs below describe the methods applied by the Intesa Sanpaolo Group to implement and use those elements.

General fair value principles

The Intesa Sanpaolo Group governs and defines the fair value measurement of financial instruments through the "Group Guidelines and Rules for Valuation of Financial Instruments at Fair Value", prepared by Market & Financial Risk Management and applied by the Parent Company and all consolidated subsidiaries, including the insurance companies.

The "Guidelines for Valuation of Financial Instruments at Fair Value", once a favourable opinion has been given by the Group Financial Risks Committee, are revised and approved at least on an annual basis by the Board of Directors, with the support of the Risks and Sustainability Committee. The "Rules for Valuation of Financial Instruments at Fair Value" are reviewed, revised and approved at least on an annual basis by the Group Financial Risks Committee, which is specifically delegated to do so by the Management Bodies, and which also reviews material changes and updates proposed by Market & Financial Risk Management.

The "Rules for the measurement of unlisted equity investments", drawn up by Group Shareholdings and approved by the Group Financial Risks Committee, govern the fair value measurement of unlisted equities and financial instruments with unlisted equities as their underlying.

IFRS 13, which harmonises the measurement rules and the related disclosure, defines fair value as the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants (i.e. not as part of the compulsory liquidation or a below-cost sale) as at the measurement date. Fair value is a market measurement criterion, not specifically referring to a single Bank. Underlying the definition of fair value is the assumption that the Bank is carrying out normal operations, without any intention of liquidating its assets, significantly reducing the level of operations or carrying out transactions at unfavourable conditions.
The Bank measures the fair value of an asset or liability by adopting the assumptions that would be used by market participants when pricing an asset or liability, presuming that they act with a view to satisfying their own economic interest in the best way possible. Measurement at fair value presumes that the asset is sold or the liability transferred:

a. in the principal active market for the asset or liability;
b. in the absence of a major market, in the most advantageous active market for the asset or liability.

The Bank is not required to conduct an exhaustive study of all possible markets to identify the major market or, in the absence of the major market, the most advantageous market, but must take into account all the reasonably available information. If there is no evidence to the contrary, the market that the entity normally operates in to sell the asset or transfer the liability is assumed to be the major market or the most advantageous market, if there is no major market. The Intesa Sanpaolo Group considers the principal market of a financial asset or liability to be the market in which the Intesa Sanpaolo Group generally operates.

In accordance with IFRS 13, the Group considers an active market to be a market where transactions in an asset or liability occur with sufficient frequency and volume to provide useful information for determining price on an ongoing basis. More specifically, a financial instrument is regarded as quoted in an active market if quoted prices are readily and regularly available from an exchange, dealer, broker, industry group, pricing service or regulatory agency, and those prices represent actual and regularly occurring market transactions on an arm's length basis.

In specific cases, governed by the Guidelines and Rules for Valuation of Financial Instruments at Fair Value, and despite being quoted on regulated markets, relevant research is carried out to verify the significance of the official market values. In the event of a significant reduction in the volume or level of operations compared to normal operations for the asset or liability (or for similar assets or liabilities) highlighted by a number of indicators (number of transactions, limited significance of market prices, significant increase in implicit premiums for liquidity risk, widening or increase of the bid-ask spread, reduction or total lack of market for new issuances, limited publicly-available information), analyses of the transactions or of the quoted prices must be carried out. A reduction in the volume or the level of activity alone may not indicate that the price of a transaction or the quoted price does not represent fair value or that the transaction in that market is not ordinary. If an entity determines that a transaction price or quoted price does not represent fair value (e.g., non-ordinary transactions) an adjustment to the transaction prices or listed prices is required if the entity uses those prices as the basis for fair value measurement and that adjustment may be significant with respect to the fair value as a whole.

The fair value of financial instruments

The presence of quoted prices in an active market represents the best evidence of fair value and these prices are therefore the quoted prices to be used on a priority basis for the measurement of financial assets and liabilities. If there is no active market, the fair value is determined using valuation techniques aimed, ultimately, at establishing the price the product would have had, at the measurement date, in an arm's length exchange motivated by normal business considerations.
The choice of the above measurement methods is not optional, because they must be applied in hierarchical order: the availability of a price stated in an active market prevents the use of one of the other measurement approaches.

Inputs of the valuation techniques

The inputs are defined as the assumptions that market participants would have used to determine the price of the asset or the liability, including assumptions regarding risk, such as, for example, the risk relating to a particular valuation technique used to measure fair value or the risk relating to the inputs of the valuation technique. The inputs may be observable or unobservable.
Observable inputs are those produced using market data, such as publicly available information on operations or actual events, which reflect the assumptions that market participants would use in determining the price of the asset or the liability.
Unobservable inputs are those for which no market information is available and that are produced using the best available information regarding the assumptions that market participants would use to determine the price of the asset or the liability.

Fair value hierarchy

IFRS 13 establishes a fair value hierarchy in which inputs to fair value measurement techniques are divided into three levels. That hierarchy assigns top priority to (unadjusted) quoted prices on active markets for identical assets or liabilities (level 1 data) and the lowest priority to unobservable inputs (level 3 data). Specifically:

- fair value level 1 applies when an instrument is measured directly on the basis of (unadjusted) quoted prices on active markets for identical assets or liabilities to which the entity has access on the measurement date;
- fair value level 2 applies when a price has not been found on an active market and the instrument is measured according to valuation techniques, on the basis of observable market parameters, or of the use of parameters that are not observable but are supported and confirmed by market evidence, such as prices, spreads or other inputs (the comparable approach);
- fair value level 3 applies when fair value is measured using various inputs, not all of which are directly drawn from observable market parameters, and which thus entail estimates and assumptions by the valuator.

If various inputs are used to measure the fair value of an asset or liability, classification in the hierarchy is determined on the basis of the lowest-level input used in measurement. When assigning a level in the fair value hierarchy, priority is given to the inputs of the valuation techniques rather than the valuation techniques themselves.
The attachment "Fair Value Hierarchy Rules" to the "Rules for Valuation of Financial Instruments at Fair Value" defines, with regard to the respective financial instrument valuation models/inputs, the basic rules that market inputs must comply with in order to be classified as Level 2, and the significance thresholds which, when overrun, result in the assignment of Level 3.

For level 1 financial instruments, the current bid price is used for financial assets and the current ask price for financial liabilities, struck on the principal active market at the end of the reference period.
For financial instruments with a scarcely significant bid-ask spread or for financial assets and liabilities with offsetting market risks, mid-market prices are used (again referred to the last day of the reference period) instead of the bid or ask price.
The following are considered level 1 financial instruments: contributed bonds (i.e. bonds for which the Composite Bloomberg Bond Trader is available from the Information Provider Bloomberg, or, alternatively, a price on the EuroMTS circuit, or at least three prices available from the Information Provider Bloomberg), contributed equities (i.e., quoted on the official market of reference), contributed UCITS funds (covered by EU directives), spot exchange rates, and derivatives for which prices are available on an active market (for example, exchange traded futures and options) and UCITS hedge funds.
Conversely, all other financial instruments that do not belong to the above-described categories or that do not have the contribution level defined by the Guidelines and Rules for Valuation of Financial Instruments at Fair Value are not considered level 1 instruments.

When no listing on an active market exists or the market is not functioning regularly, that is when the market does not have a sufficient and continuous number of trades, and bid-ask spreads and volatility that are not sufficiently contained, the fair value of the financial instruments is mainly determined through the use of valuation techniques whose objective is the establishment of the price at which, in an orderly transaction, the asset is sold or the liability transferred between market participants, as at the measurement date, under current market conditions.
In the case of instruments classified as level 2, the valuation is based on prices or credit spreads presumed from the official listing of instruments which are similar in terms of risk factors, using a given calculation methodology (valuation model). The use of this approach requires the identification of transactions on active markets in relation to instruments that, in terms of risk factors, are comparable with the instrument to be measured. Level 2 calculation methodologies reproduce prices of financial instruments quoted on active markets (model calibration) and do not contain discretional parameters – parameters for which values may not be inferred from quotations of financial instruments present on active markets or fixed at levels capable of reproducing quotations on active markets – that significantly influence the final measurement.
The following are measured using level 2 input models:

- bonds without official quotations expressed by an active market and whose fair value is determined through the use of an appropriate credit spread which is estimated starting from contributed and liquid financial instruments with similar characteristics;
- loans whose fair value is determined through the use of an appropriate credit spread which is estimated starting from market data of financial instruments with similar characteristics;
- derivatives measured through specific models, fed by input parameters (such as yield, foreign exchange and volatility curves) observed on the market;

- structured credit products (including, among others, ABSs – Asset Backed Securities, CLOs HY - Collateralized Loan Obligations High Yield, CDOs - Collateralized Debt Obligations) for which significant prices are not available and whose fair value is measured using valuation techniques that consider parameters that can be gathered from the market;
- non-contributed equity instruments measured based on direct transactions, that is significant transactions on the stock registered in a time frame considered to be sufficiently short with respect to measurement date and in constant market conditions, or using the "relative" valuation models based on multipliers;
- non-UCITS hedge funds, provided the Level 3 instruments do not exceed a set threshold.

In case of instruments classified as level 3, the calculation of the fair value is based on valuation models which consider input parameters not directly observable on the market, therefore implying estimates and assumptions on the part of the valuator. In particular, the valuation of the financial instrument uses a calculation methodology which is based on specific assumptions of:

- the development of future cash flows, which may be affected by future events that may be attributed probabilities presumed from past experience or on the basis of the assumed behaviour;
- the level of specific input parameters not quoted on active markets, for which information acquired from prices and spreads observed on the market is in any case preferred. Where this is not available, past data on the specific risk of the underlying asset or specialised reports are used (e.g. reports prepared by Rating agencies or primary market players).

The following are measured using this method:

- some transactions in derivatives, bonds, or complex structured credit instruments measured using level 3 inputs;
- hedge funds in which the level 3 assets are above a set limit;
- private equity funds, private debt funds, real estate funds and closed-end funds resulting from sales of non-performing loans valued at NAV – Net Asset Value, with possible discounts;
- shareholdings and other equities measured using models based on discounted cash flows or using equity methods;
- loans whose fair value is determined through the use of a credit spread that does not meet the criteria to be considered level 2;
- loans with underlying equity risk, whose fair value is calculated based on the discounting of expected contractual flows.

The transfer of fair value levels of financial assets and financial liabilities measured at fair value on a recurring basis occurs, as established by IFRS 13, as follows: the transfer between levels 2 and 3 occurs upon a change in the observability or significance of an input to the measurements; and the transfer between levels 1 and 2 or 3 occurs upon a change in the availability of prices in an active market.

For OTC derivatives, the initial choice of the level of fair value hierarchy depends on the degree of observability and significance of the parameters used to determine the risk-free component. The calculation of the counterparty/issuer default risk component may result in a transfer to level 3 when the current exposure is positive for the bank and the counterparty is in non-performing loan status, or when the determination of default risk requires unobservable inputs and the bilateral credit value adjustment (bCVA) component is significant when compared to the overall fair value of the netting set, or when the counterparty's sensitivity to downgrading is significant when compared to the overall fair value of the netting set.

For non-contributed equity instruments, the change of the level occurs:

- when inputs observable on the market (e.g., prices defined based on comparable transactions on the same instrument between independent and informed counterparties) have become available during the period. In this case, the Intesa Sanpaolo Group reclassifies from level 3 to level 2;
- when the directly or indirectly observable elements used as the basis for the valuation cease to exist, or when they are no longer up to date (e.g., comparable transactions that are no longer recent or multiples that are no longer applicable). In this case, the Intesa Sanpaolo Group uses valuation techniques that use unobservable inputs.

Valuation of financial instruments

The valuation of financial instruments entails the following phases:

- identification of the sources for valuation: for each asset class, the Guidelines and Rules for Valuation of Financial Instruments at Fair Value establish the processes that are necessary to identify market parameters and the manner according to which such data must be extracted and used;
- validation and processing of input data for periodic valuation: this stage consists of the accurate verification, at each accounting measurement date, of the market parameters used (verifying the integrity of data contained on the proprietary platform with respect to the source of contribution), reliability tests (consistency of each single figure with similar or comparable figures) and verification of concrete application means;
- certification of the measurement methods: this phase is aimed at verifying the consistency and the adherence of the various measurement techniques used with current market practice, at highlighting any critical aspects in the measurement models used and at determining any adjustments necessary for measurement;
- monitoring and revision of the measurement methods: the monitoring consists of the ongoing checking of the adherence to the market of the valuation model and enables the timely discovery of any gaps, in order to initiate the necessary checks and measures.

Identification, certification and processing of the input data for the measurements

The fair value calculation process and the need to distinguish between products which may be measured on the basis of effective market quotes rather than through the application of measurement techniques, highlight the need to establish univocal principles in the determination of market parameters. To this end, the Guidelines and Rules for Valuation of Financial Instruments at Fair Value establish the processes needed to identify the market parameters, the contribution sources considered appropriate and how the data must be received (cut-offs) and used for the measurement of financial instruments held for any purpose in the proprietary portfolios of the Parent Company and its subsidiaries. The same sources are used in measurements carried out for third parties under Service Level Agreements, entered into in advance. The adequacy of the input data for the measurements is guaranteed by the respect of reference requirements, which are based on comparability, availability and transparency of the data, or the possibility of extracting the figure from one or more info providing systems, measuring the contribution bid-ask, and lastly, for OTC products, verifying the comparability of the contribution sources.
The use of all market parameters in Intesa Sanpaolo is subordinated to their certification by Market & Financial Risk Management, in terms of specific controls (verifying the integrity of data contained on the proprietary platform with respect to the source of contribution), reliability tests (consistency of each single figure with similar or comparable figures) and verification of concrete application means.

Certification of measurement methods

The measurement methods used by the Intesa Sanpaolo Group are certified by IMI CIB Risk Management, with the involvement of all relevant structures. The purpose of the certification is to verify the consistency of the methods with current market practice, to highlight any problems or limitations, and to determine any fair value adjustments, in accordance with the applicable regulations. The certification process considers all aspects of the measurement method (basic assumptions, mathematical derivation, any approximations, numerical algorithms used, inputs and outputs) but also all contextual elements that are relevant to the management, including the characteristics of the associated products (payoffs, early termination clauses, etc.), any ancillary agreements (e.g. netting or collateral agreements), the market where the products are traded, and how they are used by end users (e.g. precision vs. performance, calculation of risk measures, etc.). These aspects are subject to qualitative and quantitative analysis and are duly reported in the internal documentation.
The possibility of independent validation issued by high standing financial service companies is also envisaged in highly-complex cases and/or in presence of market turbulence (market dislocation).
At the end of the certification process, the measurement method is recorded in the Rules for Valuation of Financial Instruments at Fair Value.

Monitoring and review of measurement methods

As required by the applicable regulations, the measurement methods used are subject to ongoing monitoring of their performance with respect to the evolution of financial instruments, markets and methodological innovations developed by the scientific community, in order to ensure their continuous alignment to the market, promptly highlight any inadequacies and initiate the necessary checks and actions. The Rules for Valuation of Financial Instruments at Fair Value detail all elements considered for the periodic monitoring and revision of the measurement methods. The functions involved in the monitoring process are the same as those involved in the process of certification of the measurement methods mentioned above and in the IPV process governed by the Guidelines and Rules on Independent Price Verification.

Valuation risk: fair value adjustments

The Intesa Sanpaolo Group defines valuation risk as the risk of losses arising from the valuation uncertainty for the fair value exit price of financial instruments, due to any limitations of the measurement techniques used or particular market conditions.
The main measure of the valuation risk associated with a financial instrument are the fair value adjustments, which are designed to take into account the valuation uncertainty or the difficulty in the disposal of specific financial positions, and may relate to a single financial instrument or to the net position for a particular risk factor. The adjustments may be calculated as add-ons to the valuation or included directly in the valuation. They are regularly reviewed, also considering market trends, or the introduction of new liquid instruments, different calculation methodologies and, in general, methodological advances which may also lead to significant changes in measurement methods chosen and their implementation.
In particular, the Intesa Sanpaolo Group envisages fair value adjustments for the following categories of measurement uncertainty:

- uncertainty of input data: any valuation uncertainty related to the input data for the valuation (whether mid, bid or ask) is measured with respect to temporary or structural conditions on the markets or in relation to the size of the values held (in the case of concentration), and where necessary a fair value adjustment is made, quantifying the consequent impact on the valuations;
- illiquidity of the underlying positions or risk factors: similarly to the case above, the market bid-ask spread is measured and, where necessary, a fair value adjustment is made, quantifying the consequent impact on the valuations;
- model risk: this is based on the identification and use of variants of the same model or alternative models, with which to carry out comparison analyses aimed at quantifying the variability of the valuations (in particular any directionality of the price when the model changes) and the behaviour of the model in various market scenarios (stress tests). The quantification of the fair value adjustment is based, where possible, on easily comprehensible and measurable financial variables (e.g. vega, delta, correlation shift). This category includes transactions involving ESG contractual clauses that condition cash flows on the achievement of environmental, social or governance objectives by the counterparty. If these clauses are favourable to the counterparty, a prudential fair value adjustment is made by considering the most unfavourable scenario for the Bank;
- counterparty and funding risk: counterparty and funding risks, collectively referred to as XVA, include Bilateral Credit Value Adjustment (bCVA) and Funding Value Adjustment (FVA). The bCVA takes account of the counterparty risk premium associated with the possibility that the counterparties may not honour their mutual commitments (for example in the event of bankruptcy). This component derives, in turn, from two components: the Credit Value Adjustment (CVA, negative) and the Debt Value Adjustment (DVA, positive), which consider, respectively, the scenarios where the Counterparty goes bankrupt before the Bank (and the Bank has a positive exposure towards the Counterparty), and vice

versa the scenarios where the Bank goes bankrupt before the Counterparty (and the Bank has a negative exposure towards the Counterparty). The Funding Value Adjustment (FVA, negative), on the other hand, takes into consideration the funding risk premium, connected to the costs of funding the cash flows (coupons, dividends, collateral, etc.) generated by the Bank's overall OTC derivatives portfolio. The calculation of the XVAs depends on the overall exposure between the two counterparties, calculated using techniques for simulating the underlying risk factors of the transactions considered, taking into account any counterparty risk mitigation arrangements (in particular netting and collateralisation agreements), as well as any contractual clauses. The calculation of the XVAs also depends on the Loss Given Defaults (LGDs) based on the estimated value of the expected recovery in the event of counterparty default, and the probability of counterparty default (PD). LGDs and PDs are obtained from credit default swap market quotes or are based on internal estimates by sector/rating used for credit risk. In addition, the FVA calculation is based on a funding curve representative of the best market counterparties that the Bank could renegotiate transactions with, in accordance with the most IFRS 13 advantageous market principle, as there is currently no real main market for these transactions.

The management process for fair value adjustments is formalised in the Guidelines and Rules for Valuation of Financial Instruments at Fair Value and the Rules for the Valuation of Unlisted Equity Investments with appropriate calculation methodologies on the basis of the different configurations of the points set out above, and is carried out in the most objective, consistent and systematic manner possible by IMI CIB Risk Management and Group Shareholdings. The introduction and release of the fair value adjustments depend on the factors described above. Such processes are a combination of quantitative elements that are rigidly specified and qualitative elements, valued based on the different configuration over time of the risk factors which generated the adjustments. Thus, the estimates subsequent to initial recognition are always guided by the mitigation or elimination of said risks.

For new products, the decision to apply the adjustments is taken during the new product approval process, upon proposal by IMI CIB Risk Management.

The application of the adjustments is subject to an authorisation procedure that, above a certain warning threshold defined for specific cases, involves both the area of the Chief Risk Officer and the Manager responsible for preparing the Company's financial reports.

A.4.1 Fair value levels 2 and 3: valuation techniques and inputs used

The sections below provide a summary of the information, by type of financial instrument (securities, derivatives, structured products, hedge funds, and loans), on the valuation models used.

I. Valuation of non-contributed debt securities

The fair value of non-contributed debt securities is measured using the income approach, i.e. by calculating the present value of expected future cash flows using an appropriate risk premium represented by the credit spread, identified on the basis of contributed and liquid financial instruments with similar characteristics. The sources used for this measurement are the following:

- contributed and liquid debt securities of the same issuer;
- credit default swaps on the same reference entity;
- contributed and liquid securities of an issuer with the same rating and belonging to the same sector.

In any case, the different seniority of the security to be priced is considered with regard to the issuer's debt structure.

In the case of Italian public issuers, a rating/maturity matrix is defined on the basis of the spread levels on government issues, to which the spreads among the various rating/maturity classes with respect to public issues (regions, provinces, municipalities, government entities) are applied.

When applying the spread for the pricing of the non-contributed instrument, if the estimated 'fair' credit curve does not respect the same characteristics of the instrument, correction factors are considered.

Also, for bonds that are not quoted on active markets, an extra spread, estimated based on the bid/ask spread recorded on the market, is added to the "fair" credit spread component, to take account of the higher premium demanded by the market compared to similar contributed securities.

Finally, if the instrument includes an optional component, a further adjustment is made to the spread by adding a component designed to capture the hedging costs of the structure and any illiquidity of the underlying assets. This component is calculated based on the type of option, using the corresponding valuation models for derivatives mentioned below.

Similarly, Intesa Sanpaolo's credit spread for the Banking Group's financial liabilities designated at fair value is determined and measured based on the bonds issued by the Parent Company, with regular, periodic coupons, maturity beyond one year and quoted on an active market in compliance with IAS/IFRS. The implicit credit rating is determined on the basis of market prices and subsequently adjusted through interpolation models which generate credit spread curves by type of coupon, maturity and subordination level. Similarly, the issued certificates are measured at fair value by breaking them down into the following two components: an issued bond, measured as described above, and an option component, measured using the corresponding derivative pricing models described below.

Finally, measurement of the financial liabilities designated at fair value of the insurance companies (mainly liabilities associated with unit-linked investment contracts that do not present significant insurance risk) reflects the market value of the underlying assets, which are determined in application of the various methods described herein.

II. Valuation of loans

Loans are measured at fair value through contributions from info providers when available or by calculating the present value of expected future cash flows using an appropriate credit spread, identified starting from the following sources:

- contributed loans on the market;
- sector/rating-specific loan market curves;
- contributed securities of the same issuer;

- credit default swaps on the same reference entity.

In any case, the different seniority of the instrument to be priced is considered with regard to the issuer's debt structure.
When applying the spread for the pricing of the loan, if the estimated 'fair' credit curve does not respect the same characteristics of the instrument, correction factors are considered.
Moreover, where, in determining the credit spread of the loans, reference is made to the curves created through bonds, a Bond – Loan basis must be applied, to capture the different structure of the market, if any, and the different type of loan.
In order to consider the premium required by the market for illiquid and/or structured instruments, several adjustments are applied to the credit spread.
Loans with an underlying unlisted equity risk (which include financial instruments that, pursuant to IAS 32, cannot be classed as equity, e.g. loans convertible into shares) are usually measured by discounting the cash flows provided for by the contract. Since these are debt securities, the cash flows are normally discounted using a rate consisting of the sum of: a risk free rate, a spread deriving from the CDS or measured on listed securities or similar disbursements, and any additional risk premium.
In the case of non-performing loans, the fair value is determined based on the recoverable amount of the position. This estimate is made taking into account the contractual elements that characterise the loan and may involve, for example, the valuation of the cash flows from the sale of the real estate pledged as collateral or the valuation of any capital instruments that may be acquired following the introduction of an equity conversion clause for the position.

III. Valuation of OTC derivatives

Derivatives, if not traded on regulated markets, are Over The Counter (OTC) instruments, which are bilaterally exchanged with market counterparties and are measured through specific measurement methods and input parameters (such as, for example, interest rate, foreign exchange and volatility curves) observed on the market and subject to the certification and monitoring illustrated above.
The fair value of an OTC derivative is calculated considering the risk premium related to the various underlying risk factors. Specifically, there are two relevant cases, according to whether or not the instrument is subject to collateralisation agreements (CSAs) aimed at mitigating the counterparty and funding risk:

- for CSA transactions with characteristics that reduce counterparty and funding risk to a negligible level, the fair value is calculated according to the non-arbitrage principle, by including the market risk premium related to the risk factors underlying the contract (e.g. interest rates, volatility, etc.), and, in the most significant cases, using the rate of remuneration for the collateral as the discount rate for the future cash flows;
- for transactions without CSAs, or with CSAs with characteristics that do not reduce the counterparty and funding risk to a negligible level (e.g., One Way CSAs, or with non-negligible limits or minimum transfer amounts), the fair value of the instrument may be stated, under appropriate circumstances, as the sum of the reference (or base) value, equal to the price of the corresponding collateralised instrument, and several additional valuation components related to the counterparty and funding risk premium, referred to jointly as XVA (see "Valuation risk: fair value adjustments").

In view of the number and complexity of the OTC derivatives, a systematic reference framework has been developed which represents the common elements (calculation algorithms, processing models, market data used, basic assumptions of the model) that are used for their measurement.

The table below illustrates the main methods used to measure OTC derivatives based on the category of underlying asset.

Underlying class	Valuation models	Market data and input parameters
Interest rate	Net Present Value, Shifted-Black, Shifted-SABR, Libor Market Model, Hull-White, Bivariate log-normal, Hagan exact formula for CMS	Interest rate curves (deposits, FRA, Futures, OIS, swap, basis swap, CMS), cap/floor/swaption option volatility, correlation between interest rates
Foreign exchange rate	Net present Value FX, Garman-Kohlhagen, Mixture, Stochastic Local Volatility, Local Volatility	Interest rate curves, spot and forward FX curves, FX volatility, "quanto" volatility and correlations
Equity	Accrual, Net present Value Equity, Generalised Black-Scholes, Heston, Local Volatility, Jump Diffusion	Interest rate curves, underlying asset spot rate, expected dividends, underlying asset volatility and correlation between underlying assets, "quanto" volatility and correlations
Inflation	Inflation NPV, Inflation SABR, Inflation Jarrow-Yildirim	Nominal and inflation interest rate curves, interest and inflation rate volatility, seasonality ratios of consumer price index, correlation between inflation rates
Commodity	Net present Value Commodity, Black-Scholes Commodity, Independent Forward, Local Volatility, 2-Factors Jump Diffusion	Interest rate curves, spot rate, forwards and futures of underlying assets, underlying asset volatility and correlation between underlying assets, "quanto" volatility and correlations
Loans	Net present Value, CDS Option (or log-normal model), Contingent CDS	Probability of default, Recovery rate, credit index volatility.

As envisaged by IFRS 13, in determining fair value the Intesa Sanpaolo Group also takes into account the effect of non-performance risk. This risk includes changes in the counterparty credit rating and changes in the issuer's own credit risk.

IV. Valuation model for structured credit products

With regard to asset-backed securities (ABSs), if significant prices are not available, valuation techniques are used that take into account parameters that can be gathered from an active market (level 2 inputs) or, where parameters cannot be observed, estimated parameters (level 2 or 3 inputs, where immaterial or material).

In this case, the cash flows are obtained from infoproviders or specialised platforms, where available, or are taken from the business plan of the transaction, supplemented with periodic reporting, such as the case of Non-Performing Loans (NPLs) and Unlikely to Pay (UTP); the spreads are gathered from prices available on the market/market info provider, further strengthened by a qualitative analysis relative to the performance of the underlying assets presumed from periodic investor reports and aimed at highlighting structural aspects that are not (or not fully) encompassed by the analyses described above, relating to the actual future ability to pay the expected cash flows and analyses of relative value with respect to other similar structures.

In the case of securitised high-yield loans to European corporate borrowers (HY CLO), valuation techniques call for calculation of the net present value of the expected cash flows, determined through specialised platforms, discounted using market spreads. When modelling expected future flows, account is taken of all contractual aspects of the HY CLOs that may influence the waterfall, i.e. the distribution of cash flows from the collateral on the notes.

After this valuation, credit analyses on underlying assets are fine-tuned to incorporate further valuation elements not included in the quantitative models. In particular, a Qualitative Credit Review is provided for and entails an accurate analysis of credit aspects referred to the specific structure of the HY CLO and to the collateral present. This is to identify any present or future weaknesses which emerge from the characteristics of the underlying assets, which could have been missed by rating agencies and as such not fully considered in the valuations described in the previous point.

V. Valuation of non-contributed equities

Level 2 equities include:

- equities measured based on direct transactions, that is significant transactions on the stock registered in a time frame considered to be sufficiently short with respect to measurement date and in constant market conditions;
- equities measured using relative methods, based on multipliers: implied multiples in transactions in comparable listed or unlisted companies, within a time frame deemed sufficiently short with respect to the time of measurement and under constant market conditions (M&A multiples) or implicit multiples in the stock market prices of a sample of comparable companies (stock market multiples).

Level 3 equities for which the “relative” models described above are not applicable in significant terms, and, therefore, “absolute” valuation models are used, include:

- equities for which analytical models based on flows are used, which determine the value through estimates of the cash or income flows that the company is expected to generate over time, discounted using an appropriate rate based on the level of risk of the instrument;
- equities measured based on net worth criteria such as NAV or Adjusted Net Asset Value (ANAV), which estimates the fair value of the various components of the assets of the investee.

Any values deemed representative of the fair value of the equity instrument deriving from contractual clauses (for example, options) are classified in level 2 or 3 of the fair value hierarchy, according to the observability of the inputs used in the valuation. Specifically, if the negotiation of the clause resulted in strike prices or pre-defined algorithms and multiples, the instrument is classified in level 2.

The cost criterion as estimate of fair value is used to a lesser extent, where none of the previous methods are applicable due to lack of sufficient information, and in the cases where there is a wide range of possible fair value measurements and it is not possible to identify the most appropriate value among these.

This case also includes Equity Instruments which, in accordance with IAS 32, have the characteristics to be considered as equities.

VI. The valuation of hedge funds

The fair value of a hedge fund corresponds to the Net Asset Value (NAV) provided by the fund administrator, to which an adjustment can be applied, deriving from a measurement process aimed at capturing the main risk factors that the management of the funds is subject to, which consist of the following two types:

- counterparty (broker) risk, i.e. the risk that the assets of the fund are exposed to when a single service provider is entrusted with prime brokerage or custodian activities, subject to the risk of default;
- illiquidity risk, i.e. the risk that the assets of the fund are illiquid due to the limited prices available or due to a lack of information on the assessment policies used by the fund.

These risks are assessed on the basis of the information contained in the documentation received periodically from the fund managers or administrators.

The fair value hierarchy level is Level 2, provided the Level 3 instruments do not exceed a set threshold.

VII. The valuation of private debt funds

For Private Debt Funds, the investment authorisation process involves an initial due diligence to verify the consistency between each fund's asset valuation policy and the Guidelines and Rules for Valuation of Financial Instruments at Fair Value. The fund is subsequently valued at NAV. The fair value hierarchy level is Level 3.

VIII. Valuation of closed-end private equity funds, real estate funds and closed-end funds resulting from sales of non-performing loans

Closed-end private equity funds are usually valued using the latest Net Asset Value approved by the asset management company (published half yearly or quarterly), adjusted solely to take into account events that have not yet occurred at the reference date of the NAV, such as:

- a material transaction on a portfolio company;
- the bankruptcy or liquidation of a portfolio company;
- the alignment of any listed assets to current prices;
- draw downs and distributions by the fund.

Closed-end real estate funds are valued using the last available Net Asset Value, adjusted for any subsequent call ups or distributions and, where considered necessary, applying a discount calculated using an internal model, with the aid of an independent expert. Specifically, this model enables the calculation of a discount on the Net Asset Value based on five different factors: (i) the size of the asset management company that manages the fund; (ii) the number of subscribers; (iii) the fund's historical return; (iv) the fund's return for the period; and (v) the level of debt. These factors are calibrated differently based on the business model and the fund's resulting risk profile, distinguishing between core, value added and opportunistic funds.

With regard to closed-end funds resulting from sales of non-performing loans, where an information set is available that makes it possible to conduct an analysis of the business plan of the positions held by the fund, individually or by uniform cluster, to determine the fair value of the units of the fund, in general the Bank uses the support of an independent expert, who, among other duties, carries out a comparison of performance of the business plans of the underlying exposures, and states in its report, that the fair value determined by the expert complies with the indications from the main regulators[169].

Where it is not possible to apply the approach mentioned above, for each fund a comparison is made between the expected return of the fund and a benchmark rate, defined using a model that factors in various elements, such as: i) the fund's valuation policies, verifying whether they are compliant with criteria consistent with the definition of fair value pursuant to IFRS 13, ii) verification that there is an updated business plan and of the performance of the fund compared to the available business plan, iii) the characteristics of the fund's assets, iv) the level of the cost of funding on the market for issuing liquid instruments, v) the completeness and extensiveness of the information provided by the fund, and vi) the fund management methods. Where the expected return of the fund is higher than the defined benchmark rate, the NAV communicated by the asset management company is used as the fair value measure. Where, instead, the benchmark rate is higher than the expected return of the fund, the fair value is determined based on the NAV minus a discount, which takes account of the spread between the benchmark rate and the expected return of the fund and the average residual life of the fund (Weighted Average Life or WAL).

For the funds of this type classified under Investments in associates and companies subject to joint control, the impairment test in accordance with IAS 28 is conducted using the measurement criteria described above for the determination of the fair value of the funds classified under the financial assets measured at fair value through profit or loss (FVTPL).

[169] See Bank of Italy/Consob/Ivass Document no. 8 "Treatment in the financial statements of sales without recourse of unlikely-to-pay loans in exchange for units of investment funds", published in April 2020.

Valuation of financial assets and liabilities not measured at fair value on a recurring basis

Finally, for asset and liability financial instruments measured at amortised cost, whose fair value is determined solely for the purposes of disclosure in the notes to the financial statements, the following is noted:

- the fair value of the bonds is calculated using the methods described above;
- the fair value measurement of the other medium- and long-term asset and liability financial instruments is performed by discounting future cash flows using the discount rate adjustment approach, which requires credit risk factors to be taken into account in the discount rate for future cash flows;
- for short-term assets and liabilities, the book value is assumed to be a reasonable approximation of fair value.

For more information see paragraph A.4.5.4.

As required by IFRS 13, the table below highlights, for financial assets and liabilities measured at level 3 fair value, quantitative information on the significant, unobservable inputs used in the fair value measurement.

(thousands of euro)

Financial assets/ liabilities	Valuation technique	Main non-observable input	Minimum value of range of changes	Maximum value of range of changes	Unit	Favourable changes in FV	Unfavourable changes in FV
Securities and loans	Discounting Cash Flows	Credit Spread	-3	4	%	1,683	-2,527
Structured securities and loans	JD model	JD parameters	-46	14	%	281	-611
Structured securities and loans	Two-factor model	Correlation	-33	29	%	12,343	-9,172
ABSs	Discounting Cash Flows	Credit Spread	-2	2	%	468	-516
CLOs Cash	Discounting Cash Flows	Credit Spread	-6	6	%	240	-250
OTC derivatives subject to FV adjustment for CVA/DVA	CVA	Loss Given Default Rate (LGD)	0	100	%	433	-1,338
OTC derivatives subject to FV adjustment for CVA/DVA	CVA	Probability of default (PD) based on counterparty's internal rating	CCC	A	internal rating	775	-690
OTC Derivatives - Equity basket option	Black - Scholes model	Equity basket correlation	92	99	%	12	-9
OTC Derivatives - Equity Option	Black - Scholes model	Historical volatility	8	37	%	544	-1,732
OTC Derivatives - Equity Option	Marshall Olkin Model	Historical correlation	4	67	%	63	-44
Fondi hedge	Discounting Cash Flows	Net Asset Value	-1	2	%	70	-48
Uncontributed Equity Securities	Net present value	Cost of Equity	-100	100	bp	6,245	-5,027
Uncontributed Equity Securities	Various	Carrying Amount/Net Asset Value	-1	1	%	4,661	-4,661
UCI units deriving from sales of non-performing loans and similar assets	Adjusted NAV on IRR Basis/Net Present Value	IRR benchmark / Cost of Equity	-100	100	bp	40,493	-42,979
UCI units not deriving from sales of non-performing loans and similar assets	Net Asset Value	Net Asset Value	-1	1	%	16,108	-16,108

A.4.2 Valuation processes and sensitivity

For a description of the valuation processes used by the Group for instruments measured at level 3 in a recurring and non-recurring manner, see paragraphs A.4.1 and A.4.5 respectively.

As required by IFRS 13, for the financial assets and liabilities measured at level 3 fair value, the following table lists the effects of a change in one or more significant non-observable parameters used in the valuation techniques adopted to determine the fair value. Note that only the total material effects at the end of the year are shown in the table.

Financial assets/liabilities	Non-observable parameters	Sensitivity (thousands of euro)	Change in non-observable parameter
FVTPL and FVTOCI securities and loans	Credit spread	-96	1 bp
FVTPL and FVTOCI securities and loans	JD parameters	-23	1%
FVTPL and FVTOCI securities and loans	Correlation	-160	1%
OTC Derivatives - Equity	Correlation between underlying equity baskets	-32	10%
OTC Derivatives - Equity	Historical volatility	825	10%
OTC Derivatives - Equity CPPI	Historical correlation	-17	10%
Fondi Hedge	Net Asset Value	42	1%

For tax credits held under the Hold to Collect and Sell and Other/Trading business models, which are initially recognised and subsequently measured at fair value, note that the fluctuations in fair value are mainly due to the trends in risk-free rates.

Specifically, an increase (decrease) in interest rates of 1 basis point is estimated to correspond to a negative (positive) fluctuation of:
- 1,304 thousand euro for tax credits classified under the Other/Trading business model;
- 546 thousand euro for tax credits classified under the Hold to Collect and Sell business model;

A.4.3. Fair value hierarchy (transfers between the different levels)
A description of the policy for determining when transfers occur between the different levels of fair value hierarchy (see IFRS 13, par. 95) is provided above (see “Fair value hierarchy").

A.4.4. Other information
In calculating the bCVA, the Intesa Sanpaolo Group considers the net positions in derivatives of each counterparty (see paragraph A.4.1 above for further details on the measurement of derivatives). For other cases, the Group does not make use of the option provided in paragraph 48 of IFRS 13, which permits an entity “to measure the fair value of a group of financial assets and financial liabilities on the basis of the price that would be received to sell a net long position (i.e. an asset) for a particular risk exposure or paid to transfer a net short position (i.e. a liability) for a particular risk exposure in an orderly transaction between market participants at the measurement date under current market conditions”.

General Independent Price Verification principles
The Intesa Sanpaolo Group governs and defines the independent price verification process through the Group Guidelines and Rules on Independent Price Verification, documents that are coordinated by Market & Financial Risk Management and applied by the Parent Company and all consolidated subsidiaries of the Banking Group.
The “Guidelines on Independent Price Verification”, once a favourable opinion has been given by the Group Financial Risk Committee, are revised and approved at least on an annual basis by the Board of Directors, with the support of the Risks and Sustainability Committee. The level I and II “Rules on Independent Price Verification” are revised and approved at least on an annual basis by the Group Financial Risks Committee, which is specifically delegated to do so by the Management Bodies, and which also reviews material changes and updates proposed by Market and Financial Risk Management.
According to the provisions of Regulation (EU) 575/2013 (Capital Requirement Regulation – CRR), Article 4, par. 1.70 and Article 105, par. 8, the Intesa Sanpaolo Group governs the Independent Price Verification (IPV) process, which consists of the regular verification of the accuracy and independence of market prices or the data input in pricing models, carried out by an organisational unit independent from the business functions, at a frequency commensurate with the trading carried out and the nature of the market.
The Intesa Sanpaolo Group has set up an IPV process with 3 levels of control in line with the provisions of Bank of Italy Circular 285/2013 (Supervisory regulations for banks), incorporated into the Integrated Internal Control System, which requires the risk management processes to be incorporated in the processes and methods for valuing the company activities, also for accounting purposes.
Within the IPV, the level I, II and III control functions have the following main responsibilities:
- the level I control function participates in the definition of the related methodological framework and carries out the level I implementations and controls, reporting the results to the business function and the level II control functions;
- the level II control function defines the methodological and control framework, ensures alignment with current regulations and consistency between the IPV controls, accounting valuations and additional valuation adjustments (AVA) (carried out, respectively, on the basis of the Guidelines and Rules for Valuation of Financial Instruments at Fair Value and the Guidelines and Rules for Prudent Valuation of Financial Instruments at Fair Value) and supervises the level I controls and performs the level II controls;
- the level III control function carries out internal audit controls to identify breaches of procedures and regulations, as well as to periodically assess the completeness, adequacy, functionality (in terms of efficiency and effectiveness) and reliability of the organisational structure of the other components of the internal control system and the IT system at Group level, at scheduled deadlines in relation to the nature and intensity of the risks.

The level I and II IPV controls are qualitative and quantitative controls and are distinguished according to the type of instruments subject to control. They are applied consistently to both the input data underlying the valuations and the valuations themselves, and ensure consistency between the management valuations and the accounting valuations carried out in the various systems. They are characterised by completeness and suitability of application, absence of overlaps, sequentiality and complementarity in execution. The IPV control instruments use, as far as possible, specific applications or IT procedures, which enable extensive data analysis on a daily basis. In particular:
- the level I controls are aimed at ensuring the validation of the market data entered into the systems and are based on an in-depth analysis of the data obtained from external providers. If the level I controls detect that certain thresholds have been exceeded for the data contained in the systems, or the data is not considered correct by the level I control functions, a comparison process (challenge) is activated with the involvement of the business function and the level II control functions, in line with the degree of complexity of the report;
- the level II controls are characterized by sequentiality and complementarity in execution with the level I controls and are designed to ensure alignment between management and accounting valuations, based on an in-depth analysis of consensus or counterparty data and, where these are not available, through the application of pricing models associated with the respective instruments.

The results of the IPV process are analysed, assessed and coordinated by the Financial Measurements Working Group, a technical body set up specifically for this purpose, with the aim of facilitating integration and comparison between the business functions and the control functions.

General prudent value principles

The framework of financial measurements is completed with the prudent valuation of financial instruments measured at fair value, which involves the calculation of additional valuation adjustments for prudential purposes, without impacts on the fair value calculated for accounting purposes in accordance with the IFRS.

The Intesa Sanpaolo Group governs and defines the prudent value measurement of financial instruments through the Group Guidelines and Rules for Prudent Valuation of Financial Instruments at Fair Value, prepared by Market & Financial Risk Management and applied by the Parent Company and all the consolidated subsidiaries of the Banking Group.

The “Guidelines on Prudent Valuation of Financial Instruments”, once a favourable opinion has been given by the Group Financial Risks Committee, are revised and approved at least on an annual basis by the Board of Directors, with the support of the Risks and Sustainability Committee. The “Rules for Prudent Valuation of Financial Instruments” are revised and approved at least on an annual basis by the Group Financial Risks Committee, which is specifically delegated to do so by the Management Bodies, and which also reviews material changes and updates proposed by Market & Financial Risk Management.

In accordance with the provisions of Regulation (EU) 575/2013 (Capital Requirements Regulation – CRR), prudent valuation entails the calculation of specific additional valuation adjustments (AVAs) for the financial instruments measured at fair value, aimed at capturing different sources of valuation uncertainty and ensuring the achievement of a suitable level of certainty in the measurement of the positions. The total value of the AVAs is deducted from the Common Equity Tier 1 capital, without impacts on accounting fair values.

The Intesa Sanpaolo Group, in line with the criteria indicated in Delegated Regulation (EU) 101/2016, is subject to the application of the core approach for the determination of AVAs both at individual and at consolidated level for all the positions measured at fair value. In particular the following AVAs are considered:

- market price uncertainty: this reflects the uncertainty of the market prices, calculated at valuation exposure level;
- close-out costs: it reflects the uncertainty of the exit price calculated at valuation exposure level;
- model risks: it considers the valuation model risk which arises due to the potential existence of a range of different models or model calibrations, which are used by market participants, and the lack of a firm exit price for the specific product being valued;
- unearned credit spreads: it reflects the valuation uncertainty in the adjustment necessary according to the applicable accounting framework to include the current value of expected losses due to counterparty default on derivative positions;
- investment and funding costs: it represents the valuation uncertainty in the funding costs used when assessing the exit price according to the applicable accounting framework;
- concentrated positions: it reflects the uncertainty relating to the exit price of the positions defined as concentrated;
- future administrative costs: it considers administrative costs and future hedging costs over the expected life of the valuation exposures for which a direct exit price is not applied for the close-out costs AVAs for concentrated positions;
- early termination: it considers the potential losses arising from non-contractual early terminations of customer trades;
- operational risks: it considers the potential losses which may be incurred consequently to the operational risks connected to the valuation processes.

The prudent value corresponds to the exit price from the position with a level of certainty equal to 90%. Where possible, this value is determined on the basis of a distribution of exit prices observed on the market. In all the other cases, an expert-based approach is used, referring to the qualitative and quantitative information available.

The AVA value associated to the single position and to the single source of uncertainty in valuation thus corresponds to the difference between the prudent value and the fair value. The total AVA is obtained by aggregating the single AVAs, taking into account the corresponding weighting ratios.

The “Rules for Prudent Valuation of Financial Instruments” outline, for each AVA, the definition and interpretation, the scope of application, the input data and the detailed calculation method for each class of financial instrument.

FAIR VALUE OF REAL ESTATE AND VALUABLE ART ASSETS

Fair value of real estate assets

As extensively illustrated in the first part regarding the accounting policies, the Group has adopted the revaluation model as the basis of measurement for the owner-occupied properties accounted for according to IAS 16 and fair value for the investment properties accounted for according to IAS 40.

Measurement of real estate assets

The revaluation model applied to owner-occupied properties envisages that property and equipment, whose fair value can be reliably determined, is recorded at a revalued amount, equal to its fair value at the date of the revaluation, net of depreciation and any accumulated impairment losses.
For the properties held for investment, the Intesa Sanpaolo Group has chosen the fair value method, according to which, after initial recognition, all investment properties are measured at fair value.

Valuation approach

IFRS 13 defines fair value as "the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date".
The valuation approach has been defined on the basis of the business relevance and plan for the use of the properties, which consists of three main groups:

- "trophy assets", i.e. particularly prestigious properties used by management functions located in the main cities where the Bank is based or properties of particular historical and artistic interest because they are listed by the Ministry for Culture;
- "owner-occupied properties";
- "investment properties".

The properties are valued individually asset-by-asset without considering any discount, or premium, that may be agreed during commercial negotiations if all or part of the portfolio is sold in bulk or in lots.
The Intesa Sanpaolo Group has chosen to assign the valuation activity to professionally qualified external companies with an international structure, able to provide property valuations based on the RICS Valuation standards[170] which guarantee:

- determination of the value consistent with the fair value configuration indicated in the IAS/IFRS;
- compliance with the professional, ethical and independence requirements for experts, in line with the provisions of international and European standards.

To determine the value of the assets, the following valuation methods are used based on the characteristics of the asset and the conditions of the market of reference; the valuer determines the most suitable method for each individual property:

- The Discounted Cash Flow Method: the discounted cash flow method is based on the discounting (for a variable period based on the rental/occupational situation of the property and its subsequent optimisation) of the future net proceeds from the rental or sale of the property. At the end of this period, the value of the property is assumed to be the sale price obtained by capitalising the income of the last year at a market rate for investments similar to the object of the estimate or through a split sale. This method is used for the valuation of all the owner-occupied properties or real estate leased to third parties, located in Italy.
- Comparative or Market Method: the comparative or market method is based on the comparison between the assets examined and similar assets recently sold/purchased or offered on the same market or in competitive environments. This criterion is based on a comparison with properties that have recently been sold or offered on the open market and, if possible, have the same characteristics. In the absence of observations directly related to the property examined, cases are used that are as similar as possible to the property examined, making the necessary adjustments. This method, which also represents the basis for other valuation methods, can be adopted in particular for non-owner-occupied assets and/or, in any case, for unrestricted and available assets in Italy and abroad.
- Direct capitalisation income approach: the income approach is based on the current value of the potential market income of a property, obtained by capitalising the income at a market rate. This approach is applied mainly to owner-occupied properties abroad, where a prolonged stay within the building is envisaged.
- Investment Value (Worth): the Investment Value (Worth) is defined by the International Valuation Standard as: "the value of an asset to a particular owner or prospective owner for individual investment or operational objectives". This definition is consistent with the provisions of the latest edition of the "RICS Valuation - Global Standards" of the Royal Institution of Chartered Surveyors of the United Kingdom, where the Investment Value is defined as "the value of an asset to the owner or a prospective owner for individual investment or operational objectives".
  The Investment Value is applicable to properties built by the entity or properties with a strong business relevance subject to significant investments for technological, construction and functional adaptation.
  The Investment Value of these properties is determined on the basis of a 12+6 year plan for business use without break options, whose annual rent is determined by applying an appropriate gross rate of return to the amount of direct and indirect costs capitalised by the owner, including the costs of purchasing the land.

For the purposes of the valuation, where applicable and relevant, the assumptions include considerations relating to specific legislation (for example on safety, accessibility, and the removal of architectural barriers) as well as sustainability considerations connected to climate change factors and energy efficiency. In conclusion, based on the assessments conducted by the independent expert, it can be confirmed that at present the climate variables have not led to any significant impacts on the 2024 Financial Statements.

[170] Standards set out in the Royal Institution of Chartered Surveyors of the United Kingdom document "RICS Valuation – Global Standard" (also known as the "Red Book"): the version in force as at 31 December 2024 was issued in November 2021 and took effect on 31 January 2022.

Frequency of valuation

Revaluations must be made with sufficient regularity to ensure that the carrying amount does not differ materially from that which would be determined using fair value at the reporting date.

The frequency of revaluations depends upon the changes in fair values of the property and equipment being revalued. When the fair value of a revalued asset differs materially from its carrying amount, a further revaluation is required.

Specifically, based on the market trends, different valuation frequencies have been identified that, according to the characteristics of the assets and their location, are considered capable of capturing the significant changes in the value of the assets.

The following distinction is made for owner-occupied properties:

– for trophy assets, the revaluation is carried out by verifying the value through a scenario analysis (market trend analysis) every year and with a new appraisal every two years;
– for the other owner-occupied properties, the revaluation is carried out through scenario analysis (market trend analysis) every year and through a new appraisal every three years.

If the scenario analysis identifies significant changes (+/- 10%), specific and updated appraisals must be carried out to adjust the fair value of the asset to the valuations of the real estate market.

For investment properties, the value is determined on the basis of new appraisals each year.

Based on the rules mentioned above, in 2024, the investment properties and the owner-occupied properties, for which the scenario analysis identified changes with respect to the threshold set, were subject to periodic valuation.

Scenario analysis

As part of the annual update of the fair value of the owner-occupied properties, in the years when a revaluation of the property is not envisaged, a scenario analysis (market trend analysis) is carried out using the best information sources available for the various countries in which the properties are located, in order to identify deviations, using databases, in the market values between the analysis period and the previous period.

In particular, for real estate located in Italy, the changes are defined using at least 3 different sources. The main source is that provided by the Italian Revenue Agency, based on the specific OMI (Real Estate Market Monitor) zones. The second publication source is Nomisma for which, for the related zoning, the same queries are conducted as those for the OMI (main database).

Lastly, the third source is based on the analyses of the changes during the year surveyed in terms of the offers present on the real estate market.

Accordingly, the experts identify the annual deviations in rents and/or prices by related asset class for each property.

Real estate located abroad is grouped, for each country, into different clusters based on location and asset class. Specific market analyses are conducted based on local and national knowledge of the particular target real estate market.

The market study also takes account of the following macroeconomic drivers:

– analysis of economic data (unemployment rate, GDP per capita, inflation and consumer price index); these macroeconomic factors constitute the first economic analysis, supporting the real estate market forecasts;
– movement in average yield;
– movement in market rents;
– range of movement in unit values.

The above-mentioned market survey, together with a qualitative weighting of the macroeconomic key drivers is used to determine a range of percentage deviation from the last assessment carried out, which is compared with the target threshold set, identifying a synthetic percentage factor for each individual property, included in a single worksheet.

This activity is carried out close to the end of the year in order to produce a range of deviations within a reference threshold and to enable the timely planning of the updating of the specific appraisals for the properties whose deviation exceeds the threshold.

The permitted variation threshold is +/-10%.

If the deviations identified exceed this threshold, a new valuation will be carried out before the end of the year.

Sensitivity of valuations

Just as for financial instruments, level 3 non-financial assets and liabilities measured at fair value for which, due to the valuation model used to determine the fair value, execution is possible, and whose results are significant, are subject to sensitivity analysis. The analysis essentially concerned the properties of the Parent Company Intesa Sanpaolo, which represent the Core perimeter of the Group's real estate assets.

It is noted that the sensitivity analysis was conducted by identifying the most important variables in the valuation model used to value the various classes of real estate, represented by the discounted cash flow method. Specifically, taking account of the trend recorded in the various asset classes of the real estate market and the parameters featuring greater volatility/variability, for owner-occupied properties, reference was made to the net capitalisation rate (yield) and the average medium/long-term inflation rate, while for investment properties, to the exit value. In compliance with the estimate assumptions applied to real estate assets, for the purpose of the analysis, variation ranges were used that were consistent with the potential trends in the market at the reporting date. For owner-occupied properties, a change of +/- 25 bps for the net capitalisation rate and a concurrent change of -/+20% for the inflation rate were assumed, in relation to which average deviations of fair value of +4.4% and -3.8% were recorded. For investment properties, a change of +/- 5% in the exit value was assumed, in relation to which there were average deviations of fair value of +4.5% and -4.4%.

Fair value of valuable art assets

The Bank's valuable art assets are also valued using the revaluation model, which envisages that property and equipment, whose fair value can be reliably determined, is recorded at a revalued amount, equal to its fair value at the date of the revaluation.

Works of art included in the asset class "valuable art assets" are works of particular importance, recognised for their historic and artistic value by experts and in line with the ministerial guidelines, and particularly those set out in Ministerial Decree 537 of 6 December 2017 on the exportation of works of art, such as: the state of preservation, the historical importance of the artist, the importance of the work in terms of art criticism/history, illustrious origin, certain quality and attribution and the declaration of interest by the Italian government.

Valuation approach

The valuation is carried out by determining the value through external appraisals, entrusted to qualified independent experts.
These values are obtained from online databases such as Artnet and Artprice, which list over 100 million works of art and monitor the results of leading Italian and international auction houses. These are objective parameters that are compared with the market as a whole, in an analysis that also involves monitoring galleries and art fairs.
In particular, the factors considered for the fair value measurement include objective factors relating to the historical-critical-artistic value of the author, state of preservation, execution technique, size and quality of the artwork, importance of the artwork in the production by the artist, publication of the artwork in specialist catalogues, period of execution of the artwork, international exposure of the artworks by the artist, distinguished provenance, certainty of attribution, guarantee of authenticity of an artwork, as well as other factors (which may change over time, depending on the evolution and tastes of the market), such as the reputation of the museum hosting the artwork by the artist, the prestige of fairs/exhibitions/galleries/auction houses that handle the artwork, the reputation of its critics and collectors, and the quality of the communications concerning the artist's work.
Once these factors have been identified, the fair value is determined comparing them firstly with artworks similar to those examined (in terms of period of production/year, technique, size, type of subject and state of preservation), by the same artist and from the same period, if available (this is more feasible for modern and contemporary works) and, secondly, with works by artists or schools and areas that are close in style, philosophy and importance in the same historical period. Where several similar artworks are available, average values are used to take account of price volatility.
In addition to considering the trends in auction trading, starting from the most recent trading and also including unsold items in the analysis, which are a possible indicator of the loss of market value for the artwork/artist, the valuation also considers the current market interest in an artwork or an artist, measured by the number and quality of temporary exhibitions held in internationally important museum spaces and accompanied by specific publications.
The valuations also take into account any declarations of historical-artistic interest formally expressed by the Italian Ministry for Culture (commonly referred to as "notifications"), which tie part of the artworks in the collection to Italy's heritage and restrict their circulation to the country's territory, reducing the price obtainable on the international market.
The pricing is also influenced by the importance of the buyers/sellers (e.g. prices paid by famous collectors or known investors may be more significant).
The valuation approach is based on the monitoring of the objective market values of the artworks included in the category examined, which follows three methodological approaches:

– prudent basis, analysing the average values of a variety of different information sources, based on robust, updated and statistically representative databases: in a market of "unique" artworks, often without transactions for decades, this approach ensures the periodic identification of any outlier values and avoids following speculative trends;
– comparison, monitoring the transactions that have taken place at a global level in a variety of distribution channels, in order to avoid considering only certain forms of transaction and the related financial values: in a global market with global demand, this approach enables verification of the presence of any geographical arbitrage or specific appreciation/depreciation phenomena with potential impacts;
– recurrence, since it updates and monitors price trends over the shortest period of time that the specific features of the market allow, i.e. the half year: in a market in which there are no public trades monitored daily, the shortness of the measurement period ensures maximum attention and timeliness of any changes.

This approach is applied to all the "valuable art assets".

Frequency of valuation

For valuable art assets, the revaluation is carried out by means of an expert appraisal every three years. However, a scenario analysis is carried out annually to identify any appreciable changes in value in order to bring forward the valuation.
Based on the rules mentioned above, in 2024, the artworks, for which the scenario analysis identified changes with respect to the threshold set, were subject to valuation.

Scenario analysis

In order to identify and determine the changes in the market of the artworks being valued, market trends are monitored to detect signs of significant change that require appraisals to be made in advance with respect to the frequency established.
This monitoring is carried out on a two-fold basis:

– Monitoring of the market prices of the top artworks in terms of value held in Intesa Sanpaolo's collections, which represent 75% of the total value of the artworks included in the "valuable art assets" class, by verifying both the results of the main international auctions (which are based on a calendar of precise seasonal deadlines) and the reports of the two main world databases (Artprice and Artnet), whose analytics provide useful tools for monitoring prices;
– Monitoring the performance of the art market in general, to identify trends and changes with respect to Intesa Sanpaolo's "valuable art assets", verifying both the results of the main international auctions (which are based on a calendar of precise seasonal deadlines), and the reports of the two main world databases (Artprice and Artnet); since the works of many artists in the Intesa Sanpaolo's collection very rarely go up for auction due to the limited number of items left in the market, it is important to monitor the trend of similar artists or works; accordingly, the monitoring is not just limited to the works held and their artists, but also extends to the authors and artworks related to the same area, to take into account trend data.

If the annual monitoring identifies a potential, positive or negative, value deviation of more than 15% for individual artworks/collections of artists in Intesa Sanpaolo's collections and comparable on the basis of objective criteria (such as period of production/year, size, technique, period of production, etc.), the appraisals are commissioned according to the usual internal procedures in order to align the carrying amount.

Looking at the table, with regard to assets, level 3 instruments, which allow for more discretion in fair value measurement, they represent a small portion of the portfolio, with an impact of 5.5% on total assets (5.7% as at 31 December 2023).
Level 3 financial assets refer mainly to UCI units under Financial assets mandatorily measured at fair value, and are mainly attributable to equity and bond funds of insurance companies. With regard to the banking segment, the UCI units under Financial assets mandatorily measured at fair value are mainly attributable to the Parent Company and in terms of composition they relate, in order of significance, to real estate funds, private equity funds, private debt funds, infrastructure funds, hedge funds, and venture capital funds. The caption also includes 197 million euro relating to interests held by the bank in the Atlante Fund and in the Italian Recovery Fund (formerly Atlante Fund II), alternative investment funds to support Italian banks in their recapitalisation transactions and in the management of the bad loans in the sector.
Property and equipment measured at level 3 fair value includes real estate assets and valuable art assets, which represent 38.4% of the balance sheet assets at level 3 fair value.
A total of 80.3% of assets measured at fair value are determined based on market prices (level 1), and therefore without any discretion by the valuator.
A total of 93% of the liabilities at fair value are attributable to Level 2, primarily to Financial liabilities designated at fair value.

A.4.5.1 Assets and liabilities measured at fair value on a recurring basis: fair value by level (of which: Banking Group and Other companies)

(millions of euro)

4. Property and equipment	-	-	6,600	-	-	7,214
5. Intangible assets	-	-	-	-	-	-
Total	**84,890**	**40,523**	**11,587**	**72,706**	**41,374**	**11,634**
1. Financial liabilities held for trading	6,882	35,974	10	7,825	35,611	50
2. Financial liabilities designated at fair value	1,488	21,873	76	91	21,222	31
3. Hedging derivatives	-	4,363	-	-	5,105	-
Total	**8,370**	**62,210**	**86**	**7,916**	**61,938**	**81**

With regard to assets of the Banking Group and Other Companies, level 3 instruments, which allow for more discretion in fair value measurement, account for a limited portion of the portfolio, with an impact of 8.5% on total assets (9.3% as at 31 December 2023).
A total of 62% of assets measured at fair value are determined based on market prices (level 1), and therefore without any discretion by the valuator.
Property and equipment measured at level 3 fair value includes real estate assets and valuable art assets, which represent 57% of the balance sheet assets at level 3 fair value.
A total of 88% of these liabilities are classified in level 2, and the share of level 3 instruments is less than 1% of total liabilities.
As at 31 December 2024, the impact of non-performance risk (Credit Value Adjustment and Debt Value Adjustment) in the determination of the fair value of derivative contracts amounted to a reduction of 101 million euro in positive fair value and a reduction of 2 million euro in negative fair value.
The impact of the Funding Value Adjustment in reducing the fair value amounted to 43 million euro, equal to the cost of funding the cash flows generated by the Parent Company's overall portfolio of OTC derivatives.
Determining the quantity of those adjustments is irrespective of the effects of the correlated operational hedging strategies, where present.

Lastly, the caption "Other assets", not directly included in the table above, comprised tax credits recognised and measured at fair value for 11.2 billion euro as at 31 December 2024, of which 3.3 billion euro held under the Hold to Collect and Sell business model and 7.9 billion euro held under the Other/Trading business model. The fair value of those credits was determined with reference to the changes in interest rates. Given the specific characteristics of the credits in question, they have been assigned to level 3, also in line with the considerations set out in the clarification note issued by the Bank of Italy on 24 July 2023 ("Clarification Note on credit risk").

In addition to the transfers relating to financial assets and liabilities measured at level 3 as detailed below, please note that the following transfers were made during 2024:

- from level 1 to level 2:
  - financial assets held for trading for 55 million euro (book value as at 31 December 2024);
  - financial assets measured at fair value through other comprehensive income for 18 million euro (book value as at 31 December 2024);
  - financial liabilities designated at fair value for 76 million euro (book value as at 31 December 2024);
- from level 2 to level 1:
  - financial assets held for trading for 102 million euro (book value as at 31 December 2024);
  - financial liabilities held for trading of 6 million euro
  - financial liabilities designated at fair value for 1,488 million euro (book value as at 31 December 2024).

The transfers between fair value levels are determined by the trends in the observability of prices or market data used to measure the instruments and by the materiality of the unobservable inputs.
The transition from level 1 to level 2 is a consequence of the disappearance of an active market for that instrument assessed by analysing the reliability and the reciprocal consistency of the available prices according to the provisions of the Group's Fair Value Policy. Conversely, securities for which a mark-to-model measurement is performed using inputs that can be observed on the market – classified, therefore, as level 2 – are transferred to level 1 when the existence of an active market is identified.

A.4.5.1 Assets and liabilities measured at fair value on a recurring basis: fair value by level (of which: Insurance Companies)

(millions of euro)

Assets / liabilities at fair value	31.12.2024			31.12.2023		
	Level 1	Level 2	Level 3	Level 1	Level 2	Level 3
1. Financial assets measured at fair value through profit or loss	97,676	1,078	5,554	95,785	661	5,248
a) Financial assets held for trading	38	-	-	25	2	-
of which: equities	-	-	-	-	-	-

b) Financial assets designated at fair value	-	-	-	-	-	-
c) Other financial assets mandatorily measured at fair value	97,638	1,078	5,554	95,760	659	5,248
of which: equities	*5,918*	-	*91*	*5,441*	-	*82*
of which: quotas of UCI	*83,830*	-	*4,696*	*83,627*	-	*4,371*
2. Financial assets measured at fair value through other comprehensive income	69,911	2,982	80	69,588	2,354	193
of which: equities	-	-	*7*	-	*7*	-
3. Hedging derivatives	-	36	-	-	24	-
4. Property and equipment	-	-	7	-	-	8
5. Intangible assets	-	-	-	-	-	-
Total	**167,587**	**4,096**	**5,641**	**165,373**	**3,039**	**5,449**
1. Financial liabilities held for trading	8	8	-	4	3	-
2. Financial liabilities designated at fair value	-	50,646	-	-	51,438	-
3. Hedging derivatives	-	47	-	-	83	-
Total	**8**	**50,701**	**-**	**4**	**51,524**	**-**

With regard to assets of Insurance Companies, level 3 instruments, which allow for more discretion in fair value measurement, account for a very small portion of the portfolio, with an impact of 3.2% on total assets (3.1% as at 31 December 2023).
94.5% of financial assets measured at fair value in the insurance segment are determined based on market prices (level 1), and therefore without any discretion by the valuator.
Liabilities at fair value were almost entirely measured using level 2 inputs and attributable to Financial liabilities designated at fair value.

In addition to the transfers relating to financial assets and liabilities in the insurance segment designated at level 3 as detailed below, please note that the following transfers were made during 2024:
- from level 1 to level 2:
  - financial assets mandatorily measured at fair value for 131 million euro (book value as at 31 December 2024);
  - financial assets measured at fair value through other comprehensive income for 596 million euro (book value as at 31 December 2024);
- from level 2 to level 1:
  - financial assets measured at fair value through other comprehensive income for 143 million euro (book value as at 31 December 2024);

The transfers between fair value levels are determined by the trends in the observability of prices or market data used to measure the instruments and by the materiality of the unobservable inputs.
The transition from level 1 to level 2 is a consequence of the disappearance of an active market for that instrument assessed by analysing the reliability and the reciprocal consistency of the available prices according to the Group's Guidelines and Rules for Valuation of Financial Instruments at Fair Value. Conversely, securities for which a mark-to-model measurement is performed using inputs that can be observed on the market – classified, therefore, as level 2 – are transferred to level 1 when the existence of an active market is identified.

Caption 2.3 “Transfers from other levels” of Financial assets measured at fair value through other comprehensive income amounting to 378 million euro, includes 375 million euro relating to the transfer from Level 2 to Level 3 of the Bank of Italy shares. In the absence of recent direct transactions on the shares, they were valued using the Dividend Discount Model (DDM), which confirmed the carrying amount. The use of that method also resulted in the classification at Level 3 of the fair value hierarchy, instead of Level 2 as in the 2023 Financial Statements.

The captions of Property and equipment “Other increases” and “Other decreases” include the transfers from Investment property to Property and equipment used in operations and vice versa. These also include transfers of assets held for sale. Specifically, “Other decreases” include a portfolio of real estate reclassified by Intesa Sanpaolo S.p.A. to assets held for sale pursuant to IFRS 5, as part of a contribution of real estate assets to funds managed by Coima, for 506 million euro from Intesa Sanpaolo S.p.A. and a further 10 million euro from Immit – Immobili Italiani S.r.l.

Financial assets and liabilities

For financial assets and liabilities not measured at fair value (loans and loans represented by securities, amounts due to customers and securities issued), the Group measures fair value by calculating the present value of future cash flows at a rate that incorporates the estimate of the main risks and uncertainties associated with the financial instrument to be measured (discount rate adjustment approach).

In particular, the interest rate used to discount the future cash flows is determined by taking into account the following risk factors:

- interest rate risk, which represents the rate offered by the market for each unit of capital provided to risk-free counterparties;
- credit risk, which is the premium for having provided capital to counterparties with insolvency risk.

For fixed-rate instruments, the cash flows are those envisaged by the contracts. For floating-rate instruments, the future cash flows are determined based on forward rates, implicit in the zero-coupon interest rate curves observed at the various fixing dates and differentiated by indexation type.

The value of the risk premium (credit spread) is determined per individual position, through acquisition of the risk class (LGD) and rating (PD). These amounts, together with the average residual financial life, constitute the guideline for acquisition of the credit spread. For securities issued, the construction of the spread curve follows the rules set out in the Rules for Valuation of Financial Instruments at Fair Value.

The following assumptions were used in determining the fair values indicated in table A.4.5.4:

- for loans represented by securities, the same rules envisaged for the fair value measurement of other categories of securities are used;
- for securities issued, the rules used are the same as those applied to securities under assets;
- the book value is calculated as the reasonable approximation of fair value for:
  - demand financial items (assets and liabilities) or financial items with an original maturity equal to or shorter than 12 months and residual maturity equal to or shorter than 12 months: in the table, the column corresponding to level 2 of the fair value hierarchy presents the short-term financial items and cash collateral for financial operations, while the column corresponding to level 3 of the fair value hierarchy presents demand loans;
  - non-performing assets which in the table are included in the column corresponding to level 3 of the fair value hierarchy.

A.5 – INFORMATION ON “DAY ONE PROFIT/LOSS”

Under IFRS 9, financial instruments shall be initially recognised at fair value. The fair value of a financial instrument at initial recognition is normally the "transaction price", i.e. the fair value of the consideration given or received in relation to, respectively, financial assets and liabilities. The fact that, upon initial recognition, the fair value of a financial instrument normally coincides with the transaction price is usually intuitively verifiable in the case of transactions falling under level 1 of the fair value hierarchy. Any differences between the price and the fair value are usually attributable to the so-called commercial margins, which are considered as not falling within the scope of Day One Profit (DOP). Therefore, commercial margins are taken to the income statement on the first subsequent measurement of the financial instrument. Also in the case of level 2, which is based on quotes that can be derived indirectly from the market (Comparable Approach), the fair value and the price often coincide upon initial recognition. Any residual differences, as in the previous case, are usually attributable to the commercial margins. With respect to level 3 instruments, no definite reference benchmark is available to compare the transaction price with, since there is more discretion in fair value measurement. For the same reason, the calculation of any commercial margin to be taken to the income statement is also difficult. In this event, the instrument is always initially recognised at the transaction cost, irrespective of whether it is possible to identify commercial margins. Subsequent measurement shall not include the difference between cost and fair value identified upon initial recognition (also defined as DOP). This difference shall be recognised in the income statement only when it arises from changes to the factors over which market participants base their valuations when fixing prices (including the time effect). Where unobservable inputs used to estimate the fair value become observable, the residual deferred DOPs are recognised in the income statement. Similarly, in the event of “on the book” transactions falling under the investment division’s activities, the DOPs earned on transactions – included in the above on the book management – are taken to the income statement when transactions are carried out which substantially eliminate the risks linked to unobservable parameters of the instrument which generated the DOP.

At the end of 2024, the amount of the DOPs deferred in the balance sheet had been fully released to the income statement, following the closing of the associated transactions.

Part B - Information on the consolidated balance sheet

ASSETS

SECTION 1 - CASH AND CASH EQUIVALENTS - CAPTION 10

1.1 Cash and cash equivalents: breakdown

(millions of euro)

	31.12.2024	31.12.2023
a) Cash	3,882	3,934
b) Current accounts and on demand deposits with Central Banks	32,531	81,582
c) Current accounts and on demand deposits with banks	4,120	3,754
Total	**40,533**	**89,270**

Sub-caption b) Current accounts and on-demand deposits with Central Banks refers to (overnight) on-demand deposits for an amount of 32,531 million euro, down on the amount of 81,582 million euro as at 31 December 2023. That change mainly reflects the decrease in “Financial liabilities measured at amortised cost” due to the repayment of TLTRO III operations during the year.

SECTION 2 - FINANCIAL ASSETS MEASURED AT FAIR VALUE THROUGH PROFIT OR LOSS CAPTION 20

2.1 Financial assets held for trading: breakdown

TOTAL (A+B)	**14,948**	**26,337**	**154**	**11,546**	**26,487**	**130**

The total amount of the Financial assets held for trading as at 31 December 2024 of 41,439 million euro (38,163 million euro as at 31 December 2023) consisted of 41,401 million euro for the "Banking Group" and 38 million euro for the "Insurance Companies"; as at 31 December 2023 these amounts were 38,136 million euro and 27 million euro respectively.

Structured securities as at 31 December 2024 consist of 19 million euro of debt securities convertible into shares and 16 million euro of fixed-rate debt securities indexed to inflation, as an additional component.
Other debt securities are made up of the securities connected with securitisations for a total amount of 1,017 million euro (962 million euro Level 2 and 55 million euro Level 3), of which 832 million euro is senior, 177 million euro is mezzanine and 8 million euro is junior.

Equity instruments as at 31 December 2024 include investments correlated with financial trading derivatives on equity instruments and stock indices.

As the gross positive fair value of the derivative instruments implemented with the legal clearing agent LCH Ltd. meets the requirements set out for offsetting between gross positive and negative balances pursuant to IAS 32, paragraph 42, it was subject to offsetting, with recognition of the net fair value under Financial liabilities held for trading and Financial assets held for trading, respectively.

With regard to the Banking Group, the quotas of UCI are mainly attributable to the Parent Company and in terms of composition they relate, in order of significance, to private equity funds, real estate funds, private debt funds, infrastructure funds, hedge funds, and venture capital funds. The caption also includes 196 million euro relating to interests held by the bank in the Atlante Fund and in the Italian Recovery Fund (formerly Atlante Fund II), as alternative investment funds to support Italian banks in their recapitalisation transactions and in the management of the bad loans in the sector.
With regard to the insurance undertakings, on the other hand, the quotas of UCI are attributable to Intesa Sanpaolo Assicurazioni and Fideuram Vita and in terms of composition they mainly relate to bond, equity and flexible funds.

In addition, loans include credit exposures classified among financial assets mandatorily measured at fair value as they failed the test on the contractual characteristics of cash flows (SPPI Test) required by IFRS 9.

Loans included in this caption, as illustrated in Part A - Accounting policies, refer to portions of syndicated loans underwritten and destined to be subsequently sold.

Structured securities as at 31 December 2024 consist entirely of fixed-rate debt securities indexed to inflation, as an additional component.

Other debt securities include the securities connected with securitisations for a total amount of 2,203 million euro (entirely Level 2), of which 2,152 million euro is senior and 51 million euro is mezzanine.

Financial assets measured at fair value through other comprehensive income (caption 2. Equities – Level 3) include the stakes in the capital of the Bank of Italy for an amount of 375 million euro. In this regard, lacking recent direct transactions on the stakes, the method based on the discounting of future dividends deriving from the investment (DDM – “Dividend Discount Model”) was used, which confirmed the carrying value. The use of that method also resulted in the classification at Level 3 of the fair value hierarchy, instead of Level 2 as in the 2023 Financial Statements.

The book value of equity instruments deriving from the recovery of impaired financial assets amounted to 11 million euro.

2. Debt securities	2,308	-	-	2,120	143	22	1,645	-	-	1,569	20	18
2.1 Structured	-	-	-	-	-	-	-	-	-	-	-	-
2.2 Other	2,308	-	-	2,120	143	22	1,645	-	-	1,569	20	18
TOTAL	**38,401**	**59**	**-**	**2,120**	**27,730**	**8,585**	**32,807**	**92**	**-**	**1,569**	**24,269**	**7,065**

The total amount of the Financial assets measured at amortised cost – Due from banks - relates entirely to the Banking Group.
The sub-caption "Other loans - Other" includes operating loans, i.e. operations connected to the provision of financial activities and services with no credit facilities, for an amount of 129 million euro. Those exposures are essentially performing loans classified in Stage 1 and adjusted based on IFRS 9.

4.2 Financial assets measured at amortised cost: breakdown of loans to customers

(millions of euro)

Transaction type/Amount	31.12.2024						31.12.2023

1.7. Other loans	117,497	840	10	X	X	X	116,611	878	13	X	X	X
2. Debt securities	**66,860**	**29**	**-**	**41,975**	**13,994**	**8,103**	**64,067**	**41**	**-**	**37,053**	**12,966**	**11,274**
2.1. Structured securities	3,778	-	-	2,270	930	49	4,922	-	-	3,362	321	633
2.2. Other debt securities	63,082	29	-	39,705	13,064	8,054	59,145	41	-	33,691	12,645	10,641
Total	**475,269**	**4,780**	**193**	**41,975**	**271,239**	**159,157**	**481,019**	**4,813**	**219**	**37,053**	**272,114**	**167,031**

The total amount of the Financial assets measured at amortised cost – loans to customers as at 31 December 2024 of 480,242 million euro (486,051 million euro as at 31 December 2023) consisted of 472,543 million euro for the "Banking Group", 5 million euro for "Insurance Companies", and 7,694 million euro for "Other companies"; as at 31 December 2023 these amounts were 476,230 million euro, 5 million euro and 9,816 million euro respectively.
The sub-caption "Other loans" includes operating loans, i.e. operations connected to the provision of financial activities and services with no credit facilities, for an amount of 846 million euro. Those exposures are essentially performing loans classified in Stage 1 and adjusted based on IFRS 9.
The amount of Debt securities - Structured securities, under sub-caption 2.1, consists entirely of fixed-rate debt securities indexed to inflation, as an additional component.
Debt securities include the securities connected with securitisations for a total amount of approximately 7,720 million euro, of which 7,704 million euro is senior notes and 16 million euro mezzanine.

4.3 Financial assets measured at amortised cost: breakdown by borrower/issuer of loans to customers

For the approach used to represent the gross value and the total adjustments to impaired financial assets, see the illustration provided in Part A – Accounting policies.

On 16 December 2022, the EBA repealed the Guidelines on reporting and disclosure of exposures subject to measures applied in response to the COVID-19 crisis, contained in EBA/GL/2020/07, with effect from 1 January 2023, following the change in the scenario related to the pandemic. However, the Bank of Italy, in the communication dated 14 March 2023, requested that certain financial statement disclosures be maintained on loans subject to public guarantees, in free format at the bottom of this table.

In this regard, it should be noted that the gross value of the loans subject to public guarantees issued in response to the COVID-19 situation as at 31 December 2024 amounted to 15,416 million euro, of which 12,361 million euro in stage 1, 2,076 million euro in stage 2, and 979 million euro in stage 3.
The total adjustments amounted to 415 million euro, of which 13 million euro related to stage 1, 33 million euro to stage 2, and 369 million euro to stage 3.

SECTION 5 - HEDGING DERIVATIVES – CAPTION 50

Concerning the objectives and the strategies underlying hedging transactions see the information provided in Part E – Information on risks and relative hedging policies, Section 2 – Market risks.

5.1 Hedging derivatives: breakdown by type of hedge and level

(millions of euro)

	Fair value 31.12.2024			Notional amount	Fair value 31.12.2023			Notional amount
	Level 1	Level 2	Level 3	31.12.2024	Level 1	Level 2	Level 3	31.12.2023
A. Financial derivatives								
1. Fair Value	-	6,352	-	302,837	-	6,960	-	209,858
2. Cash flows	-	153	-	18,385	-	46	-	2,690
3. Foreign investments	-	-	-	-	-	-	-	-
B. Credit derivatives								
1. Fair Value	-	-	-	-	-	-	-	-
2. Cash flows	-	-	-	-	-	-	-	-
Total	**-**	**6,505**	**-**	**321,222**	**-**	**7,006**	**-**	**212,548**

The total amount of the hedging derivatives as at 31 December 2024 of 6,505 million euro (7,006 million euro as at 31 December 2023) consisted of 6,469 million euro for the "Banking Group" and 36 million euro for the "Insurance Companies". As at 31 December 2023, these amounts were 6,980 million euro, 24 million euro and 2 million euro respectively.

With regard to the Banking Group, because the gross positive fair value of Hedging derivatives implemented with the legal clearing agent LCH Ltd. meets the requirements set out for offsetting between gross positive and negative balances pursuant to IAS 32, paragraph 42, it was subject to offsetting, with recognition of the net fair value under Financial liabilities held for trading.
The annual decrease in the fair value of the financial hedging derivatives was attributable to the reduction in interest rates in the final months of 2024.

5.2 Hedging derivatives: breakdown by hedged portfolio and type of hedge

(millions of euro)

Transactions / Type of hedge	Fair Value							Cash-flow		Foreign investm
	Specific						Generic	Specific	Generic	
	debt securities and interest rates	equities and stock indices	foreign exchange rates and gold	credit risk	commodities	other				
1. Financial assets measured at fair value through other comprehensive income	609	-	163	-	X	X	X	36	X	X
2. Financial assets measured at amortised cost	1,570	X	1	-	X	X	X	28	X	X
3. Portfolio	X	X	X	X	X	X	2,099	X	89	X
4. Other transactions	-	-	2	-	-	-	X	-	X	-
Total assets	**2,179**	**-**	**166**	**-**	**-**	**-**	**2,099**	**64**	**89**	**-**
1. Financial liabilities	471	X	125	-	-	-	X	-	X	X
2. Portfolio	X	X	X	X	X	X	1,312	X	-	X
Total liabilities	**471**	**-**	**125**	**-**	**-**	**-**	**1,312**	**-**	**-**	**-**
1. Forecast transactions	X	X	X	X	X	X	X	-	X	X
2. Financial assets and liabilities portfolio	X	X	X	X	X	X	-	X	-	-

The table indicates positive fair values of hedging derivatives, broken down in relation to asset or liability hedged and type of hedge.
Considering the values gross of netting in the financial statements, these continued to refer mainly to macro fair value hedges of loans disbursed, as well as micro fair value hedges of debt securities under assets.

SECTION 6 – FAIR VALUE CHANGE OF FINANCIAL ASSETS IN HEDGED PORTFOLIOS – CAPTION 60

6.1 Fair value change of hedged assets: breakdown by hedged portfolios

(millions of euro)

Fair value change of hedged assets / Amount	31.12.2024	31.12.2023
1. Positive fair value change	**1,357**	**16**
1.1 of specific portfolios:	1,315	16
a) financial assets measured at amortised cost	*1,315*	*16*
b) financial assets measured at fair value through other comprehensive income	-	-
1.2 overall	42	-
2. Negative fair value change	**-4,959**	**-5,711**
2.1 of specific portfolios:	-4,906	-5,666
a) financial assets measured at amortised cost	*-4,906*	*-5,666*
b) financial assets measured at fair value through other comprehensive income	-	-
2.2 overall	-53	-45
Total	**-3,602**	**-5,695**

The balance of the changes in value of assets subject to macrohedging against interest rate risk is recorded in this caption. For the application the Group took advantage of the option envisaged by IFRS 9 to continue to apply the provisions permitted by the IAS 39 carve out.

The lower negative balance compared to 31 December 2023 of the fair value change of financial assets in hedged portfolios from interest rate risk was due to the reduction in interest rates in the final months of 2024.

SECTION 7 – INVESTMENTS IN ASSOCIATES AND COMPANIES SUBJECT TO JOINT CONTROL – CAPTION 70

7.1 Investments in associates and companies subject to joint control: information on equity interests

(a) Type of relationship:
1 - majority of voting rights at Ordinary Shareholders' Meeting;
2 - dominant influence at Ordinary Shareholders' Meeting;
3 - agreements with other shareholders;
4 - company subject to significant influence;
5 - unitary management as defined in Art. 26.1 of "Legislative Decree 87/1992";
6 - unitary management as defined in Art. 26.2 of "Legislative Decree 87/1992";
7 - joint control;
8 - other relationship.

(b) Where different from the % portion, the availability of the votes in the Ordinary Shareholders' Meeting is indicated, distinguishing between the effective (*) and potential (**) voting rights, where applicable.

(c) Intesa Sanpaolo S.p.A. also holds 100% of the Participating Financial Instruments issued by Apside S.p.A.

(d) These are vehicles used for securitisation transactions within the Group. The put&call options are exercisable in the half year following the closing date of the securitisation.

(e) The different value between the actual share and the number of votes in the Shareholders' Meeting is linked to the presence of various categories of shares (A and B). Only category A shares (also held by Intesa Sanpaolo) grant rights to vote in the Shareholders' Meeting.

(f) Intesa Sanpaolo S.p.A. also holds 100% of the Participating Financial Instruments issued by Destination Gusto S.r.l.

(g) The different value between the actual share and the number of votes in the Shareholders' Meeting is linked to the presence of various categories of shares. The category of the shares held by managers does not attribute the right to vote in the Shareholders' Meeting, but only in the Special Meeting (pursuant to Art. 2766 of the Italian Civil Code).

(h) The interest is included under Companies subject to significant influence because, even though it represents a more complex situation than that typical of an ordinary non-controlling interest, the absence has been confirmed of the conditions for exercise of control envisaged by IFRS 10 on the basis of the corporate governance provisions in the articles of association/regulations.

(i) EIB Funds: the economic effects of the investments in equity and loans underlying the fund's operations will be borne in full by the EIB.

(j) The different value between the actual share and the number of votes in the Shareholders' Meeting is linked to the presence of a category of shares (B) lacking the right to vote in the Shareholders' Meeting.

The illustration of the criteria and the methods for the definition of the scope of consolidation and the reasons which determine that a company is subject to joint control or significant influence is contained in Part A – Accounting policies, to which reference should be made.

7.2 Individually material investments in associates and companies subject to joint control: book value, fair value and dividends received

The figures for these companies are updated to December 2024 for Intrum and Penghua; 30 September 2024 for Idea CCR II Comparto Crediti, Efesto and Mooney; 30 June 2024 for Back2Bonis, RSCT Fund, Fondo UTP Italia Comparto Crediti, Lendlease Msg Heartbeat, Retail & Leisure Fund and Neva First-FCC; and 31 December 2023 for Equiter.
For Mooney Group S.p.A., the figures shown above refer to 30 September 2024, even though the figures as at 31 December 2024 were used for the purposes of the Group's consolidated financial statements. The latter will be made public following approval by the company's Shareholders' Meeting.
It is specified that no figures are shown for the UTP Restructuring Corporate fund, as this is a newly-established fund which had not made its Report available at the date of this document.

(millions of euro)

As regards UTP Restructuring Corporate, the figures represent the value at cost because, as indicated above, it is a newly-established fund.

For investment funds classified under interests subject to significant influence, the "Comprehensive equity" is determined through a process of periodic valuation, and takes account of the changes in the NAV, adjusted, if necessary, according to the valuation policies applied by the Group.

7.4 Individually immaterial investments in associates and companies subject to joint control: financial information

(millions of euro)

	Book value of investments in associates and companies subject to joint control	Total assets	Total liabilities	Total revenues	Income (loss) after tax from continuing operations	Income (Loss) after tax from discontinued operations	Net income (loss) (1)	Other comprehensive income (net of tax) (2)	Consolidated comprehensive income (3) = (1) + (2)

D. Final amount	**3,036**	**2,501**
E. Total revaluations	**468**	**355**
F. Total impairment losses	**-507**	**-291**

Sub-caption B.1 Purchases primarily relates to the following purchases, relating to contributions of loan portfolios:
- Efesto for 194 million euro;
- UTP Restructuring Corporate for 137 million euro;
- Retail & Leisure S.p.A. for 126 million euro.

The sub-caption B.3 revaluations mainly includes the profits of companies carried at equity (including Penghua Fund Management Co. Ltd. for 47 million euro and Intrum Italy S.p.A. for 20 million euro).

The sub-caption B.4 Increases - Other changes mainly comprises the following transactions:
- reclassification from other portfolios of Idea CCR II Comparto Crediti for 235 million euro;
- a gain on the sale of Bancomat for 17 million euro.

The sub-caption C.2 Impairment losses mainly includes the impairment of the following equity investment:
- Intrum Italy S.p.A. for 54 million euro.

The sub-caption C.3 Write-downs mainly refers to the companies indicated below:
- Mooney Group S.p.A. for 31 million euro;
- Lendlease MSG Heartbeat for 80 million euro;
- Back2bonis for 16 million euro.

The sub-caption C.4 Decreases - other changes mainly comprises:
- the payment of dividends by Penghua Fund Management Co. Ltd totalling 30 million euro;
- the redemptions in cash of FI.NAV Sub-Fund A - Loans for 101 million euro, Efesto for 27 million euro and Fondo UTP Italia Comparto Crediti for 25 million euro;
- the reclassification of Bancomat to other portfolios for 32 million euro;
- the reclassification of Alpian S.A. to other portfolios for 31 million euro.

7.6 Significant evaluations and assumptions to establish the existence of joint control or significant influence

Entities are considered to be companies subject to joint control if control is contractually shared between the Group and one or more other parties, or where the decisions about the relevant activities require the unanimous consent from all parties sharing control.

Companies are considered subject to significant influence (associates) when the Group holds 20% or more of the voting rights (including “potential” voting rights) or if it – with a lower equity stake – has the power of participating in the determination of financial and management policies of the company based on specific juridical relations, such as the participation in voting syndicates. Certain companies in which the Group holds a stake exceeding 20% are not considered subject to significant influence since it solely has economic rights on a portion of the returns generated by the investment, but does not have access to management policies and may exercise governance rights limited to the safeguarding of its economic interests.

7.7 Commitments referred to investments in companies subject to joint control

As at 31 December 2024, there were commitments on capital referring to Mir Capital S.C.A. Sicar for a total of 35.5 million euro; to Mooney Group S.p.A. for a total of 10 million euro; and to Apside S.p.A. for a total of 14.4 million euro, relating to the subscription of equity instruments issued by the company.

7.8 Commitments referred to investments in companies subject to significant influence

As at 31 December 2024, the following commitments were outstanding: the commitment made by Intesa Sanpaolo Innovation Center S.p.A. and Neva SGR S.p.A. to pay the amounts for the call ups of the Neva First FCC Fund for a residual 21.2 million euro; a commitment to pay the amounts relating to any call ups made by the ECRA Private Debt Fund for 11.9 million euro; a commitment to pay the amounts relating to any call ups made by the Lendlease MSG Heartbeat Fund for 7.9 million euro; a commitment to pay the amounts relating to any call ups made by the Basket Eque Fund for 5 million euro; a commitment to subscribe equity instruments issued by the associate Destination Gusto S.r.l. for a maximum of 1.6 million euro; and lastly a residual commitment on Leonardo Technology S.r.l. of a modest amount.

7.9 Significant restrictions

There is nothing to report in terms of significant restrictions.

7.10 Other information

For most of the companies subject to joint control or significant influence, the timing regarding the availability of the financial statements at the end of the year is not compatible with the terms set for the closure of Intesa Sanpaolo's consolidated financial statements; on this point, for the application of the equity method, reference is made to the last accounting reports available that, in most cases, include the interim statement of the first 9 months for the listed associates or the last financial statements or half-yearly report available for the other associates. In any case, when the accounts of the associate or joint venture used in the application of the equity method refer to a date that is different from that of Intesa Sanpaolo's financial statements, adjustments are made to take into account the effects of operations or significant events which took place between that date and the reporting date of Intesa Sanpaolo's financial statements.

Impairment tests of investments in associates and companies subject to joint control

As required under the IAS/IFRS, investments in associates and companies subject to joint control are subjected to impairment testing to assess whether there is objective evidence to consider that the carrying value of the assets is not fully recoverable.
With reference to investments in associates and companies subject to joint control, the process of detection of any impairment involves verification of the presence of impairment indicators and the determination of any write-down. The impairment indicators are essentially divided into two categories: qualitative indicators, such as the generation of negative economic results or in any case a significant variance with respect to the targets budgeted or established in the multi-year plans disclosed to the market, the announcement/start-up of insolvency proceedings or restructuring plans, and the downgrading by more than two classes of the rating; quantitative indicators, represented by a reduction in fair value of over 30% below the carrying value or for a period of over 24 months, by market capitalisation lower than the company's net book value, in the case of securities listed on active markets or by a carrying value of the investment in the Parent Company's financial statements higher than the carrying value in the consolidated financial statements of the investee's net assets and goodwill or by distribution by the latter of a dividend that is higher than its total income. If impairment indicators are detected, the recoverable amount, represented by the higher of the fair value less costs to sell and the value in use, is calculated and if it proves lower than the carrying value, impairment is recognised. If, subsequently, the recoverable amount is higher than the new carrying amount and the reasons for the impairment no longer apply following an event subsequent to the recognition of the impairment, write-backs are recognised, through profit or loss, up to the amount of the adjustment previously recognised.
In particular, where impairment indicators were recorded with respect to investments in associates or companies subject to joint control, analyses were carried out based, as a priority, on market methodologies (direct or comparable transactions and market multiples) or alternatively on "fundamental" analyses mainly based on an estimate of the expected discounted cash flows or on the adjusted net asset value (ANAV).
The results of these assessments led to the need to recognise adjustments, mainly referring to the investment in Intrum Italy S.p.A. (54 million euro).

SECTION 8 – INSURANCE ASSETS – CAPTION 80

From 1 January 2023, insurance assets and liabilities have been recognised in the financial statements in accordance with IFRS 17. The figures as at 31 December 2024 are compared with the figures as at 31 December 2023.

This section includes the tables in line with the indications of IVASS, based on the updates to Regulation 7 of 13 July 2007, directly applicable also pursuant to Circular 262/2005, for the disclosure required by IFRS 17 for insurance contracts pertaining to consolidated insurance companies.

Specifically, details are provided of the asset caption 80 b) Insurance assets - reinsurance contracts held that are assets, 249 million euro as at 31 December 2024 (401 million euro as at 31 December 2023), and the liability caption 110 b) Insurance liabilities - reinsurance contracts held that are liabilities, 68 million euro as at 31 December 2024 (175 million euro as at 31 December 2023). The balance of reinsurance contracts held was a positive 181 million euro as at 31 December 2024 (226 million euro as at 31 December 2023).

Reconciliations are presented that show how the net carrying amounts of reinsurance contracts held changed during the period because of cash flows and income and expenses recognised in the statement(s) of financial performance. Specifically, the tables show:
- the changes in the carrying amount of the reinsurance contracts held broken down by basis of aggregation[171] and by measurement model (General Measurement Model - GMM and Premium Allocation Approach - PAA);
- the changes in the carrying amount of the reinsurance contracts held per measurement component (Present Value of Cash Flows, Adjustment for Non-Financial Risks and Contractual Service Margin), broken down by basis of aggregation;
- the changes in contractual service margin of the reinsurance contracts held allocated according to contracts outstanding at the time of transition to IFRS 17 broken down by basis of aggregation;
- measurement components of the reinsurance contracts held recognised during the year broken down by basis of aggregation;
- contractual service margin broken down by expected timing of recognition in the income statement.

For the methodological choices adopted by the Group, see Part A - Accounting Policies.

Below is a summary table of the changes reported in the section below, with the related reconciliation with the financial statement captions.

(millions of euro)

	31.12.2024	31.12.2023
80. INSURANCE ASSETS		
b) Reinsurance contracts held that are assets	**249**	**401**
of which 8.1 Changes in the carrying amount of the reinsurance contracts held – GMM – assets for remaining coverage and for incurred claims – Life Segment	*43*	*57*
of which 8.1 Changes in the carrying amount of the reinsurance contracts held – GMM – assets for remaining coverage and for incurred claims – Non-Life Segment	*12*	*6*
of which 8.2 Changes in the carrying amount of the reinsurance contracts held – PAA – assets for remaining coverage and for incurred claims – Non-Life Segment	*194*	*338*
110. INSURANCE LIABILITIES		
b) Reinsurance contracts held that are liabilities	**68**	**175**
of which 8.1 Changes in the carrying amount of the reinsurance contracts held – GMM – assets for remaining coverage and for incurred claims – Life Segment	*7*	*14*
of which 8.1 Changes in the carrying amount of the reinsurance contracts held – GMM – assets for remaining coverage and for incurred claims – Non-Life Segment	*3*	*3*
of which 8.2 Changes in the carrying amount of the reinsurance contracts held – PAA – assets for remaining coverage and for incurred claims – Non-Life Segment	*58*	*158*

[171] The bases of aggregation for the reinsurance contracts held consist of the Life Segment and the Non-Life Segment.

8.1 Changes in the carrying amount of the reinsurance contracts held – General Measurement Model (GMM) – assets for remaining coverage and for incurred claims – *Life Segment*

In accordance with the requirements of paragraph 97 of IFRS 17, the ISP Group has used the Premium Allocation Approach (PAA) for types of insurance contracts that have a duration of 12 months or less and for which the measurement of the liability using the PAA generates results in line with those obtained from the application of the General Measurement Model (GMM). In addition, no adjustment to reflect the time value of money and financial risk has been considered in the measurement of the liability, because the financing component is considered to be not significant. For the recognition of the acquisition costs, it was decided not to use the option provided for annual contracts in paragraph 59(a) of IFRS 17. These costs have been recognised on an accrual basis in accordance with paragraph B.125 of the Standard.

E. Measurement at cost	**1,429**	**2,319**	**-**	**-**	**115**	**-**	**3,863**

The table above shows the values of owned assets, as well as the rights of use acquired under leases.

As explained in Part A – Fair value of real estate and valuable art assets, in accordance with the rules on valuation frequencies, the properties classified as owner-occupied assets and the valuable art assets were valued during the scenario analyses, through external appraisals, entrusted to qualified and independent experts.

Sub-captions B.4 and C.4 respectively report the positive and negative changes in fair value relating to owner-occupied real estate (land and buildings) and valuable art assets, for which the Bank applies the revaluation model.

Sub-captions B.7 and C.7 relating to Other increases and Other decreases, respectively, refer mainly to renegotiations and early terminations during the year of leases (IFRS 16) and, only regarding decreases, to amortisation and depreciation recorded during the year on assets deriving from the acquisition of business lines of the former Venetian banks, covered using the allowance for risks and charges specifically allocated at the time.

Sub-caption E. Measurement at cost only contains property and equipment measured according to the revaluation model.

9.6 Of which - Property and equipment used in operations - Rights of use acquired under leases: annual changes

E. Fair value measurement	**-**	**-**

The table above shows the values of owned assets, as well as the rights of use acquired under leases.

Investment property, comprised of land and buildings, is measured at fair value, in compliance with IAS 40.
Sub-captions B.3 Positive fair value differences and C.3 Negative fair value differences reflect the recognition of the effects of the update of the appraisals for the investment properties. See Part A - Information on fair value - Fair value of real estate and valuable art assets for more information on the measurement criteria.

9.7 Of which - Investment property - Rights of use acquired under leases: annual changes

As at 31 December 2024, the amount for Investment property - Rights of use acquired under leases was immaterial.

9.9 Commitments to purchase property and equipment

Commitments to purchase property and equipment in existence as at 31 December 2024 amounted to approximately 2 million euro, mainly relating to efficiency improvement measures implemented on the systems installations in the Group's head office buildings.

SECTION 10 - INTANGIBLE ASSETS - CAPTION 100

10.1 Intangible assets: breakdown by type of asset

(millions of euro)

	31.12.2024		*Of which:*						31.12.2023	
			Banking group		*Insurance companies*		*Other companies*			
	Finite useful life	Indefinite useful life	*Finite useful life*	*Indefinite useful life*	*Finite useful life*	*Indefinite useful life*	*Finite useful life*	*Indefinite useful life*	Finite useful life	Indefinite useful life
A.1 Goodwill	**X**	**3,697**	***X***	***2,690***	***X***	***1,007***	***X***	**-**	**X**	**3,672**
A.1.1 Group	x	3,697	*x*	*2,690*	*x*	*1,007*	*x*	-	x	3,672
A.1.2 Minority interests	x	-	*x*	-	*x*	-	*x*	-	x	-
A.2 Other intangible assets	**4,281**	**1,882**	***4,102***	***1,882***	***170***	**-**	***9***	**-**	**3,970**	**1,882**
of which: software	3,680	-	*3,541*	-	*139*	-	-	-	3,307	-
A.2.1 Assets measured at cost	4,281	1,882	*4,102*	*1,882*	*170*	-	*9*	-	3,970	1,882
a) Internally generated intangible assets	2,399	-	*2,290*	-	*109*	-	-	-	2,308	-
b) Other assets	1,882	1,882	*1,812*	*1,882*	*61*	-	*9*	-	1,662	1,882
A.2.2 Assets measured at fair value	-	-	-	-	-	-	-	-	-	-
a) Internally generated intangible assets	-	-	-	-	-	-	-	-	-	-
b) Other assets	-	-	-	-	-	-	-	-	-	-
Total	**4,281**	**5,579**	***4,102***	***4,572***	***170***	***1,007***	***9***	**-**	**3,970**	**5,554**

As at 31 December 2024, the amount for software was 3,680 million euro, of which 2,399 million euro produced internally and 1,281 million euro purchased externally.

The allocation of goodwill between "Cash Generating Units" is reported in the following table.

(millions of euro)

CGUs/Goodwill	31.12.2024	31.12.2023
Banca dei Territori	-	-
IMI Corporate & Investment Banking	56	56

10.3 Other information

As at 31 December 2024, there were commitments relating to investments in intangible assets, primarily software, of approximately 73 million euro.

Information on intangible assets and goodwill

The application of IFRS 3 to the accounting of acquisitions may lead to the recognition of new intangible assets and goodwill. In the case of the Intesa Sanpaolo Group, the merger between Banca Intesa and Sanpaolo IMI and the subsequent acquisitions led to the recognition of significant amounts for intangible assets and goodwill.

With regard to movements of intangible assets and goodwill, in 2024 the Intesa Sanpaolo Group finalised the purchase of First Bank S.A., a Romanian commercial bank focused on services to SME and retail customers and, through Fideuram – Intesa Sanpaolo Private Banking, of Alpian S.A., a Swiss digital bank operating in private banking and financial advisory services, in which the Group already held a stake of 41.6%.

The Purchase Price Allocation (PPA) processes for those business combinations, definitively finalised in the 2024 Financial Statements, resulted in the recognition of a negative goodwill of 10 million euro, attributed to the positive components of the income statement for the acquisition of First Bank and goodwill of 28 million euro, allocated to the Private Banking CGU, referring to the acquisition of Alpian. For more details on those two operations, refer to Part G – Business combinations of these Notes to the consolidated financial statements.

The table below summarises the values of the intangible assets and goodwill recorded in the consolidated financial statements with the related changes during the period, subdivided by Cash Generating Unit (CGU), which represent the groups of assets subject to impairment testing on intangible assets in order to determine the recoverable amount.

(millions of euro)

(1) Foreign exchange differences on the goodwill attributable to Eurizon Capital SLJ and on the portion of amortisation of intangibles attributable to Reyl & Cie SA.

The intangible assets with finite useful lives recognised refer to customer relationships and relate to the valuation of insurance products (Value of Business Acquired) classified as investments, falling within the scope of application of IFRS 9, Assets Under Administration (AUA), Assets Under Management (AUM) and Core Deposits. For the intangible assets with a finite useful life, the amortisation for the year was recognised to the income statement (under “220. Net adjustments to/recoveries on intangible assets”) for a total of 54 million euro gross of the tax effect.

The brand name, an intangible asset related to marketing, was also measured. This asset is considered to have an indefinite life since it is expected to contribute for an indefinite period of time to the formation of income flows.

Based on IAS 36, both intangible assets with an indefinite useful life and goodwill are submitted to impairment testing on an annual basis to verify recoverability of their value. In addition, intangible assets with a finite useful life must be tested for impairment whenever there is evidence of impairment indicators. The recoverable amount consists of the higher of the fair value and the value in use, less costs to sell.
Lastly, it should be mentioned that IAS 36, for the purpose of calculating the value in use of intangibles subject to impairment testing, states that reference must be made to cash flows arising from intangible asset in its current condition (as at the impairment test date), with no distinction between cash flows arising from the asset initially recognised according to IFRS 3 and those relating to the asset outstanding at the impairment test date. This because it would be difficult, especially with regard to extraordinary transactions between businesses or changes in the asset following significant turnover in volumes, customers, contracts, etc., to separate cash flows relating to the original asset from others.
This concept can also be applied in impairment testing of goodwill to calculate the Value in use of the CGUs, for which the cash flows have to be considered with regard to all assets and liabilities of that CGU and not only the assets and liabilities for which goodwill was recognised on application of IFRS 3.
Pursuant to IAS 36, the recoverable amount consists of the higher of the fair value and the value in use, less costs to sell. As in previous financial statements, for impairment testing in the 2024 Financial Statements, to calculate the recoverable amount, the Value in use, which represents the present value of net future cash flows from the asset (or business) being valued, was used, because the fair value, represented by the stock market price of the Intesa Sanpaolo share, could theoretically in and of itself constitute sound evidence of the recoverability of the goodwill recognised, considering the Group's market capitalisation which, as at 31 December 2024, showed levels higher than its net book value, with P/BV and P/TBV multiples higher than 1. However, it is important to consider that the fair value, identified by the stock market price, is available only for the Intesa Sanpaolo Group as a whole, not by single CGU which, instead, is the level at which the test must be carried out pursuant to IAS 36. The stock market prices may also be impacted by factors extraneous to the performance of the business policies set by the Group, and are values that refer to the sale of minority shares which, thus, do not include a premium for control, over a short-term investment horizon, contrary to the logics underlying the impairment test. Vice versa, the value in use is based on a general approach, in which the value of an asset is the direct expression of the cash flows it is able to generate over the period of its use.
As a result, for the financial statements as at 31 December 2024, in line with the previous financial statements, the impairment test on goodwill was conducted by applying the DCF (Discounted Cash Flow) model, to which the Dividend Discounted Model (DDM) is added, as a check of the consistency of the results of using the DCF model. Both of these approaches were based on the individual estimates made internally for the 2025-2029 period, which for the year 2025, are based on the forecasts deriving from the budget figures, while the flows for the years 2026-2029 were estimated through inertial tracking of the flows for 2025, on the basis of internal forecasts relating to the macroeconomic scenario.
It is noted that the tests mentioned above did not concern the Banca dei Territori, International Banks, Bank of Alexandria or Pravex Bank CGUs in consideration of the absence, as of the date of the test, of goodwill allocated to those CGUs to be subject to impairment test.
These tests were also accompanied by an autonomous test, using an independent expert, of the fair value of the component of the brand name attributable to Banca dei Territori, the CGU to which the main portion of that intangible asset is allocated and which did not have any allocated goodwill as at 31 December 2024.
The results of the impairment test as at 31 December 2024 showed no need to recognise any goodwill impairment or adjustments to intangible assets with an indefinite life (brand name) with regard to any of the CGUs in the Intesa Sanpaolo Group.

Lastly, the methods, assumptions and results of the impairment test procedures for intangible assets and goodwill defined by management were approved by the Board of Directors prior to approval of the draft financial statements for 2024.

Impairment testing of intangibles

Insurance portfolio
With regard to the intangible assets related to insurance products falling within the scope of IFRS 9, on the other hand, these continue to be recognised and amortised according to the original amortisation schedule. Given that IAS 36 stipulates impairment testing must not be limited only to the cash flows deriving from the policies acquired, but should take account of all the cash flows linked to the assets of the specific CGU, and considering the immateriality of the contracts underlying the initial valuation of those intangible assets with respect to the total contracts in the Insurance CGU as a whole, it is confirmed that there were no signs of impairment of those intangible assets.
As at 31 December 2024, considering the share amortised during the year, amounting to 10 million euro, the total value of intangible assets related to insurance products falling within the scope of IFRS 9 amounted to 31 million euro and was fully allocated to the Insurance CGU.

Asset management and administration portfolio

The intangible asset recognised in Intesa Sanpaolo's financial statements is regarded as having a finite useful life. Accordingly, for the purposes of the 2024 Financial Statements, analyses were conducted on the main indicators of the value of this asset, which were also monitored throughout the year, mainly represented by the performance of assets. Those analyses regarded the component of the intangible assets linked to assets under administration (AUA) and under management (AUM), represented by the capacity of the relationships existing at the acquisition date to generate cash flows over the residual useful life of those relationships, recognised in the financial statements following the acquisitions that were carried out over time.

More specifically, this aspect concerns the asset management portfolios of the former Venetian banks, acquired in 2017, and of the Morval Group, acquired by Fideuram - Intesa Sanpaolo Private Banking in 2018. Subsequently, as part of the acquisition of the UBI Group, during 2020 intangible assets were measured linked to indirect customer deposits and, in particular, the intangible assets pertaining to assets under administration (AUA) and assets under management (AUM), whereas during 2021 the intangible assets relating to the assets under administration and assets under management of Reyl & Cie S.A., a Swiss private bank with an international presence, were recognised. Lastly, in 2022 new customer relationships related intangible assets were recognised in connection with the indirect customer deposits of Compagnie de Banque Privée Quilvest (CBPQ) and VUB Generali.

As stated above, IAS 36 provides that impairment testing must not be limited only to the cash flows deriving from the assets acquired, but should take account of all the cash flows linked to the assets of the specific CGU, also including the cash flows generated after initial measurement of the intangible assets. On this regard, it is noted that the volumes of assets underlying the measurement of the intangible assets recognised in the financial statements are negligible if compared with the total assets of the CGUs.

Accordingly, in the light of the above, it can be confirmed that there were no signs of impairment of the intangible assets recognised in the financial statements and pertaining to asset under management and asset under administration relationships.

As at 31 December 2024, taking account of the portion amortised in the meantime, the intangible asset linked to AUM totalled 500 million euro and was allocated to the Banca dei Territori CGU (159 million euro), to the Private Banking CGU (185 million euro), to the Asset Management CGU (88 million euro) and to the International Banks CGU (68 million euro). Likewise, the intangible asset linked to AUA, taking account of the component of amortisation recorded during the year, amounted to 29 million euro, of which 12 million euro was allocated to the Banca dei Territori CGU and 17 million euro to the Private Banking CGU.

The following table summarises the values of the intangible AuM and AuA, allocated to the Group's CGUs for the 'production' and 'distribution' components.

(millions of euro)

CGU	Financial statements 2023	Amortisation	Other changes (1)	Impairment losses	Financial statements 2024

(1) Foreign exchange differences on intangible assets attributable to REYL & Cie S.A.

Core Deposits

"Core Deposits" are "customer-related intangibles", generally recorded in business combinations between banks. The intangible value of core deposits stems from the future benefits implicit in on demand deposits, deriving from the stable and lower funding cost compared to market parameters. Basically, the acquirer may use funding for its lending and investment activities which pays less than the interbank market interest rate. The intangible asset consists of the valuation of this future margin, known as the "deposit premium", which represents an asset the value of which is correlated with the performance of market rates and the assets raised.

This intangible asset was recognised in 2022 as part of the acquisition of Compagnie de Banque Privée Quilvest (CBPQ) by Fideuram Bank Luxembourg, for a total amount of 30 million euro.

No impairment indicators were identified for the core deposits, considering the current interest rates, compared to those at the date of initial recognition of the intangible asset. Specifically, despite the reduction in official rates by the ECB during 2024, the interest rate on main refinancing operations (MRO) remained at a level higher than the rate recorded at the time the bank was acquired, which were used to determine the intangible asset.

Brand name

IFRS 3 considers the “brand name” a potential, marketing related intangible asset, which may be recorded in the Purchase Price Allocation (PPA) process.
For this purpose, please note that the term “brand” is used in accounting standards with an extensive meaning and not as a synonym of “logo” or “name”. It is considered a general marketing term which defines a set of complementary intangible assets (in addition to the name and the logo, also the competencies, consumer trust, service quality, etc.) which concur to form brand equity.
With reference to acquisition of the Sanpaolo IMI Group, it was decided to limit the analysis to just two brands: the corporate brand Sanpaolo IMI, intended as an “umbrella” brand to which the brands of the other network banks were also related, and the brand of the subsidiary Fideuram – Intesa Sanpaolo Private Banking (former Banca Fideuram), as an autonomous brand widely recognised on the market for the placement of financial products through a network of financial advisors. Both are considered intangibles with indefinite useful life, since they are deemed to contribute indefinitely to the formation of income flows. Market methods and flow-based methods (and, thus, based on fundamental analyses) were used in the valuation of the two brands. Value was determined as the average of the values obtained using the various methods.
The amount recorded in the 2024 Financial Statements came to 1,882 million euro, of which 1,507 million euro was allocated to the Banca dei Territori CGU and 375 million euro to the Private Banking CGU.
In general, the brand name is considered an intangible asset that has no independent cash flows and, thus, to be subject to impairment testing as part of the verification of the retention of goodwill for the various CGUs. For the purposes of this impairment test, with regard to the brand name allocated to the Banca dei Territori CGU, it was considered that this CGU did not have any goodwill allocated and, in line with that carried out for the previous financial statements, it was decided to conduct a specific, autonomous valuation of the specific intangible based on the fair value resulting from the dedicated appraisal commissioned from a third party expert.
Lacking specific transactions on comparable banking brand names, the fair value of the brand name allocated to the Banca dei Territori CGU was estimated using the following methods:

- Royalty Relief;
- the implicit value in estimating brands with comparable PPAs;
- the implicit value in the public estimates of brands provided by independent third parties (Brand Finance);
- Hirose.

The brand valuation criteria used by the expert, with the exception of the criterion of comparable PPAs, while remaining in line with the method used for previous valuations, took account of the Group’s ESG positioning. The analyses conducted were based on the ESG score from the info provider Refinitiv.

Royalty Relief Criterion

The Royalty Relief criterion determines the value of the brand from the present value of income deriving from the brand, estimated as the product of a royalty rate reconstructed on the basis of implicit rates in comparable PPAs and the value of net turnover (operating income, for banks).

Criterion of the implicit value in estimating brands with comparable PPAs

The criterion of the implicit value in estimating brands with comparable PPAs determines the value of the brand based on the “Fair value of the brand/Operating income” multiples recorded on PPA and their fundamental drivers.
The multiple, calculated in relation to net operating income, is taken from the fair value of the brands recognised on PPA of commercial banks from the Markables database.

Criterion of the implicit value in the public estimates of brands provided by independent third parties (Brand Finance)

Brand Finance is a UK company specialising in valuing brands. Each year, Brand Finance publishes the updated estimated value of the brands of the top 500 global banks.
The valuation of brands carried out by Brand Finance is consistent with the relief from royalties criterion, widely used in valuation to estimate the value of brands. According to this criterion, the value of the brand corresponds to the current value of royalty flows saved. The royalty rates are determined based on the trademark license agreements of comparable companies and applied to the specific bank brand based on the strength of the brand estimated and discounted at an opportunity cost of capital in line with the assigned brand rating.

Hirose Criterion

This criterion is based on the comparison of the profitability of the branded company (in this case, the Banca dei Territori CGU) and unbranded competitor companies. The income-based method adopted is attributable to the profit-split criterion.

To check the values resulting from the four methods, the brand value was also estimated based on the Residual Income Model criterion, which expresses the value of a bank based on its equity and current value of residual income, calculated as the difference between the net income and the product of the opportunity cost of capital and shareholders’ equity.

Based on the analyses conducted, all the methods used returned a value of the Intesa Sanpaolo brand for the Banca dei Territori CGU higher than the book value of that intangible asset, demonstrating the value of the Group’s brand and the resulting competitive advantage it continues to provide the Group in relation to its competitors.

Instead, the brand name allocated to the Private Banking CGU was subject to impairment testing as part of the activities regarding the verification of the recoverable amount of the goodwill allocated to that CGU.

Impairment testing of CGUs and goodwill

Definition of Cash Generating Units (CGUs)

As goodwill is an intangible asset that does not generate autonomous cash flows without the contribution of other company assets, in conducting the impairment test, IAS 36 requires that those intangible assets be preliminarily attributed to specific Cash Generating Units (CGU), representing organisational units that are relatively autonomous in terms of operations, capable of generating cash flows that are largely independent from those generated by other areas of operation, but interdependent within the organisational unit generating them. Only once the CGUs and the goodwill allocated to them have been defined can the values in use to be compared to the carrying amounts be calculated.
According to the provisions of IAS 36, the CGUs must be identified in a way that reflects the company's operating and management situation. Specifically, it is necessary to correlate the level at which the goodwill is tested with the level of internal reporting at which management controls the increases and decreases in value. Definition of the level at which the CGUs will be anchored closely depends on the organisational models adopted and on the managerial responsibilities governing the operating guidelines and monitoring activity.
For the ISP Group, the identification of the CGUs is influenced by the centralised organisational model adopted, which reflects the methods used to formulate company policies, plan revenue flows and monitor operating performance. This organisational model is not based on the legal entities through which the Group conducts its business, but rather on operating divisions, which constitute the level of analysis and management of the Group's performance. Therefore, based on the considerations made, and with the only exception of the subsidiaries Pravex Bank and Bank of Alexandria, pursuant to IAS 36 and considering the significance of the impairment test on goodwill, the CGUs were identified as the operating segments, as defined by IFRS 8:

- Banca dei Territori;
- IMI Corporate & Investment Banking;
- Insurance;
- Asset Management;
- Private Banking;
- International Banks.

This was done based on several specific drivers, in line with the provisions of IAS 36:

- management decisions are highly centralised at the level of the heads of the operational segments;
- strategies, identification of new products or services and commercial penetration initiatives are outlined and directed centrally for each operating division;
- planning processes and reporting systems are managed at the operational segment level;
- as a result of this centralisation, income flows are highly dependent on the policies set up at segment level, based on balanced development of the entire division and not of the individual operating areas or legal entities considered individually;
- specialised transversal areas are defined to provide support and develop products benefiting many subsidiaries;
- the management of financial risks is also highly centralised in order to maintain, also as a result of regulatory provisions, a balance between the capital allocation policies and the financial risks in development of the various business lines;
- the divisions operate in homogeneous markets or sectors in terms of economic characteristics and development level.

In line with the choices made in previous years, considering the difficult geopolitical and financial scenario that impacted and could still impact the cash flows of the Division in the future, the subsidiaries Pravex Bank and Bank of Alexandria were separated out of the International Banks Division and considered autonomous CGUs. In any event, the goodwill relating to those two companies was eliminated in 2008 and 2011, respectively. Therefore, the identification of the two subsidiaries as autonomous CGUs has no impact on the results of the impairment test.
Likewise, the CGUs Banca dei Territori and International Banks had no goodwill allocated as at 31 December 2024.
In addition to having no goodwill allocated, and considering the Group's confirmed intention to reduce its corporate presence in Russia, also in line with the regulator's expectations, the contribution of the Russian investee Joint-Stock Company Banca Intesa (Banca Intesa Russia) to the Group's prospective profitability was sterilised, in line with the related equity contribution, which is periodically eliminated on consolidation through a specific provision.

Book value of the CGUs

The book value of the CGUs must be determined in a manner consistent with the criterion used to estimate their recoverable amount. For a banking business, the cash flows generated by a CGU cannot be identified without considering the cash flows deriving from financial assets/liabilities, as these represent the core business. In other words, the recoverable amount of the CGUs is influenced by the aforementioned cash flows and therefore the CGUs' book value must include financial assets/liabilities in accordance with the scope of the recoverable amount estimate process.
Consequently, these assets and liabilities must be properly allocated to the associated CGUs. On this basis (so-called "equity side"), the book value of the Intesa Sanpaolo Group's CGUs may be determined in terms of contribution to consolidated shareholders' equity including the minority interest.
Accordingly, the carrying amount of the CGUs composed of companies belonging to a single operating division was determined by summing up the individual contributions to the balance sheet.
However, where the Parent Company or other Group companies contribute to multiple CGUs from a management standpoint, and this division is not represented in accounting information, management values must be used. In this specific case, the management driver was identified as each division's "regulatory capital", which represents the capital absorption necessary to handle the types of risk envisaged by the regulatory supervision rules.
The table below provides the book values of the CGUs and the goodwill and brand name allocations to each. The values, determined for impairment testing purposes, include the portion of goodwill attributable to minority interests (included in the last column with minority interests).

(millions of euro)

CGU	Values as at 31.12.2024			
	Book value	*of which goodwill Group share*	*of which brand name*	*of which minority interests*

Criteria for estimates of CGUs' value in use

The value in use of CGUs is determined by estimating the present value of future cash flows that may be expected to be generated by the CGUs. These cash flows are normally estimated by using the latest publicly available business plan or, in its absence, through the drawing up by management of an internal forecast plan.
The forecasting period for the analysis usually consists of a maximum of five years. The cash flow of the final year of the forecast is projected in perpetuity (through the use of perpetual return formulae, or, alternatively, temporary return formulae, if it is not realistic to expect the assets subject to measurement to generate positive cash flows over the long term), using an appropriate growth rate "g" for the purposes of the so-called "Terminal Value." The "g" rate is determined by assuming as growth factor the rate of increase in the gross domestic product of the countries in which the cash flows are generated.
Alternatively, the Terminal Value could be determined on the basis of a final sale or liquidation value.
For the determination of the value in use, the cash flows must be discounted at a rate that reflects the present valuations of the time value of money and the asset's specific risks. Specifically, the discount rates to be used must incorporate the present market values with reference to the risk-free component and the risk premium associated with the equity component observed over a sufficiently long time period to reflect different market conditions and economic cycles.
In addition, given the diverse risks of the respective operating areas, different Beta coefficients must be used for each CGU. All the resulting rates have been adjusted to take into account the "Country Risk".

Cash flow estimates

For determining the Value in Use of the CGUs, the first step in defining the forward-looking cash flows for the various business areas entails the forecasts regarding the macroeconomic scenario and sector. The reference economic is the one drawn up by the Intesa Sanpaolo Research Department, and is uncertain, influenced by significant political and macroeconomic factors. Trump's return to the presidency of the United States introduces new elements of instability, with possible protectionist policies and deregulation that will have global impacts, which are still difficult to quantify.
The assumption underlying the scenario drawn up by the Research Department is that the Trump administration will only partially implement its electoral agenda, whose consequences will, in any case, need time to develop: in the first half of 2025 the impacts will be transmitted to the rest of the world mainly through the channels of confidence (which could be negatively influenced by the risk of a trade war) and of the financial markets (marked by opposing forces, currently more positive than negative). Those effects could be partly offset by a more robust trend in US demand.
The scenario assumes global growth at the same levels of 2024 and inflation expected to decrease. The commodities markets remain exposed to geopolitical risks, while fiscal policies in advanced countries are demonstrating that they are insufficient to stabilise the level of public debt, which will keep growing in various countries, including Italy. It is assumed that the significant geopolitical factor (the conflicts in the Middle East and Ukraine) will not compromise the availability of fossil fuels and will not have a more negative impact - as compared to the current one - on the climate of confidence in Europe.
For the Eurozone, the forecasts of GDP growth were reduced over the entire horizon of the forecast. This revision not only reflects the negative consequences for investments of the political change in the United States, but also the worsening of the outlook for European manufacturing (structural decrease in energy-intensive segments, difficulties for auto manufacturers and increased exposure to Chinese competition). More specifically, in 2025 and in the next years, modest acceleration in economic growth on an average annual basis is expected. The strengthening of growth is linked to the recovery of private consumer spending, which should benefit from both the increase in real disposable income (already observed) and a decrease in the propensity to save (due to the drop in interest rates and the restoration of liquidity buffers following the inflationary crisis). GDP is expected to grow by 0.9% in 2025 and 1.2% in 2026. In the following years, accommodating financial conditions and the end of the phase of rebalancing in manufacturing should result in growth rates equal to or higher than those of 2026.
Average annual inflation fell to 2.4% in 2024, in line with forecasts. The decrease in inflation should continue in 2025, when the cooling off of prices will also reach the services sector. Inflation is expected to fall in line with the ECB target from mid-2025, save for adverse shocks in the energy sector.
In Italy, the average annual GDP growth is estimated at 0.5% in 2024, that is, two tenths less than the forecast one year ago. Nonetheless, the comparison has been changed due to the significant revision of national accounts carried out by ISTAT. Just as for the Eurozone, growth was seen exclusively in services. On the demand side, final domestic demand and net imports contributed in equal shares. Different from the rest of the Eurozone, fixed investments in construction once again provided a marginal positive contribution to the GDP growth, however, mainly due to carry over. Based on the official reporting, the

contribution of the National Recovery and Resilience Plan to the increase in demand was slight: according to that published by the Ministry of the Economy and Finance in its financial planning documents, it is unlikely that total expenditure will increase compared to 2023. Therefore, this widely missed the estimates proposed during the planning.
With inflation decreasing more rapidly than forecast, and several negative risks for real growth taking shape, during 2025 the decrease in ECB official rates is expected to be quicker and larger than previously expected.
The scenario incorporates a positive trend in the BTP-Bund spread for the two-year period 2024-25, linked to the decreasing trend in the deficit/GDP ratio. However, an expansion is expected over the medium/long-term due to the relatively unfavourable trend in public debt.

The banking scenario is showing initial signs of recovery in lending following a period of decline. During 2024, the criteria for granting loans and conditions improved, through the reduction in interest rates, in line with the continuing exit from monetary restriction. Despite the improvement in the credit offering and the reduction in interest rates, demand for loans by businesses continued to drop due to the greater use of self-financing options and the postponement of investments. Differently, loans to households showed constant improvement through the second half of 2024, with the downward trend associated with the tighter monetary policy stance of the two-year period 2022–2023 bottoming out and a progressive recovery in loan stock, albeit still at modest levels. The recovery was driven by a turnaround in demand for mortgage loans and continued growth in consumer credit. In relation to funding, bank deposits also started to grow again in 2024, though at a slower pace compared to the past.
The scenario forecasts that loans to businesses will stabilise in 2025, while the demand for mortgages from household should keep growing, and deposits should consolidate at modest rates of change.
The growth in mortgages, and, as a result, in total loans to households, is expected to continue also in the following years, at a moderate pace, slightly higher until 2026, and slightly slowing in the following year, due to the slight increase in official rates of the Eurosystem in 2027, incorporated into the baseline scenario, and to lesser growth in housing prices in the years up to 2029. From 2026, the possible dissipation of the most significant factors of uncertainty should result in the start of modest recovery in loans to businesses, whose trend is expected to continue at a slow pace, at an annual average of 1.5% over the time horizon of the forecast - 2026-29. Lastly, in asset management, the scenario forecasts a recovery in net inflows of investment funds and life insurance, also due to less competition with fixed-rate securities.
During 2024, bank deposits started growing once again, initially driven by those of non-financial companies. The process of reallocating savings to domestic government securities gradually decreased, and household deposits recorded a gradual recovery, with moderately positive annual changes in the second half, after 18 months of decreases. The sharp trend in bank bonds decelerated, which followed over a year of double digit growth. Nonetheless, the pace of bonds remained robust, contributing to supporting the increase in total customer deposits. Deposits are expected to normalise year-over-year in 2025, following the significant outflows in 2023 towards more remunerative bond instruments, and the recovery in 2024. Assuming that the reallocation of excess liquidity on current accounts has almost run its course, on the whole, deposits will undergo a consolidation phase, maintaining a modest growth rate of around 1%. In 2024 a turnaround was seen in the mark-down on on-demand deposits, which after the all-time high posted at the end of 2023 began falling, which is expected to continue at a faster pace and scope in 2025. Given the approach taken by official and monetary rates, the mark-down is expected to stabilise in 2026, to then moderately rise in 2027 and consolidate in the following years. By contrast, the mark-up on short-term lending rates showed little movement in 2024, after the drop witnessed in response to the tightening in monetary policy in 2022–2023. Only a slight increase was seen in the last of the year, as cuts in reference rates passed on quickly by one-year lending rates. The mark-up is expected to moderately recover in 2025, then substantially stabilise in 2026, to then reach a slightly lower level in the last three years of the forecast time horizon.

The table below illustrates the macroeconomic variables expected in the period 2025-2029, only for Italy, as no goodwill was recognised for the CGUs operating in foreign countries.

(values as a percentage)

Italy	2024	2025	2026	2027	2028	2029

Scenario produced in December 2024 by CFO-Research. Forecast data (estimates for 2024).

The various CGUs' expected cash flows were subject to impairment testing, taking account of the macroeconomic scenario described above, and were estimated by following a two-stage assessment process.
Specifically, with regard to the first forecast period, in line with the choices made for the previous Financial Statements, a timeframe of 5 years has been considered, i.e., the five-year period 2025-2029. For that period, with regard to 2025, the estimates are based on the budget forecasts, substantially in line with those approved by the Board of Directors' meeting of 4 February 2025. Conversely, the flows for the following years were estimated through inertial tracking of the flows for 2025, on the basis of internal forecasts relating to the macroeconomic scenario, without considering the effect of addition managerial initiatives.
The net income projected for the forecast years of the long-term plan has been adjusted, in accordance with IAS 36, to consider non-monetary components and the minority-interest share of net income and exclude the effects of any reorganisation and restructuring transactions or capital gains arising from future disposals of company assets. It also excludes the effects of any reorganisation and restructuring transactions and the capital gains on future sales of company assets. In addition, cash flows include those allocated to the various CGUs deriving from central corporate assets. In accordance with the equity-side approach mentioned above in relation to the determination of the carrying values of CGUs, the cash flows used for impairment testing include the flows correlated with financial assets and liabilities, given that these represent the company's core business.
Among various financial valuation techniques, such as that used for determining the value in use, the value of a company at the end of the flow forecast period, the so-called terminal value, is normally determined by infinite compounding, at an appropriate "g" rate, of the cash flow achievable "at full capacity". This rate, even if subject to time variations, may be assumed to be constant or decreasing (or increasing in rarer circumstances).
As an alternative to the terminal value estimation methodology, doctrine also envisages (i) the exit multiple approach and (ii) the approach based on an estimation of the liquidation value of the company. Specifically, with regard to approach (i) it should be mentioned that an exit multiple estimate has complex (and potentially subjective) elements, while approach (ii) is valid only for companies due to be wound up on termination of the forecasting period, and therefore not applicable with a view to a business as a going concern.
For the purposes of the Terminal Value, i.e. the second stage of valuation, the cash flow forecast for 2029, the last year of the analytical projections, was used as the cash flow achievable at full capacity.
In line with the impairment tests of the previous years, the "g" rate was determined as the average growth rate of Italy's nominal GDP, observed and forecast in the 2008-2029 period (it should be noted that, in consideration of the impairment made in the previous financial statements, no goodwill is allocated to the Banca dei Territori, International Banks, Bank of Alexandria and Pravex Bank CGUs; consequently, it is not necessary to calculate the "g" rate for the purpose of the goodwill test for the foreign countries where the Group operates). Nominal GDP is the sum of the real GDP growth rate and the inflation rate. Expected real GDP and inflation figures used to calculate the "g" rate were drawn from the forecasts prepared by the Intesa Sanpaolo Research Department described above. Each component has been calculated as the average for the period 2008-2029. The choice of the observation period for the growth rates, considering the current particular macroeconomic situation, is attributable to the trends in the real GDP of the last few years, which were often negative and mainly influenced by the various economic and financial crises that hit the global economies in the last two decades. As a result, the period 2008-2029 was deemed sufficiently wide to include, and thus mediate, both periods of harsh crisis, and a future period of return to a scenario of moderate economic growth, and thus, capable of expressing a long-term growth rate.
Furthermore, with a prudential approach, it was checked that the "g" rate was not higher than Italy's GDP growth rate in 2029 or, for each CGU, the growth rate of the last year of analytical forecasting.

Cash flow discounting rates

For the determination of the value in use, the cash flows must be discounted at a rate that reflects the present market valuations, the time value of money and the asset's specific risks.

In practice, the first characteristic (current market conditions) translates into the calculation of all parameters based on the latest available information as at the reference date of the estimate, so as to best take into account the current market assessments. The second characteristic (consistency between risks/flows and rates) must follow the specificity of flows used for impairment testing of the CGUs. This rate (in its various components) must therefore be decided by observing the specific nature of flows used to assess each CGU, in order to maintain coherence and consistency with the flows. Specifically, consistency becomes important with regard to inflation, country risk and other risk factors that, according to IAS 36, may be expressed in the flows or rate. It is important to point out that a characteristic common to all CGUs recording goodwill (and, in general, intangibles with an indefinite life) is the long-term perspective of flows used to estimate the CGU's value in use. In fact, by its very nature, goodwill has an indefinite useful life, and therefore future cash flows are normally infinitely projectable.

This long-term perspective should be reflected in all discounting rate benchmarks by means of the appropriate selection of each, in such a way that they express normalised conditions in the long term.

The discounting rate should normally include the cost of the various sources of funding of the asset to be assessed, in other words the equity cost and debt cost (i.e. WACC, weighted average capital cost).

However, in the case of a banking entity, it is estimated according to an equity-side approach, that is to say by considering only the cost of equity capital (Ke), in a manner consistent with the methods for determining cash flows, which, as stated above, include those deriving from financial assets and liabilities.

The cost of capital is determined using the Capital Asset Pricing Model (CAPM), as the sum of risk-free rate and a risk premium, in turn dependent on the specific risks implicit in the business activities.

The cost of capital is determined net of taxes, in order to ensure consistency with the discounted cash flows.

As the various CGUs of the Intesa Sanpaolo Group operate in different business segments and with different risk factors, the specific costs of capital of each CGU were identified. It should be noted that, since cash flows were determined in nominal terms, discounting rates were also determined in nominal terms, meaning that they incorporate inflation expectations.

Entering into the details of the various components that contribute to the determination of discounting rates, it may be remarked that:

- with regard to the choice of cash flow discounting rates, and in particular of the risk-free rate and Country Risk Premium (CRP), in view of the structure of interest rates in the current macroeconomic scenario, it was prudentially decided, in line with the previous financial statements, to confirm the approach that involves the use of differentiated discount rates for the discounting of cash flows expected over the explicit forecast horizon and for the terminal value cash flow:
  - concerning the risk-free component included in the cash flow discounting rate of the explicit forecast horizon (2025-2029), a decision was made to use the average monthly return (December 2024) of the 10-year German Government bonds (Bund);
  - concerning the risk-free component included in the cash flow discounting rate of the terminal value (cash flow projectable beyond the explicit forecast period), a decision was made to use the average annual return of 10-year German government bonds (Bund) forecast for 2029, which is the last year of flow forecast period, based on estimates from the Intesa Sanpaolo Research Department.

  In line with the above, also for the Country Risk Premium (CRP) a methodology was considered that envisages the use of differentiated values. In addition, it should be noted that there is no goodwill allocated to CGUs other than those (mainly) operating in Italy - the "country risk" essentially coincides with the "Italy risk". Therefore, in the methodological choices for the impairment test of goodwill for the purpose of the 2024 Financial Statements, the CRP was calculated as follows:
  - concerning the CRP included in the cash flow discounting rate of the explicit forecast horizon, the average BTP-Bund spread of December 2024 was considered;
  - concerning the CRP included in the cash flow discounting rate of the terminal value, the average annual BTP-Bund spread estimated for 2029 was considered, based on the medium-term forecast scenario mentioned previously;

  The dual discount rate approach is also consistent with the current market situation, which still features current rates that are lower than the prospective rates incorporated in the above-mentioned macroeconomic scenario. Specifically, Intesa Sanpaolo's forecasts on the future yields of Bunds and BTPs take into account the gradual reduction by the ECB of the stocks of government securities of EU countries in its portfolio, purchased as part of the Quantitative Easing programme initiated in 2015. In this regard, the ECB's new policy is expected to shift the rate curve to steeper inclines, more in line with the trends observed historically. The approach used is therefore based on principles of prudence, also considering the volatility of forecasts relating to the medium/long-term rate scenario;
- the equity risk premium – represented by the difference between stock market yield and the Return on Investment on risk-free securities determined in reference to a sufficiently wide time horizon – was calculated on the basis of historical data, given its higher degree of reliability and visibility and the complexity of formulating reliable forecasts of results in order to estimate the equity risk premium implicit in stock market quotations. Specifically, the geometric mean for the equity risk premium was used, recorded on the US market for the period 1928-2024, adjusted for the differential between the US inflation rate and the German inflation rate (the market used as the basis for risk-free calculation);
- the Beta coefficient, which measures the specific degree of risk of an individual company or business sector, was calculated by identifying a sample of companies, comparable in business terms, for each CGU, and with reference to this sample the average or median Beta figure used was that recorded on a monthly basis over a five-year period;

Summary of growth rates and discounting rates used

The following table presents a summary, for each CGU subject to impairment test, of the parameters relevant to determining value in use: weighted average 2025-2029 growth rates for the cash flows of the various CGUs, including the allocation of cash flows related to the central corporate assets, the "g" growth rates for terminal value purposes, and the various discounting rates and inflation rates.

RATES/PARAMETERS	Nominal growth rates for impairment test (2025-2029)	NOMINAL DISCOUNTING RATES				LONG-TERM "G" GROWTH RATES		INFLATION RATES	
CGU		2024 flows	2024 Terminal Value	2023 flows	2023 Terminal Value	2024	2023	2024	2023
CGU subject to impairment test									
IMI Corporate & Investment Banking	3.32%	10.17%	12.02%	10.44%	11.89%	1.97%	2.00%	1.88%	1.92%
Insurance	1.97%	9.76%	11.61%	10.12%	11.57%	1.97%	2.00%	1.88%	1.92%
Asset Management	2.06%	9.93%	11.79%	10.12%	11.58%	1.97%	2.00%	1.88%	1.92%
Private Banking	4.29%	9.30%	11.16%	9.80%	11.26%	1.97%	2.00%	1.88%	1.92%

Impairment testing results

The outcomes of the impairment test showed how the values in use of each of the CGUs to which goodwill was allocated as at 31 December 2024 were higher than the respective carrying amounts. Thus, it was not necessary to proceed to any impairment of the goodwill or brand names allocated to the CGUs.
In addition, it is specified that, for the sake of completeness of the analysis, the Group's total value in use was confirmed to be greater than the sum of the carrying amounts of the individual CGUs.

Verification of the results of impairment testing using an alternative calculation method

As the value of a company or a business line may also be determined by discounting the distributable cash flows, understood as the future cash flows estimated to be generated by the business area (the single CGUs) net of the share of income that must be retained in equity to meet the supervisory requirements, the recoverability of the book value of the goodwill allocated to the CGUs was verified also by discounting the aforementioned cash flows according to the excess capital version of the Dividend Discounted Model (DDM).
With reference to the supervisory requirements, a Common Equity Tier 1 ratio of 10.50% was used, as resulting from the Group Risk Appetite Framework. For the Insurance CGU, a Solvency Ratio of 170% was taken into account, as per the aforementioned RAF.
Thus, the distributable cash flows were obtained by integrating the expected cash flows determined as illustrated above, factoring in an increase in capital surplus in relation to the above-mentioned minimum limits of capital, or a decrease in the shares of income needed to cover the requirements deriving from the estimated growth trend in risk-weighted assets. These flows, estimated for each CGU, were discounted by applying the same discounting rates and growth rates "g" used in applying the Discounted Cash Flow (DCF) method.
The results of this method confirmed the results based on the calculation made using the DCF method.

Reconciliation of the results of the impairment test with the market valuation

The Intesa Sanpaolo share price rose significantly in 2024 (around +46%), slightly underperforming the Italian sector index (FTSE IT All-Shr Banks, around +53%) and outperforming the main benchmark index of Borsa Italiana (FTSE MIB Index, around +13%). The Intesa Sanpaolo share also outperformed the Stoxx 600 banks index, which rose by around 26% year-on-year.
Specifically, during the year, the share price grew steadily and robustly, showing a pace of growth, especially in the last quarter of the year, that led the stock market price to a value of 3.86 euro at the end of December 2024, compared to 2.64 euro at the end of 2023. In January 2025 the Intesa Sanpaolo stock appreciated further, with prices at the end of January of approximately 4.1 euro per share and a market capitalisation of approximately 75 billion euro (with a P/BV multiple of approximately 1.3x).
Valuations and reports by financial analysts produced during 2024 saw a significant upward revision of 12-month target prices, with the trend broadly in line with the rise in Intesa Sanpaolo's share price, recording an average value in the last part of the year and January 2025 of around 4.6 euro per share.
Analysts underline, among Intesa Sanpaolo's strengths, the solidity of the brand and highly qualified management esteemed by the market. Intesa Sanpaolo also has the ability to generate profitability among the highest in the sector, also benefiting from its diversified business model, with significant presence in the wealth management sector, and a strong equity position. It has also conducted a highly successful de-risking strategy in the last few years, which makes it possible to more calmly face possible deterioration of the macroeconomic scenario.

In any event, it bears observing that valuations expressed by financial analysts have different characteristics from the "fundamental" assessment represented by value in use. The following may be observed regarding those valuations:

- he projected income flows forecast by analysts extend to 2027 and are, at Group level, substantially in line with the estimates produced internally by the Group, while the forecasts used for the impairment test cover a five-year period extending to 2029;
- the cost of the capital used (in not particularly frequent cases where this parameter is explicitly stated) is often determined in overall terms at Group level; the cost of capital of Intesa Sanpaolo, used to discount the terminal value cash flows, is generally lower than the average value shown in the reports by the analysts. The latter tend to use discount rates implicit in stock market values which, being lower than the Value in Use, return higher cost of capital values;
- similarly to the observations made for the impairment test of the 2023 Financial Statements, from the methodological standpoint, multiples (in terms of P/E and P/PTBV) applied to current market prices or expected profitability for the coming years 2025 or 2026 were often used. These are thus methods that provide a fair value, rather than a long-term value in use.

It bears observing that the valuations expressed by the analysts were intended for financial investors and thus aimed to determine prices and values in the short term. These valuations represent the value potentially obtainable from sale on the market of limited amounts of securities, i.e. the disposal of a minority interest, and are therefore closely pegged to prices and to current market conditions.
The difference in the values from the analysts' estimates compared to the value of the Intesa Sanpaolo Group for the purposes of impairment testing, which reflect on a methodological difference between the fair value and the value in use, may be explained by the following factors:

- different unit of valuation: as stated, the fair value calculated by the analysts represents the price of a single share, different from the Value in Use, which measures the Bank's entire capital. However, there is a control premium between the two values, which is lacking in the former case, and which is generally valued within a range of 15% to 25%;
- different time horizon of reference considered by the market: the period covered by the estimates of the cash flows, as mentioned, has a considerable impact on the valuation of the Group; given the time horizon considered by analysts, which in general covers a period of 3 years, the average cost of capital of analysts, higher on average than the cost of capital calculated internally, and deducting the control premium, the Group's total recoverable amount would be, in terms of value per share, in line with that given by analysts as the target price;
- different value of the cost of capital: the analysts' estimates, deriving from stock market prices, factor in elements external to the Group's ability to generate profits for the purpose of remunerating its shareholders.

Finally, it is believed that impairment tests must be performed with the awareness of the fact that the current economic situation contains elements of uncertainty which could impact expected short- and medium-term cash flows from operating activities, without however affecting the Intesa Sanpaolo Group's primary sources of income and competitive edges, as has also been demonstrated by the results of the past few years in which forecast targets have consistently been achieved, and the income dynamics for 2024.
Accordingly, in developing the valuation model, the following precautions were adopted:

- the forecast flows include the financial effects of the services rendered by the Corporate Centre. Moreover, the final figures of the last few years were substantially in line with or significantly higher than the forecast figures;
- the cost of capital was determined analytically, based on market parameters for each CGU, depending on the different risk of the respective businesses, also considering analytically the various risk factors.
- the "g" growth rate, for the purpose of terminal value for Italy, which represents the area where goodwill is still recognised, was near zero in real terms.

Lastly, the parameters and information used to test the recoverability of intangible assets with indefinite useful life are significantly influenced by the macroeconomic environment and financial market trends, which might undergo changes that cannot be predicted at the present time. If the macroeconomic scenario were to deteriorate in the future with respect to the assumptions, this could lead to impacts on the main assumptions adopted for the determination of the cash flows of the various CGU, which could obviously yield results in the financial statements of the coming years different from those outlined in the Financial Statements as at 31 December 2024. In this regard, it is important to emphasise that the assumptions and hypotheses adopted for the purposes of this impairment test were formulated in a context still characterised by uncertainty, also in view of the current global geopolitical context, which could affect consumers and businesses to a greater extent than currently incorporated in the estimates, slowing down the recovery of economic activity. Nonetheless, it must be noted that the business units that still have significant amounts of goodwill (Insurance, Asset Management and Private Banking) have always had, and are expected also in the future to have profitability that largely justifies the values of goodwill recognised.

Sensitivity analyses
Since the value in use is determined by using estimates and assumptions that may contain some level of uncertainty, sensitivity analyses to verify the sensitivity of the results obtained to changes in the parameters and in the underlying hypotheses, referring to the DCF method, were carried out, as required by the IAS/IFRS.
For CGUs that present residual values of goodwill, the impact on the value in use of an increase of up to 50 basis points in discount rates or a decrease of up to 50 basis points in the growth rate for terminal value purposes was verified. No impairment would emerge in any of the CGUs tested, even in the event of an increase in discounting rates of 50 basis points or a decrease in the "g" rate of 50 basis points.

The table below illustrates the sensitivity (in percentage terms) of the Value in Use of the CGUs that present goodwill to changes in the "g" rate or discount rate of -/+10 basis points, as well as a reduction in the cash flows used for terminal value purposes of 10%.

Sensitivity	CHANGE IN VALUE IN USE		
CGU	Sensitivity to growth rate "g" - 10 bps	Sensitivity to discount rate + 10 bps	Sensitivity to Terminal value cash flows - 10%
IMI Corporate & Investment Banking	-0.64%	-0.90%	-8.80%
Insurance	-0.68%	-0.94%	-6.05%
Asset Management	-0.67%	-0.94%	-6.09%
Private Banking	-0.75%	-1.02%	-6.39%

Based on the table above, changes in the Ke (increasing) or the "g" (decreasing) values within 10 basis points would lead to a general decrease in the values in use of around 1%. Regarding the cash flow considered for the purpose of the terminal value, a 10% decrease of the same would lead to reductions in the values in use ranging from 6-8%. In any event, no issues of impairment would arise for any CGU at that amount of sensitivity.

Still considering stress testing, analyses were performed with the aim of determining the limits for the main inputs, beyond which impairment testing of the CGUs would require the recognition of impairment. The following table presents the "g" growth rates and discounting rates for each CGU that would result in a Value in Use in line with its carrying amounts, assuming equal cash flows to be discounted.

Sensitivity CGU	"g" growth rate	Difference compared to the "g" rate used	TV discounting rate	Difference compared to the Ke discounting rate used
IMI Corporate & Investment Banking	0.62%	-135 bps	13.06%	104 bps
Insurance	-4.99%	-696 bps	16.61%	500 bps
Asset Management	-34.63%	-3660 bps	34.00%	2221 bps
Private Banking	n.s.	n.s.	n.s.	n.s.

(1) For the Private Banking CGU, the discounted cash flows over the explicit forecast horizon are already substantially higher than the carrying amount. As a result, the sensitivity analysis on the parameters that change the discounted value of the terminal value, with the same cash flows, is not applicable in this case, because there would never be a reduction in the terminal value sufficient to bring the CGU's Value in Use back to values close to the carrying amount.

As shown by the data contained in the table, the Values in Use of the CGUs would reduce until the book values, with consequent impairment problems, only in correspondence with the significant worsening of the discounting rates (Ke) and the "g" growth rates.

Finally, within the framework of analysis regarding possible changes in the cash flows of the CGUs on the basis of alternative scenarios to those used for the purposes of this impairment test, account was taken of the impact on forward-looking cash flows of the application of an alternative macroeconomic scenario, consistent with the "adverse" scenario incorporated into the Expected Credit Loss models used to measure loans pursuant to IFRS 9. In that adverse scenario, economic growth is penalised by the start of trade wars by the United States and by supply-side shocks due to the escalation of the conflict in the Middle East. A more aggressive implementation of Trump's agenda is also forecast, with an increase in trade barriers, a decrease in confidence in Europe and Asia and restrictions on immigration with impacts on the workforce and a higher public deficit. The scenario also forecasts negative effects on the stock and real estate markets, while in Europe, France is expected to be downgraded by one notch by all ratings agencies by the end of the forecast time horizon. The above scenario translates into a reduction in cash flows at Group level of 7% on average over the forecast horizon, with impacts substantially distributed across all CGUs. In any event, the reduction in cash flows over the forecast horizon of 2025-2029 based on that scenario would not result in any impairment of the Group's CGUs.

SECTION 11 – TAX ASSETS AND LIABILITIES – CAPTION 110 OF ASSETS AND CAPTION 60 OF LIABILITIES

11.1 Deferred tax assets: breakdown

Deferred tax assets, recognised with regard to deductible temporary differences, totalled 11,266 million euro, of which 9,936 million euro refers to taxes recorded through profit or loss and 1,330 million euro to taxes with a balancing entry under shareholders' equity. The first of these amounts refers to losses brought forward, to the portion of tax benefits not offset in relation to adjustments to loans and provisions for risks and charges deductible in future years, and to the benefit from realignment of the taxable value of goodwill, trademarks and other intangible assets pursuant to Article 15, par. 10, 10-bis and 10-ter of Decree Law 185/2008. Deferred tax assets recorded as a balancing entry under shareholders' equity almost exclusively refer to tax on negative valuation reserves for financial assets measured at fair value through other comprehensive income, to the cash flow hedges and to recognition of actuarial losses on personnel funds.

11.2 Deferred tax liabilities: breakdown

Deferred tax liabilities amounted to 1,714 million euro and the balancing entry is in the income statement (1,375 million euro) as well as in shareholders' equity (339 million euro).

11.3 Changes in deferred tax assets (through profit or loss)

Among Increases, sub-caption a) related to previous years is made up of 206 million euro for the recognition of the deferred tax assets on a portion of the tax losses carried forward pertaining to the incorporated companies UBI Banca and Provis. In addition to the above-mentioned deferred tax assets posted in the fourth quarter, 130 million euro was posted in the income statement as at 30 June, against the payment (non-tax deductible) of the same amount to the National Resolution Fund, posted under Other income/expenses.

Again, among Increases, sub-caption d) other refers mainly to the recognition of convertible deferred tax assets on the portion of the tax loss that is attributable to the reversal of accumulated adjustments to loans and goodwill and the deductible temporary differences arising during the year, connected to provisions for risks and charges, in addition to 293 million euro referring to the recognition of deferred tax assets on the intangibles of ISP Life (incorporated into Intesa Sanpaolo Vita on 1 December 2023, with the latter renamed to Intesa Sanpaolo Assicurazioni S.p.A. on 1 December 2024).

Other increases mainly consist of the write-off of netting against deferred tax liabilities, applied as at 31 December 2023.

Among Decreases, sub-caption 3.1 a) reversals mainly refer to the elimination of deferred tax assets pursuant to Law no. 214/2011 and deferred tax assets previously recorded in relation to provisions for risks and charges, as a result of their use during the year.
Among Other decreases, sub-caption a) changes into tax credits pursuant to Law no. 214/2011 refers to the information set out in Part C, table 21.1.
Again, among Other decreases, sub-caption b) other refers to the netting against deferred tax liabilities applied during the year.

4. Final amount	**339**	***285***	***54***	**-**	**287**

Among Increases, sub-caption c) other refers to taxable temporary differences which arose during the year in relation to the measurement of financial assets measured at fair value through other comprehensive income and the fair value measurement of property and equipment.
Other increases mainly consist of the write-off of netting against deferred tax assets applied as at 31 December 2023.

Among Decreases, sub-caption a) reversals refers to the discharge of deferred tax liabilities previously recorded in relation to the valuation of financial assets measured at fair value through other comprehensive income and cash flow hedging derivatives.
Caption 3.3 Other decreases mainly relates to the netting against deferred tax assets through profit or loss for the year.

As indicated in the accounting policies, with regard to current and deferred taxation, no provision is made in the financial statements for reserves subject to latent taxation only in the event of distribution, since the size of the available reserves which have already been taxed leads to the belief that the Bank will not undertake any transactions which may cause taxation of those untaxed reserves.

Probability test on deferred taxation

IAS 12 requires for deferred tax assets and liabilities to be recognised according to the following criteria:
- a deferred tax liability (or DTL) must be recognised, as a general rule, for all taxable temporary differences;
- a deferred tax asset (or DTA) must be recognised for all deductible temporary differences to the extent that it is probable that taxable income will be earned that can offset the deductible temporary differences. Deferred tax assets not recognised in the past - inasmuch as the conditions for their recognition were not met - are recognised during the year in which those conditions arise.

Deferred tax assets are then divided into “eligible” deferred tax assets and “ineligible” deferred tax assets.
For the former, as illustrated in greater detail hereinafter, the regulations set out a specific mechanism for conversion into tax credits which legitimises, in and of itself, their recognition in the financial statements.
Instead, the book value of “ineligible” deferred tax assets must be tested to determine whether it is likely that taxable income will be earned in the future that will ensure their recovery (probability test).
“Eligible” deferred tax assets amounted to 4,205 million euro, while “ineligible” deferred tax assets subjected to the probability test amounted to 7,061 million euro (joined by 1,714 million euro in deferred tax liabilities).
The probability test on the “ineligible” deferred tax assets carried in the 2024 Financial Statements separately regarded, due to the different conditions of use of the underlying temporary differences and similarly to the previous years, the following cases:
- IRES deferred tax assets recognised in relation to previous tax losses. In particular, these were deferred tax assets relating to the tax losses of Intesa Sanpaolo and the merged companies (mainly generated by the former Venetian banks and by the companies in the former UBI Group);
- other deferred tax assets triggered by deductible temporary differences for IRES tax purposes, arising at the Group companies included in the consolidated financial statements (“Other deferred tax assets - IRES”);
- deferred tax assets triggered by deductible temporary differences for IRAP tax purposes (“Deferred tax assets - IRAP”).

In the 2024 Financial Statements, deferred tax assets relating to tax losses carried forward of the parent company Intesa Sanpaolo were recognised for a total of 2,982[172] million euro, of which 2,258 million euro equal to the base IRES tax rate of 24% and 724 million euro to the additional IRES tax rate of 3.5%. Of those deferred tax assets, 336 million euro was recognised for the first time in 2024 for tax losses carried forward pertaining to the former UBI Banca (310 million euro, of which 152 million euro at 24% and 158 million euro at 3.5%; "New UBI DTAs") and of the former Intesa Sanpaolo Provis (26 million euro at 3.5%; "New Provis DTAs" and, with the "New UBI DTAs", the "New DTAs"; see below).
The probability test on the deferred tax assets relating to the tax losses was conducted considering the individual position of Intesa Sanpaolo.
The possibility of use on an exclusively individual basis by Intesa Sanpaolo derives: (i) for the losses of the former Venetian banks, from the regulations that set out the transfer (Art. 7, paragraph 3 of Decree Law no. 99/2017, converted with amendments by Law no. 121/2017, and Art. 15 of Decree Law no. 18/2016) at the time of the purchase of the business lines of Banca Popolare di Vicenza and Veneto Banca (in 2017) and the subsequent merger of their former subsidiaries Banca Nuova and Banca Apulia (effective on 1 January 2018 and 1 January 2019, respectively); (ii) for the losses of UBI Banca and the other companies of the former UBI Group incorporated into Intesa Sanpaolo, from the incorporation of those companies into Intesa Sanpaolo during 2021 and 2022; and (iii) for the losses of Intesa Sanpaolo Provis, from the incorporation of those companies into Intesa Sanpaolo during 2023.
For the purposes of the probability test, the income prospects of Intesa Sanpaolo were estimated, in line with the choices made for the 2023 Financial Statements, over a time frame of 5 financial years, i.e. the five-year period 2025-2029. For that period, the year 2025 represents the annual budget for the last year of the 2022-2025 Business Plan. The years from 2026 to 2029 represent an "inertial" overhang of the new scenario, starting with the 2025 Budget, without considering other managerial initiatives. For the years following 2029, it was prudentially assumed that the gross income would remain steady, equal to that estimated for 2029 (thus without considering the effect of the growth rate "g"). Based on the analyses conducted, total absorption of the deferred tax assets in question – and also of the "New DTAs" – could be achieved over a time horizon deemed compatible with the "probability" of recovery required by IAS 12.
In order to achieve a sufficient degree of confidence regarding the recognition of "New DTAs" relating to losses carried forward, the following was also assumed: (i) a baseline scenario with a sensitivity analysis based on a 10% reduction in the tax bases for 2030 and subsequent years, not covered by analytical forecasting and (ii) a scenario consistent with the "adverse" scenario incorporated into the Expected Credit Loss models used for the valuation of loans pursuant to IFRS 9, which essentially provides for the lowest GDP growth forecasts among those reported in the Consensus Economics survey for the main advanced countries (with similar effects on consumption and fixed investments), a general shock also for stock market indices and real estate prices, as well as the more aggressive assumptions on the implementation of Trump's agenda (sharp increase in trade barriers by the United States, decrease in the workforce due to stricter restrictions on immigration, and increase in the public debt in the United States by around one percentage point on the baseline scenario).
Based on the analyses conducted, also with respect to such downsize scenarios, total absorption of the deferred tax assets in question – and also of the "New DTAs" recognised in the 2024 Financial Statements – could be achieved over a time horizon deemed compatible with the "probability" of recovery required by IAS 12.
Specifically with regard to the "New UBI DTAs" recognised in 2024 (as for the general issue of the UBI DTAs, for more details, see the Consolidated Financial Statements as at 31 December 2023 - Notes to the Consolidated Financial Statements – Part B – Information on the Consolidated Balance Sheet – Assets – Section 11 Deferred tax assets and liabilities), the following events occurred during the year covered.
In the consolidated income statement as at 30 June 2024 the amount of 130 million euro paid to the National Resolution Fund (NRF) was recorded as Profit Sharing as part of the settlement agreement (the "Agreement") entered into by Intesa Sanpaolo S.p.A. (as the incorporating entity of UBI Banca) and the Bank of Italy (as the managing entity of the National Resolution Fund). The purpose of the Agreement is to settle the interpretation differences arising between the parties on the literal interpretation of the Share Purchase Agreement signed on 18 January 2017 between UBI Banca and the NRF, concerning the sale by the NRF to UBI Banca of the entire share capital of Nuova Banca delle Marche S.p.A., Nuova Banca dell'Etruria e del Lazio S.p.A. and Nuova Cassa di Risparmio di Chieti S.p.A. At the time of recognising that charge, the conditions were met to recognise, after verifying sufficient tax capacity, a corresponding share of the residual DTAs, equal to the related charge paid to the NRF, and thus, 130 million euro. Therefore, this had no effect on the net income.
In the financial statements as at 31 December 2024, the residual amount (180 million euro) of the remaining DTAs was recognised, based on a probability test conducted analytically, using accounting data and updated forecasts as of the reporting date. This means that, as at 31 December 2024, deferred tax assets were recognised in the financial statements of the merging company Intesa Sanpaolo corresponding to the entire amount of the tax losses carried forward pertaining to the merged company UBI Banca.
With regard to the New Provis DTAs, Intesa Sanpaolo's right to full use of the tax losses of the merged company was confirmed on 14 August 2024 by the Italian Revenue Agency in response to a specific ruling request filed by the Parent Company. On that basis, the conditions were met to recognise the New Provis DTAs in the financial statements as at 31 December 2024, subjecting them to the relevant probability test.
Note that, as at 31 December 2024 the previous years' tax losses of the Luxembourg subsidiary Intesa Sanpaolo Holding International (ISPHI) were fully reabsorbed and, as a result, the deferred tax assets recognised in the previous years' financial statements were fully absorbed (6 million euro remaining as at 31 December 2023).
In conducting the probability test for the Other deferred tax assets - IRES and the Deferred tax assets - IRAP carried in the Group's Financial Statements as at 31 December 2024, deferred tax assets arising from temporary deductible differences associated with impairment losses on loans (other than those deriving from the first-time adoption of the IFRS 9; see below),

[172] That amount is already net of the benefit deriving from the transformation into tax credits of a total of 220 million euro (of which 110 million euro referring to 2020 and 110 million euro referring to 2021) in deferred tax assets relating to tax losses, due to the sales, carried out by 31 December 2020 and 31 December 2021, respectively, of non-performing loans pursuant to Art. 55 of Decree Law no. 18/2020 ("Cura Italia" Decree), and Art 19 of Decree Law no. 73/2021 ("Sostegni bis" Decree).

as well as - if recognised within 2014 – from goodwill and other intangible assets with indefinite useful lives[173] ("eligible deferred tax assets" and "eligible temporary differences"), were considered separately from others. In this regard, it bears noting that, effective from the tax period ended 31 December 2011, deferred tax assets (for corporate income tax or IRES) recognised to account for tax losses due to the deferred deduction of "eligible" temporary differences are eligible for conversion into tax credits (article 2, paragraph 56-bis, of Decree Law 225 of 29 December 2010, introduced by article 9 of Decree Law 201 of 6 December 2011). Effective from the 2013 tax period, a similar conversion is allowed where the regional business tax (IRAP) return shows a negative net production value also in relation to IRAP deferred tax assets that pertain to "eligible" temporary differences that have contributed to determining the negative net production value (article 2, paragraph 56-bis.1, of Decree Law 225 of 29 December 2010, introduced by Law 147/2013). The above convertibility forms – which are in addition to that already envisaged for cases in which the separate financial statements show a loss for the year (article 2, paragraphs 55 and 56, of Decree Law 225/2010, as most recently amended by Law 147/2013) – provide an additional, supplementary recovery method suited to ensuring the recovery of "eligible" deferred tax assets in all situations, regardless of the company's future profitability. If in a given year there are surplus "eligible" temporary differences with respect to taxable income or net production value, the recovery of deferred tax assets takes the form not of a decrease in current taxes, but of the recognition of deferred tax assets on the tax loss or the negative net production value, convertible into tax credits pursuant to Art. 2, paragraphs 56-bis and 56-bis.1, of Decree Law 225/2010. The convertibility of deferred tax assets on tax losses and negative net production values that result from eligible temporary differences is therefore a suitable and sufficient condition for the recognition of "eligible" deferred tax assets, making it possible to exclude them from the area of application of the probability test.
A limit to the straight convertibility of "eligible" deferred tax assets was introduced by art. 11 of Decree Law 59 of 3 May 2016, amended by Decree Law 237 of 23 December 2016, which subordinated the transformation into tax credits of the eligible deferred tax assets which were not matched by an actual prepayment of taxes (so-called "type 2 DTA") to the payment of an annual fee, equal to 1.5% of their overall value, for the years 2016-2030. Instead, no fee is due for the transformation into tax credits of the "eligible" deferred tax assets which were matched by an actual prepayment of greater taxes ("type 1 DTA"). Considering that the "eligible" deferred tax assets recognised by the Companies that are part of the fiscal consolidation of Intesa Sanpaolo, as well as those included in the Parent Company's financial statements following the acquisition of the business lines of the former Venetian Banks and, most recently, those of the former UBI Group are all "type 1 DTA", the Group is not currently concretely required to pay this fee.
Article 1, paragraphs 1067 and 1068 of the 2019 Budget Act (Law 145 of 30 December 2018) envisage the deductibility (both for IRES and IRAP purposes) over ten tax periods, starting from the one under way as at 31 December 2018, of the adjustments to loans to customers recognised in the financial statements of banks and financial institutions on first-time adoption of IFRS 9[174]. According to that clarified in the Explanatory Report on the Measure, deferred tax assets recognised in financial statements in relation to the deferral of said deduction cannot be converted into tax credits based on the aforementioned provisions of Decree Law no. 225/2010. Therefore, those taxes must be subject to the probability test.
That being said, the following is noted with regard to the Other deferred tax assets – IRES.
In the consolidated financial statements as at 31 December 2024 (and in the separate and consolidated financial statements of Intesa Sanpaolo Assicurazioni), deferred tax assets amounting to 260.5 million euro were recognised for the first time, relating to the intangibles (Value in Force and Goodwill) deriving from the merger by incorporation of Intesa Sanpaolo Life ("ISP Life") into Intesa Sanpaolo Assicurazioni ("ISP Assicurazioni" or "Insurance Company"), finalised with legal, accounting and tax effects on 1 December 2023. Following the operation, the assets and liabilities of ISP Life were assigned to ISP Assicurazioni's newly-established branch of Dublin.
The Merger was recorded in the separate and consolidated financial statements of Intesa Sanpaolo Assicurazioni (and in the consolidated financial statements of Intesa Sanpaolo) by applying book value accounting, as transactions between entities under common control, recognising the assets and liabilities of ISP Life at the same book values at which they were recognised in the accounts of the merged entity.
In terms of taxation, applying the provisions of Article 166-*bis* of Italian Presidential Decree no. 917/1986 ("the Income Tax Code"), the merger resulted in the tax recognition of the market value ("Entry Values") of the assets and liabilities of the merged company, including intangibles (Value in Force or also "VIF" and "Goodwill") attributable to it.
The above Entry Values were the subject of an agreement with the Italian Revenue Agency ("Agreement") pursuant to the combined provisions of Article 166-*bis* of the Income Tax Code, and Article 31-*ter*, paragraph 1, letter a) of Italian Presidential Decree no. 600/1973. The Agreement was signed on 17 December 2024, as a result of in-depth discussions that began with the submission of a specific ruling request on 15 May 2023.

Considering that the Entry Values recognised as above for tax purposes are higher than the carrying amounts, the merger triggered deductible temporary differences specifically referring to the value attributed to the intangible asset of insurance contracts in force (VIF) and Goodwill (together with the Value in Force, "Life Intangibles"). This means that the (higher) tax value of the Life Intangibles compared to their carrying amounts (equal to zero, as the merger was recorded applying book value accounting), can be deducted over 18 tax periods, starting from the period in which the merger was finalised (2023), with a total tax benefit of 293.1 million euro. Instead, no IRAP tax benefits were obtained, given the results of the specific ruling request submitted by ISP Assicurazioni.
The New Life DTAs, recognised for the first time in the Financial Statements as at 31 December 2024, the year the Agreement was concluded, equal to 260.5 million euro, as stated, are posted against the amortisation charges of the Life Intangibles not yet deducted at 31 December 2024. They will be reabsorbed annually on a straight-line basis over the subsequent 16 tax periods, starting from 2025 (the tax benefit for the charges pertaining to 2023 and 2024, equal to 16.3 million euro per year, has already been absorbed).

[173] With art. 17 of Decree Law 83 of 27 June 2015, the convertibility into tax credits was excluded (for any reason provided for by Decree Law 225 of 29 December 2010) of the deferred tax assets relating "to the value of the goodwill and the other intangible assets entered for the first time starting from the financial statements relating to the year underway at the date the provision comes into force", i.e. starting from 2015.
[174] The ten-year instalment period, which should have originally concluded in 2027, was extended to 2029 by the measures set out in the 2020 Budget Act (Law no. 160 of 27 December 2019) and the 2025 Budget Act (Law no. 207 of 30 December 2024).

The probability test on other deferred tax assets - IRES was carried out as follows:

- identifying the “Other deferred tax assets - IRES”, i.e. those not relating to the tax losses of Intesa Sanpaolo, which were subject to a specific test to determine whether they could be recognised in the financial statements (see above);
- identifying “ineligible” deferred tax assets among other deferred tax assets, as they cannot be converted into tax credits (see above);
- analysing such “ineligible” deferred tax assets and deferred tax liabilities carried in the consolidated financial statements, distinguishing them by causal relationship and by foreseeable recovery timing;
- provisionally determining the amount of the Group's future taxable income in order to verify its ability to recover the “ineligible” “other deferred tax assets - IRES”. The estimate of future taxable income was made, for the years 2025-2029, using the same database used for the impairment test on intangibles in the 2024 Financial Statements (see above). For the subsequent years, an overhang of the forecasts was cautiously assumed, without considering a growth rate “g”.

The analysis conducted indicated an IRES taxable base that was sufficient and adequate to allow recovery of the deferred tax assets relating to IRES carried in the financial statements as at 31 December 2024.

Also for “deferred tax assets - IRAP”, the probability test was conducted analytically, referring only to the “ineligible” deferred tax assets (for those that can be converted into tax credits, as stated, the prospective certain use based on the cases of conversion into tax credits set out in paragraphs 56-bis and 56-bis.1 of Art. 2 of Decree Law 225/2010, effectively constitutes a sufficient prerequisite for recognition in the financial statements, implicitly passing the related probability test). The test was conducted by comparing the estimated forecast taxable income for IRAP purposes of Intesa Sanpaolo, estimated on the basis of the same forecast data assumed in carrying out the probability test on tax losses, with the cancelled ineligible temporary differences found as at 31 December 2024 and resulting in the residual IRAP taxable base for each year.

Considering that, for IRAP purposes, different from that set out for IRES tax losses, there is no carrying forward of tax losses or the possibility of offsetting them as part of tax consolidation, if in one or more years the residual taxable base is negative, for example, the deferred tax assets - IRAP that can be recognised in the financial statements should be limited to only the amounts of the temporary differences that can be recovered in each year considered.

The calculations performed resulted in a positive residual IRAP taxable base in each of the years included in the reference time horizon of the test.

In support of the positive results of the probability test on the DTAs recognised for each of the above categories, please note that:

- Intesa Sanpaolo’s results show a steady improvement. Net of dividends (which are in fact irrelevant for the purposes of determining taxable income), both the net interest and other banking income and gross income improved on the previous year, confirming Intesa Sanpaolo's solid track record in terms of profitability;
- the forecast data from 2025 onwards on which the estimate is based also prudently reflect, as already mentioned, unfavourable scenarios compared to the baseline scenario;
- all scenarios, including the adverse one described earlier, during the period covered by the Forecasts, show an improvement in Intesa Sanpaolo's taxable profit;
- for the purposes of additional prudence, when performing the probability test, the taxable profit for the years where no specific estimate of future profits is available, even when there is a trend of growth in profits, is assumed to be equal (i.e. not increasing with respect) to the taxable profit of the last year covered by the Forecasts;
- in any event, the future earnings estimates used for the probability test are updated at least annually to take account of intervening changes in the market scenarios;
- under the current Italian regulations, tax losses can be carried forward without time limits (Article 84, Income Tax Code);
- the negative taxable income does not derive from a natural “inability” to generate taxable income, but rather from some rules specific to the Italian tax system, which resulted in deferred tax assets whose reversals penalised and will continue to penalise (but only up to 2029) the taxable income (accrual of adjustments to loans not deducted until 2014; accrual of expected credit losses on loans to customers recognised as a result the IFRS 9 FTA; and repeated deferral of the start of the recovery period for goodwill realigned for payment);
- almost all the deferred tax assets on tax losses relate to the entities acquired by Intesa Sanpaolo and arose prior to the acquisition by Intesa Sanpaolo.

Therefore, the prospects for recovery resulting from the estimates are considered to meet the “probability of recovery” requirement of IAS 12.

The table above contains assets and related liabilities which no longer refer to continuing operations as they are being disposed of.

Caption A.1 Financial assets, amounting to 42 million euro net, in addition to 3 million euro in caption C.3 Other liabilities, consists of non-performing loans (329.3 million euro gross, 41.7 million euro net) which will be disposed of as part of operations planned for 2025.
This amount compares with the 139 million euro recorded as at 31 December 2023, which mainly included: portfolios classified as UTP and, for a residual amount, performing loans that were sold in 2024.

A.2 Equity investments amount to 50 million euro as at 31 December 2024 and refer to the investment in Cronos Vita S.p.A.

Caption A.3 Property and equipment comprises an operation of contribution to the Coima Funds of real estate assets for a value of 506 million euro deriving from Intesa Sanpaolo S.p.A., an additional 10 million euro from Immit – Immobili Italiani S.r.l., and from single properties held for sale for 29 million euro.

12.2 Other information

There is no other information to be noted in addition to the above.

SECTION 13 – OTHER ASSETS – CAPTION 130

13.1 Other assets: breakdown

(millions of euro)

Captions		
Amounts to tax authorities		27,417
Amounts to be credited and items under processing		952
Cheques and other instruments held		405
Leasehold improvements		125
Transit items		18
Other		4,822
TOTAL	**31.12.2024**	**33,739**
TOTAL	**31.12.2023**	**31,232**

The sub-caption Amounts due from tax authorities includes 22.5 billion euro in tax credits acquired from customers, of which 11.3 billion euro under the Hold to Collect business model, 3.3 billion euro under the Hold to Collect and Sell business model and 7.9 billion euro under the Other/Trading business model.

The sub-caption “Other” includes the following main components: (i) prepayments and accrued income not reallocated of 396 million euro; (ii) costs incurred to obtain and execute contracts with customers for an amount of 680 million euro, mainly referring to costs for bonuses capitalised by Fideuram – Intesa Sanpaolo Private Banking (and, therefore, subject to amortisation for 85 million euro); and (iii) pursuant to paragraphs 116 and following of IFRS 15, operating loans and receivables, i.e. loans for operations connected with the provision of non-financial activities and services, amounting to 94 million euro.

LIABILITIES

SECTION 1 – FINANCIAL LIABILITIES MEASURED AT AMORTISED COST – CAPTION 10

1.1 Financial liabilities measured at amortised cost: breakdown of amounts due to banks

(millions of euro)

2.4 Debts for commitments to repurchase own equity instruments	-	X	X	X	-	X	X	X
2.5 Lease liabilities	3	X	X	X	4	X	X	X
2.6 Other debts	8,785	X	X	X	10,397	X	X	X
Total	**45,794**	**-**	**33,581**	**12,139**	**93,242**	**-**	**78,724**	**14,351**

The illustration of the criteria used to determine the fair value is contained in Part A – Accounting policies.

The total amount of Financial liabilities measured at amortised cost – due to banks as at 31 December 2024 of 45,794 million euro (93,242 million euro as at 31 December 2023) consisted of 44,944 million euro attributable to the “Banking Group”, 710 million euro to the “Insurance Companies”, and 140 million euro to “Other Companies”; as at 31 December 2023 these amounts were 92,345 million euro, 741 million euro and 156 million euro respectively.
As at 31 December 2023, the caption “Amounts due to Central Banks” included the balance of TLTRO financing operations for a total of 45 billion euro.

Repurchase agreements related to assets sold not derecognised are detailed in Part E – Section E – Sales of the Notes to the financial statements.
The Group’s repurchase agreements shown in the table include long-term repurchase agreements with a total carrying amount of 200 million euro, attributable to Fideuram – Intesa Sanpaolo Private Banking for de-risking transactions completed in previous years with the twofold aim of both funding the bank’s operations (through repurchase transactions) and reducing the credit risks associated with the portfolio of securities issued (also through the acquisition of financial guarantees). The transactions have a non-replaceable underlying portfolio of Italian government bonds (with maturities from 2031 to 2033) hedged against interest rate risk through interest rate swap contracts and against credit risk through credit default swap contracts, already recorded in the financial statements at the time of execution of the repurchase transactions and recognised under financial assets measured at amortised cost. The nominal value and the maturity date of the repurchase agreements are the same as that of the securities.
For recognition purposes, an assessment was conducted aimed at understanding the purpose underlying the contractual agreements, taking into account the instructions provided by the Supervisory Authorities in Bank of Italy/Consob/IVASS Document No. 6 of 8 March 2013, “Accounting treatment of ‘long-term structured repurchase agreements’.”
The analysis focused on the structure, cash flows and risks associated with the transactions and was aimed at verifying whether the cases described above were similar to the long-term structured repurchase agreements described in the above Document, and, in order to be compliant with the principle of the prevalence of substance over form, whether the indicators referred in paragraph B.6 of the Guidance on Implementing IFRS 9, according to which the transaction may be considered substantially similar to a credit derivative contract, and, in particular, a credit default swap, were present.
The case described above consists of repurchase agreements that are not concurrent with the purchases of the securities, because they were already present in the portfolio. In addition, buying securities and entering into the related hedging derivatives occurred with market counterparties other than those with which the repurchase agreements were entered into.
The credit risk was also closed with financial guarantees.
Consequently, the analysis shows elements of differentiation from the long-term structured repurchase agreements described in the aforementioned Document, supporting the inapplicability of the guidelines provided in paragraph B.6 of the Guidance on Implementing IFRS 9, with the result that the transactions must be recognised in the financial statements with the individual contractual components shown separately.

1.2 Financial liabilities measured at amortised cost: breakdown of amounts due to customers

(millions of euro)

Transaction type/Amount	31.12.2024				31.12.2023			
	Book value	Fair value			Book value	Fair value

The total amount of the Financial liabilities measured at amortised cost – securities issued as at 31 December 2024 of 110,369 million euro (108,428 million euro as at 31 December 2023) consisted of 109,764 million euro attributable to the “Banking Group”, 587 million euro to the “Insurance Companies”, and 18 million euro to “Other Companies”. As at 31 December 2023 these amounts were 107,092 million euro, 1,327 million euro and 9 million euro, respectively.

1.4 Details of subordinated debts/securities

As at 31 December 2024 subordinated debts amounted to 608 million euro, entirely attributable to the Insurance Companies, and in particular to Intesa Sanpaolo Assicurazioni.
As at the reporting date, subordinated securities issued amounted to 12,378 million euro, of which 11,791 million euro attributable to the Parent Company and 587 million euro to the Insurance Companies.

1.5 Details of structured debts

As at 31 December 2024 there were no structured debts.

1.6 Lease payables

As at 31 December 2024 lease payables amounted to 1,097 million euro, of which 221 million euro maturing within one year, 560 million euro maturing within 1 to 5 years and 316 million euro maturing in over 5 years.
Lease payables comprise 1,094 million euro referring to customer counterparties and 3 million euro to bank counterparties.
These derive from the application of the financial reporting standard IFRS 16 relating to Leases, with effect from 1 January 2019.

SECTION 2 – FINANCIAL LIABILITIES HELD FOR TRADING – CAPTION 20

(*) Fair value calculated excluding changes in creditworthiness of the issuer after issue date.

The total amount of Financial liabilities held for trading as at 31 December 2024 of 42,882 million euro (43,493 million euro as at 31 December 2023) consisted of 42,866 million euro attributable to the “Banking Group” and 16 million euro to the “Insurance Companies”. As at 31 December 2023 those amounts consisted of 43,486 million euro attributable to the “Banking Group” and 7 million euro to the “Insurance Companies”.
Amounts due to banks and customers consist entirely of short selling of securities.
The aggregate 3.2.1 Other structured securities consists entirely of securitised derivatives (certificates) which provide for partial or full redemption of the premiums paid on maturity, pursuant to Bank of Italy Communication of 21 October 2014, issued by the Group throughout 2019.
Derivative instruments include 7,650 million euro in certificates with characteristics similar to financial derivative instruments due to the prevalence of market risks in relation to the return of the premiums paid.
The changes in fair value recorded during the year due to the change in its own credit rating were positive by 5 million euro and related to Derivatives and Debt securities – Other.
The values of Derivative Instruments as at 31 December 2024 include the results of the offsetting of accounts between positive and negative gross balances of hedging derivatives undertaken with the legal clearing agent LCH Ltd. as they meet the requirements set out in IAS 32, paragraph 42.

2.2 Breakdown of “Financial liabilities held for trading”: subordinated liabilities

The aggregate Financial liabilities held for trading includes subordinated liabilities represented by Due to banks for 383 million euro and Due to customers for 46 million euro.

2.3 Breakdown of “Financial liabilities held for trading”: structured debts

As at 31 December 2024, structured debts classified under Financial liabilities held for trading amounted to 1 million euro due to customers and 9 million euro due to banks, attributable to 4 million euro of short selling of fixed-rate bonds indexed to inflation, as an additional component, and 6 million euro of short-selling of convertible bonds.

SECTION 3 – FINANCIAL LIABILITIES DESIGNATED AT FAIR VALUE – CAPTION 30

3.2 Other	-	-	-	-	X	-	-	-	-	X
Total	**74,056**	**1,488**	**72,519**	**76**	**73,810**	**73,168**	**91**	**72,660**	**31**	**72,607**

(*) Fair value calculated excluding changes in creditworthiness of the issuer after issue date.

The total amount of the Financial liabilities designated at fair value as at 31 December 2024 of 74,083 million euro (72,782 million euro as at 31 December 2023) consisted of 23,437 million euro attributable to the "Banking Group" and 50,646 million euro to the "Insurance Companies". As at 31 December 2023 those amounts were 21,344 million euro and 51,438 million euro, respectively.

The Group has classified the LECOIP 3.0 for the employment agreements, terminated early, of employees of Group companies and life policies connected to social initiatives, managed by the Bank based on fair value, under Amounts due to customers.

Sub-caption 3.1 Debt securities – Structured comprised certificates which provide for partial or full redemption of the premiums paid on maturity, pursuant to Bank of Italy Communication of 21 October 2014 (certificates with guaranteed or protected capital). As they were issued after 1 January 2020, these are classified under Financial liabilities designated at fair value (Fair Value Option), as a result of the Bank's implementation of a business model based on a banking book approach, with the goal of generating stable inflows.
Certificates representing Financial liabilities designated at fair value record the related changes in fair value attributable to changes in own credit risk in the Statement of comprehensive income (shareholders' equity). Changes in the Bank's own credit rating during the year were negative by 98 million euro.

(*) Fair value calculated excluding changes in creditworthiness of the issuer after issue date.

3.2 Breakdown of “Financial liabilities designated at fair value”: subordinated liabilities

As at 31 December 2024, the Group did not have any subordinated liabilities classified under Financial liabilities designated at fair value.

SECTION 4 – HEDGING DERIVATIVES – CAPTION 40

4.1 Hedging derivatives: breakdown by type of hedge and level

(millions of euro)

	31.12.2024			Notional value	31.12.2023			Notional value
	Fair value				Fair value			
	Level 1	Level 2	Level 3	31.12.2024	Level 1	Level 2	Level 3	31.12.2023
A. Financial derivatives	**-**	**4,410**	**-**	**210,950**	**-**	**5,188**	**-**	**226,301**
1) Fair value	-	4,315	-	204,427	-	4,978	-	214,267
2) Cash flows	-	95	-	6,523	-	210	-	12,034
3) Foreign investments	-	-	-	-	-	-	-	-
B. Credit derivatives	**-**	**-**	**-**	**-**	**-**	**-**	**-**	**-**
1) Fair value	-	-	-	-	-	-	-	-
2) Cash flows	-	-	-	-	-	-	-	-
Total	**-**	**4,410**	**-**	**210,950**	**-**	**5,188**	**-**	**226,301**

The total amount of the hedging derivatives as at 31 December 2024 of 4,410 million euro (5,188 million euro as at 31 December 2023) consisted of 4,363 million euro for the "Banking Group" and 47 million euro for the "Insurance Companies". As at 31 December 2023, those amounts were 5,105 million euro and 83 million euro respectively.

As the gross negative fair value of Hedging derivatives implemented with the legal clearing agent LCH Ltd. meets the requirements set out for offsetting between gross positive and negative balances pursuant to IAS 32, paragraph 42, it was subject to offsetting, with recognition of the net fair value under Financial liabilities held for trading.

4.2 Hedging derivatives: breakdown by hedged portfolio and type of hedge

(millions of euro)

Transactions/Type of hedge	FAIR VALUE							CASH FLOW		FOREIGN INVESTM.
	Specific						Generic	Specific	Generic	
	debt securities and interest rates	equities and stock indices	foreign exchange rates and gold	credit risk	commodities	other				
1. Financial assets measured at fair value through other comprehensive income	597	-	20	-	X	X	X	47	X	X
2. Financial assets measured at amortised cost	1,242	X	195	-	X	X	X	-	X	X
3. Portfolio	X	X	X	X	X	X	976	X	3	X
4. Other transactions	-	-	-	-	-	-	X	-	X	-
Total assets	**1,839**	**-**	**215**	**-**	**-**	**-**	**976**	**47**	**3**	**-**
1. Financial liabilities	238	X	292	-	-	-	X	-	X	X
2. Portfolio	X	X	X	X	X	X	755	X	45	X
Total liabilities	**238**	**-**	**292**	**-**	**-**	**-**	**755**	**-**	**45**	**-**
1. Forecast transactions	X	X	X	X	X	X	X	-	X	X
2. Financial assets and liabilities portfolio	X	X	X	X	X	X	-	X	-	-

The table indicates negative fair values of hedging derivatives, broken down in relation to asset or liability hedged and type of hedge.
Considering the values gross of netting in the financial statements, these continue to refer mainly to macro fair value hedges of core deposits as well as micro-hedges of liabilities issued and debt securities under assets. Cash flow hedges refer to funding through floating-rate securities issued, and in particular macro hedges, to the extent used to fund fixed-rate investments.

SECTION 5 – FAIR VALUE CHANGE OF FINANCIAL LIABILITIES IN HEDGED PORTFOLIOS – CAPTION 50

5.1 Fair value change of hedged liabilities

(millions of euro)

Fair value change of hedged liabilities/Group members	31.12.2024	31.12.2023
1. Positive fair value change of financial liabilities	1,625	13
2. Negative fair value change of financial liabilities	-3,444	-3,980
Total	**-1,819**	**-3,967**

The balance of the changes in value of liabilities subject to macrohedging against interest rate risk is recorded in this caption. For the application, the option envisaged by IFRS 9 to continue to apply the provisions permitted by the IAS 39 carve out was applied.
The lower negative balance compared to 31 December 2023 of the fair value change of financial liabilities in hedged portfolios from interest rate risk was due to the reduction in interest rates in 2024.

SECTION 6 – TAX LIABILITIES – CAPTION 60

For information on this section, see Section 11 of Assets.

SECTION 7 – LIABILITIES ASSOCIATED WITH NON-CURRENT ASSETS HELD FOR SALE AND DISCONTINUED OPERATIONS – CAPTION 70

For information on this section, see Section 12 of Assets.

SECTION 8 – OTHER LIABILITIES – CAPTION 80

8.1 Other liabilities: breakdown

(millions of euro)

Captions		
Amounts to be credited and items under processing		2,944
Due to tax authorities		2,669
Due to suppliers		1,752
Amounts due to third parties		288

As specified in the comment to the previous table, there are no amounts attributable to the caption “Allowances on other commitments and other guarantees given”.
“Other allowances for risks and charges” include net provisions of 587 million euro to caption 200, letter b) of the income statement and net provisions to other income statement captions, for the residual amount. These include allowances regarding staff leaving incentives, including those relating to the agreement signed with the trade unions on 23 October 2024. Uses refer almost entirely to payments.

10.3 Allowances for credit risk associated with commitments and financial guarantees given

(millions of euro)

	Allowances for credit risk associated with commitments and financial guarantees given

10.4 Allowances on other commitments and other guarantees given

As at 31 December 2024, there were no allowances on other commitments and guarantees given.

10.5 Post-employment defined benefit plans

1. Illustration of the characteristics of the funds and related risks

As already illustrated in Part A – Accounting policies, for defined benefit plans, the liability of the Bank, according to IAS 19 “Employee Benefits”, is determined via the “projected unit credit method” by an independent actuary. The liability is recognised net of any plan assets of each Pension Fund and the actuarial gains and losses calculated in the valuation process for the plans are recognised in the statement of comprehensive income and, therefore, in shareholders’ equity.

The defined benefit supplementary pension plans, in which the Intesa Sanpaolo Group companies are co-obliged, can be distinguished in:
– internal funds;
– external funds.

Internal funds include:
– Three defined benefit plans in force for the London branch, relating to the former Cariplo, Banca Commerciale Italiana and Banco Ambrosiano Veneto branches. The private pension funds have been set up by the UK employers to integrate the levels of the local state pension, which has always been very low. The London branches of Cariplo, Banca Commerciale Italiana and Banco Ambrosiano Veneto set up defined benefit plans for their employees at the time of their opening, under the form of Trusts incorporated under English law and managed by Boards of Trustees, appointed partly by the employers and partly by beneficiaries. Such funds are operational for employees hired until the end of 1999 for Banco Ambrosiano Veneto and Cariplo and until the end of 2000 for Banca Commerciale Italiana. In general, all funds guarantee a pension payable when the beneficiary turns 65 and the benefit is determined, with different rules for the various funds, on the basis of the annual gross wage received in the last year of service;
– post-retirement medical plan and other benefits for employees of Bank of Alexandria (Egypt): defined benefit plans providing health coverage and other benefits to employees, even after retirement. The bank is responsible for the costs and risks related to the disbursement of said benefits;
– defined benefit plans in effect within Banca Intesa Beograd: these are long-term benefits established by the Collective Contract (which refers to provisions of law in the Republic of Serbia) for employees in service to be paid upon termination of employment.

External funds include:
– the Intesa Sanpaolo Group Defined-Benefit Fund “Fondo Pensione a Prestazione definita del Gruppo Intesa Sanpaolo”, the name given to the former Supplementary Pension Fund for the Employees of Banco di Napoli “Fondo Pensione Complementare per il Personale del Banco di Napoli – Sezione A”, identified as a collector of other “defined benefit” forms under the reorganisation and rationalisation of the existing pension schemes within the Intesa Sanpaolo Group, with protection of the rights of the (active and retired) subscribers. To this end, the “Fund” – in the virtually separated sections – has been assigned the asset captions contained in the financial statements of the pre-existing pension schemes, in order to ensure full coverage of the supplementary benefits. For that reason, with regard to this Pension Fund, liabilities to be recorded in the financial statements (net of the plan assets) are calculated section by section, considering the specific characteristics of each base. The Fund, which is a legal entity with independently managed assets, includes the following: employees enrolled in the plan and other beneficiaries from former Banco di Napoli; retired employees receiving Supplementary Pension Cheques, formerly the Sanpaolo IMI internal fund; retired employees from the former Banca Nazionale delle Comunicazioni; current and retired employees of Cassa di Risparmio in Bologna, formerly enrolled in the Complementary pension fund for the employees of said bank, transferred to the Fund in question in 2004; retired employees of the Complementary pension fund of the former Fin.Opi, transferred to the Fund in question on 1 June 2005; current and retired employees of the former Banca Popolare dell’Adriatico, formerly enrolled in the Pension fund for the employees of Banca Popolare dell’Adriatico, transferred to the Fund in question on 30 June 2006; retired employees of Cassa di Risparmio di Udine e Pordenone, formerly enrolled in the Complementary pension fund for the employees of said bank, transferred to the Fund in question in 2006; retired employees of Cassa di Risparmio di Forlì, formerly enrolled in the Complementary pension fund for the employees of said bank, transferred to the Fund in question on 1 January 2007; retired employees of the former Carive internal Fund, transferred to the Fund in question on 1 January 2008; retired employees of the former CR Firenze FIP internal fund, transferred to the Fund in question on 1 January 2010; retired employees of Cassa di Risparmio di Pistoia e Pescia internal fund, transferred to the Fund in question on 1 September 2012; retired tax-collection personnel of the Supplementary pension fund for tax-collection personnel formerly employed by Cariplo, transferred to the Fund in question on 1 January 2015; retired employees formerly enrolled in the Complementary pension fund for employees of Mediocredito Lombardo S.p.A., transferred to the Fund in question on 1 January 2015; retired employees formerly enrolled in the Pension Fund for key Managers, former Key Managers and entitled parties of former Comit, transferred to the Fund in question on 1 January 2015; retired employees formerly enrolled in the “Casse del Centro” Pension Funds, in particular those enrolled in the Supplementary INPS benefits fund for the compulsory insurance for invalidity, old-age and survivors for personnel of Cassa di Risparmio di Città di Castello, Supplementary INPS benefits fund for the compulsory insurance for invalidity, old-age and survivors for personnel of Cassa di Risparmio di Foligno, Company complementary pension AGO fund for employees of Cassa di Risparmio di Spoleto, Supplementary/complementary pension fund for the mandatory pension for employees of Cassa di Risparmio di Rieti, Pension fund for the Employees of Cassa di Risparmio della Provincia di Viterbo and Company supplementary pension fund for employees of Cassa di Risparmio di Ascoli Piceno, transferred to the Fund in question on 1 January 2015; retired employees formerly enrolled in the Company complementary pension fund of INPS benefits for employees of Cassa di Risparmio di Civitavecchia, transferred to the Fund in question on 1 January 2015; retired employees formerly enrolled in the Supplementary fund of SIL – Società Italiana Leasing S.p.A., transferred to the Fund in question on 1 January 2015; retired employees formerly enrolled in the Complementary Pension Fund for the personnel of Banca Monte Parma, transferred to the Fund in question on 1 January 2016; employees and retired employees formerly enrolled in the Pension Fund for the personnel of the former Crediop hired before 30 September

1989, transferred to the Fund in question on 1 January 2016; retired employees formerly enrolled in the Supplementary Pension Fund for the personnel of Cassa di Risparmio di Mirandola, transferred to the Fund in question on 1 April 2016; retired employees formerly enrolled in the Pension Fund for the Personnel of the former Cassa di Risparmio di Prato transferred to the Fund in question on 1 May 2018; retired employees formerly enrolled in the Defined Benefit Plan of the former Cassa di Risparmio di Fabriano e Cupramontana transferred to the Fund in question on 1 May 2018; current and retired employees of the Supplementary pension fund for the personnel of Istituto Bancario Sanpaolo di Torino, transferred to the Fund in question on 1 January 2019; retired employees of the Supplementary pension fund for the personnel of Cassa di Risparmio di Padova e Rovigo, transferred to the Fund in question on 1 July 2019; employees and retired employees formerly enrolled in the former UBI Banca internal Funds – which include the Funds relating to the former Centrobanca (former Supplementary Pension Fund for employees of Centrobanca – former Banca Centrale di Credito Popolare S.p.A.), former Banca Regionale Europea (former Fund for the personnel of Banca Regionale Europea from the former Banca del Monte di Lombardia and the former Cassa di Risparmio di Cuneo), former Carime (former Fund of the former Cassa di Risparmio di Calabria e Lucania, Fund of the former Cassa di Risparmio di Puglia, Fund of the former Cassa di Risparmio Salernitana) and former Banca Adriatica (former Retirement Fund for the personnel of the loans business line of the former Cassa di Risparmio di Macerata S.p.A., Retirement Fund for the personnel of the former Banca Ca.Ri.Ma. transferred to Se.Ri.Ma. – now Equitalia Servizi di Riscossione S.p.A., Retirement Fund for the personnel of the former Mediocredito Fondiario Centro Italia S.p.A., Retirement Fund for personnel in the tax-collection segment of the former Cassa di Risparmio di Pesaro, Retirement Fund for the personnel of the former Cassa di Risparmio di Jesi, Retirement Fund for personnel in the tax-collection segment of the former Cassa di Risparmio di Pesaro S.p.A. transferred to the former SE.RI.T. S.p.A.) – transferred to the Fund in question on 1 July 2022; retired employees formerly enrolled in the Pension Fund of the former UBI Banca Group of the former Banca Popolare di Bergamo and its subsidiaries, transferred to the Fund in question on 1 September 2022; retired employees formerly enrolled in the Pension Fund for the Personnel of the former Banca Popolare di Ancona and its subsidiaries, transferred to the fund in question on 1 September 2022; and employees and retired employees formerly enrolled in the former Pension Fund of the Cassa di Risparmio di Firenze, transferred to the Fund in question on 1 January 2023.
It should be clarified that the Articles of Association of the Group Defined-Benefit Fund of the Intesa Sanpaolo Group provide for the immediate settlement by the co-obligated Banks, if sections of the Fund present a technical imbalance determined according to the statutory methodology (without prejudice to provisions to the contrary in trade union agreements). Any outlays to settle the technical imbalance to be made in the next year will be determined at the time the financial statements of the Fund are approved, which is scheduled for June 2025;

- Pension fund for the employees of Cariplo, a fund with legal status and full economic independence, whose aim is to guarantee supplementary pension treatment in addition to AGO cheques to former Cariplo employees already retired on 30 June 1998;
- a defined benefit plan at the New York branch: the fund was established in 1977 by the branch of Banca Commerciale Italiana and guarantees a pension treatment to all the employees resident in the United States who have been in service at the Bank for at least 5 years. The benefit is considered to be accrued even if the employment relationship ceases in advance. The benefit is calculated based on the highest average wage considering three consecutive years out of the last 10 years of service, or, if the employment relationship ceases before, based on the average wage in the last three years of service. The fund is fully managed by Prudential;
- an employee pension plan of REYL & Cie S.A.: the plan provides supplementary benefits when the pension is due or in the event of an unfavourable event (disability and death) under the local social security provisions (LPP); the obligations are covered by dedicated assets, managed through a contractual relationship between the company and La Collective de Prévoyance - Copré, Geneva;
- an employee pension plan of Alpian S.A.: the plan provides supplementary benefits when the pension is due or in the event of an unfavourable event (disability and death) under the local social security provisions (LPP); the obligations are covered by dedicated assets, managed through a contractual relationship between the company and La Collective de Prévoyance - Copré, Geneva.

On 5 December 2017, Intesa Sanpaolo S.p.A., also in its capacity as Parent Company, signed an agreement with the Trade Unions, as Fund Founders, for the integration of the Supplementary Pension Fund for the Personnel of Istituto Bancario San Paolo di Torino into the former Supplementary Pension Fund for the Personnel of Banco di Napoli (now, as previously indicated, the “Fondo pensione a prestazione definita del Gruppo Intesa Sanpaolo”). This agreement also provided for the formulation of an individual capitalisation offer for the supplementary benefits to be made to the participants, which was carried out in the second half of 2018. The subscriptions received over time led to a decrease in the obligation, which, in the current year, amounted to around 2 million euro, partly covered by the Fund’s assets and partly through the use of Funds set up specifically for this purpose by the Bank, under the guarantee given.

With regard to the investment and integrated risk management policies, the Funds verify the level of coverage and the possible outcomes under various scenarios. For this purpose, various investment configurations and portfolio mixes and allocations are defined, in order to satisfy the pension and profitability objectives as adequately as possible.

2. Changes in the year of net liabilities (assets) with defined benefits and redemption rights

(millions of euro)

Pension plan liabilities defined benefit obligations	31.12.2024			31.12.2023		
	Employee termination indemnities	Internal plans	External plans	Employee termination indemnities	Internal plans	External plans
Initial amount	**767**	**154**	**1,089**	**853**	**176**	**1,152**
Current service costs	4	2	9	4	2	7
Recognised past service costs	-	-	-1	-	-	-
Interest expense	23	14	32	27	12	35
Actuarial losses due to changes in financial assumptions	10	-	28	-	3	8
Actuarial losses due to changes in demographic assumptions	1	1	1	-	-	21
Actuarial losses based on past experience	-	15	11	2	2	2
Positive exchange differences	-	5	1	-	2	9
Increases - business combinations	-	-	-	-	-	-
Participants' contributions	X	-	14	X	-	13
Actuarial profits due to changes in financial assumptions	-	-7	-2	-19	-16	-31
Actuarial profits due to changes in demographic assumptions	-	-1	-21	-1	-	-
Actuarial profits based on past experience	-6	-6	-21	-8	-3	-1
Negative exchange differences	-	-20	-3	-	-16	-1
Benefits paid	-85	-9	-116	-100	-8	-115
Decreases - business combinations	-	-	-	-	-	-
Curtailments of the fund	X	-	-	X	-	-
Settlements of the fund	X	-	-	X	-	-
Other increases	32	-	10	36	-	-
Other decreases	-40	-	-	-27	-	-10
Final amount	**706**	**148**	**1,031**	**767**	**154**	**1,089**

Pension plan liabilities defined benefit obligations	31.12.2024			31.12.2023		
	Employee termination indemnities	Internal plans	External plans	Employee termination indemnities	Internal plans	External plans
Unfunded plans	706	33	-	767	60	-
Partly funded plans	-	-	-	-	-	-
Wholly funded plans	-	115	1,031	-	94	1,089

The actuarial gains recognised due to changes in demographic assumptions mainly depend on the updating of mortality rates of the general population of Italy. Actuarial losses recognised due to changes in financial assumptions are mainly due to the decrease in the discount rate.

3. Information on the fair value of plan assets

The following tables show the changes in plan assets for certain defined benefit plans and their composition.

(millions of euro)

Plan assets	31.12.2024		31.12.2023

The difference between net defined benefit liabilities (see the previous disclosure, Table 10.5, point 2) and the plan assets (see the previous disclosure, Table 10.5, point 3) is recognised, based on the criteria illustrated in paragraph 10.5, point 1) above, under the company post-employment plans and, in some cases, under other allowances for risks and charges.
The plans in place at the London branch are subject to the effect of the limitation of the asset ceiling determined pursuant to IFRIC 14, equal to 16 million euro as at 31 December 2024 (30 million euro as at 31 December 2023).

4. Description of the main actuarial assumptions

The table below indicates the actuarial assumptions and interest rates used by the various funds.

Actuarial assumptions	31.12.2024				31.12.2023			
	Discount rate	Expected rate of return	Expected rate of wage rises (a)	Annual inflation rate	Discount rate	Expected rate of return	Expected rate of wage rises (a)	Annual inflation rate
EMPLOYEE TERMINATION INDEMNITIES	from 2.58% to 3.73%	X	from 2.53% to 2.63%	1.9%	from 3.1% to 3.9%	X	from 2.6% to 2.8%	2.1%

- of which Switzerland	0.8%	1.0%	-	1.0%	1.5%	1.0%	-	1.3%

(a) Net of career developments.

The Intesa Sanpaolo Group primarily uses the Eur Composite AA rate as its discounting rate, weighted by the ratio of payments and advances referring to each maturity, on the one hand, and the total amount of payments and advances to be made for the final fulfilment of the entire obligation, on the other. In the case of defined-benefit plans in particular, the rate used is the average rate that reflects the market parameters covered by the plan. The Eur Composite AA curve is obtained daily from the Bloomberg's information provider and refers to a basket of securities issued by investment-grade corporate issuers included in the AA rating class, residing in the Eurozone and belonging to various sectors.

Likewise, the Intesa Sanpaolo Group mainly uses the European Zero-Coupon Inflation-Indexed Swap rate curve, weighted on the basis of the ratio of the amount paid for each maturity and the total amount to be paid until the obligation is finally discharged in full, as the inflation rate.

5. Information on amount, timing and uncertainty of cash flows

(millions of euro)

Sensitivity analysis	31.12.2024					
	EMPLOYEE TERMINATION INDEMNITIES		INTERNAL PLANS		EXTERNAL PLANS	
	+100 bps	-100 bps	+100 bps	-100 bps	+100 bps	-100 bps
Discount rate	662	753	133	168	945	1,134
Rate of wage rises	705	705	159	140	1,040	1,023
Inflation rate	735	677	154	143	1,080	985

The sensitivity analysis is not conducted on the expected rate of return as it has no effect on the calculation of the liabilities.

The sensitivity analysis was carried out on the net defined benefit liabilities (pursuant to the previous disclosure, 10.5, point 2). The absolute values of the data presented indicate the possible amount of net defined benefit liabilities in the event of a change in rate of +/- 100bps.

The average duration of the defined benefit obligation is 10.33 years for pension funds and 6.86 years for employee termination indemnities.

6. Multi-employer plans

The Group has the following defined benefit plans regarding more than one employer:

– Pension Fund for the employees of the former Crediop hired before 30 September 1989, which on 1 January 2016 was transferred to the Supplementary Pension Fund for the Employees of Banco di Napoli (now the Intesa Sanpaolo Group Defined-Benefit Fund "Fondo Pensione a Prestazione Definita del Gruppo Intesa Sanpaolo"). The commitments of Crediop S.p.A. (now Dexia-Crediop) and the former Sanpaolo IMI (now Intesa Sanpaolo S.p.A.) with regard to the Fund are governed by the agreement entered into between the parties on 28 May 1999. Its transfer into the Intesa Sanpaolo Group Defined-Benefit Fund "Fondo Pensione a Prestazione Definita del Gruppo Intesa Sanpaolo" did not modify the guarantees and commitments undertaken by the parties in the past;
– Retirement Fund for former employees of Banca Ca.Ri.Ma., transferred to Se.Ri.Ma. (now Equitalia Servizi di Riscossione S.p.A.), whose tax collection services were transferred on 1 January 1990 to the former Equitalia Marche S.p.A. (currently Agenzia delle Entrate - Riscossione) which was transferred to the Intesa Sanpaolo Group Defined-Benefit Fund on 1 July 2022. The trade union agreement and agreements between subscribers of the operation sanctioned that the then-parent company Ca.Ri.Ma. (then former Banca Marche S.p.A., then former Nuova Banca Marche S.p.A. and subsequently former Banca Adriatica S.p.A., then merged into former UBI Banca, in turn merged into Intesa Sanpaolo S.p.A.) would continue to allocate in its financial statements the mathematical reserves pertaining to personnel hired before the operation was finalised;
– Pension Fund for the Personnel of the former Banca Popolare di Ancona and its subsidiaries, transferred on 1 September 2022 to the Intesa Sanpaolo Group Defined-Benefit Fund, which provides a guarantee of settlement of the respective shares of the subscribers by Intesa Sanpaolo S.p.A. (former UBI Banca) and Credito Valtellinese.

7. Defined benefit plans that share risks among entities under joint control

The Intesa Sanpaolo Group Defined-Benefit Fund is a defined-benefit plan that shares the risks amongst the various Group companies. These companies issue a joint guarantee for their registered employees and pensioners with respect to the subject pension entities.
The liabilities of each jointly responsible company are determined by an Independent Actuary through the "projected unit credit method" and are recorded in the financial statements net of the plan assets. Similarly, the current service cost, which represents the average present value at the measurement date of the benefits accrued by workers in service during the year, is calculated for each company by said Actuary.

10.6 Allowances for risks and charges – Other allowances

(millions of euro)

Other allowances refers to:

– Legal and tax disputes: the allowance was set up mainly to cover expected outlay for litigation, revocatory action and tax disputes;
– Personnel charges: the allowance includes charges for incentive-driven exit plans, employee seniority bonuses (calculated on the basis of actuarial assumptions) and provisions for bonuses and other outlays relating to employees; charges for exit incentives during 2024 included those relating to the agreement signed with the trade unions on 23 October 2024;
– Other risks and charges: these mainly refer to provisions to cover private bankers' indemnities, charges connected with the sale of portfolios of NPLs and other charges relating to various obligations, as well as the provisions for risks for the allowances made on consolidating the investee Banca Intesa Russia, aimed at eliminating its equity contribution to the Group's consolidated financial statements.

SECTION 11 – INSURANCE LIABILITIES – CAPTION 110

From 1 January 2023, insurance assets and liabilities have been recognised in the financial statements in accordance with IFRS 17. The figures as at 31 December 2024 are compared with the figures as at 31 December 2023.

This section includes the tables in line with the indications of IVASS, based on the updates to Regulation 7 of 13 July 2007, directly applicable also pursuant to Circular 262/2005, for the disclosure required by IFRS 17 for insurance contracts pertaining to consolidated insurance companies.

Specifically, details are provided of the asset caption 80 a) Insurance assets - insurance contracts issued that are assets, 444 million euro as at 31 December 2024 (412 million euro as at 31 December 2023), and the liability caption 110 a) Insurance liabilities - insurance contracts issued that are liabilities, 126,013 million euro as at 31 December 2024 (119,674 million euro as at 31 December 2023). The balance of insurance contracts issued is negative at 125,569 million euro as at 31 December 2024 (119,262 million euro as at 31 December 2023).

Reconciliations are presented that show how the net carrying amounts of insurance contracts issued changed during the period because of cash flows and income and expenses recognised in the statement(s) of financial performance. Specifically, the tables show:

- the changes in the carrying amount of insurance contracts issued, broken down by basis of aggregation[175] and by measurement model (General Measurement Model – GMM or Variable Fee Approach – VFA and Premium Allocation Approach – PAA);
- the changes in the carrying amount of the insurance contracts issued per measurement component (Present Value of Cash Flows, Adjustment for Non-Financial Risks and Contractual Service Margin), broken down by basis of aggregation;
- the changes in insurance revenues and contractual service margin of insurance contracts issued allocated according to contracts outstanding at the time of transition to IFRS 17, broken down by basis of aggregation;
- measurement components of insurance contracts issued recognised during the year, broken down by basis of aggregation;
- contractual service margin broken down by expected timing of recognition in the income statement;
- development of claims gross and net of reinsurance (Non-Life Segment only).

For the methodological choices adopted by the Group, see Part A - Accounting Policies.

Below is a summary table of the changes reported in the section below, with the related reconciliation with the financial statement captions.

(millions of euro)

	31.12.2024	31.12.2023
80. INSURANCE ASSETS		
a) Insurance contracts issued that are assets	**444**	**412**
of which 11.1 Change in the book value of insurance contracts issued – GMM or VFA – liabilities for remaining coverage and incurred claims – Insurance contracts issued with direct participation features – Life Segment	*12*	*37*
of which 11.1 Change in the book value of insurance contracts issued – GMM or VFA – liabilities for remaining coverage and incurred claims – Insurance contracts issued without direct participation features – Life Segment	*1*	*1*
of which 11.1 Change in the book value of insurance contracts issued – GMM or VFA – liabilities for remaining coverage and incurred claims – Insurance contracts issued without direct participation features – Non-Life Segment – Non-Motor	*125*	*128*
of which 11.2 Change in the book value of insurance contracts issued – PAA – liabilities for remaining coverage and incurred claims – Non-Life Segment – Motor	*101*	*90*
of which 11.2 Change in the book value of insurance contracts issued – PAA – liabilities for remaining coverage and incurred claims – Non-Life Segment – Non-Motor	*205*	*156*
110. INSURANCE LIABILITIES		
a) Insurance contracts issued that are liabilities	**126,013**	**119,674**
of which 11.1 Change in the book value of insurance contracts issued – GMM or VFA – liabilities for remaining coverage and incurred claims – Insurance contracts issued with direct participation features – Life Segment	*123,671*	*117,249*
of which 11.1 Change in the book value of insurance contracts issued – GMM or VFA – liabilities for remaining coverage and incurred claims – Insurance contracts issued without direct participation features – Life Segment	*711*	*758*
of which 11.1 Change in the book value of insurance contracts issued – GMM or VFA – liabilities for remaining coverage and incurred claims – Insurance contracts issued without direct participation features – Non-Life Segment – Non-Motor	*590*	*594*
of which 11.2 Change in the book value of insurance contracts issued – PAA – liabilities for remaining coverage and incurred claims – Non-Life Segment – Motor	*183*	*171*
of which 11.2 Change in the book value of insurance contracts issued – PAA – liabilities for remaining coverage and incurred claims – Non-Life Segment – Non-Motor	*858*	*902*

[175] The bases of aggregation for insurance contracts issued consist of (i) Insurance contracts issued with direct participation features - Life Segment; ii) Insurance contracts issued without direct participation features - Life Segment; iii) Investment contracts issued with discretionary participation features - Life Segment; iv) Insurance contracts issued without direct participation features - Non-Life Segment – Motor; and v) Insurance contracts issued without direct participation features - Non-Life Segment – Non-Motor. For the tables in which the opening of the life segment is required for the bases of aggregation i) and iii), the ISP Group has decided, in line with the provisions of ISVAP Regulation no. 7 of 13 July 2007, to also include the “Investment contracts issued with discretionary participation features” in the “Insurance contracts issued with direct participation features - Life segment” basis of aggregation.

11.1 Changes in the carrying amount of insurance contracts issued – General Measurement Model (GMM) or Variable Fee Approach (VFA) – liabilities for remaining coverage and incurred claims

2. Insurance contracts issued that are assets	-12	-	-	-12	-37	-	-	-37
3. Net carrying amount as at 31 December	**122,790**	**119**	**750**	**123,659**	**116,463**	**135**	**614**	**117,212**

To improve the disclosure provided in the table, in the “loss” column, only the component of loss was presented, not the entire liability for the remaining coverage it refers to. The comparative figures as at 31 December 2023 were changed as a result.

The increase in insurance liabilities on 31 December 2023 is mainly attributable to:
– a decrease in the capital gains on FVOCI securities (caption E.1.2) to be recognised to customers, mainly as a result of the reduction of the interest rate curve (the portfolio is primarily fixed-rate);
– positive net inflows for 208 million euro.

In accordance with the requirements of paragraph 97 of IFRS 17, the ISP Group has used the Premium Allocation Approach (PAA) for types of insurance contracts that have a duration of 12 months or less and for which the measurement of the liability using the PAA generates results in line with those obtained from the application of the General Measurement Model (GMM). In addition, no adjustment to reflect the time value of money and financial risk has been considered in the measurement of the liability, because the financing component is considered to be not significant. For the recognition of the acquisition costs, it was decided not to use the option provided for annual contracts in paragraph 59(a) of IFRS 17. These costs have been recognised on an accrual basis in accordance with paragraph B.125 of the Standard.

11.3 Changes in the carrying amount of insurance contracts issued broken down by measurement component

In 2024 capital was affected by the annulment of 479,128,488 ordinary shares following the purchase of own shares in the period from 3 June to 18 October 2024 in execution of the buyback plan announced to the market on 27 May 2024. During that period, a total of 479,128,488 shares with no par value were purchased, equal to around 2.62% of the pre-annulment share capital, at an average purchase price per share of 3.5481 euro, for a total value of 1,699,999,992.53 euro. The shares were annulled on 23 October. As a result of the annulments, the share capital changed its composition, due to the reduction in the number of shares constituting it, while its amount remained unchanged at 10,368,870,930.08 euro.

The caption "Purchase of own shares" includes purchases to service the free incentive plan for personnel. The programme was launched on 9 September 2024 and ended on 11 September 2024, resulting in the purchase of 21,000,000 ordinary shares of the Bank at an average purchase price per share of 3.7154 euro for a total amount of 78,023,430.57 euro. The Parent Company alone purchased 10,301,330 shares at an average purchase price per share of 3.7146 euro, for a total amount of 38,265,555.39 euro. The purchase transactions were executed in compliance with the provisions included in Articles 2357 and following and 2359-bis and following of the Italian Civil Code and within the limits determined in the resolutions passed by the Shareholders' Meeting of Intesa Sanpaolo of 24 April 2024.

13.3 Share capital: other information

The share capital of Intesa Sanpaolo as at 31 December 2024 amounted to 10,369 million euro, divided into 17,803,670,501 ordinary shares, with no par value. Each ordinary share gives the right to one vote in the Shareholders' Meeting. The share capital is fully paid-in. As at 31 December 2024, the Group holds treasury shares of Intesa Sanpaolo of 179 million euro, of which approximately 80 million euro attributable to the Parent Company and the remaining 99 million euro to the other Group companies.

13.4 Reserves from retained earnings: other information

Group reserves amounted to 12,343 million euro and included the legal reserve, extraordinary reserve, concentration reserves (Law 218 of 30 July 1990, art. 7, par. 3 and Law 218 of 30 July 1990, art. 7) and other reserves, as well as the consolidation reserve.
The legal reserve, set up as provided for by law, must be at least one fifth of share capital; in the past it was set up by allocating each year at least one twentieth of net income for the year. Should the reserve decrease, it must be reintegrated by allocating at least one twentieth of net income for the year.
Concentration reserves under Law 218 of 30 July 1990 were set up at the time of reorganisations or concentrations carried out pursuant to the aforementioned law.
Other reserves included reserves pertaining to international branches and other reserves set up in the past following specific legal provisions.
Consolidation reserves were generated following the elimination of the book value of equity investments against the corresponding portion of the shareholders' equity of each investment.
The valuation reserves amounted to a negative figure of 2,332 million euro and included valuation reserves for assets measured at fair value through other comprehensive income of -2,242 million euro, valuation reserves pertaining to insurance companies of -297 million euro, reserves for cash flow hedges of -119 million euro, exchange rate valuation reserves (relating to fully consolidated equity investments) of -1,490 million euro, reserves relating to the hedging of foreign investments of -10 million euro, reserves for revaluations of property and equipment and legally-required revaluation reserves of 2,159 million euro, valuation reserves relating to financial liabilities designated at fair value through profit or loss (changes in the Group's own credit rating) of -190 million euro, as well as the negative reserve on actuarial profits (losses) from defined benefit pension plans of -178 million euro, in addition to approximately 35 million euro of valuation reserves connected to minority equity investments.

Note regarding contractual clauses of financial payables

In relation to point 3: "IFRS 7 – Contractual clauses of financial payables", of Bank of Italy/Consob/Isvap document no. 4 of March 2010, the following is specified:

– there were no cases of non-compliance by Intesa Sanpaolo Group companies with the relative contractual clauses set forth in bond issues, medium-/long-term loans received from financial entities and other debt contracts, which involved or which could involve the application of acceleration clauses;
– bond issues, medium-/long-term loans received from Supranational Organisations and other debt contracts of Intesa Sanpaolo Group companies may contain standard negative pledges and covenants based on current practice.

Due to the nature of commitments undertaken, in line with market practices, and the remote probability of default, these clauses may be considered as immaterial.

6. Financial assets subject to offsetting in the financial statements or subject to master netting arrangements or similar agreements

IFRS 7, amended in 2013, requires specific disclosure for financial instruments that have been offset in the Balance Sheet pursuant to IAS 32 or that may be potentially offset, upon occurrence of specific conditions, but are recognised in the Balance Sheet without any netting since they are regulated by "master netting arrangements or similar agreements" that do not respect all of the criteria set forth by IAS 32, paragraph 42.
In this respect, the Intesa Sanpaolo Group has netting arrangements in force that meet the requirements envisaged by IAS 32, paragraph 42, for netting in the financial statements.
In terms of instruments that may be potentially offset upon occurrence of such events and to be presented in Tables 6 and 7, it is noted that the Intesa Sanpaolo Group uses bilateral netting arrangements that allow, in the event of counterparty default, the netting of claims and obligations in relation to financial and credit derivatives, as well as securities financing transactions (SFTs). In particular, there are ISDA agreements (for transactions in derivatives), GMRAs (for repurchase agreements) and GMSLAs (for securities lending).
With regard to securities lending transactions, only those transactions that require the payment of a cash guarantee fully available to the lender must also be reported in tables 6 and 7, as this is the only type of transaction recognised in the Balance Sheet. The Intesa Sanpaolo Group did not have any such transactions as at 31 December 2021.
For the purposes of preparing the tables and in compliance with the provisions of IFRS 7 and the new provisions that govern the financial statements of banks, the following are noted:
- the effects of the potential offsetting of the balance sheet values of financial assets and liabilities are indicated under column (d) "Financial instruments", together with the fair value of financial collateral consisting of securities;
- the effects of the potential offsetting of the exposure with the relative cash collateral are included under column (e) "Cash deposits received/pledged as collateral";
- repurchase agreement transactions are recognised in the tables based on the amortised cost measurement criterion, while the relative collateral is measured at fair value;
- derivatives transactions are recognised at fair value.

These effects are calculated for each individual counterparty included in a master netting arrangement, to the extent of the exposure indicated in column (c).

Based on the preparation methods indicated above, the netting arrangements between financial instruments and the relative collateral permit a significant reduction in credit/debt exposure to the counterparty, as indicated under column (f) “Net amount”.

8. Securities lending transactions

The securities lending accessory banking service, offered mainly by the Parent Company and by Intesa Sanpaolo Private Banking (ISPB) to their customers (natural persons, legal entities and commercial entities), is worth mentioning. The contract involves transfer of the ownership of a certain quantity of securities of a specific type, with the obligation for ISPPB to return them, paying a consideration amount as remuneration for their availability. The transaction involves government bonds that ISPPB in turn transfers to the Parent Company Intesa Sanpaolo for non-speculative purposes.
As at 31 December 2024, the collateral of transactions mainly referring to ISPPB amounted to 93 million euro.

9. Disclosure on joint-control assets

With regard to the disclosure required in this paragraph, the Intesa Sanpaolo Group holds a stake in Mooney Group S.p.A. as a material jointly controlled entity. For details concerning this entity, please refer to section 7 of Assets.

Part C – Information on the consolidated income statement

SECTION 1 – INTEREST – CAPTIONS 10 AND 20

1.1. Interest and similar income: breakdown

(millions of euro)

Captions/Types	Debt securities	Loans	Other transactions	2024	2023

of which: interest income on financial lease	*X*	*427*	*X*	*427*	*437*

Interest and similar income also includes interest income on debt securities relating to repurchase agreements.
Interest on impaired financial assets also includes interest due to the passing of time, equal to 168 million euro relating to customers (time value) which came to 172 million euro in 2023.
The caption “Hedging derivatives” includes the differentials on hedging transactions, which adjust interest income recognised on hedged financial instruments.
“Financial liabilities” include residual interest on funding transactions with negative rates.
Finally, the caption “Financial assets measured at amortised cost”, sub-caption “Due from banks”, includes interest on “on demand” loans due from banks and central banks classified in the balance sheet to the caption “Cash and cash equivalents”.

The total amount of the Interest and similar income as at 31 December 2024 of 34,602 million euro (32,525 million euro as at 31 December 2023) consisted of 31,700 million euro for the “Banking Group”, 2,469 million euro for the “Insurance Companies”, and 433 million euro for the “Other companies”; as at 31 December 2023, these amounts were 29,652 million euro, 2,457 million euro and 416 million euro respectively. The details for the “Banking Group” and “Insurance Companies” are provided below.

Total	**28,232**	**60,345**	**-31,313**	**-57,182**	**493**

Profits and losses on Financial assets held for trading are shown for each single purchase or sale, in line with the method of accounting recognition used by the Bank, and include the results of both long and short positions.
"Net result" includes profits, losses, revaluations and write-downs on currency transactions and currency and gold derivatives.

The net result of the exchange differences on Financial assets and liabilities, reported in sub-caption 3, is connected to the result of sub-caption 4.1 relating to Derivatives - Financial derivatives on currencies and gold, which includes the results of the related operational hedges taken out by the Bank on foreign exchange risk using financial trading derivatives. Similarly, the result in Financial derivatives on debt securities and interest rates should be viewed in conjunction with the results of the Financial assets held for trading in Debt securities and Financial liabilities held for trading in Payables (short selling of securities) respectively, as these transactions are operationally linked to each other.
Regarding structured credit products and their impact on the income statement, for detailed information please refer to Part E of these Notes to the consolidated financial statements - Information on risks and relative hedging policies.

Below is the breakdown by "Banking Group" and "Insurance Companies", which together account for all of this caption.

4.1 Profits (Losses) on trading: breakdown (of which: Banking Group)

(millions of euro)

Transactions/Income components	Revaluations	Profits on trading	Write-downs	Losses on trading	Net result
1. Financial assets held for trading	**442**	**621**	**-299**	**-564**	**200**

SECTION 5 – FAIR VALUE ADJUSTMENTS IN HEDGE ACCOUNTING - CAPTION 90

5.1 Fair value adjustments in hedge accounting: breakdown

(millions of euro)

Income component/Amount	2024	2023
A. Income from:		
A.1 fair value hedge derivatives	4,305	7,172
A.2 financial assets hedged (fair value)	2,968	7,297
A.3 financial liabilities hedged (fair value)	215	19
A.4 cash flow hedge: derivatives	-	-
A.5 currency assets and liabilities	14	8
Total income from hedging (A)	**7,502**	**14,496**
B. Expenses for		
B.1 fair value hedge derivatives	-4,022	-8,001
B.2 financial assets hedged (fair value)	-837	-115
B.3 financial liabilities hedged (fair value)	-2,621	-6,431
B.4 cash flow hedge: derivatives	-1	-
B.5 currency assets and liabilities	-14	-8
Total expense from hedging (B)	**-7,495**	**-14,555**
C. Fair value adjustments in hedge accounting (A - B)	**7**	**-59**
of which: fair value adjustments in hedge accounting on net positions	*-*	*-*

This caption mainly relates to the “Banking Group”.
The Group has exercised the option, provided for on the introduction of IFRS 9, of continuing to fully apply the provisions of IAS 39 on hedge accounting (in the carved-out version endorsed by the European Commission) for each type of hedge (both for micro hedges and macro hedges). For this reason, table “5.1 Fair value adjustments in hedge accounting: breakdown”, contains no amounts in the row “of which: profits (losses) on hedges of net positions” envisaged for parties that apply IFRS 9 also to hedges.

SECTION 6 – PROFITS (LOSSES) ON DISPOSAL OR REPURCHASE - CAPTION 100

6.1 Profits (Losses) on disposal or repurchase: breakdown

(millions of euro)

Captions/Income components	2024			2023		
	Profits	Losses	Net result	Profits	Losses	Net result

1.2 Loans to customers	*216*	*-151*	*65*	*199*	*-257*	*-58*
2. Financial assets measured at fair value through other comprehensive income	368	-358	10	429	-874	-445
2.1 Debt securities	*368*	*-356*	*12*	*429*	*-838*	*-409*
2.2 Loans	*-*	*-2*	*-2*	*-*	*-36*	*-36*
Total assets (A)	**591**	**-531**	**60**	**633**	**-1,136**	**-503**
B. Financial liabilities valued at amortized cost						
1. Due to banks	26	-25	1	1	-1	-
2. Due to customers	-	-7	-7	-	-	-
3. Securities issued	87	-84	3	50	-14	36
Total liabilities (B)	**113**	**-116**	**-3**	**51**	**-15**	**36**

Below is the breakdown by “Banking Group” and “Insurance Companies”, which together account for all of this caption.

6.1 Profits (Losses) on disposal or repurchase: breakdown (of which: Banking Group)

(millions of euro)

Captions/Income components	2024			2023		
	Profits	Losses	Net result	Profits	Losses	Net result
A. Financial assets						
1. Financial assets measured at amortised cost	223	-173	50	204	-262	-58
1.1 Due from banks	*7*	*-22*	*-15*	*5*	*-5*	*-*
1.2 Loans to customers	*216*	*-151*	*65*	*199*	*-257*	*-58*
2. Financial assets measured at fair value through other comprehensive income	326	-88	238	379	-200	179
2.1 Debt securities	*326*	*-86*	*240*	*379*	*-164*	*215*
2.2 Loans	*-*	*-2*	*-2*	*-*	*-36*	*-36*
Total assets (A)	**549**	**-261**	**288**	**583**	**-462**	**121**
B. Financial liabilities valued at amortized cost						
1. Due to banks	26	-25	1	1	-1	-
2. Due to customers	-	-7	-7	-	-	-
3. Securities issued	87	-84	3	50	-14	36
Total liabilities (B)	**113**	**-116**	**-3**	**51**	**-15**	**36**

The Net result on Financial assets measured at amortised cost in sub-caption 1.2 Loans to customers, primarily attributable to the Parent Company, mainly relates to the sale on the market of government debt securities. The sub-caption Losses, also mainly attributable to the Parent Company, relate almost entirely to loans.
The Net result on Financial assets measured at fair value through other comprehensive income in sub-caption 2.1 Debt securities, also primarily attributable to the Parent Company, relates to profits and losses mainly deriving from the sale of government debt securities.
Profits and losses on Financial assets measured at fair value through other comprehensive income, represented by debt securities, are shown for each single purchase or sale.

6.1 Profits (Losses) on disposal or repurchase: breakdown (of which: Insurance companies)

Sub-caption 2.1 Financial liabilities - Securities issued, reports the net result of the certificates which provide for partial or full redemption of the premiums paid on maturity, pursuant to Bank of Italy Communication of 21 October 2014 (certificates with guaranteed or protected capital), issued after 1 January 2020.
The revaluations and write-downs shown in the table refer to the fair value measurement of these financial instruments, calculated excluding the changes in value due to the change in own credit rating recognised in the Statement of comprehensive income (Shareholders' equity).
The Realised gains and losses relate to disbursement made to the holders of certificates where contractually provided for, as well as repurchases of certificates made by the issuer as market maker.
For information on the methods used to measure counterparty risk, reference should be made to Section A.4 – Information on fair value of the Notes to the consolidated financial statements.

7.1 Net change in the value of other financial assets and liabilities measured at fair value through profit or loss: breakdown of financial assets and liabilities designated at fair value (of which: Insurance companies)

(millions of euro)

Transactions/Income components	Revaluations	Gains on disposal	Write-downs	Losses on trading	Net result

SECTION 9 – PROFITS/LOSSES FROM CHANGES IN CONTRACTS WITHOUT DERECOGNITION – CAPTION 140

9.1 Profits (Losses) from changes in contracts: breakdown

Within the profits (losses) from changes in contracts without derecognition, losses of 28 million euro were recognised, entirely attributable to the "Banking Group". In 2023, the losses amounted to 29 million euro.

SECTION 10 – INSURANCE SERVICE RESULT - CAPTION 160

Section 10 includes the tables in line with the indications of IVASS, based on the updates to Regulation 7 of 13 July 2007, directly applicable also pursuant to Circular 262/2005, for the disclosure required by IFRS 17 for insurance contracts pertaining to consolidated insurance companies.
In particular, the tables report the insurance income and expenses attributable to the insurance companies broken down by basis of aggregation.

10.1 Insurance income and expenses from insurance contracts issued - Breakdown

Other information

There is no other information to be noted in addition to the above.

SECTION 11 – BALANCE OF FINANCE INCOME/EXPENSES RELATING TO INSURANCE BUSINESS – CAPTION 170

Section 11 includes the tables in line with the indications of IVASS, based on the updates to Regulation 7 of 13 July 2007, directly applicable also pursuant to Circular 262/2005, for the disclosure required by IFRS 17 for insurance contracts pertaining to consolidated insurance companies.
In particular, the tables report the finance income and expenses attributable to insurance companies broken down by basis of aggregation.

11.1 Net finance income and expenses from insurance contracts issued

(millions of euro)

Captions/Aggregation bases	31.12.2024				31.12.2023			
	Basis A1	Basis A2	Basis A3	Total	Basis A1	Basis A2	Basis A3	Total
1. Interest accreted	-	-1	-4	-5	-	-2	-3	-5
2. Effects of changes in interest rates and other financial assumptions	-	-2	-6	-8	-	-	-8	-8

A.2 Net gains/losses on assets measured at fair value through profit or loss	7,713	*3,169*	-	7,713	5,926	*2,858*	2	5,928
A.3 Net losses/recoveries for credit risk	30	*15*	-	30	-29	*-15*	-	-29
A.4 Other net income/expenses	925	*341*	-25	900	445	*276*	-31	414
A.5 Net gains/losses on financial assets measured at fair value through other comprehensive income	1,551	*751*	27	1,578	4,450	*2,446*	84	4,534
B. NET CHANGE IN INVESTMENT CONTRACTS ISSUED UNDER IFRS 9	**-4,340**	***-***	**-**	**-4,340**	**-2,820**	***-450***	**-**	**-2,820**
C. TOTAL NET GAINS/LOSSES ON INVESTMENTS	**8,289**	***5,438***	**61**	**8,350**	**10,388**	***6,444***	**96**	**10,484**
of which: recognised in profit or loss	6,738	*4,687*	34	6,772	5,938	*3,998*	12	5,950
of which: recognised in other comprehensive income	1,551	*751*	27	1,578	4,450	*2,446*	84	4,534

Of which: DPF (Direct Participation Features) = Insurance contracts issued with direct participation features
Investment contracts issued IFRS 9 = Investment contracts issued without discretionary participation features

The net financial result of the insurance segment was a positive amount of 8,350 million euro as at 31 December 2024, compared to amount of 10,484 million euro as at 31 December 2023. The performance was mainly attributable to the investment components, primarily at fixed-rate, which were affected by the market environment characterised by the decrease of interest rates in 2024.

11.4 Insurance business - Summary of profit and loss results broken down by life segment and non-life segment

(millions of euro)

Other information

There is no other information to be noted in addition to the above.

SECTION 12 - ADMINISTRATIVE EXPENSES - CAPTION 190

12.1 Personnel expenses: breakdown

(millions of euro)

Type of expense	2024	2023
1) Employees	**7,387**	**6,744**
a) wages and salaries	4,794	4,692
b) social security charges	1,208	1,192
c) termination indemnities	36	47
d) supplementary benefits	8	10
e) provisions for termination indemnities	27	31
f) provisions for post-employment benefits	12	14
- defined contribution plans	*-*	*-*
- defined benefit plans	*12*	*14*
g) payments to external pension funds	397	361
- defined contribution plans	*394*	*358*
- defined benefit plans	*3*	*3*
h) costs from share based payments	148	158
i) other benefits in favour of employees	757	239
2) Other non-retired personnel	**19**	**20**
3) Directors and statutory auditors	**16**	**17**
4) Early retirement costs	**-**	**-**
Total	**7,422**	**6,781**

This caption does not include the expenses for the personnel of the insurance sector and the personnel of the distribution networks dedicated to the distribution of insurance products, which in application of IFRS 17, are allocated to caption “160. Insurance service result”.

It should be specified that sub-caption 3) “Directors and statutory auditors” includes remuneration to members of the Board of Directors of the Parent Company and members of the Board of Directors and the Board of Statutory Auditors of the various Group companies.

12.2 Average number of employees by categories

	2024	2023
Personnel employed	**88,215**	**88,500**
a) managers	1,829	1,792
b) total officers	34,169	34,315
c) other employees	52,217	52,393
Other personnel	**120**	**99**
TOTAL	**88,335**	**88,599**

In 2024, the average number of employees (with part-time employees calculated, per standard practice, at 0.5) was slightly down on 2023 mainly due to the application of the provisions agreements over the two years.

12.3 Post-employment defined benefit plans: costs and revenues

(millions of euro)

	2024			2023		
	Employee Termination Indemnities	Internal plans	External plans	Employee Termination Indemnities	Internal plans	External plans
Current service cost	-4	-2	-9	-4	-2	-7
Interest expense	-23	-14	-32	-27	-12	-35
Interest income	-	5	29	-	4	31
Reimbursement from third parties	-	-	-	-	-	-
Past service cost	-	-	1	-	-	-
Curtailment of the fund	X	-	-	X	-	-
Settlement of the fund	X	-	-	X	-	-

This table illustrates the economic components referred to “Employee termination indemnities” – caption 90 of Balance sheet liabilities and “Allowances for risks and charges - post employment benefits” – caption 100b of Balance sheet liabilities.

12.4 Other benefits in favour of employees

This caption had a balance of 757 million euro in 2024 and mainly related to charges for exit incentives for personnel including those relating to the agreement signed with the trade unions on 23 October 2024. The caption also includes healthcare contributions, the canteen contributions including meal vouchers, as well as the adjustment of seniority bonuses.

12.5 Other administrative expenses: breakdown

(millions of euro)

Type of expense/Amount	2024	2023
Expenses for maintenance of information technology and electronic equipment	748	768
Telephonic, teletransmission and transmission expenses	60	63
Information technology expenses	**808**	**831**
Rentals and service charges - real estate	37	45
Security services	43	42
Cleaning of premises	46	47
Expenses for maintenance of real estate assets furniture and equipment	73	68
Energy costs	128	177
Property costs	7	8
Management of real estate assets expenses	**334**	**387**
Printing, stationery and consumables expenses	25	24
Transport and related services expenses (including counting of valuables)	90	78
Information expenses	261	247
Postal and telegraphic expenses	49	50
General structure costs	**425**	**399**
Expenses for consultancy fees	158	135
Legal and judiciary expenses	103	114
Insurance premiums - banks and customers	56	54
Professional and legal expenses	**317**	**303**
Advertising and promotional expenses	**207**	**190**
Services rendered by third parties	**403**	**336**
Indirect personnel costs	**174**	**170**
Other costs	**198**	**230**
Contributions to resolution funds and guarantee schemes	**435**	**696**
Taxes and duties	**1,312**	**1,217**
Recovery of taxes and duties	**-7**	**-7**
Recovery of other expenses	**-31**	**-28**
Total	**4,575**	**4,724**

This caption does not include the other administrative expenses of the insurance sector and of the distribution networks attributable to the management and distribution of insurance products, which in application of IFRS 17, are allocated to caption “160. Insurance service result”.

The amount of the sub-caption Rentals and service charges - real estate relates to contracts with a total lease term of 12 months or less and to contracts with a value of the underlying asset, when new, of 5,000 euro or less ("low value"). In such cases, as allowed by IFRS 16, the lease payments for these lease contracts are recognised as an expense on a straight-line basis for the contract term.

The sub-caption "Contributions to resolution funds and guarantee schemes" includes 83 million euro of contributions to the formation of the Insurance Guarantee Fund for life insurance policies in line with Law no. 213 of 30 December 2023, accounted for according to IFRIC 21 "Levies" as per the guidance provided by IVASS in the letter to the market dated 18 December 2024. As at 31 December 2023 the amount included 323 million euro in charges related to the European Resolution Fund. This fund for the banking union EU countries is currently in funded status.

SECTION 13 - NET PROVISIONS FOR RISKS AND CHARGES - CAPTION 200

13.1 Net provisions for credit risk associated with loan commitments and financial guarantees given: breakdown

(millions of euro)

	Provision	Reallocations	Net provision
Stage1	-122	90	-32
Stage2	-84	85	1
Stage3	-123	74	-49
Total	**-329**	**249**	**-80**

This caption refers entirely to the "Banking Group".

13.2 Net provisions associated with other commitments and other guarantees given: breakdown

With regard to net provisions associated with other commitments and other guarantees given, there were no amounts as at 31 December 2024.

13.3 Net provisions for other risks and charges: breakdown

(millions of euro)

	Provisions	Reallocations	Net provision
Net provisions for legal and tax disputes	-168	76	-92
Net provisions for other personnel charges	-	-	-
Net provisions for risks and charges	-540	45	-495
Total	**-708**	**121**	**-587**

"Net provisions for risks and charges", which amounted to a negative 587 million euro, recorded the provisions attributable to the year relating to legal and tax disputes and other risks and charges, net of reallocations. This caption consists of 544 million euro for the "Banking Group" and 43 million euro for the "Other Companies".

The sub-caption "Net provisions for legal disputes" includes provisions for legal disputes, including bankruptcy claw-back actions and other disputes, net of releases for the year.

The caption "Other net provisions for risks and charges" includes 263 million euro for the provision made upon consolidation of the investee Banca Intesa Russia, aimed at eliminating its equity contribution to the Group's consolidated financial statements.

SECTION 14 – NET ADJUSTMENTS TO/RECOVERIES ON PROPERTY AND EQUIPMENT - CAPTION 210

14.1 Net adjustments to property and equipment: breakdown

(millions of euro)

Assets/Income components	Depreciation	Impairment losses	Recoveries	Net result
A. Property and equipment				
A.1 Used in operations	-629	-12	-	-641
- Owned	*-338*	*-12*	*-*	*-350*
- Licenses acquired through lease	*-291*	*-*	*-*	*-291*
A.2 Investment property	-	-	-	-
- Owned	*-*	*-*	*-*	*-*
- Licenses acquired through lease	*-*	*-*	*-*	*-*
A.3 Inventories	X	-6	-	-6
B. Non-current assets held for sale	X	-	-	-
Total	**-629**	**-18**	**-**	**-647**

The total amount of the Net adjustments to intangible assets as at 31 December 2024 of 647 million euro consisted of 562 million euro for the "Banking Group", 1 million euro for the "Insurance Companies", 84 million euro for the "Other Companies".

With regard to the revision of the useful life of property and equipment, see the description provided in Part A – "Accounting policies" of the Notes to the consolidated financial statements in paragraph "17. Other information - Use of estimates and assumptions in preparing financial reports".

SECTION 15 – NET ADJUSTMENTS TO/RECOVERIES ON INTANGIBLE ASSETS - CAPTION 220

15.1 Net adjustments to intangible assets: breakdown

(millions of euro)

Assets/Income components	Amortisation	Impairment losses	Recoveries	Net result
A. Intangible assets				
of which: software	*-1,021*	*-32*	*-*	*-1,053*
A.1 Owned	-1,079	-32	-	-1,111
- Internally generated	-706	-15	-	-721
- Others	-373	-17	-	-390
A.2 Rights of use acquired through the lease	-	-	-	-
B. Non-current assets held for sale	**X**	**-**	**-**	**-**
Total	**-1,079**	**-32**	**-**	**-1,111**

The total amount of the Net adjustments to intangible assets as at 31 December 2024 of 1,111 million euro consisted of 1,082 million euro for the "Banking Group", 25 million euro for the "Insurance Companies", 4 million euro for the "Other Companies".

With regard to the revision of the useful life of intangible assets, see the description provided in Part A – "Accounting policies" of the Notes to the consolidated financial statements in paragraph "17. Other information - Use of estimates and assumptions in preparing financial reports".

With regard to the method of the impairment testing for intangible assets and related impairment recognised to the income statement, see Part B – Section 10 – Intangible Assets in these Notes to the consolidated financial statements.

SECTION 16 – OTHER OPERATING EXPENSES (INCOME) - CAPTION 230

16.1 Other operating expenses: breakdown

(millions of euro)

Type of expense/Amount		
Amortisation of leasehold improvements		38
Other expenses for consumer credit and leasing transactions		16
Other expenses		564
Total	**2024**	**618**
Total	**2023**	**509**

The sub-caption "Other expenses" includes the losses arising from the trading of precious metals and gold and the results of their valuation of around 53 million euro, in addition to the amount paid to the National Resolution Fund recorded as Profit Sharing under the settlement agreement entered into by Intesa Sanpaolo S.p.A. (as the incorporating entity of UBI Banca S.p.A.) and the Bank of Italy of 130 million euro.

16.2 Other operating income: breakdown

(millions of euro)

Type of expense/Amount		
Recovery of other expenses		1,114
Income related to consumer credit and leasing		39
Rentals and recovery of expenses on real estate		22
Recovery of services rendered to third parties		12
Negative Goodwill		10
Other income		582
Total	**2024**	**1,779**
Total	**2023**	**1,419**

The caption "Negative Goodwill" relates to the acquisition of First Bank. For more details on the accounting recognition of the acquisition, see the description provided in part G of these Notes to the consolidated financial statements and Report on operations accompanying these financial statements.
The sub-caption "Other income" includes the gains from the trading of precious metals and gold and the results of their valuation of approximately 73 million euro, as well as income relating to commercial agreements signed by the Parent Company.

As required by paragraph 116 c) of IFRS 15, it is specified that revenues deriving from performance obligations satisfied in the previous years are included, amounting to 19 million euro.

SECTION 17 – PROFITS (LOSSES) ON INVESTMENTS IN ASSOCIATES AND COMPANIES SUBJECT TO JOINT CONTROL - CAPTION 250

17.1 Profits (Losses) on investments in associates and companies subject to joint control: breakdown

(millions of euro)

Income components/Sectors	2024	2023
1) Companies subject to joint control		
A. Revenues	31	2
1. Revaluations	*1*	*2*
2. Profits on disposal	*30*	*-*
3. Recoveries	*-*	*-*
4. Other	*-*	*-*
B. Charges	-32	-35
1. Write-downs	*-32*	*-35*
2. Impairment losses	*-*	*-*
3. Losses on disposal	*-*	*-*
4. Other	*-*	*-*
Net result	**-1**	**-33**
2) Investments in associates		
A. Revenues	156	344
1. Revaluations	*135*	*127*
2. Profits on disposal	*21*	*217*
3. Recoveries	*-*	*-*
4. Other	*-*	*-*
B. Charges	-187	-148
1. Write-downs	*-132*	*-57*
2. Impairment losses	*-55*	*-91*
3. Losses on disposal	*-*	*-*
4. Other	*-*	*-*
Net result	**-31**	**196**
Total	**-32**	**163**

The total amount of the Profits (Losses) on investments in associates and companies subject to joint control as at 31 December 2024 of -32 million euro (163 million euro as at 31 December 2023) consisted of 49 million euro for the “Banking Group” and -81 million euro for the “Other Companies”; as at 31 December 2023 these amounted to 217 million euro and -54 million euro respectively).

For companies subject to joint control and significant influence, revenues from recognition at equity of the equity stakes is included under Revaluations, while the charges from the recognition at equity of the equity stakes is recorded under Write-downs.

SECTION 18 - VALUATION DIFFERENCES ON PROPERTY, EQUIPMENT AND INTANGIBLE ASSETS MEASURED AT FAIR VALUE – CAPTION 260

18.1 Valuation differences on property, equipment and intangible assets measured at fair value or estimated realisable value: breakdown

(millions of euro)

Assets/Income component	Revaluations	Write-downs	Foreign exchange differences		Net result
			Positive	Negative	
A. Property and equipment	**8**	**-31**	**-**	**-**	**-23**
A.1 Used in operations:	-	-8	-	-	-8
- Owned	*-*	*-8*	-	-	*-8*
- Licenses acquired through lease	-	-	-	-	-
A.2 Investment:	8	-23	-	-	-15
- Owned	*8*	*-23*	-	-	*-15*
- Licenses acquired through lease	-	-	-	-	-
A.3 Inventories	-	-	-	-	-
B. Intangible assets	**-**	**-**	**-**	**-**	**-**
B.1 Owned:	-	-	-	-	-
B.1.1 Internally generated	-	-	-	-	-
B.1.2 Other	-	-	-	-	-
B.2 Licenses acquired through lease	-	-	-	-	-
Total	**8**	**-31**	**-**	**-**	**-23**

The total amount of the Valuation differences on property, equipment and intangible assets measured at fair value or estimated realisable value as at 31 December 2024 was -23 million euro entirely attributable to the “Banking Group”.

SECTION 19 – GOODWILL IMPAIRMENT - CAPTION 270

19.1 Goodwill impairment: breakdown

The results of impairment testing on goodwill recorded in the financial statements did not lead to adjustments in 2024. See Part A – Accounting policies for details on the means of determination of goodwill impairment.

For a description of the impairment testing methods for goodwill, reference should be made to Part B – Section 10 – Intangible Assets in these Notes to the consolidated financial statements.

SECTION 20 – PROFITS (LOSSES) ON DISPOSAL OF INVESTMENTS - CAPTION 280

20.1 Profits (Losses) on disposal of investments: breakdown

(millions of euro)

Income component/Amount	2024	2023
A. Real estate assets	**-2**	**51**
- profits on disposal	2	65
- losses on disposal	-4	-14
B. Other assets (a)	**1**	**117**
- profits on disposal	5	123
- losses on disposal	-4	-6
Net result	**-1**	**168**

(a) Included profits and losses on disposal of subsidiaries.

The total amount of Profits (Losses) on disposal of investments as at 31 December 2024 of -1 million euro is entirely attributable to the “Banking Group”. The amount of 168 million euro as at 31 December 2023 consisted of 128 million euro for the “Banking Group” and 40 million euro for the “Other Companies”. In 2023, the profits on disposal in sub-caption A. Real estate assets were mainly attributable to other companies (Risanamento S.p.A.).In 2023, the profits on disposal in sub-caption B. Other assets were mainly attributable to capital gains of 116 million euro recognised in relation to the sale of the PBZ Card acquiring business to Nexi in the first quarter.

SECTION 21 - TAXES ON INCOME FROM CONTINUING OPERATIONS - CAPTION 300

21.1 Taxes on income from continuing operations: breakdown

(millions of euro)

Income component/Amount	2024	2023
1. Current taxes (-)	-2,154	-2,173
2. Changes in current taxes of previous years (+/-)	98	84
3. Reduction in current taxes of the year (+)	4	1
3. bis Reduction in current taxes of the year for tax credits pursuant to Law no. 214/2011 (+)	470	391
4. Changes in deferred tax assets (+/-)	-1,503	-1,463
5. Changes in deferred tax liabilities (+/-)	-314	166
6. Taxes on income for the year (-) (-1+/-2+3+3bis+/-4+/-5)	**-3,399**	**-2,994**

The current taxes for the year include 17 million euro pertaining to the Top-up Tax payable by the Group's companies in accordance with the Global Minimum Tax rules.
The reduction in current taxes for the year, measured at 470 million euro, as required by the “Roneata” Letter from the Bank of Italy of 7 August 2012, shows the transformation into tax credits of the deferred tax assets pursuant to Law 214/2011 due to the tax loss of Intesa Sanpaolo S.p.A. in relation to 2024. This effect is entirely offset by the corresponding decrease in the caption Changes in deferred tax assets with the ensuing nil impact on the income statement.
The sub-caption relating to the change in deferred tax assets includes an increase of 499 million euro, which took place in the fourth quarter, relating to losses carried forward pertaining to the merged UBI Banca and Provis, and intangibles of ISP Life (merged on 1 December 2023 into Intesa Sanpaolo Vita and renamed Intesa Sanpaolo Assicurazioni S.p.A. from 1 December 2024). In addition to the above-mentioned deferred tax assets posted in the fourth quarter, 130 million euro was posted in the income statement as at 30 June connected to the payment (non-tax deductible) of the same amount to the National Resolution Fund, posted under Other income/expenses.

21.2 Reconciliation of theoretical tax charge to total income tax expense for the period

(millions of euro)

	2024	2023
Income (Loss) before tax from continuing operations	12,058	10,746
Income (Loss) before tax from discontinued operations	-	-
Theoretical taxable income	**12,058**	**10,746**

	Taxes (a)	Impact % on theoretical taxable income
Income taxes - theoretical tax charge (b)	**3,986**	**33.1**
Increase of taxes	**456**	**3.7**
Non-deductible cost	295	2.4
Other	161	1.3
Decrease of taxes	**-1,043**	**-8.6**
Effects of the participation exemption	-32	-0.3
Effects of international companies lower rates	-801	-6.6
Other	-210	-1.7
Total changes in taxes	**-587**	**-4.9**
Total income tax expense for the period	**3,399**	**28.2**
of which: - total income tax expense from continuing operations	**3,399**	**28.2**
- total income tax expense from discontinued operations	**-**	**-**

(a) Tax expenses are indicated with a positive sign and tax income with a negative sign.
(b) Includes IRES ordinary tax 24%, IRES additional rate 3.5% and IRAP weighted average rate 5.56%.

SECTION 22 – INCOME (LOSS) AFTER TAX FROM DISCONTINUED OPERATIONS CAPTION 320

22.1 Income (Loss) after tax from discontinued operations: breakdown
There was no Income (loss) after tax from discontinued operations in 2024 or 2023.

22.2 Breakdown of taxes on income from discontinued operations
There were no taxes on income from discontinued operations in 2024 or 2023.

SECTION 23 – MINORITY INTERESTS - CAPTION 340

23.1 Breakdown of caption 340 Minority interests

(millions of euro)

		31.12.2024	31.12.2023
Investments in consolidated companies with significant minority interests			
1	Bank of Alexandria S.A.E.	-31	-24
2	Vub Generali Dochodkova Spravcovska Spolocnost, A.S.	-2	-
3	Alpian S.A.	6	-
4	Reyl & CIE S.A.	10	-
5	Risanamento S.p.A.	25	-
6	Intesa Sanpaolo RBM Salute S.p.A.	-	-2
7	InSalute Servizi S.p.A.	-	-1
Other investments		-1	-1
TOTAL		**7**	**-28**

With regard to Intesa Sanpaolo RBM Salute S.p.A., on 19 November 2024 the merger deed was signed for its merger by incorporation into Intesa Sanpaolo Assicura S.p.A. (which was renamed “Intesa Sanpaolo Protezione S.p.A.”).

SECTION 24 – OTHER INFORMATION
There is no information further to that already provided in the previous sections.

SECTION 25 – EARNINGS PER SHARE

Earnings per share

	Ordinary shares	
	31.12.2024	31.12.2023
Weighted average number of outstanding shares (*)	18,017,340,115	18,370,426,095
Income attributable (millions of euro)	8,666	7,724
Basic EPS (euro)	0.48	0.42
Diluted EPS (euro)	0.48	0.42

(*) The weighted average number of outstanding shares is calculated excluding repurchased treasury shares.

25.1 Average number of ordinary shares (fully diluted)
The diluted earnings per share is equal to the basic earnings per share because no potential ordinary shares with dilutive effect were identified.

25.2 Other information
There is no other information to be provided.

Part D – Consolidated comprehensive income

(millions of euro)

Statement of comprehensive income		2024	2023
10.	**Net income (loss)**	**8,659**	**7,752**
	Other comprehensive income that may not be reclassified to the income statement	**133**	**-133**

250.	**Total consolidated comprehensive income pertaining to the Parent Company**	**8,342**	**8,115**

Part E – Information on risks and relative hedging policies

INTRODUCTION

In this Part E, the qualitative and quantitative disclosure is presented according to the order established by Bank of Italy Circular 262, which specifically regulates not only the format of the tables but also the sequence of the various topics, except for the section relating to market risks in relation to the application of internal models.
As an accompaniment to the disclosure on the control actions and main accounting issues related to the Russia-Ukraine risk contained in the introductory chapter of the Report on Operations, this Part E, within the comments on credit risk, provides a detailed description of the exposures to Russia and Ukraine, together with an examination of the related valuation aspects, with particular regard to the choices made for the calculation of ECLs on cross-border exposures.
The paragraph “Basic principles” below provides information on the limited impacts, where present, connected to the ongoing conflict with respect to the other main types of risk.

Basic principles

The Intesa Sanpaolo Group attaches great importance to risk management and control, as condition to ensure a reliable and sustainable value creation in a context of controlled risk.
The risk management strategy aims to achieve a complete and consistent overview of risks, considering both the macroeconomic and geopolitical scenario and the Group’s risk profile, stimulating the growth of the risk culture and enhancing a transparent and accurate representation of the riskiness of the Group’s portfolios.
The Risk-taking strategies are summarised in the Group’s Risk Appetite Framework (RAF), approved by the Board of Directors. The RAF is established to ensure that risk-taking activities remain in line with shareholders’ expectations, taking into account the Group’s risk position and the economic situation. The framework defines both the general risk appetite principles and the control of the overall risk profile and the main specific risks.
The general principles that govern the Intesa Sanpaolo Group’s risk-taking strategy may be summarised as follows:

- the Group is a Banking Financial Conglomerate focused on a commercial business model where domestic retail activities remain the Group’s structural strength, and include not only banking products and investment services, but also insurance and wealth management solutions tailored to the Group’s customers;
- the Group’s goal is not to eliminate risks, but to understand and manage them in such a way as to guarantee adequate returns on the risks taken and guarantee soundness and business continuity over the long term;
- the Group has a low risk profile in which capital adequacy, profits stability, a sound liquidity position and a strong reputation are the key strengths for maintaining its current and prospective profitability;
- the Group aims for a capitalisation level in line with its main European peers;
- the Group intends to maintain strict control over the risks arising from its activities;
- the Group devotes particular effort to the continuous strengthening of its risk culture as a fundamental instrument to promote sound risk-taking and ensure that risk-taking activities exceeding its risk appetite are recognised, assessed, escalated and addressed in a timely manner;
- to guarantee the sustainability of its operating model over the long-term, the Group attributes particular emphasis to monitoring and controlling non-financial risks, model risk, reputational risks and Environmental, Social and Governance (ESG) and climate change risks. With specific regard to the latter, Intesa Sanpaolo recognises the strategic importance of ESG factors and the urgency of limiting climate change, and is committed to including the impact of these aspects in strategic decision-making processes and to fully integrate them into its risk management framework with the goal of maintaining a low risk profile. This includes controlling how ESG risks and those connected with climate change impact existing risks (credit, operational, reputational, market and liquidity risk) and implementing high ethical and environmental standards in internal processes, products and services offered to customers and in the selection of counterparties and suppliers.

The general principles are applicable at Group level as well as at the individual entity level (business unit/legal entity). In case of an external growth, these general principles will be applied taking into consideration the specific characteristics of the business in which the target is involved and its competitive environment.
The Risk Appetite Framework thus represents the overall framework within which the management of corporate risks is developed, with the establishment of general risk appetite principles and the resulting structuring of the control of:

- the overall risk profile; and
- the Group’s main specific risks.

The control of the overall risk profile derives from the definition of general principles and is structured in the form of a framework of limits aimed at ensuring that the Group, even under severe stress conditions, complies with minimum requirements of capital adequacy, liquidity, resolvability capacity and profitability, and also contains the non-financial risks, model risk, as well as reputational risks, ESG and climate change risks within appropriate limits.

In detail, the control of the overall risk profile is aimed at maintaining adequate levels of:
- capitalisation, also in conditions of severe macroeconomic stress, in relation to both Pillar 1 and Pillar 2, by monitoring the Common Equity Ratio, the Total Capital Ratio, the Leverage Ratio, the Risk Bearing Capacity, the Solvency Ratio and the Accumulated Other Comprehensive Income (AOCI) reserve;
- liquidity, sufficient to face periods of tension, including extended ones, on the various funding markets, with regard to both the short-term and the structural situation, by monitoring the internal limits of the Liquidity Coverage Ratio, Net Stable Funding Ratio, Loan/Deposit Ratio, Asset Encumbrance ratio and Survival Period in an adverse scenario;
- stability of profits, by monitoring the net profit adjusted and the adjusted operational cost on income, which represent the main potential causes for their instability;
- resolvability capacity (Total and Subordination MREL Ratios) in order to be able to absorb any losses and restore the Group's capital position, continuing to perform its critical economic functions during and after a crisis;
- non-financial risks, in order to minimise the potential impact of negative events that jeopardise the Group's economic stability;
- model risk, with the aim of limiting the financial and reputational impacts of its portfolio of models;
- reputational, ESG and climate change risks, through active management of one's image, aiming to prevent and contain any negative effects on one's reputation and integrating aspects connected to ESG factors, including climate change, into the risk management framework.

In compliance with the applicable regulations and in particular the EBA Guidelines (EBA/GL/2021/11) concerning the "Recovery plan indicators", the Group includes asset quality, market-based and macroeconomic indicators, to ensure consistency with its Recovery Plan.

The control of the main specific risks is implemented by establishing specific limits and mitigation actions to be taken in order to limit the impact of particularly severe future scenarios on the Group. These limits and actions regard the typical risks of the Group's activities, such as credit risk, market risk and interest rate risk, as well as the most significant risk concentrations such as, for example, on single counterparties, sovereign risk and public sector risk, as well as other types of operations deemed worthy of specific attention by the Corporate Bodies (e.g. transactions exposed to valuation risk, exposure to associated entities[177]).
Within the monitoring of the specific risks, the Credit Risk Appetite (CRA) Framework, a specific Risk Appetite Framework (RAF) for credit risk, identifies areas of growth for loans and areas to be monitored, using an approach based on ratings and other predictive statistical indicators, to guide lending growth by optimising the management of risk.

The limits set in the RAF are divided into two categories, Hard Limits and Soft Limits, which differ in the escalation process triggered by their breach. In particular, with regard to the Group limits, whose governance is established in detail in the Guidelines on the Group Risk Appetite Framework, the responsibility for approving the remediation plan is assigned:
- to the Board of Directors for Hard Limits, typically set for the main metrics used to control overall risk profile (e.g. Common Equity Tier 1 ratio, Liquidity Coverage ratio, etc.);
- to the Managing Director and CEO for Soft Limits, set on the metrics used to control the main specific risks (e.g. single name concentration, concentration towards the Italian public sector, etc.).

In addition to the limits themselves, Early Warning thresholds may be defined, the exceeding of which is promptly discussed in the competent managerial committee[178].

Defining the Risk Appetite Framework is an articulated process headed by the Chief Risk Officer, which involves close interaction with the Chief Financial Officer and the Heads of the various Divisions, is developed in line with the Internal Capital Adequacy Assessment Process (ICAAP), Internal Liquidity Adequacy Assessment Process (ILAAP), Recovery Plan, Capital Plan and Liquidity Plan processes, and represents the risk framework in which the Budget and Business Plan are developed. This ensures consistency between the strategy and the risk-taking policy and the Plan and Budget process.
Within the annual RAF update process, it is possible to identify the following phases:
- definition of the scope of RAF risks: risks are identified continuously within the Group to maintain ongoing alignment with the changing internal and external context and to guarantee the adequacy of the controls and limits implemented to safeguard the Group Long term viability. The activity is formalised within the Group's Risk Identification process. The scope of RAF risks is thus defined starting with that process, paying particular attention to the evolution of the risks for which specific limits and/or risk strategy actions are deemed necessary;
- formulation of the limits proposal: in general, the RAF limits are defined according to a prudential approach. However, the criteria adopted to determine the risk limits differ depending on whether related to control of the overall Group risk or to control of the main specific Group risks;
- reconciliation between the RAF, Business Plan/Budget, Recovery Plan and Divisions operations: consistency between the RAF and the Business Plan/Budget and other processes is sought in all phases of the related preparation procedures

[177] With regard to "Associated Entities", see the "Group Procedures regulating the conduct of transactions with Related Parties of Intesa Sanpaolo S.p.A. and Associated Entities of the Group", which set out the rules on relationships with parties with special elements of "proximity" to the decision-making centres of the Bank and the Banking Group, classified as Associated Entities, in compliance with the provisions issued on this matter by the Bank of Italy and in line with the CONSOB requirements. In that context, within the Risk Appetite Framework, at least once a year specific plafonds of Group exposure are proposed to the Board of Directors by involving the Parent Company structures concerned. Those plafonds, defined in line with the applicable limits, are broken down into sub-limits of exposure, divided among the Parent Company structures concerned and each Group company, considering the credit, equity and financial components of the market.

[178] The competent Managerial Committee varies according to the RAF metrics considered:
- for model risk metrics, the responsibility lies with the Credit Risk and Pillar 2 Internal Models Committee;
- for non-financial risks and reputational risk metrics, the responsibility lies with the Group Control Coordination and Non-Financial Risks Committee;
- for the metrics related to liquidity, market, interest rate for banking book, equity participation, structural foreign exchange and insurance risks metrics, the responsibility lies with the Group Financial Risks Committee;
- for the metrics of capital adequacy, resolvability capacity, stability of profits, ESG & climate change, asset quality, credit risk, country risk, wealth management metrics and for all those metrics not explicitly indicated in the points above, the responsibility lies with the Steering Committee.

through a process of mutual consultation and dialogue that lasts for several months, involving not only the structures of the Chief Risk Officer Governance Area, the Chief Financial Officer Governance Area, and the Chief Sustainability Officer Governance Area, for its area of responsibility, but also the Business Divisions/Structures;
– approval of the RAF: in line with the provisions of the applicable regulations, the Board of Directors defines and approves the risk objectives, the tolerance threshold (where identified) and the risk governance policies.

The RAF is updated annually in preparation for the Annual Budget and/or the Business Plan. During the year, when significant events occur, such as exceptional changes in the market context in which the Group operates, significant changes in the configuration of the Group and/or its strategy or based on direct instructions from the Board of Directors, also through the Risks and Sustainability Committee, the Chief Risk Officer Governance Area assesses whether the RAF is still adequate and, if necessary, proposes partial or full revisions to the framework.
The definition of the RAF and the consequent operational limits for the main specific risks, the use of risk measurement instruments in credit management and operational risk control processes, the use of capital-at-risk measures for corporate performance reporting and assessment of the internal capital adequacy of the Group represent fundamental milestones in the operational application of the risk strategy defined by the Board of Directors along the Group's entire decision-making chain, down to the single operational units and to the single desks.
The Group sets out these general principles in policies, limits and criteria applied to the various risk categories and business areas, in a comprehensive framework of limits and procedures for governance and control.

As part of correct risk assessment and the development of an adequate system of monitoring and control to mitigate them, the Chief Risk Officer, with the support of the Chief Compliance Officer and the Chief Governance, Operating & Transformation Officer, where envisaged, conducts a preventive risk assessment of Most Significant Transactions (MSTs) – understood as transactions of particular importance of the proprietary type or with individual customers or counterparties or that could potentially have a significant impact on the overall risk profile and/or on specific risks of the Group, as defined in the RAF – in order to ensure the assumption of a risk level acceptable for the Group and in line with the RAF. The MST governance model also requires the Chief Risk Officer to report every six months to the Corporate Bodies on the activities performed.

The assessment of the Group's capital adequacy and liquidity profiles is conducted annually with the ICAAP and the ILAAP, which represent self-assessment processes according to the Group's internal rules, the results of which are then also discussed and analysed by the Supervisor.
With regard to the ICAAP, in accordance with the ECB requirements, the capital adequacy self-assessment process incorporates two complementary perspectives, both of which are analysed from an actual perspective and, on a prospective basis, in a baseline scenario and a stress scenario:
– regulatory perspective, in which the regulatory metrics for the Pillar 1 risks over the medium term (several years) are represented for both these scenarios;
– financial and operating perspective, in which the management measures and metrics covering all the risks, including the Pillar 2 risks, are presented, with a time horizon of several years in the baseline scenario, and a time horizon of at least two years in the stress scenario.

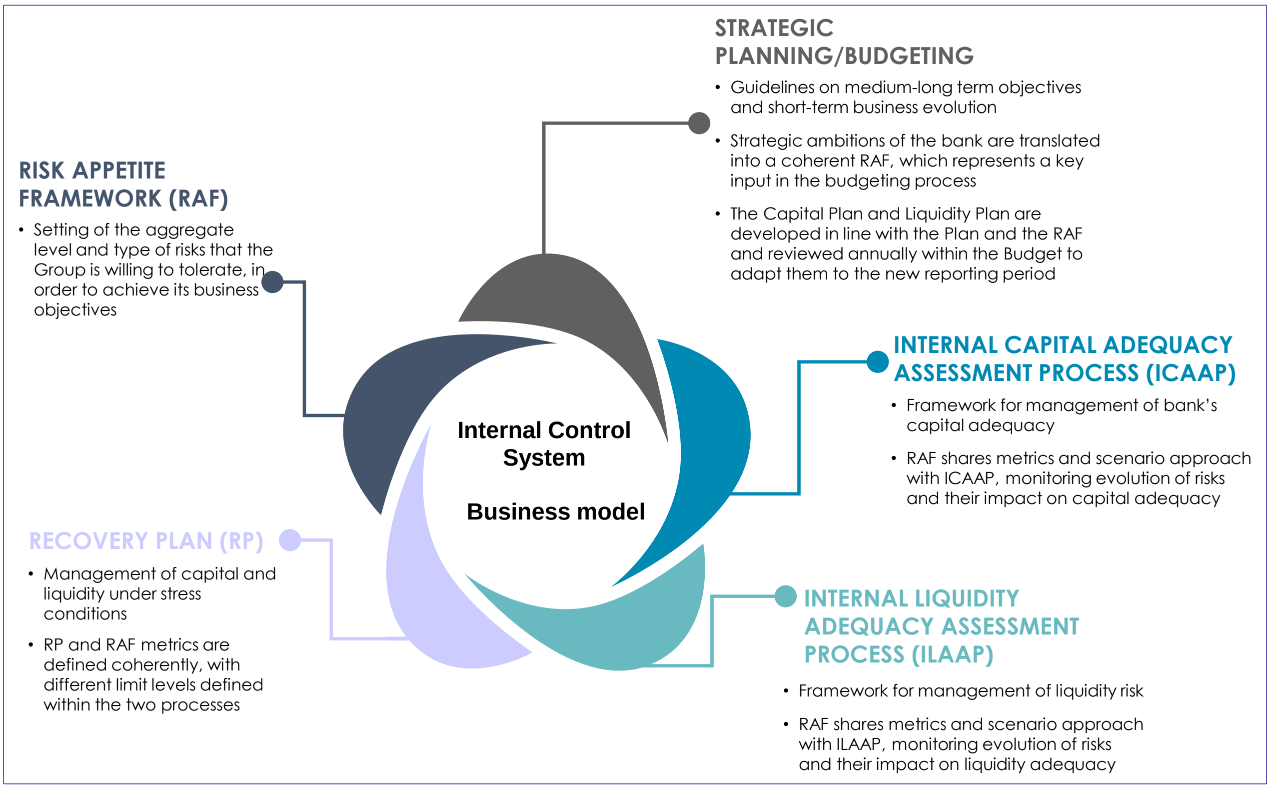
The scope of analysis also includes the insurance segment to better capture the specific characteristics of the Group's business model (financial conglomerate).
The quantitative reconciliation between regulatory requirements and management estimates of capital adequacy is set out in a specific document attached to the ICAAP, which reports the differences in scope and definition of risks considered in both areas, as well as the differences, where appreciable, between what is considered in the two perspectives in terms of the main parameters (e.g. confidence interval and holding period) and assumptions (such as those relating to the diversification of effects).
The ILAAP is the internal process of self-assessment of the adequacy of the Group's short-term and structural liquidity position. Like the ICAAP, it is based on two complementary pillars – the economic perspective and the regulatory perspective – aimed at supporting a clear assessment of the liquidity risks and their effective governance, based on a management strategy, all aspects of which have been carefully considered, with the establishment of an appropriate system of risk-taking limits.

The Group is required to provide a Recovery Plan according to indications received by Supervisory Authorities. The Recovery Plan is governed by the European Bank Recovery and Resolution Directive – BRRD - 2014/59/EU, transposed into Italian law by Legislative Decrees no. 180 and no. 181 of 16 November 2015 and the Bank Recovery and Resolution Directive – BRRD II - Directive 2019/879/EU, transposed into Italian law by Legislative Decree no. 193 of 8 November 2021, in force from 1 December 2021, and establishes the methods and measures to be used when an institution comes under severe stress and in an early intervention phase, in order to restore financial strength and long-term viability.
Within the annual preparation process for the Group Recovery Plan, the Chief Risk Officer Governance Area identifies the stress scenarios suitable for highlighting the main vulnerabilities of the Group and its business model (e.g. significant exposure to the domestic market), as well as measuring their potential impacts on the Group's risk profile.
For 2024, in accordance with the applicable regulations, the Intesa Sanpaolo Group has developed four stress scenarios, one of which is purely idiosyncratic, with very rapid evolution, while the other three are "combined", as they are based on a macroeconomic scenario that is made more severe by the addition of specific events. In particular, one of the combined scenarios was developed assuming a global crisis generated by the escalation of geopolitical tensions in the Middle East.
Following the publication of the European Banking Authority's Final Report on Recommendation on the coverage of entities in a group recovery plan (EBA/Rec/2017/02), dated 1 November 2017, Intesa Sanpaolo has adopted specific criteria for the classification of Group companies among:
– Group-relevant;
– Locally relevant;
– Not relevant.

The application of these criteria to the Group scope has led to the Parent Company, as well as Fideuram ISPB Group, VUB Group, Banka Intesa Sanpaolo d.d., Intesa Sanpaolo Bank Ireland, Intesa Sanpaolo Bank Luxembourg, CIB Group, PBZ

Group, Banca Intesa Beograd and Intesa Sanpaolo Romania, being classified among the Group-relevant entities. The remaining companies are included in the category of not relevant entities. The above breakdown is consistent with the scope covered by the 2023 Recovery Plan.

The Intesa Sanpaolo Group ensures full consistency of the business model and internal control system with the Business Plan and the Budget, the RAF, the Recovery Plan, the ICAAP and the ILAAP, as illustrated in the diagram below.



Stress Tests

Stress tests are a fundamental risk management tool that enable institutions to adopt a forward-looking perspective in their risk management, strategic and capital planning activities.
The Group regularly carries out stress tests within the main company processes (RAF, ICAAP/ILAAP, Recovery Plan, Budget/Capital Plan,...) aimed at assessing capital and liquidity adequacy.
In line with the applicable regulations, the Group has a structured stress testing framework that governs the stress testing activities with reference to both the organisational and governance aspects, as well as the methodological and data infrastructure related aspects. It is an integral part of the Group's risk management systems, providing fundamental support to the company processes and decisions, the strategic ones in particular, which are linked to the management of capital and liquidity. It also enables a forward-looking assessment of the potential material risks and of the main vulnerabilities which the Group is exposed, also in stress scenarios, using both scenario analyses and sensitivity analyses, depending on the objective of the exercise.

The stress testing framework establishes the:
- roles and responsibilities of the structures involved and of the Corporate Bodies;
- stress testing activities (types of exercises, scope, frequency, objectives and applications);
- macro-process adopted;
- methodological approach;
- data infrastructure;
- Group steering and coordination.

With regard to the *macro-process*, the stress test exercises consist of three fundamental phases:
- selection and approval of scenarios;
- execution of stress tests activities;
- approval of the outcome.

With regard to the *types of exercises*, the Group conducts the following stress exercises:
- **multi-risk exercises**: based on scenario analysis, it allows the assessment, according to a forward-looking approach, of the simultaneous impact on the Group of multiple risk factors, also taking into account the inter-relations and possibly the ability of Top Management to react. This type of exercise, which requires the full revaluation of each impact, is also used as part of the processes of RAF, ICAAP/ILAAP and Recovery Plan;

- **regulatory multi-risk exercises**: requested and coordinated by the Supervisor/Regulator which defines the general assumptions and scenarios, requires the full revaluation of the impacts;
- **situational exercises**: requested by the Top Management or by the Supervisor/Regulator in order to assess, in a forward-looking approach, the impact of particular events (relating to the geopolitical, financial, economic, competitive environment, etc.). Their scope may vary from case to case;
- **single or specific risk exercises**: aimed at assessing the impact of scenarios (or single or more specific risk factors) on specific risk areas;
- **single or specific risk regulatory exercises**: ordered and coordinated by the Supervisor/Regulator which defines its general assumptions and scenarios, to assess the impact on specific risk areas.

The results of the stress exercises, carried out through scenario and/or sensitivity analyses, represent a support for the Group in the:

- overall current and forward-looking assessment of capital and liquidity adequacy within the main strategic processes (ICAAP, ILAAP, Recovery Plan and Budget/Capital Plan);
- assessment of the potential vulnerabilities to which the Group is exposed and possible mitigation actions;
- setting of the limits envisaged in the RAF.

With regard the regulatory stress tests, Intesa Sanpaolo Group carried out the following exercises during 2024:

- 2024 ECB Cyber Resilience Stress Test: exercise conducted by the ECB aimed at assessing the ability of the banks to respond and recover in the event of a cybersecurity incident that disrupts current operations, under a severe but plausible scenario common to all banks. The exercise, which involved 109 banks and included the Intesa Sanpaolo Group, limited to the Parent Company and the subsidiary PBZ Banka, showed that the participating banks were generally well capable of managing the attack thanks to operational resilience built up over the years, although some areas for improvement were identified;
- 2024 EBA One-off Fit-for-55 climate risk scenario analysis: exercise promoted by the EBA, aimed at collecting climate risk data to assess the resilience of the financial sector in the context of the Fit-for 55 scenario and to gather information on the capacity of the financial system to support the green transition even under conditions of stress. The data collected from the banks were used to feed a top-down model developed by the ECB. The results of the exercise, published on an aggregate basis, showed that the estimated losses in the adverse Run-on-Brown scenario had a limited impact on the EU financial system, while the higher estimated losses in the same scenario, when integrated with other macroeconomic and financial risk factors, should be mitigated by other income components of the banks, which are not included in the exercise;
- 2024 EIOPA stress test: the Intesa Sanpaolo Vita Insurance Group (now Intesa Sanpaolo Assicurazioni Group) participated in the exercise conducted by EIOPA, in collaboration with the European Systemic Risk Board (ESRB). The aim of the stress exercise, which involved 48 insurance companies at European level, was to test the resilience of the European insurance industry in a scenario of uncertainty resulting from the economic consequences of an intensification or prolongation of geopolitical tensions, both in terms of capital adequacy and liquidity. The results of the exercise, published at aggregate level, demonstrated the resilience of the European insurance sector, also under adverse economic conditions, in terms of both capital adequacy and liquidity.

In 2025, the Intesa Sanpaolo Group will take part in the 2025 EU-Wide Stress Test, conducted by the European Banking Authority (EBA), in collaboration with the Single Supervisory Mechanism (SSM), the Bank of Italy, the European Central Bank (ECB) and the European Systemic Risk Board (ESRB). The results of the exercise will be published by the EBA in early August. As with previous exercises, no minimum capital threshold has been set, and the results will be used as inputs in the Supervisory Review and Evaluation Process (SREP).

Risk Culture

Risk Culture is the subject of increasing attention, as an essential tool to promote solidity as a crucial value, in a rapidly changing environment. This is two-sided, as it is an expression of the principles guiding the Group (top-down) on one side, and the values and attitudes of its people on the other (bottom-up). Particular attention is paid to the promotion of the guiding principles, also by systematically and carefully updating the reference documents on risk (e.g. Tableau de Bord of Group Risks, ICAAP, RAF) and the information set for the exercise of operational activities. In addition, several initiatives were carried out during 2024 to strengthen risk awareness and responsibility, including:

- workshops/webinars dedicated to the Control Functions for dissemination and training purposes, held by internal and external speakers, on innovative topics with a high potential impact on the Group's risk profile (e.g. metaverse, generative artificial intelligence, reputation, Basel IV, cybersecurity, geopolitics, and risk digital strategy, as well as the megatrends of the Group's operating environment);
- in line with previous years, the Risk Culture Ambassador initiative entailed the temporary secondment of resources from the Chief Risk Officer Area, receiving the same number of resources from the recipient structures of the Head Office Departments and Divisions.

Risk governance organisation

The policies relating to risk taking and the processes for the management of the risks to which the Group is or could be exposed are approved by the Board of Directors of Intesa Sanpaolo as the Parent Company, with the support of the Risks and Sustainability Committee. The Management Control Committee, which is the Body with control functions, supervises the adequacy, efficiency, functionality and reliability of the risk management process and of the Risk Appetite Framework (RAF).
The Managing Director and CEO has the power to submit proposals for the adoption of resolutions concerning the risk system and implements all the resolutions of the Board of Directors, with particular reference to the implementation of the strategic guidelines, the RAF and the risk governance policies. In addition, as an Officer performing management functions, he/she is designated as the Anti-Money Laundering Officer.

The Corporate Bodies also benefit from the action of some Managerial Committees on risk management. These Committees operate in compliance with the primary responsibilities of the Corporate Bodies regarding internal control system and the prerogatives of Corporate control functions, and specifically the risk control function. In particular:

- the Steering Committee, chaired by the Managing Director and CEO, is a Group body with a decision-making, consulting and reporting role, which, within the Group Risk Analysis Session, seeks to ensure the control and management of risks and safeguard business value at Group level, including the internal control system, in implementation of the strategic guidelines and management policies established by the Board of Directors. Its various tasks include examining the RAF proposal for the Group, preparatory and instrumental to its approval by the Board of Directors, the analysis of the ICAAP and ILAAP Group packages and of the Tableau de Bord of Group Risks;
- the Group Financial Risks Committee is a technical body with decision-making, reporting and consulting powers, focused both on the risks relating to the banking business (including market risk, banking book financial risks, liquidity risk, financial risks for customer investments, supervision and monitoring of business models, and Active Value Management) and those in the life and non-life insurance business (result exposure to the trend in market variables and technical variables). The functions of said Committee are set out in three sessions:
  - the Risk Analysis and Valuation Session, chaired by the Chief Risk Officer, responsible for evaluating, inter alia, in advance of approval by the Board of Directors, the guidelines on undertaking and measuring financial risks and the liquidity risk of the Group, with a view to consistency with the RAF, proposals for operational limits for financial operations referring to interest rate risk of the banking, the trading book and valuation risk defining, within the scope of the powers received, the distribution thereof amongst the Group's major units. It also periodically analyses the overall financial risk profile and exposure to liquidity risk and interest rate risk of the Group and the single Group banks and companies, verifying any breaches of the limits and monitoring the approved come-back procedures;
  - the Management Guidelines and Operating Choices Session (ALCO), chaired by the Chief Financial Officer, provides the Group companies operational guidelines in implementation of the strategic guidelines and risk management policies laid down by the Board of Directors, in respect of management of the banking book, liquidity, interest rate and exchange risk;
  - the ALCO session – Extended, chaired by the Chief Risk Officer, which analyses the performance of loans and deposits, in current and prospective terms, together with the expected trend in Risk-Weighted Assets (RWA) and financial assets (debt securities and loans) measured at Fair Value through Other Comprehensive Income (FVOCI reserves), in order to monitor and assess their impact on the Group's liquidity and capital profiles.
- the Credit Risk and Pillar 2 Internal Models Committee is a technical body with a decision-making, reporting and advisory role responsible for:
  - the internal models for the measurement and management of credit risk;
  - the internal models for Pillar 2 risks[179].
- the Group Control Coordination and Non-Financial Risks Committee is divided into specific and distinct sessions:
  - the Integrated Internal Control System session, with a reporting and advisory role, whose objective is to reinforce coordination and the interdepartmental cooperation mechanisms within the Group internal control system, thus promoting the integration of the risk management process, in relation to non-financial and reputational risks, to facilitate their effective management;
  - the Operational and Reputational Risk session, with a decision-making, reporting and advisory role, which has the

[179] The scope does not include the Pillar 2 models for the measurement and quantification of financial risks in the banking book, which already come under the scope of the Group Financial Risks Committee and the Pillar 2 models for the measurement and quantification of operational and reputational risks, which, instead, come under the scope of the Group Control Coordination and Non-Financial Risks Committee. However, it does include the models used for stress testing and forward-looking income statement valuations.

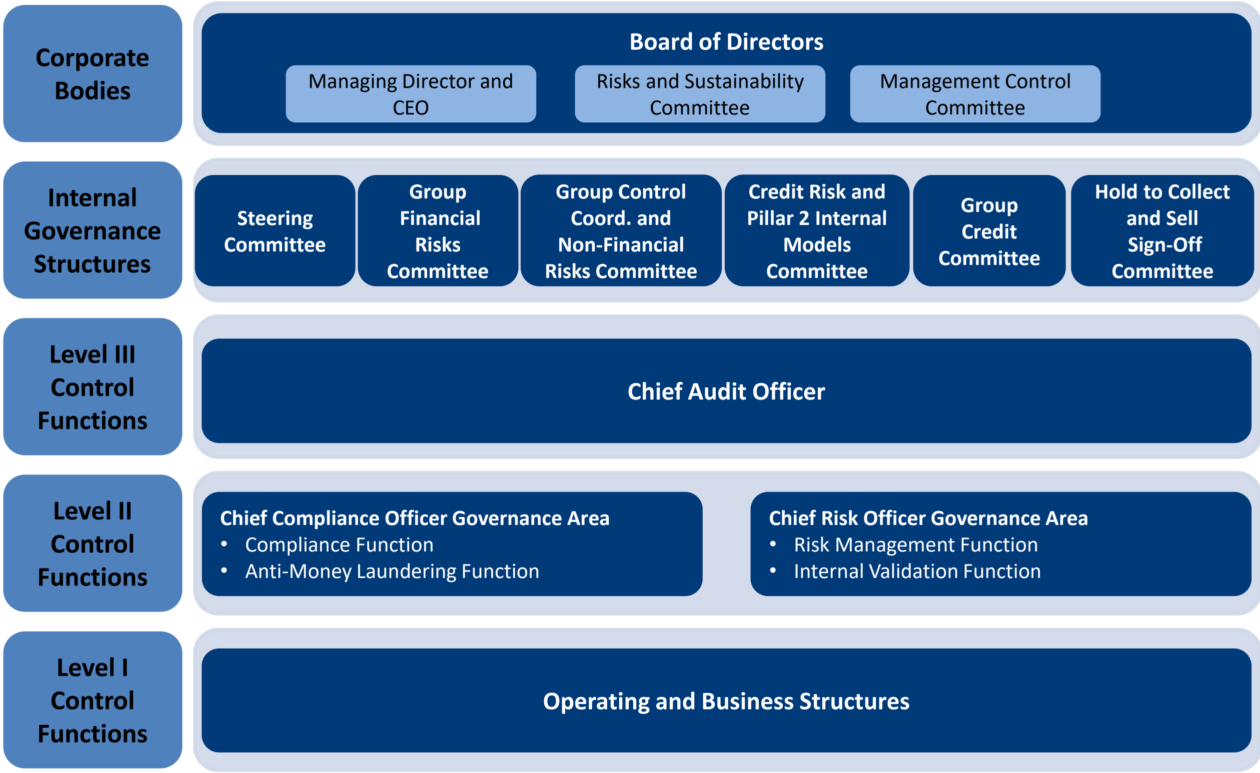
task of supervising the implementation of operational and reputational risk management guidelines and policies in accordance with indications formulated by the Board of Directors and periodically reviewing the overall non-financial risk profile, monitoring the implementation of the mitigation actions identified in accordance with indications formulated by the Corporate Bodies and/or the Steering Committee;
    - the Compliance Risk Session, for reporting and consulting purposes, which is tasked with examining the results of the periodic compliance risk assessments.

  The sessions of the Committee are attended by, among others, the Heads of Corporate control functions, as well as the Manager responsible for preparing the Company's financial reports as a permanent member. This contributes to fulfilling the assigned legal obligations and the responsibilities established in the Company Regulations on the supervision of the financial reporting process. It also enables the promotion of the inter-functional coordination and integration of control activities, within its area of responsibility;
- the Group Credit Committee is a technical Body with a decision-making and advisory role tasked with ensuring the coordinated management of issues relating to credit risk, and is organised in separate sessions. Among other duties, the Committee resolves on the granting, renewal and confirmation of loans within the scope of the powers assigned to it;
- lastly, the Hold To Collect and Sell (HTCS) Sign-Off Committee is tasked with proposing the assumption of market risks put forward by the business structures of the Parent Company or the subsidiaries, on the HTCS shares required for Originate to Share ("OtS") transactions. These transactions consist of loans originated with the intention of being distributed to third-party operators on the primary or post-primary/secondary market and which upon origination have a holding period that varies according to the counterparty's rating class and product type.

The Chief Risk Officer Governance Area, directly reporting to the Managing Director and CEO, in which the risk management functions are concentrated, including the controls on the risk management and internal validation process, represents a relevant component of the "second line of defence" of the internal control system that is separate and independent from the business supporting functions.
This Area is responsible for governing the macro process of definition, approval, control and implementation of the Group's Risk Appetite Framework with the support of the other corporate functions involved, as well as assisting the Corporate Bodies in setting and implementing the Group's risk management guidelines and policies, in accordance with the company's strategies and objectives, and coordinates and verifies their implementation by the responsible units of the Group, also within the various corporate areas, guaranteeing the measurement and control of the Group's exposure to various types of risk, implementing the II level controls on credit and other risks, in addition to ensuring the validation of risk measurement and management internal systems.
To that end, the Chief Risk Officer Governance Area is broken down into the following Organisational Units:
- Credit, Enterprise & Operational Risk Management Coordination Area:
    - Credit Risk Management;
    - Enterprise Risk Management;
    - Operational, IT & Cyber Risk Management;
- Business Units, Market & Financial Risk Management Coordination Area:
    - Market & Financial Risk Management;
    - IMI CIB Risk Management;
    - BdT Risk Management;
    - ISB & Other Subsidiaries Risk Management.
- Internal Validation & Controls Coordination Area:
    - Internal Validation & Model Risk Management;
    - Second Level Controls & Data Governance Validation.

The Chief Risk Officer Governance Area is responsible for operational implementation of the strategic and management guidelines along the Bank's entire decision-making chain, down to individual operational units. The risk control functions of subsidiaries with a decentralised management model and any representatives of the Parent Company's risk control function at subsidiaries with a centralised management model report to it.

The Chief Compliance Officer Governance Area, which reports directly to the Managing Director and CEO, in a position that is independent from operating departments and separate from internal auditing, ensures the monitoring of the Group regulatory compliance risk, including conduct risk. Within the Risk Appetite Framework, the Chief Compliance Officer Governance Area (i) proposes the statements and limits set for compliance risk and (ii) collaborates with the Chief Risk Officer Governance Area in the monitoring and control of non-financial risks for compliance purposes and, if the set limits are exceeded, in the identification/analysis of events attributable to non-compliance with regulations and in the identification of appropriate corrective measures.
The Chief Compliance Officer Governance Area is broken down into the following Organisational Units:
- Regulatory Compliance Retail and Private Banking Head Office Department;
- Regulatory Compliance Corporate and Investment Banking Head Office Department;
- Compliance Governance, Privacy and Controls Head Office Department, which includes the Data Protection Officer function that performs the tasks assigned by data protection legislation;
- Anti Financial Crime Head Office Department, which is tasked, *inter alia,* with the duties and responsibilities of the anti-money laundering function;
- Compliance Digital Transformation.



The Parent Company performs a guidance and coordination role with respect to the Group companies[180], aimed at ensuring effective and efficient risk management at Group level, exercising responsibility in setting the guidelines and methodological rules for the risk management process, and pursuing, in particular, integrated information at Group level to the Corporate Bodies of the Parent Company, with regard to the completeness, adequacy, functioning and reliability of internal control system. For the corporate control functions in particular, there are two different types of models within the Group based on the specific characteristics of the subsidiaries and the local regulatory constraints: (i) the centralised management model based on the centralisation of the activities at the Parent Company and (ii) the decentralised management model that involves the presence of locally established corporate control functions that conduct their activities under the direction and coordination of the same corporate control functions of the Parent Company, to which they report in functional terms.
Irrespective of the control model adopted within their company, the corporate bodies of the Group companies are aware of the choices made by the Parent Company and are responsible for the implementation, within their respective organisations, of the control strategies and policies pursued and promoting their integration within the Group controls.

[180] In this regard, it is specified that Intesa Sanpaolo does not exercise management and coordination over Risanamento S.p.A. or its subsidiaries pursuant to Articles 2497 *et seq.* of the Italian Civil Code.

The internal control system

To ensure a sound and prudent management, Intesa Sanpaolo combines business profitability with an attentive risk-acceptance activity and an operating conduct based on fairness.
Therefore, the Bank, in line with legal and supervisory regulations in force and consistently with the Corporate Governance Code for Listed Companies, has adopted an internal control system capable of identifying, measuring and continuously monitoring the risks typical of its business activities.
Intesa Sanpaolo's internal control system is built around a set of rules, functions, structures, resources, processes and procedures aimed at ensuring, in compliance with sound and prudent management, the achievement of the following objectives:

– verification of the implementation of Company strategies and policies;
– containment of risk within the limits set out in the reference framework for determining the Bank's risk appetite (Risk Appetite Framework – RAF);
– safeguard of asset value and protection from losses;
– effectiveness and efficiency of the Company processes;
– reliability and security of Company information and IT procedures;
– prevention of the risk that the Bank may be involved, including involuntarily involved, in illegal activities (with special regard to those relating to money-laundering, usury and financing of terrorism);
– compliance of business operations with the law and supervisory regulations, as well as internal policies, procedures and regulations.

The internal control system plays a crucial role and involves the entire company organisation (bodies, structures, hierarchical levels, all personnel). In compliance with the provisions of Bank of Italy Circular 285/2013 (First Part, Title IV, Chapter 3) the "Integrated Internal Control System Regulation" was finalised. This aims to define the guidelines of Intesa Sanpaolo's internal control system, in its capacity as Bank and Parent Company of the Banking Group, through the adaptation of the reference principles and the definition of the responsibilities of the Bodies and of the functions with control duties, which contribute, in various ways, to the proper operation of the internal control system, as well as the identification of coordination arrangements and information flows supporting system integration.
The internal control system is made up of a documentation infrastructure (regulatory framework) that provides organised and systematic access to the guidelines, procedures, organisational structures, and risks and controls present in the Company, which incorporate all the company policies and the instructions of the Supervisory Authorities, as well as the provisions of law, including the principles laid down in Legislative Decree 231/2001.
The regulatory framework consists of "Governance Documents", adopted from time to time, that oversee the operation of the Bank (Articles of Association, Code of Ethics, Group Internal Code of Conduct, Group Regulations, Group Committees Regulation, Regulation on Related Party Transactions, Integrated Internal Control System Regulation, Authorities and powers, Guidelines, Function charts of the Organisational Structures, etc.) and more strictly operational regulations that govern business processes, individual operations and the associated controls (Rules, Process Guidelines, Control Sheets, etc.).
More specifically, the corporate rules set out organisational solutions that:

– ensure sufficient separation between the operational and control functions and prevent situations of conflict of interest in the assignment of responsibilities;
– are capable of adequately identifying, measuring and monitoring the main risks assumed in the various operational segments;
– enable the recording of every operational event and, in particular, of each transaction, with an adequate level of detail, ensuring their correct allocation over time;
– guarantee reliable information systems and suitable reporting procedures for the various managerial levels assigned the control functions;
– ensure the prompt notification to the appropriate levels within the business and the swift handling of any anomalies found by the business units, the internal audit department and the other control functions;
– ensure adequate levels of business continuity.

The Company's organisational solutions also include controls at each operational level that enable the uniform and formalised identification of responsibilities, particularly in relation to the tasks of controlling and correcting the irregularities found.
In terms of Corporate Governance, Intesa Sanpaolo adopted the one-tier corporate governance system, pursuant to Articles 2409-sexiesdecies and following of the Italian Civil Code. It therefore conducts its operations through a Board of Directors, certain members of which are also members of the Management Control Committee.
Based on this system:

– the Board of Directors is the body responsible for strategic supervision and performs all the tasks assigned to it by the Articles of Association, the applicable regulations and the Bank's governance documents;
– the Managing Director and CEO performs the tasks assigned by the supervisory regulations to the body responsible for management, as set out in the Bank's governance documents, approved by the Board of Directors, except for the responsibilities assigned to the Board;
– the Management Control Committee performs the control function.

The Board of Directors elects a Managing Director from its members, other than the Chair of the Board, the members of the Management Control Committee or the minimum number of Independent Directors.
The Intesa Sanpaolo Group adopts an internal control system based on three levels, in line with the legal and regulatory provisions in force.
The model has the following types of control:

– Level I: line controls which are aimed at ensuring proper performance of operations (for example, hierarchical, systematic and sample-based controls) and which, to the extent possible, are incorporated in the IT procedures. They are carried out by the same operating and business structures, including through units dedicated exclusively to control duties reporting to the heads of the same structures or performed as part of the back office.
– Level II: risk and compliance controls for the purpose of ensuring, inter alia:
    - correct implementation of the risk management process;
    - compliance with the operational limits assigned to the various functions;

- regulatory compliance of company operations, also in relation to self-regulatory provisions.

  The functions assigned to such controls are separate from the ones in charge of production and contribute to the definition of the risk governance policies and the risk management process. In the Intesa Sanpaolo Group, Level II includes the following Parent Company structures and the equivalent local units of the Group companies, where established:
  - Chief Compliance Officer Governance Area, which has the tasks and responsibilities of the "compliance function", as defined in the applicable regulations, and which includes the "anti-money laundering function", within the Anti Financial Crime Head Office Department, which has the tasks and responsibilities laid down in the regulations on anti-money laundering, counter-terrorism, monitoring of financial sanctions, anti-corruption and the "data protection officer function", within the Compliance Governance, Privacy and Controls Head Office Department, which performs the tasks assigned by data protection legislation;
  - Chief Risk Officer Governance Area, which is assigned the role of the risk management function, as defined by the applicable regulations. The Chief Risk Officer Governance Area also includes the Internal Validation & Controls Coordination Area, which is tasked, among other things, with the duties and responsibilities of the "validation function", as defined by the applicable regulations, as well as Level II controls on credit and data governance;
- Level III: internal audit controls to identify breaches of procedures and regulations, as well as to periodically assess the completeness, adequacy, functionality (in terms of efficiency and effectiveness) and reliability of the internal control system and the IT system at Group level, at scheduled deadlines in relation to the nature and intensity of the risks.

In the Intesa Sanpaolo Group, internal auditing is carried out by the Parent Company's Chief Audit Officer and by the equivalent local units of Group companies, where established.

The Manager responsible for preparing the Company's financial reports also contributes to the internal control system, who, pursuant to Article 154 bis of the Consolidated Law on Finance, exercises oversight at Group level of the internal control system for the purpose of accounting and financial and sustainability reporting.
The internal control system is periodically reviewed and adapted in relation to business development and the reference context.
Intesa Sanpaolo has an internal control structure consistent with the indications provided by the Supervisory Authorities.

Compliance

The governance of compliance risk is of strategic importance to the Intesa Sanpaolo Group as it considers compliance with the regulations and fairness in business to be fundamental to the conduct of banking operations, which by nature are founded on trust.
The responsibilities and duties of the compliance function are assigned to the Chief Compliance Officer, who is independent and autonomous in relation to the operating structures, reports directly to the Corporate Bodies and has access to all activities within the Bank, as well as any significant information for the performance of its duties.
The Group's Compliance Model is set out in the Guidelines approved by Intesa Sanpaolo's Corporate Bodies, which indicate the responsibilities of the various company structures and macro processes to mitigate compliance risk:
- identifying and assessing compliance risk;
- proposing the organisational measures functional for mitigation of this risk;
- conducting pre-assessments of the compliance of innovative projects, operations and new products and services;
- providing advice and assistance to the governing bodies and the business units in all areas with significant compliance risk;
- monitoring of ongoing compliance, both through control of compliance with regulations by company structures, and through the use of information provided by the other control functions;
- disseminating a corporate culture founded on the principles of honesty, fairness and respect for the spirit and the letter of the rules, as well as the enhancement of technical-professional skills, including in the area of IT developments;
- managing relations with the Authorities with regard to compliance issues and non-compliance events.

The compliance function also includes the data protection officer function, which performs the tasks assigned by data protection legislation in accordance with the governance model described in the Guidelines on the protection of personal data of natural persons.

The regulatory scope, including Environmental, Social and Governance (ESG) factors, and the procedures for monitoring regulatory areas that present significant risks of non-compliance for the Group are defined in the aforementioned guidelines. The Chief Compliance Officer submits periodic reports to the Corporate Bodies on the adequacy of compliance control, with regard to all regulatory aspects applicable to the Group which show compliance risks. On an annual basis, these reports include an identification and assessment of the primary compliance risks to which the Group is exposed and a schedule of the associated management measures, and on a half-yearly basis they include a description of the activities performed, critical issues noted, and remedies identified. A specific notice is also given when events of particular significance occur.

As regards to the method of direction, coordination and control of the Group, the Group Compliance Guidelines envisage the adoption of two models. These models are organised in such a way as to account for the Group's structure in operational and territorial terms.
In particular:
- for the specifically identified Italian Banks and Companies, whose operations have a high level of integration with the Parent Company, compliance monitoring is centralised at the Parent Company;
- for the other Companies, that have a legal obligation or have been specifically identified based on the business conducted, as well as the Foreign Branches, an internal compliance function is established and a local Compliance Officer is appointed, which are assigned compliance responsibilities. The Compliance Officers of the subsidiaries functionally report to the Chief Compliance Officer Governance Area structures, while those of the Foreign Branches,

except where not permitted by local regulations, hierarchically report to the Chief Compliance Officer Governance Area structures. Functional reporting is also in place for the local Data Protection Officers of Group Companies established in the European Union.

Anti-Money Laundering

The duties and responsibilities of the anti-money laundering function are assigned, as required by the regulations, to the Anti Financial Crime Head Office Department, which reports to the Chief Compliance Officer, and is therefore independent and autonomous in relation to the operating structures, reporting directly to the Corporate Bodies, and has access to all activities within the Bank, as well as to any significant information for the performance of its duties.
Specifically, as envisaged in the Guidelines for combating money laundering and the financing of terrorism and for managing embargoes and the Group Anti-Corruption Guidelines, the Anti Financial Crime Head Office Department ensures monitoring of compliance risk in the area of money laundering, terrorist financing, breach of embargoes, weapons and corruption (Financial Crime), by:

- laying down the general principles to be adopted within the Group for the management of compliance risk;
- identifying and assessing compliance risk;
- conducting ongoing monitoring, with the support of the competent functions, of developments in the national and international context of reference, verifying the adequacy of company processes and procedures with respect to applicable regulations and proposing appropriate organisational and procedural changes;
- providing advice to the corporate functions, as well as establishing adequate training plans;
- preparing appropriate periodic reporting for Corporate Bodies and top management;
- discharging the required specific obligations including, in particular, enhanced customer due diligence, controls of proper management of the data storage Archive and the assessment and monthly submission to the Financial Intelligence Unit of data relating to aggregated anti-money laundering reports, and the assessment of reporting of suspicious transactions received from operating structures for the submission to the Financial Intelligence Unit of reports deemed accurate.

The Anti Financial Crime Head Office Department also performs its role of direction, coordination and control of the Group according to a model similar to the one described for the compliance function.

The Risk Management and Internal Validation Function

The Chief Risk Officer Governance Area is responsible for operational implementation of the strategic and management guidelines for risk along the Bank's entire decision-making chain, down to individual operational units. The tasks and functions are discussed in detail in the subsequent chapters of this Part.
Through the Internal Validation & Controls Coordination Area, the Chief Risk Officer Governance Area carries out the Level II controls on credit and data governance.
The purpose of the credit controls is to verify the proper classification and provisioning and the adequacy of the management and recovery process for individual exposures (so-called single names).
In general, the control activities development includes the credit processes assessment also to verify that suitable Level I controls are in place, including proper execution and traceability. The potential areas of investigation to be examined through Single Name controls also consider the results of the monitoring carried out by the Level I Control Functions on different credit clusters.
As part of the overall risk management process, the Coordination Area carries out the Level II controls connected with data quality, in line with the internal and external regulations on the matter, with specific focus on the input data used in internal models. In accordance with regulatory developments, the Internal Validation & Controls Coordination Area is also responsible for the development, maintenance and oversight of the framework for the model risk governance, aimed at ensuring the identification, assessment, monitoring and mitigation of the risk for all Internal Systems, including the Pillar 1 and 2 risk measurement systems and the systems that are used for accounting purposes. To that end, the Coordination Area mainly carries out the following activities, in coordination with the Functions concerned: a) defining and developing the model risk governance and methodological framework to identify models, assign the related priorities and assess and mitigate model risk, including the methodology for quantifying the economic capital in relation to model risk; b) defining, managing and upgrading the Group Model Management platform (Group Model Inventory) with the goal of guaranteeing a complete, updated inventory of the models and tracking of the processes connected to the various phases of their life cycles; c) ensuring the periodic identification and assessment of model risk and contributing the calculation of the economic capital in relation to model risk; d) overseeing the process for assigning priorities to models (tiers) in order to efficiently steer their governance, with specific reference to the levels of detail, analysis and frequency of validation and development activities; e) for the model risk component, contributing to the annual proposal to update the Group RAF and periodically monitoring the model risk appetite indicators; and f) providing periodic disclosure on the Model Risk Management Framework and on the results of the model risk assessments to the Head of the Chief Risk Officer Area, the competent managerial committees and the Corporate Bodies.
Moreover, the Internal Validation & Controls Coordination Area is assigned the validation function, aimed at ensuring the validation at Group level of the internal risk measurement systems, used both for the determination of capital requirements and for non-regulatory purposes, in order to assess their compliance with regulatory provisions, operational needs and reference market demands[181].
The internal systems adopted by the Group are validated on first adoption (based on the plans of gradual extension made by the Group) or when changes are made to them, in compliance with the development and validation process approved by the Corporate Bodies. The validation function also ensures the periodic review of internal systems in terms of models, processes, data used and implementations in IT, assessing their adequacy, predictive ability and performance, as well as their compliance over time with regulatory provisions, company needs and changes in the reference market.

[181] Regulation (EU) 575/2013 (CRR), EBA Guidelines, EU Directive 2013/36 (CRD IV), Bank of Italy Circular 285/2013.

Upon First Adoption, two approaches were developed for the validation of the Pillar 1 internal credit risk models: the Stage Gate Approach and the Waterfall Approach, with the latter corresponding to the validation traditionally carried out at the end of the development of the model. The Stage Gate approach essentially involves a series of intermediate steps in which the Development function releases documentation to the Validation function (Internal Validation & Model Risk Management) at set times, following which the Validation function produces intermediate reports, which include assessments relating both to regulatory compliance and to the validation controls established (in internal regulations). The Stage Gate approach has been introduced so that the Validation observations can already be factored into the new model, making it more robust.
In addition to overseeing the regulatory aspects of the Pillar 1 credit risk models, in particular by providing regulatory assurance during model changes, the tasks of the Regulatory Requirements on Internal Risk Systems function include advisory assessments on broader regulatory issues and interpretations, in response to requests originating from the Chief Risk Officer Area. In 2024, the scope was also extended to include the ESG regulations. A Generative AI tool has also been developed to assist with the regulatory assurance activities.
The validations activities are conducted in line with the planning of the function's activities, defined consistently with the internal and external reference regulations and that presented to the competent Corporate Bodies. The relevant criteria that define the type of validation to implement (Standard or Full) and its frequency also include the tier of the model and its use, as attributed in the Model Risk Management Framework.
For Pillar 1 risks, the validation frequency is set, in any event, in line with the external reference regulations.
In order to ensure the periodic reporting on the results of the validation process continuously carried out to the Corporate Bodies and, regarding the internal Pillar 1 risk measurement systems, to the Supervisory Authorities, the Internal Validation Function prepares the Annual Validation Reports regarding the internal Pillar 1 systems and the internal systems used for management purposes. These reports summarise the results of the analyses conducted during the reporting year on the internal systems used at the Parent Company and the Group companies and the opinion formulated. In addition, the validation function prepares an update on the internal models in terms of performance and resolution of the issues raised by the function, which is submitted to the relevant corporate bodies on a half-yearly basis. In carrying out the validation process at Group level, the function interacts with the Supervisory Authorities, with the relevant Corporate Bodies and the functions responsible for the Level III controls required by the regulations. It adopts a decentralised approach for companies with local validation functions (the main Italian and international companies), coordinating and supervising the activities of those companies, and adopting a centralised approach for the others. The adopted methodologies were developed in implementation of the principles that inspire the Supervisory regulations for banks, EU directives and regulations, general guidelines of international committees and best practices in the area and take the form of documentary, quantitative and operating practice analyses.

Internal Auditing

Internal auditing activities are assigned to the Chief Audit Officer, who reports directly to the Board of Directors (and therefore it reports to the Chair), functionally reporting to the Management Control Committee, without prejudice to the appropriate links with the Managing Director and CEO. The Chief Audit Officer has not any direct responsibility on the business.
This function has a structure and a control model which is organised according to the evolution of the organisational structure of Intesa Sanpaolo and of the Group.
The Chief Audit Officer - to whom the Internal Audit Structures of the Italian and international companies of the Group functionally report - enjoys the necessary autonomy and independence from the operating structures; the Function has access to all the activities conducted at both the head office departments and the local structures. The Bank's audit function cannot be entrusted to external parties; where third parties are entrusted with relevant services for the operation of the internal control system (e.g. data processing), the Internal Audit Function must have access also to the activities of said parties.
The structure performs a level-III assessment of the completeness, adequacy, functionality and reliability of the components of the internal control system, the risk management process and the corporate processes, also with regard to their ability to identify and prevent errors and irregularities. This includes the verification of the corporate functions for risk control and regulatory compliance, also by participating in projects, in order to create added value and improve the effectiveness of the control processes and the governance of the organisation.
The Internal Audit Function is also responsible for assessing the effectiveness of the RAF definition process, the internal consistency of the overall framework and the compliance of business operations with the RAF. Within the RAF, the Chief Audit Officer prepares his/her contribution to the Integrated Risk Assessment conducted by the corporate control functions and the Manager responsible for preparing the Company's financial reports.
The structure has personnel with the appropriate professional skills and expertise and operates in accordance with best practices and the international standards for the professional practice of internal auditing established by the Institute of Internal Auditors (IIA). The internal auditors conduct their activity in line with the principles laid down in the Internal Auditor's Code of Ethics, which is modelled on that proposed by the Institute of Internal Auditors. As required by the international standards, this Function undergoes an external Quality Assurance Review at least every five years. The latest review was launched at the end of 2021, three years after the previous review, in accordance with the frequency agreed with the Management Control Committee, and ended in the first quarter of 2022, confirming the highest assessment on the scale ("Generally Compliant"). At the end of 2024, a new audit was started; it will be completed in the first quarter of 2025.
The Internal Audit Function uses structured risk assessment methods to identify the most sensitive areas and the main new risk factors. Based on the findings of the risk assessment and the resulting priorities, as well as on any specific requests for further investigation made by the Top Management or the Corporate Bodies, it prepares and submits an Annual Action Plan for prior examination by the Management Control Committee and subsequent approval by the Board of Directors, on the basis of which it conducts its activities during the year. The Function also prepares a Multi-Year Plan.
The Plan may be revised during the year as a result of extraordinary events, also deriving from potential risk evolution, and of new requests from the Corporate Bodies.
The Chief Audit Officer ensures the proper performance of the internal whistleblowing management process.

The Chief Audit Officer supports corporate governance and ensures that Top Management, the Corporate Bodies and the competent Authorities (European Central Bank, Bank of Italy, Consob, etc.) promptly and systematically receive information on the status of the control system, the outcome of activities performed and the progress of any corrective measures. The Chief Audit Officer also contributes to the spreading of a culture of risk-awareness within the Bank and the Group.

During the year, auditing was performed directly for the Parent Company as well as for other subsidiaries under an outsourcing contract. For the other Group companies having their own internal audit departments, steering and practical coordination of the local departments was performed to guarantee control consistency and adequate attention to the different types of risks, also verifying the effectiveness and efficiency levels under both structural and operational profiles. Direct auditing and review activities, in the capacity of Parent Company, were also performed for those companies, as mentioned above.

Any weaknesses are systematically reported to the Corporate Functions concerned for prompt remedial action, with appropriate follow-up to monitor the effectiveness of said action.

Summary internal control system assessments from the audit activities have been periodically submitted to the Management Control Committee and the Board of Directors.

The results of audit activities with an adverse outcome or highlighting significant shortcomings were sent to the Board of Directors, the Managing Director and CEO and the Management Control Committee, as well as the Boards of Directors and Boards of Statutory Auditors of the subsidiaries concerned.

The main weaknesses identified and their evolution have been included in the Audit Tableau de Bord, with evidence of the ongoing mitigation actions, the parties responsible for implementing them and the relevant deadlines, to ensure systematic follow-up.

The Chief Audit Officer coordinates the “Integrated Internal Control System” session of the Group Control Coordination and Non-Financial Risks Committee; he/she supports the “231 Model” Surveillance Body in ensuring constant and independent verification of the regular performance of operations and processes, to prevent or detect anomalous and risky conduct or events, and in monitoring the compliance and effectiveness of the rules in the 231 Model; lastly, he/she participates in the Plenary, Business Plan and Sustainability (ESG), Group Risk Analysis and Supervisory Remediation Plans sessions of the Steering Committee and, upon specific request, also in the Investments session.

The Internal Audit Function ensured constant self-assessment of its efficacy and efficiency in line with the internal “quality assurance and improvement” plan drafted in accordance with the recommendations of the international standards for the professional practice of internal auditing. In this context, in 2024, the strategic audit innovation programme, named Strategic Audit Innovation Line-up (SAIL), continued for the period 2022-2025 in line with the new Business Plan.

Manager responsible for preparing the Company’s financial reports

The supervision of the reliability of the Company financial reports, the financial reporting process, and compliance of the Consolidated Sustainability Statement with the reporting standards established by the CSRD, is carried out by the Manager responsible for preparing the Company’s financial reports, in compliance with the provisions of Article 154-bis of the Consolidated Law on Finance and the related implementing provisions.

This control is also ensured over the subsidiaries governed by the laws of non-EU countries, in accordance with the supervisory rules on management and accounting systems set by Article 15 of Consob Market Regulation 20249/2017 (as subsequently amended and supplemented).

In order to comply with the aforesaid provisions, the Manager responsible for preparing the Company’s financial reports:

- performs a steering and coordination role in Group companies with regard to administrative matters and in the monitoring of the internal control system functional to financial reporting;
- supervises the implementation of legal requirements according to a shared approach at Group level, set out in specific internal regulations.

With specific regard to the financial reporting, the Manager responsible for preparing the Company’s financial reports:

- issues the instructions for the correct and uniform application of the accounting standards and measurement criteria, formalised as part of the Group Accounting Policies, which are subject to regular periodic updates;
- prepares appropriate administrative and accounting procedures for the preparation of the separate and the consolidated financial statements, and updates them to ensure compliance with the corporate disclosure requirements in force;
- verifies the adequacy of the administrative and accounting procedures and the effectiveness of the control system on the financial reporting process;
- oversees the correspondence between the corporate reporting to the market with the accounting records; to this end, it has the right to promptly obtain any information deemed necessary for the performance of his/her duties and coordinates the exchange of information with the independent auditors;
- maintains a system of contact and information flows with the function of the Parent Company and of the Group companies, in order to ensure the adequacy of balance sheet, income statement and financial positions and the descriptions of the main types of risks and uncertainties to which the Group may be exposed, monitoring the reliability of the acquisition of relevant data and information;
- takes part in the Group Financial Risks Committee and the Credit Risk and Pillar 2 Internal Models Committee, in which decisions regarding regulations and the adoption of models that impact financial reporting are adopted with his/her necessary approval;
- oversees the internal control system on the financial reporting process:
  - providing a prior opinion of suitability regarding the changes to the existing organisational structure (new internal regulations) that have an impact on the adequacy of the procedures for financial reporting;
  - preparing audit plans aimed at ensuring the adequacy and effective application of administrative and accounting procedures over the period, also by subsidiaries subject to the laws of non-European Union countries in accordance with Art. 15 of the CONSOB Market Regulation;
  - monitoring the projects whose implementation impacts the production and control procedures for financial reporting;

- acquires, in relation to the impact on the financial reporting process and the reliability of the corporate information, the results of the activities carried out by the Corporate control functions and, in particular, by the Chief Audit Officer, who is responsible for the overall assurance for the internal control system in accordance with the "Integrated Internal Control System Regulation";
- acquires any recommendations formulated by the independent auditors at the end of the process of auditing the separate financial statements of the Parent Company and the consolidated financial statements, as well as the related feedback in terms of measures to improve the procedures that have an impact on accounting data, monitoring their implementation and effectiveness;
- periodically reports on the scope and results of the assurance activities performed, to the Management Control Committee and the Board of Directors.

With regard to sustainability reporting, the Manager responsible for preparing the Company's financial reports:

- issues the instructions for the correct and uniform application of the sustainable reporting standards, formalised in the Methodological rules for the preparation of the Consolidated Sustainability Statement, which are regularly updated;
- performs the verification and monitoring, through the structures reporting to him/her, designed to ensure that the Consolidated Sustainability Statement included in the Report on operations has been prepared in compliance with the reporting standards adopted in accordance with the CSRD.

The Manager responsible for preparing the Company's financial reports contributes to supervising the independence of the independent auditors, in accordance with the procedures governed by specific Company Regulations, in line with the provisions of law (Legislative Decree 39/2010 amended by Legislative Decree 135/2016, which transposed Directive 2014/56/EU into the Italian legislation, and EU Regulation 537/2014). The above-mentioned Company Regulations assign to the Manager responsible for preparing the Company's financial reports the role of supervising, overseeing and monitoring the accounting audit engagements and other services entrusted by the Parent Company departments and the Group companies to independent auditors, their networks and their affiliates, in addition to the task of regularly informing the Management Control Committee in this regard.
The Manager responsible for preparing the Company's financial reports also ensures periodic reporting to the Board of Directors regarding the legal and regulatory obligations assigned to the Board for the monitoring of the adequacy of powers and means granted to the Manager responsible for preparing the Company's financial reports and of the effective observance of administrative and accounting procedures. This reporting is discussed beforehand with the Management Control Committee and the other Board Committees, for the aspects under their responsibility.

Attestations as required by Art. 154-bis of the Consolidated Law on Finance

In relation to the supervisory and monitoring functions assigned, with regard to financial reporting, the Manager responsible for preparing the Company's financial reports:

- signs, jointly with the Managing Director and CEO, the attestations of the separate and consolidated financial statements required by the Article 154-bis, paragraph 5, of the Consolidated Law on Finance on the adequacy and actual application of administrative and accounting procedures, the compliance with the international accounting standards, the agreement of the financial statements with the supporting documentation, accounting books and records and their suitability to give a true and fair view of the financial and economic position of the Group, as well as a reliable analysis of the performance, operating result and the main risks to which the Group is exposed;
- certifies the correspondence of the documents and announcements disclosed to the market with the records, books and accounting entries, pursuant to Article 154-bis, paragraph 2, of the Consolidated Law on Finance.

The monitoring of the accounting and financial reporting process is based on the review of:

- completeness and consistency of the information provided to the market through a structured reporting system originated from the functions of the Parent Company and the Companies concerning the events deemed significant for accounting/financial disclosure purposes, especially with regard to the main risks and uncertainties to which they are exposed;
- suitability and effective implementation of organisational and IT processes and procedures used for the preparation of accounting documents and other communication of a financial nature deemed relevant pursuant to Art. 154-bis of the Consolidated Law on Finance.

Special attention is paid to monitoring the adequacy of the auditing approach and the proper conduct of the activities required for the financial reporting process; the focus of the controls is represented by the work stages which, within the various business processes, entail the recording, processing, evaluation and presentation of data and information used as input for financial reporting, and the related internal control system.
The IT processes and developments implemented on the reporting systems play a particularly important role in the oversight of the IT architectures and applications used to manage this information.
The organisational model for the supervision of the adequacy of the administration, accounting and financial reporting procedures and the related internal control system is governed by the "Administrative and Financial Governance Guidelines" and the related implementing rules. In particular, the model prescribes assessment methodologies differentiated according to, on one hand, the risk of the processes deemed significant for accounting and financial reporting purposes and, on the other, the need to realise synergies with the control activities carried out by the Internal Audit Department and the other Corporate Control Functions.
To this end, the procedures may be verified by means of in-depth analyses, conducted according to specific methodologies used to verify the correctness of the accounting and financial information, carried out by the structures that support the Manager responsible for preparing the Company's financial reports (analytical approach) and, if present, of the information collected by the Corporate control functions or by external entities such as Independent Auditors, Supervisory Authorities, etc. (synthetic approach).
For the assessment of the adequacy of the relevant processes for the financial reporting, the Manager responsible for preparing the Company's financial reports uses the results of the controls carried out by the structures reporting directly to

him, by the Internal Audit Department and the other Corporate control functions. To this end, in the Group Control Coordination and Non-Financial Risks Committee belonging to the Integrated Internal Control System, the Corporate Control Functions and the Manager responsible for preparing the Company's financial reports share their annual verification plans and their findings. Any critical issues arising from inspections conducted by external entities (Independent Auditors, Supervisory Authorities) relating to financial reporting risk are also gathered and assessed.
To conclude the preparation of the Company's financial reports according to the rules and criteria set out in Part A of the Notes to the financial statements, and the supervisory activities conducted on the financial reporting processes, according to the guidelines described herein, the Managing Director and CEO and the Manager responsible for preparing the Company's financial reports sign the attestations required by Art. 154 bis, paragraph 5, of the Consolidated Law on Finance.
These attestations are included in the reporting packages for the separate financial statements of the Parent Company and the consolidated financial statements, and are provided to the public according to the model established by the Consob Regulation.
With regard to the sustainability reporting, the Manager responsible for preparing the Company's financial reports signs, together with the Managing Director and CEO, the attestation pursuant to Article 154-bis, paragraph 5-ter, of the Consolidated Law on Finance that the Consolidated Sustainability Statement, included in the Report on operations, has been prepared:
- in compliance with the reporting standards applied in accordance with Directive 2013/34/EU of the European Parliament and of the Council of 26 June 2013 and Legislative Decree No. 125 of 6 September 2024;
- using the specifications adopted in accordance with Article 8(4) of Regulation (EU) 2020/852 of the European Parliament and of the Council of 18 June 2020.

Report pursuant to article 15 of Consob Market Regulation 20249/2017, as subsequently amended and supplemented

With regard to the protection of savings and the regulation of financial markets, the Italian Securities and Exchange Commission (Consob) has set certain conditions for the listing of companies controlling companies incorporated and subject to the laws of non-EU member states (Article 15 of the Market Regulation). As a result, Intesa Sanpaolo has set up an action plan to ensure the existence of the conditions required for subsidiaries that are of material significance, identified in compliance with the criteria established in the rules of the cited Article 15:
- ensuring the public disclosure of the accounting positions of subsidiaries prepared for the purposes of drafting the consolidated financial statements;
- obtaining details from its subsidiaries of their articles of association, membership and powers of the corporate bodies;
- determining that the subsidiaries: i) provide the independent auditor of the parent company with the information necessary to perform annual and interim audits of the parent company; and ii) enjoy access to an administrative and accounting system appropriate for regular reporting to the management and independent auditor of the parent company of the income statement, balance sheet and cash flow data necessary for the preparation of the consolidated financial statements.

On conclusion of the activities performed and the verifications conducted, compliance is confirmed with the conditions required by Article 15 of Consob Market Regulation 20249/2017 (as subsequently amended and supplemented).
The Management Control Committee and Board of Directors have been informed of compliance with those regulatory provisions governing companies incorporated in and subject to the laws of non-EU Member States, in the aforementioned "Report on the internal control system for the financial reporting process" drafted in order to illustrate the overall governance and control activities performed in accordance with the various provisions of laws and Group regulations governing the supervision of financial reporting, organically coordinated by the Manager responsible for preparing the Company's financial reports.

The scope of risks

The risks identified, covered and incorporated within the Economic Capital are as follows:

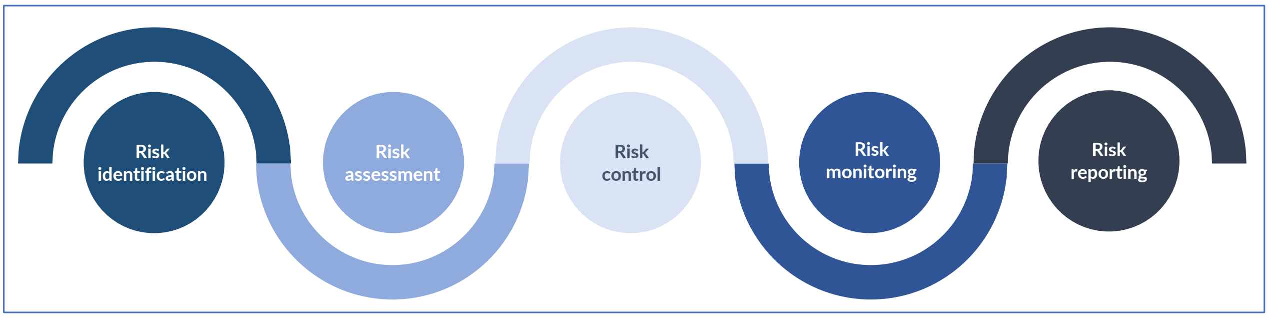
- credit and counterparty risk. This category also includes concentration risk, country risk and residual risks, both from securitisations and from uncertainty about credit recovery rates;
- market risk (trading book), including position, settlement and concentration risk on the trading book;
- financial risk of the banking book, mostly represented by interest rate and foreign exchange rate risk;
- operational risks;
- insurance risk;
- strategic risk;
- risk on real estate assets owned for whichever purpose;
- risk on equity investments not subject to line-by-line consolidation;
- risks relating to defined-benefit pension funds;
- model risk.

The hedging of risks, both those included and not included in the quantification of the Economic Capital, is based – according to the nature, frequency and potential impact of the risks – on a constant combination of mitigation/hedging actions, control procedures/processes and capital protection measures, including stress tests.

The Intesa Sanpaolo Group pays special attention to:

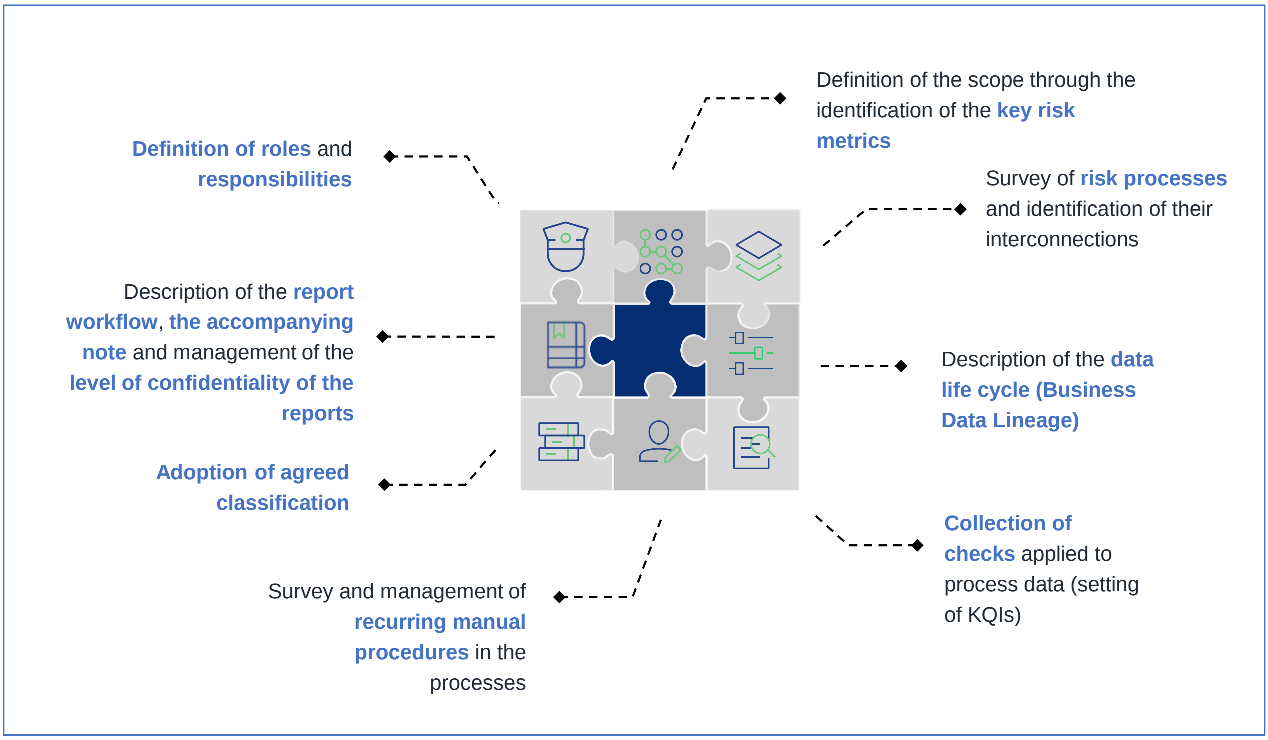
- managing the short-term and structural liquidity position by following specific policies and procedures to ensure full compliance with the limits set at the Group level and operating sub-areas in accordance with international regulations and the risk appetite approved at the Group level;
- managing reputational risk, which it pursues not only through organisational units with specific duties of promotion and protection of the company image, but also through dedicated processes for the identification and assessment of reputational risk and the creation of specific reporting flows. In addition, starting in 2018, a specific add-on for economic capital has been introduced for operational risk, determined on the basis of operational losses, to strengthen the protection against possible reputational repercussions;
- managing environmental, social and governance (ESG) risks of the economic activities the Group is involved in, as well as those associated with the activities of its corporate customers. The integration of climate change risk into the overall risk management framework is particular important for ESG risks, in line with the regulatory guidance and international best practices;
- the geopolitical context, the issues arising from it, and their evolution, in order to identify the main phenomena that could have an impact on an international scale and could significantly alter the Group’s risk profile and influence its operations. To this end, it has formalized a process for assessing the risks connected to the geopolitical context, which includes dedicated periodic reporting to the Corporate Bodies.

Over the years, the Group has developed and implemented the necessary structural and operational improvements for integrated risk reporting that is as complete, accurate and regular as possible, in order to support senior management.



The risk monitoring processes have undergone a progressive strengthening of the Data & Reporting Governance controls, also in compliance with the applicable regulations (“Principles for effective risk data aggregation and risk reporting - BCBS239”). The importance of **widespread** and **robust application** of **Data Governance** throughout the data lifecycle was reiterated with the issuance in May 2024 of the update of the “**Guide on effective Risk Data Aggregation and Risk Reporting**”. The target framework, designed and regulated by the Data & Artificial Intelligence structure, ensures the adoption of agreed classifications and uniform practices for describing the life cycle of the data, as well as the adoption of the Data Quality standards for the various Risk Areas designed to increase the accuracy of the Group’s data. Attention is also given to the data aggregation and reporting processes to ensure that they are able to meet the regulatory requirements or ad hoc requests, also in the stress/crisis situations. This is done in accordance with the expectations expressed by the Supervisory Authorities.

More generally, the strengthening of Data & Reporting Governance has involved the aspects detailed in the diagram below.



The Group has also strengthened its focus on data quality control, with the establishment of a unit responsible for second level data governance controls within the Chief Risk Officer Area.

Assessments of each single type of risk for the Group are integrated in a summary figure – the Economic Capital – defined as the maximum "unexpected" loss the Group may incur over a year, at a given confidence level. This is a key measure for determining the Group's financial structure and its risk tolerance, and guiding operations, ensuring the balance between risks assumed and shareholder return. It is estimated on the basis of the current situation and also at a forecast level, in line with the approved Risk Appetite Framework, based on the budget assumptions and the forecast macroeconomic scenario, and in relation to stress scenarios. The economic capital together with the risk capital calculated on a regulatory basis is a fundamental element in the assessment of the Group's capital adequacy within the ICAAP.
The assessment of capital is included in business reporting and is submitted quarterly to the Steering Committee, the Risks and Sustainability Committee and the Board of Directors, as part of the Tableau de Bord of the Group Risks.

In addition to managing the risks described above, Intesa Sanpaolo pays close attention to the identification and monitoring of specific areas of emerging risk, which, in the medium term, could compromise the achievement of the Group's strategic objectives or significantly influence its financial position and results.

For the purposes described above, the Intesa Sanpaolo Group uses a wide-ranging set of tools and techniques for risk assessment and management, detailed in this Part E of the Notes to the consolidated financial statements, with regard to the types of risk indicated below and in accordance with the procedures established for the qualitative disclosure in Bank of Italy Circular 262. The table below shows the mapping of the risk disclosure using these methods with reference to the Financial Statements, together with the corresponding sections of the Pillar 3 disclosure, where relevant.

	FINANCIAL STATEMENTS		PILLAR 3
	Section/Chapter	**Paragraph**	**Section**
RISKS OF THE BANKING GROUP	PART E - SECTION 2		
- Credit risk	Chapter 1.1		Sections 6-7-8-9-10
- *- Securitisations*	Chapter 1.1	*Paragraph C*	Section 12
- Market risk	Chapter 1.2		Section 13
- *- Regulatory trading book*		*Paragraph 1.2.1*	
- *- Banking book*		*Paragraph 1.2.2*	
- Counterparty risk	Chapter 1.3		Section 11
- *Financial derivatives*		*Paragraph 1.3.1*	
- *Credit derivatives*		*Paragraph 1.3.1*	
- *Accounting hedges*		*Paragraph 1.3.2*	
- Liquidity risk	Chapter 1.4		Section 5
- Operational risks	Chapter 1.5		Section 14
RISKS OF INSURANCE COMPANIES	PART E - SECTION 3		
- Insurance Risks	Chapter 3.1		
- Financial Risks	Chapter 3.2		
RISKS OF OTHER COMPANIES	PART E - SECTION 4		

In addition to credit, market trading book, banking book financial, liquidity, operational and insurance risks, discussed in detail in the following paragraphs, the Group has identified and monitors the following other risks.

Strategic risk

The Intesa Sanpaolo Group defines current or prospective strategic risk as risk associated with a potential decline in profits or capital due to changes in the operating context, misguided Company decisions, inadequate implementation of decisions, or an inability to react sufficiently to changes in the competitive scenario.
The Group's response to strategic risk is represented first and foremost by policies and procedures that call for the most important decisions to be deferred to the Board of Directors, supported by a current and forward-looking assessment of risks and capital adequacy. The high degree to which strategic decisions are made at the central level, with the involvement of the top corporate governance bodies and the support of various corporate functions ensures that the component linked to any impacts of incorrect company decisions and low reactivity to changes in the competitive scenario are mitigated.
As regards the component more directly related to business risk, i.e. associated with the risk of a potential decline in profits as a result of the inadequate implementation of decisions, changes in the operating context and unexpected changes in the cost of refinancing, is handled not only by using systems for regulating Company management, but also via specific internal capital, determined according to an approach that simulates the volatility of margins, fees and commissions, operating costs and refinancing costs, anchored to the business mix of the Group and its Business Units.
Strategic risk is also assessed as part of stress tests based on a multiple-factor model that describes the relations between changes in the economic scenario and the business mix resulting from planning hypotheses, with analyses to assess the impacts on both interest income and margins from the performance of net fees and commissions.

Reputational risk

The Intesa Sanpaolo Group attaches great importance to reputational risk, namely the current and prospective risk of a decrease in profits or capital due to a negative perception of the Bank's image by customers, counterparties, shareholders, investors and Supervisory Authorities.
The Intesa Sanpaolo Group actively manages its image in the eyes of all stakeholders, by engaging all its Organisational Units and seeking robust, sustainable growth capable of creating value for all stakeholders. In addition, the Group seeks to minimise possible negative effects on its reputation through rigorous and comprehensive governance, proactive risk management and guidance and control of its activities.
The overall management of reputational risk is pursued primarily through:

- compliance with standards of ethics and conduct and self-governance policies. The Code of Ethics adopted by the Group contains the core values that Intesa Sanpaolo intends to commit itself to and sets out the voluntary principles of conduct for dealings with all stakeholders (customers, employees, suppliers, shareholders, the environment and, more generally, the community) with even broader objectives than those required by current legislation;
- the systematic, independent contribution by the company structures tasked with safeguarding the company reputation, which maintain relations with stakeholders, within their respective areas of responsibility;
- an integrated monitoring system for primary risks, to limit exposure to those risks, and to comply with the related limits contained in the Risk Appetite Framework;
- the Reputational Risk Management processes governed by the Chief Risk Officer Governance Area, which operate transversally across the corporate functions and in synergy with decision-making processes.

Those processes, which involve control, specialist and business functions, for various purposes, specifically include:

- the Assessment of the initiatives of the Business Plan potentially exposed to reputational risk, to detect and verify the risk control already in place or, alternatively, the specific reputational risk control to be set up. The results of the assessments are submitted to the Group Control Coordination and Non-Financial Risks Committee, also in relation to possible mitigation actions to be implemented over time;
- the Reputational Risk Assessment, aimed at identifying the most significant reputational risk scenarios the Intesa Sanpaolo Group is exposed to, in order to determine their probability of occurrence and the Group's exposure to reputational risk. The analysis is carried out annually and gathers the opinion of top management regarding the potential impact of these scenarios on the Group's image, in order to identify appropriate communication strategies and specific mitigation actions, where necessary. To this end, contributions from external observers are also considered, in addition to the business information originating from the top managers and the Group Business Plan. For example, starting from 2022, an analysis has been carried out on the population with knowledge of finance and economics and on opinion leaders (e.g. economic/financial analysts and experts, academics, institutions);
- ESG & Reputational Risk Clearing, which is tasked with the ex-ante identification and assessment of the potential reputational risks associated with the most significant business operations and the selection of the Group's suppliers/partners;
- Reputational Risk Monitoring, aimed at analysing and verifying the evolution of the exposure to reputational risk on an ongoing basis, using specific national and international monitoring (e.g. Web & press monitoring), algorithms aimed at tracking the developments in the company's exposure to reputational risk, and the information provided by the reputational positioning analyses carried out periodically.

The reputational risk governance model also includes an integrated compliance risk management system, as it considers compliance with the regulations and fairness in business to be fundamental to the conduct of banking operations, which by nature are founded on trust.

In performing the Investment Service for customers, the Groups is exposed to a series of potential risks linked to the activity, such as reputational, legal, strategic and operational risks.
To minimise the above risk dimensions, also in compliance with the applicable regulations, the Group has long had appropriate processes in place to capture their key aspects. These include the following processes in particular:

- Product Governance Risk Clearing, which is assigned the objective of pre-emptive assessment, together with the other competent control functions and the business owner, of the suitability of the products being sold/distributed to customers, analysing all potential risk factors;
- Risk Profile Annual Review of the adequacy of the portfolio risk "limit" associated with each customer segment identified;
- Investment Adequacy Framework, covering the subscription of financial investments and the execution of transactions in unlisted derivatives.

The sale of financial products is therefore governed by specific preventive risk assessment from the standpoint of both the Bank (along with risks, such as credit, financial and operational risks, that directly affect the owner) and the customer (portfolio risk, complexity and frequency of transactions, concentration on issuers or on foreign currency, consistency with objectives and risk tolerance profiles, and knowledge and awareness of the products and services offered), in order to correctly identify and mitigate any potential source of risk inherent to the activity.

ESG (Environmental, Social and Governance) risks and climate change risk

Sustainability, a term referring to the ability to avoid harming the environment and communities, in order to support a medium/long-term economic, social and environmental balance, is a factor of significant, increasing importance for society as a whole. The management of ESG issues therefore requires considering not only the impacts of the related risks on the Bank's organisation, but also the potential impact on stakeholders and the risks that the Bank exposes its stakeholders and the environment to through its operations. The Intesa Sanpaolo Group is aware of the importance of fair, responsible allocation of the resources and the influence that a banking group can have in terms of sustainability in both the short and long term and pays particular attention to managing ESG risks, both regarding its operations and relating to the activities of its corporate customers and the sectors considered sensitive, i.e. with a significant ESG risk profile.
ESG risks are therefore included in the overall risk management framework as they represent potential negative impacts that an organisation or activity may have on the environment, people and communities, including risks related to the corporate conduct (corporate governance), earnings, reputational profile and credit quality with possible legal consequences. Within the ESG risks, particular importance is given to climate risk, namely the financial risk arising from exposure to the physical and transition risk related to climate change. The risks and opportunities related to climate change are identified and analysed in a coordinated manner by the various corporate functions, in order to include them in the ordinary processes of risk identification, assessment and monitoring, in the Group's credit strategies and commercial offering.
The Group is therefore committed to incorporating the impact of climate-related aspects into its strategic decision-making processes, in order to fully integrate them into the risk management framework with the aim of maintaining a limited risk profile. This includes the monitoring and management of ESG risks, including risks arising from climate change (credit, operational, reputational, market and liquidity risks) and the implementation of ethical and environmental standards in the internal processes, products and services offered to customers, and selection of counterparties and suppliers.
The Risk Appetite Framework (RAF), which represents the general framework used for the management of enterprise risk, includes a specific section dedicated to ESG, climate change and reputational risks. This section includes qualitative and quantitative information. Specifically, with regard to ESG & Climate risks, the Group recognises the strategic importance of ESG factors and the urgent need to curb climate change.

Climate change risks can be divided into physical and transitional risks.

Physical risks represent the negative financial impact from climate change, including more frequent extreme weather events and gradual climate change, as well as environmental degradation, i.e. air, water and soil pollution, water stress, biodiversity loss, and deforestation. These risks – which can usually arise in both the short/medium and long term – can be broken down into acute and chronic risks:
- **acute physical risks,** which refer to specific events that have the potential to create significant physical damage (e.g. flooding of rivers and oceans, tropical storms). These events are occurring more frequently, on both a regional and global basis;
- **chronic physical risks,** which involve a series of physical impacts of considerably longer duration than those posed by acute risks. They are identifiable as processes of change rather than single events. In most cases, the impacts are localised (e.g., drought) but chronic risks are likely to become more significant in the long term.

Transition risks are the negative financial impacts that an institution may incur, directly or indirectly, as a result of the process of adjustment to a low-carbon and more environmentally sustainable economy, arising from:
- **public policy and legal risks**: this category includes policies that attempt to limit actions that contribute to the negative effects of climate change or political actions that seek to promote adaptation to climate change and the legal risk arising from the inability of organisations to mitigate/adapt to climate change;
- **technological developments**: these include innovations that support the transition to a low-carbon and energy-efficient economic system;
- **consumer preferences**: changes in the demand and supply of certain goods, products and services that are more sustainable;
- **reputational risk:** arising from changes in customer or community perceptions of an organisation's contribution to the transition to a low-carbon economy.

The likelihood and magnitude of the impact of climate-related risk factors may be influenced by a number of additional variables such as the industry sector concerned, business model, and geographical location of the company or asset. The interactions and interdependencies between transmission channels and climate-related risk factors may result in an amplification of the related impacts. The above also applies in relation to the broader category and the transmission channels of environmental risks, where the main sources of risk for Intesa Sanpaolo's counterparties and, consequently, for the Group arise from:
- impacts on nature: changes in the state (quality and quantity) of natural capital caused by an organisation's activities that may result in changes in nature's ability to provide social and economic functions. Impacts can be positive or negative;
- dependence on nature: ecosystem services that an organisation relies on for the functioning of its business processes (e.g. the ability of ecosystems to regulate water flow).

The integration of the above-mentioned climate/environmental risks, and of ESG risks more generally, into the risk management framework consists of:
- a materiality analysis (Climate/ESG Materiality Assessment);
- establishment of specific controls within the Risk Appetite Framework (RAF);
- execution of a Climate Scenario Analysis;
- monitoring of ESG risks divided according to the different risk categories (e.g. credit, market, liquidity), with a particular focus, within the environmental risks, on climate change risk.

Climate/ESG Materiality Assessment

The Climate/ESG Materiality Assessment is aimed at identifying business sectors, geographic areas and portfolios (e.g. corporates, households and sovereigns) with higher vulnerability to climate change and ESG risks based on qualitative and quantitative approaches, in order to prioritise the risk controls to be implemented. The results of the Materiality Assessment provide the basis for:
- updating the mapping of the various climate and ESG risk factors, their transmission channels and the impact on other risk categories;
- setting the limits and Key Risk Indicators (KRIs) within the Risk Appetite Framework;
- calibrating and performing stress tests on specific climate and ESG risk factors;
- guiding the sectoral credit policies and strategies (ESG Sectoral Color Coding) and establishing specific actions aimed at mitigating ESG risks.

The materiality analysis described above contributes to determining the financial materiality for the Environmental component, which, together with the impact materiality, forms the basis for the Consolidated Sustainability Statement included in the Report on operations.

Risk Appetite Framework (RAF)

The RAF integrates and translates what has been defined in terms of strategic guidelines, Climate/ESG Materiality Assessment, and ESG Sectoral Color Coding into specific controls, identifying, on an annual basis, limits, key risk indicators (KRIs) and specific actions aimed at containing the ESG risks, with particular regard to the sectors most exposed to those risks. This also includes specific actions related, for example, to the Group's strategic choices, such as subscribing to the Net-Zero targets. Specifically, intermediate sector targets for 2030 have been set within the Business Plan for the most emission-intensive sectors, subject to a transition plan for mitigating the potential future risk, in accordance with the recommendations of the Net-Zero Banking Alliance (NZBA). In addition to the Oil & Gas, Power Generation, Automotive and Coal Mining sectors, already covered by targets, the Iron & Steel, Commercial Real Estate, Agriculture - Primary Farming, Aluminium, Cement, and Residential Real Estate sectors have been added in line with the commitments made in joining the NZBA and with the validation by the Science Based Target initiative (SBTi), requested in 2024 and obtained in January 2025.

The ESG Climate Change and Reputational Risk section of the Group RAF includes:

– specific limits in relation to the exposure to the Coal Mining and Oil & Gas sectors; for Coal Mining in particular, the limit is reviewed annually in line with the target of phasing out lending by 2025;
– specific early warning thresholds/KRIs relating to the emission intensity (CO_2eq) in terms of financed production of the counterparties belonging to the Oil & Gas, Power Generation, Automotive and Iron & Steel sectors, with the aim of meeting the commitments made within the Net-Zero Banking Alliance and the Science Based Target initiative;
– specific warning thresholds for new disbursements in the Residential Real Estate (RRE) portfolio to improve the quality of the residential properties taken as collateral and consequently reduce the transition and physical risk associated with mortgages. In particular, on the lower energy performance classes (EPC certifications) and in areas with very high physical risk;
– an early warning threshold in relation to the Group's exposure has also been introduced for sectors characterised by significant issues, especially with regard to the social dimension, in line with the ESG sectoral strategy of associated credit disincentives;
– a warning threshold in relation to the exposure to debt securities of government issuers in the Group's banking book that, based on certain internal ESG-related criteria, are defined as "high risk";
– monitoring of counterparty risk specifically for lines with "replacement risk" to the coal mining and oil & gas sectors characterised by significant problem issues, especially with regard to the social dimension.

The RAF also identifies the main limitations and exclusions to lending to sectors/counterparties most exposed to ESG risks, which are then integrated into the self-regulatory policy and/or company processes. Specifically, Intesa Sanpaolo has issued the "Rules for lending operations in the coal sector", the "Rules on Oil & Gas sector" and the "Guidelines governing transactions with subjects active in the armaments sector", aimed at establishing general and specific criteria for limiting and excluding lending operations to counterparties in those sectors. Additionally, through the "Rules on Biodiversity and Nature", the Group governs its operations with regard to risks linked to biodiversity and ecosystems, setting specific limitation and exclusion criteria, refining risk assessment procedures, and encouraging sustainable financing aimed at maintaining or improving biodiversity and ecosystem services.

The policies and actions described above are covered in detail in the Environmental section of the Consolidated Sustainability Statement included in the Report on operations.

Climate Scenario Analysis

Scenario analysis is a key element in integrating the risks and opportunities associated with climate change into the business strategies, also considering the medium- to long-term implications. The Climate Scenario Analysis is used, within the more general framework of the materiality assessment, to explore potential portfolio vulnerabilities, particularly in the credit portfolio, as part of the regulatory stress testing exercises or the Internal Capital Assessment Adequacy Process (ICAAP) and the Internal Liquidity Assessment Adequacy Process (ILAAP).
In conducting the ICAAP process, Intesa Sanpaolo adopts an approach that incorporates specific solutions designed to verify the impact of transition and physical risk on the Non Financial Corporate (NFC) portfolio and the real estate-backed portfolio. With regard to transition risk, the impact is assessed by means of shocks applied to the balance sheets of the individual counterparties and to the energy efficiency level of the residential and commercial immovable property provided as collateral. The estimate of the impact of physical risk, on the other hand, is determined based on the geolocation of collateral real estate or NFC customer production sites, according to the different types of weather events. Within the ILAAP, particular attention is paid to analysing the impact of climate and environmental risk factors that could compromise the liquidity positions from a forward-looking perspective over medium-term horizons (1-4 years).

Where required, the Group takes part in the stress tests conducted by the European Banking Authority (EBA).

The results of the impact assessments conducted so far (materiality assessment and climate scenario analysis) have shown that the Group is not exposed to a material extent to climate risks in the short term. Over the medium- to long-term horizon, exposure to these risks could intensify in a limited and concentrated manner in areas already subject to control and monitoring. In particular, with regard to the transition risk on the most emission-intensive sectors of the Banking Book (Oil & Gas, Power Generation and Automotive), intermediate sector targets to 2030 have been set in the Business Plan – aligned to the Net-Zero target by 2050 – subject to a transition plan in accordance with the NZBA guidance, to mitigate the potential future risk. The monitoring has been progressively extended to other sectors, in line with the commitments made upon joining the NZBA and with the request for validation by the SBTi.

Monitoring of ESG/climate risks in the different risk categories

Intesa Sanpaolo's risk management framework involves the integration of climate and environmental risk factors with the different risk categories impacted. This decision takes into account the fact that the impact of climate and environmental risks may be direct, for example due to lower earnings of companies or the reduction in value of assets, or indirect, for example due to legal actions (legal risk) or reputational damage that arises when the public, counterparties of the institution and/or investors associate the institution with adverse environmental effects (reputational risk).

With regard to **credit risk**, the qualitative component of the models currently validated and used by the Group considers various ESG and Climate-related aspects and elements. For Large Corporates, a specific module has also been incorporated into the model that considers quantitative ESG data provided by external providers, and for the Corporate model (companies or groups with a size of less than 500 million euro), an ad hoc module has been developed – in addition to the qualitative questions that also consider socio-environmental risks, to take into account the counterparty's exposure to physical risks arising from catastrophic events (e.g. damage to production facilities and/or warehouses) – that statistically identifies potential deteriorations in the Probability of Default, using historic and public information on catastrophic events observed at geographic area level. More specifically, for domestic counterparties, this module provides an assessment of the risk of damage related to natural disasters (floods, fires, earthquakes) to which a company is potentially exposed depending on the region (and/or municipality) where it operates and/or mainly conducts its business. Overall, the weight of these modules in the final rating is limited. Consequently, at present there does not appear to be any appreciable "large-scale" effect attributable to those modules on the ratings expressed by the internal models and, therefore, on the downstream metrics that use them (e.g. ECL).

In managing **market risk**, Intesa Sanpaolo also assesses the effects of climate and environmental factors on its current positions exposed to market risk. Specifically, the Group:
- analyses and monitors market prices and liquidity of financial instruments to identify possible evidence of climate and environmental risk factors;
- analyses the impact of climate and environmental risks on the fair value measurement of financial instruments, focusing in particular on the main asset classes, payoffs and positions explicitly linked to climate and environmental (C&E) risk factors, as well as the future investments proposed by the business structures;
- classifies current positions subject to market risk using the ESG indicators available internally (e.g. ESG Sectoral Assessment and ESG Sectoral Color Coding) and externally (e.g. economic-industrial business sectors, ESG score/rating), also through recognised providers, in order to identify specific risk controls, also considering the materiality of the exposures. These controls consist of the establishment of market risk limits on the investment activity (e.g. allocation of ceiling limits). In principle, the indicators used for assessing the ESG risks associated with the investment activity enable the establishment of negative/positive screening criteria and strategies, taking into account the specific characteristics of the different asset classes concerned, such as instruments issued by corporate counterparties and instruments issued by government or supranational counterparties.

Within the market risk management model, the assessment of exposure to ESG risks also involves stress tests to investigate the sensitivity of the portfolios to ESG risk factors and estimate the impact that those factors, particularly climate and environmental risks, may have on the actual risk level of the exposures.

As part of the **counterparty risk** management, a monthly analysis is performed to assess the concentration of the exposure in the OTC derivatives and SFTs portfolio, measured with Potential Future Exposure and Current Exposure metrics, using the internally available ESG indicators (such as ESG Sectoral Assessment and ESG Sectoral Color Coding).

With regard to **liquidity risk**, significant climate and environmental risks may lead to an increase in net cash outflows or erode available liquidity reserves. Even though, according to the general consensus in the banking industry, the link between C&E risks and liquidity is mainly indirect and potentially more long term in nature, it is considered important not to underestimate these risks and their potential transmission, and to duly incorporate an assessment of their potential effects on the Group's current and future liquidity position.
To this end, after the prior identification of climate and environmental risk factors that could adversely affect the Group's liquidity positions, specific analyses and monitoring of exposures are carried out to assess the materiality of the risk factors identified, maintaining a close connection with the qualitative assessments adopted:
- by the Bank at sector and sub-sector level (e.g. ESG Sectoral Assessment) for credit risk purposes;
- for the valuation of securities for market risk purposes.

In the assessment of the various scenarios, including stress scenarios, on the timing of inflows and outflows and the quantitative and qualitative adequacy of liquidity buffers, particular attention is also devoted to analysing the impact of climate and environmental risk factors that could compromise the liquidity positions on a forward-looking basis. These analyses are incorporated into the annual report on the Internal Liquidity Adequacy Assessment Process (ILAAP), in line with the analysis horizon for the exercise (1-4 years), and have identified relatively low absorptions of the Group's liquidity reserves.

In managing **operational risks**, Intesa Sanpaolo also considers the possible adverse impact of weather and environmental events on its real estate, business continuity and litigation risk. Specifically, the Group:
- within the loss data collection for operational events, identifies those related to climate and environmental risks, through specific event types;
- during the Operational Risk Assessment process, uses specific risk scenarios dedicated to climate and environmental risks to assess possible losses resulting from property damage, possible disruptions to its operations and potential legal liabilities;
- to protect business continuity, assesses the impact of the physical risks associated with IT centres and sites (including outsourced IT services), identifying alternative locations for disaster recovery.

Since 2023, a specific scenario has been used to assess the impacts on the Bank of an extreme weather event affecting a key supplier and compromising its ability to provide the service it was engaged for.

In relation to climate/environmental litigation risk, Intesa Sanpaolo has set up monitoring of market disputes (domestic and international), refined its litigation monitoring process, and established a special training initiative for the staff involved.
The operational losses identified in relation to climate and environmental risks, together with the results (in terms of expected loss and VaR) of the Self-Diagnosis of the assessment of the possible impacts of those risks, contribute to the calculation of the capital requirement at individual and consolidated Group level, using an advanced approach, and are included in the operational risk reporting periodically submitted to the Group Control Coordination and Non-Financial Risks Committee.

In managing **reputational risk**, the Group makes prior assessments of the potential ESG and reputational risks associated with the Group's business operations and supplier/partner selection through the ESG & Reputational Risk Clearing process.
With regard to the corporate credit granting process in particular, it is aimed at making a prior assessment of the potential ESG and reputational risks associated with credit transactions involving counterparties operating in sectors sensitive to ESG and/or reputational risks. As already mentioned in the paragraph on Reputational Risk above, the ESG & Reputational risk clearing process is applied on a proportional basis and in a differentiated manner according to the complexity of the counterparties/transactions and has escalation mechanisms differentiated according to the ESG/reputational risk class

assigned to the transaction/counterparty. The Group also monitors its web and press reputation by integrating specific assessments of events related to environmental risks/climate change (e.g. events resulting from protests or adverse campaigns arising from the Bank's lending activities). Lastly, specific scenarios relating to ESG and climate issues are included in the annual reputational risk assessment by the top management.

In relation to the **risks associated with the Investment Service for Customers**, the Group has set up a series of centralised controls aimed, on one hand, at monitoring the sustainability risk implicit in the size of the ESG score provided by a specialist info provider at instrument and portfolio level and, on the other hand, at ensuring that sufficient stress is given to Sustainable Development Goal (SDG) factors in the analyses carried out within the Product Governance process for the assets under administration issued by the Parent Company and distributed through the captive networks.

With regard to **direct environmental risks**, in view of the increasing strategic significance of the issue of CO_2 emissions, in 2022 Intesa Sanpaolo drew up a new plan, called the Own Emissions Plan, which sets a 2030 Carbon Neutrality target for own emissions through energy efficiency measures and greater use of energy from renewable sources and the purchase of carbon credits for the residual emissions. Intesa Sanpaolo is also committed to analysing and containing possible risks on its properties, as well as taking swift action to deal with any environmental emergencies that may arise. To this end, in line with the provisions of the Business Plan, since 2023 a specific tool has been available that identifies the degree of exposure of Intesa Sanpaolo's real estate assets to the main geographical and climate change risks. This platform geolocalises each individual asset and calculates the exposure index for each risk, based on data from the main national and international certified sources, such as SwissRE, Copernicus, IGNV, ISPRA, and the Department of Civil Protection, etc. With regard to hydrogeological risk (floods and landslides), which also relates to climate change and the potential occurrence of crisis scenarios in Italy which could have repercussions on Intesa Sanpaolo's properties, a series of corporate structures will be set up. Specifically, the platform supports the management of emergency events, generating alerts based on weather reports and other sources, and providing detailed information on events, including affected assets and related communications. In the event of a weather alert, the CEM (Critical Events Management) is activated to monitor the situation and coordinate the necessary actions, in continuous liaison with the head office and local structures. In serious emergency situations, the Emergency Management Operational Centre of the Business Continuity Management Department is also engaged.
The platform was further developed in 2024 and now considers a variety of physical and geographical risks, such as earthquakes, floods, landslides, droughts, and wildfires. The platform also assesses risks such as lightning, storm surges, tsunamis and other coastal phenomena, using digital terrain models and data from selected sources. The platform also enables the identification of the Group's buildings located in areas included in the World Database on Protected Areas (WDPA), the most comprehensive global database on terrestrial and marine protected areas, including Natura 2000 sites.
Additional implementations are underway to provide an overall index of exposure to geographical and climate risks for each real estate asset.

The potential impacts, the related time horizon (short, medium and long-term) and the actions identified for each observed potential risk, which are updated annually, for both indirect and direct risks, are set out in the tables below.

INDIRECT RISKS – Potential impacts

	Potential risks	Risk type	ST(0-3y)	MT(4-7y)	LT(7-30y)	BdT	C&IB	PB	IBD	AM	INS	CC	Potential Impacts
Transition Risks	**Climate change risk:** *misalignment of economic actors with actions aimed at reducing their CO2 emissions* *via:* • *Policy and Legal Risks* • *Technology Risks* • *Consumer preferences* • *Reputational risks*	**Credit Risk**	◷	◷	◷	○	○	○	○				**Non-financial corporation counterparties:** Introduction of climate policies and technological shifts can weaken companies' competitiveness, affecting their financial statements through reduction of earnings, alteration of business costs, need for investment, impacting their creditworthiness and solvency. **Households and retail customers:** Non-compliance with regulations or shifts in preferences towards low-energy housing may affect collateral value or generate stranded assets. Additionally, higher energy prices or policies promoting green mobility could impact families' costs and spending power and, in turn, their creditworthiness and solvency.
		Market risk	◷	◷	◷		○	○	○	○	○	○	**Non-financial corporation issuers:** Introduction of climate policies and technological shifts can weaken companies' competitiveness, affecting their financial statements through reduction of earnings, alteration of business costs, need for investment, impacting their creditworthiness, solvency and the value of their financial instruments traded on financial markets. **Sovereign issuers:** Impact on real economy and financial system, coupled with social adjustments to support transition, may lead to higher costs for high-emitting nations, which, in turn could impact their creditworthiness, solvency and the value of the financial instruments traded on the financial markets. **Asset Management / Insurance:** Consequences of climate change on companies in the portfolio with consequent possible reduction in the value of assets under management or investments.
		Operational risk	◷			○	○	○	○	○	○		**Conduct:** Losses arising from an unintentional or negligent failure to meet a professional obligation to specific clients (including fiduciary and suitability requirements), or from the nature or design of a product or commitments (e.g. greenwashing). **Litigation:** Litigation and liability costs associated with climate-sensitive investments and businesses.
		Liquidity risk	◷	◷		○	○	○	○			○	**Credit exposures:** Impact of transition risks on customer exposures could affect the liquidity position of the Group (e.g. undrawn committed lines/default of counterparties). **Funding:** Transition risk factors may affect customers and therefore their ability to fund the Group. **Market exposures:** Transition impacts on issuers and their financial instruments might reduce the ability for the Bank to trade or liquidate assets computed in the liquidity reserves.
		Reputational risk	◷	◷	◷	○	○	○	○	○	○		Deterioration of the Group's image due to unmet expectations in climate and environmental risk management or business adaptation • Negative perception from stakeholders and in particular from ESG investors due to nil or inadequate management of such risks • Possible exclusion from sustainability (ESG) indices or a worse ESG position or lower ESG rating

Timeframe: The timeframe indicated below considers the analyses carried out by the Banking Group in various climate-related risks assessment exercises. The analyses are not exhaustive regarding the potential impacts that the Bank could face in the short, medium, and long term, and are not indicative of the materiality of the impacts assessed as detailed in the Risk Management chapter.
Business Areas: BdT = Banca dei Territori; C&IB = Corporate & Investment Bank; PB = private banking; IBD = International Banks Division; AM = Asset Management; INS = Insurance; CC = Corporate Center. The areas where it is possible to observe climate-related risk impacts are here identified, based on the business relevance for those areas. This does not exclude the possibility that other areas, not indicated, may also have potential impacts. The details of the analyses conducted on the different business areas are set out in the Risk Management section.

INDIRECT RISKS – Actions and Opportunities

	Potential risks	Risk type	ST(0-3y)	MT(4-7y)	LT(7-30y)	BdT	C&IB	PB	IBD	AM	INS	CC	Implemented actions	Opportunities
Transition Risks	**Climate change risk:** *misalignment of economic actors with actions aimed at reducing their CO2 emissions* *via:* • *Policy and Legal Risks* • *Technology Risks* • *Consumer preferences* • *Reputational risks*	**Credit Risk**	◷	◷	◷	○	○	○	○				• Assessment of ESG and climate risks in the lending portfolio through Materiality assessment, scenario analysis, Business Environment Scan exercise and transactions risk assessment process • Definition of targets related to the physical intensity of financed counterparties belonging to specific sectors • Limits and monitoring thresholds set within the Risk Appetite Framework • Identification of environmental (e.g. net zero loans and medium-to-long-term financing with SACE green guarantees), social, governance, and other sustainable products and transactions • Implementation of self-regulation policies (credit portfolio)	• Sustainable finance: increase customer support to enforce energy transition by offering products and dedicated financial solutions (e.g. Green and Circular Economy products)
		Market risk	◷	◷	◷		○	○	○	○	○	○	• Assessment of ESG and climate risks in the investment portfolio through Materiality assessment, scenario analysis and Business Environment Scan analysis • Limits and early warning setting within the Risk Appetite Framework • Identification of green, social and sustainable investments • Implementation of self-regulation policies (investment portfolio) • Rebalancing of portfolios	• Increasing and expanding the range of investment products and services
		Operational risk	◷			○	○	○	○	○	○		• Assessment of ESG and climate risks through Materiality assessment, scenario analysis, Business Environment Scan analysis, and operational losses monitoring	
		Liquidity risk	◷	◷		○	○	○	○			○	• Assessment of ESG and climate risks through Materiality assessment and scenario analysis	• Increase of Green and ESG bond own issuances • Increase of third counterparties' Green and ESG bond in own portfolio
		Reputational risk	◷	◷	◷	○	○	○	○	○	○		• Assessment of ESG and climate risks through transactions risk assessment process • Participation in international working groups on climate change issues (e.g. UNEP FI, Net Zero initiatives) • Stakeholder engagement initiatives • Market perception and ESG rating positioning monitoring	• Improvement of the Group's perception/image for both investors and clients
		Cross-risk actions											• Active monitoring of ESG evolving regulations and implementation/integration of internal policies • Active collaboration with policy makers to highlight the need for stable and clear environmental and ESG regulations • Inclusion of climate risk in risk management systems	

Timeframe: The timeframe indicated below considers the analyses carried out by the Banking Group in various climate-related risks assessment exercises. The analyses are not exhaustive regarding the potential impacts that the Bank could face in the short, medium, and long term, and are not indicative of the materiality of the impacts assessed as detailed in the Risk Management chapter.
Business Areas: BdT = Banca dei Territori; C&IB = Corporate & Investment Bank; PB = private banking; IBD = International Banks Division; AM = Asset Management; INS = Insurance; CC = Corporate Center. The areas where it is possible to observe climate-related risk impacts are here identified, based on the business relevance for those areas. This does not exclude the possibility that other areas, not indicated, may also have potential impacts. The details of the analyses conducted on the different business areas are set out in the Risk Management section.

INDIRECT RISKS – Potential impacts

	Potential risks	Risk type (1)	ST(0-3y)	MT(4-7y)	LT(7-30y)	BdT	C&IB	PB	IBD	AM	INS(2)	CC	Potential Impacts
Physical Risks	**Climate change risk:** *Risks related to the physical impacts of climate change* (Chronic; Acute)	**Credit Risk**	X	X	X	○	○	○	○				**Non-financial corporations counterparties:** Severe weather events, both acute and chronic, may impact creditworthiness and solvency of corporate counterparties, with impacts varying based on business sector and location, potentially affecting their profitability. **Households and retail costumers:** Acute or chronic climate events can damage or destroy properties, decreasing their value and increasing credit risk.
		Market risk	X	X	X		○	○	○	○	○	○	**Non-financial corporations issuers:** Severe weather events, both acute and chronic, may impact creditworthiness and solvency of corporate counterparties, with impacts varying based on business sector and location, potentially affecting their profitability and the value of their financial instruments traded on the financial markets. **Sovereign issuers:** Severe weather events, both acute and chronic may impact the real economy and financial systems, coupled with social adjustments to support businesses and population in case of physical climate events. This could lead to higher costs for nations more prone to physical risks, which, in turn, could impact their creditworthiness, solvency and the value of the financial instruments traded on the financial markets. **Asset Management / Insurance:** Possible acute and chronic extreme weather events may cause losses on securities in managed portfolios.
		Liquidity risk	X	X		○	○	○	○			○	**Credit exposures:** The impact of physical risk on customer exposures could affect the liquidity position of the Group (e.g. undrawn committed lines/default of counterparties). **Funding:** Physical risk factors may affect customers and therefore their ability to fund the Group. **Market exposures:** Physical impacts on issuers and underlying assets of their financial instruments might reduce the ability, for the Bank, to trade or liquidate assets computed in the liquidity reserves.

(1) In the physical risk section, no potential impacts and actions directly related to reputational risk have been considered. Furthermore, in the context of Physical Risks, the Operational Risk can be considered a "Direct Risk", see next table.
(2) Catastrophic events may adversely affect the profitability of the insurance business with consequent increases in claims and may exceed insurance companies' estimates of expected risks and losses leading to higher insurance premiums with a consequent possible decrease in demand for insurance.
Timeframe: The timeframe indicated below considers the analyses carried out by the Banking Group in various climate-related risks assessment exercises. The analyses are not exhaustive regarding the potential impacts that the Bank could face in the short, medium, and long term, and are not indicative of the materiality of the impacts assessed as detailed in the Risk Management chapter.

DIRECT RISKS – Potential impacts and Actions

	Potential risks	Risk type (1)	ST(0-3y)	MT(4-7y)	LT(7-30y)	Potential Impacts	Implemented actions
Transition Risks	*Changes in environmental regulations* *■ Introduction of new greenhouse gas emission limits or new related reporting systems* *■ Increase in cost of raw materials* *Changes in environmental regulations and standards that the Group voluntarily adheres to (ISO standards)*	**Operational & Other risks**	X	X		• Possible sanctions in case of failure to comply with new Regulations • Costs for upgrading heating and air conditioning systems and for new monitoring tools • Cost related to potential taxes connected with greenhouse gas emissions • Increase in costs of energy supply • Costs of changing the certification processes in case of changes in the standards	• Constant and precautionary monitoring of possible changes to national and European regulations • Participation in dedicated training courses or workshops • Own emissions plan implementation and monitoring • Energy efficiency actions • Increase in the use of renewable energy sources • Preventive actions to replace old systems with next-generation ones with a low environmental impact, as well as consumption monitoring systems during the renovation of branches and buildings • Continuous and precautionary monitoring of possible changes in standards
Physical Risks	Acute *Extreme weather events (floods, landslides, avalanche, mudslides, heavy rainfalls, hailstorms, heavy snowfall, whirlwinds, hurricanes, cyclones, coastal storms)*	**Operational & Other risks**	X	X	X	• Business continuity: extreme weather events may cause material damage and interruptions to the Group's operations • Own assets: extreme weather events may cause material damage to the assets of the Group	• Precautionary assessment of the hydrogeological risks for buildings • Adoption of a business continuity plan and measures to prevent/mitigate/manage physical damage to the bank's structures • Creation of a platform to identify the risk level of any Intesa Sanpaolo Group real estate asset • Insurance to cover the risks and their impacts
	Increase or reduction in average temperatures, sea level rise, water stress and drought Chronic		X	X	X	• Increase in energy supply costs connected with greater heat or electricity consumption • Power-outage risk due to increased energy demand • Sea level rise with consequent impact on buildings close to the sea • Potential fires due to temperature increase in areas close to the Bank's buildings	• Energy efficiency actions • Increase in the use of renewable energy sources • Preventive actions to replace old systems with next-generation systems with a low environmental impact, as well as consumption monitoring systems during the renovation of branches buildings • Preventive assessment of the risk of sea level rise • Adoption of a business continuity plan and actions to mitigate/manage possible power outage • ISO 14001, ISO 50001 and ISO 45001 certifications taking into account climate change related risks • Creation of a platform to identify the risk level of any Intesa Sanpaolo real estate asset

(1) Within direct risks, both operational and other types of risks not directly related to the prudential framework of the Group have been considered.

Additional information on the management of environmental and climate risks is provided in the Consolidated Sustainability Statement, which, starting from the 2024 Annual Report, is included in a specific section of the Consolidated Report on Operations, and in the Basel 3 Pillar 3 Disclosure and the Climate Report[182].

Risk on owned real-estate assets

The risk on owned real-estate assets may be defined as risk associated with the possibility of suffering financial losses due to an unfavourable change in the value of such assets and it is thus included in the category of banking book financial risks. Real-estate management is highly centralised and represents an investment that is largely intended for use in company operations. The degree of risk in the portfolio of owned properties is represented by calculating an economic capital based on the volatility observed in the past in real estate price indexes (mainly Italian, the type of exposure prevalent in the Group's real-estate portfolio), with a degree of granularity of geographical location and intended use appropriate to the real estate portfolio at the reporting date.

Risk on equity investments not subject to line-by-line consolidation

The risk in the equity investment portfolio is related to the possibility of incurring economic losses due to the adverse changes in values of investments not subject to line-by-line consolidation.
The scope considered consists of the equity instruments held in financial and non-financial companies, and includes financial investment instruments, commitments to purchase, and derivatives with underlying equity instruments and equity funds.
The model used to estimate the Economic Capital is based on a PD/LGD approach similar to the credit risk portfolio model and it is used for the stand-alone equity investment portfolio, supplemented with market valuations for the listed portion. The applicable LGD is the regulatory LGD, whereas the model's other parameters are the same as those used in the portfolio model for credit risk.

Risk related to defined-benefit pension funds

The risk related to defined-benefit pension funds is attributable to the possibility of having to increase the reserve that the Parent Company Intesa Sanpaolo maintains to guarantee the benefits of those pension funds, based on an adverse change in the value of the assets and/or liabilities of the pension funds concerned. This risk is fully considered within the assessment of capital adequacy, measured and controlled from the point of view of Economic Capital, and, with an econometric model based on the main macroeconomic variables, also in the baseline and stress forward-looking scenarios.

Model risk

Model risk is defined as the potential loss an institution may sustain, as a consequence of decisions that could be principally based on the output of internal models, due to errors in the development, implementation or use of such models. In continuity with previous years, within the 2024 ICAAP Report, the Internal Validation & Controls Coordination Area updated the model risk assessment (expressed synthetically through a score) of the methodologies supporting the measurement of Pillar 1 and Pillar 2 risks that also contribute to the calculation of the Economic Capital and provided the Enterprise Risk Management structure with the parameters for the quantification of the model risk economic capital.

Emerging risks

The strengthening of the overall risk management system also involves the identification, understanding and monitoring of so-called emerging risks, i.e. risks characterised by components that are little-known or rapidly evolving, potentially significant in the medium term to the Group's financial position and business model, even though their effects are not easy to assess and cannot yet be fully integrated into the most consolidated risk management frameworks.
The identification of these types of risks derives primarily from the continuous analysis of the external environment and the main findings gathered by the risk management function as part of identifying risk, continuously performed within the Group to maintain ongoing alignment with the changing internal and external context and to guarantee the adequacy of the controls and limits implemented to safeguard long term viability. In addition to being performed as part of the identification and assessment processes, that activity also involves comparison with peers and with market best practices, as well as with the Bank's other control/business functions.
Any emerging risks for which a model for calculating economic capital has not been developed are assessed, in any event, using expert-based approaches or using proxies or simplified calculation models in order to guarantee a prudent assessment of the economic capital absorbed.
In that context, the increasing digitalisation of technological infrastructure and the commercial offering, the increased process automation (e.g. through the introduction of robotics and/or artificial intelligence) and the introduction of new ways of working have changed the morphology of certain risks. Specifically, though they do not represent intrinsically new risks, it is probable that there will be significant exposure to:

– IT and Cyber risks, in relation to: (i) the increasing dependence on ICT systems and the resulting increase in the number of users of virtual channels and interconnected devices; (ii) exponential growth in the quantity of data managed, which must be high quality and protected; (iii) greater use of IT services offered by third parties (Open Banking, Fintech, Cloud systems); (iv) low production costs of new attack techniques with the presence of organisation with specific skills and experience; and (v) repercussions of cyber attacks on Italian financial institutions, also linked to the ongoing Russian-Ukrainian crisis;
– risks connected with the digital transformation process linked to the increase in competition triggered by digitalisation in the financial sector (e.g. entry of new competitors) and the vulnerability that still marks the current operating context (e.g. costs of the digitalisation process, obsolescence of legacy systems and fragmentation of the regulatory framework);
– third party risk, in relation to: (i) greater dependence on systems and services offered by third parties (both regarding the outsourcing of company processes and the growing dependence on providers of cloud or IT services in general);
– risks associated with Artificial Intelligence (AI) supporting the execution of business processes, through the development of use cases involving the application of techniques differentiated according to the objectives and corporate functions

182 Previously the TCFD Report.

involved. The potential impact of risks associated with these applications is assessed in relation to: i) possible implications in terms of regulatory compliance (Artificial Intelligence Act); ii) ethical and responsible use of AI solutions; and iii) governance of AI solutions and assessment of the associated technological, reputational and model risks. The management of AI solutions and the assessment/mitigation of risks associated with them is ensured through the updating and supplementation of the company regulations, and the development and initial application of methodologies for preliminary risk assessment. Specific statements and metrics have been confirmed in the Group's Risk Appetite, ensuring their monitoring over time.

In addition, in view of the rapidly evolving world of digital assets, the Group has launched a series of project initiatives and participated in consortium initiatives aimed at studying, testing, and gradually implementing use cases regarding the provision of services related to digital assets and the application of the associated technologies (Blockchain, Distributed Ledger Technology - DLT, Metaverse). The analyses carried out on the risks associated with the sector indicate that transactions in digital assets and the use of new technologies have the same risk categories as traditional financial products, but with greater relevance due to the following factors:

– vulnerabilities of the new technologies not fully explored;
– technological standards being defined;
– a weak and constantly evolving regulatory/legal framework;
– absence of safeguards and guarantee schemes;
– presence of non-regulated entities and/or entities based in non-EU/OECD jurisdictions.

The risks associated with the ongoing initiatives have been assessed in the ordinary clearing processes and are monitored under the Risk Appetite Framework (overview of initiatives under study and implementation, limitations in terms of customer segments potentially affected by the initiatives, very strict operating limits, and risks identified within the ongoing projects).

The continuous evolution of the operational environment, both internal and external, requires the continuous updating of the current analysis frameworks (e.g. portfolio development policies, internal control system, payment systems, cybersecurity safeguards, anti-money laundering and counter-terrorism financing safeguards, and accounting, tax and prudential treatment of the assets) in order to take into account the new/altered operations and maximise the effectiveness of the controls for the identification and mitigation of the Group's potential exposure. In this regard, the work is continuing in the project initiatives aimed at optimising the Group's resilience profile.

Since the beginning of the conflict, the Intesa Sanpaolo Group has continued to carefully monitor the evolution of the fallout of the Russian-Ukrainian crisis – as well as the other situations of geopolitical tension – on the real economy and the main financial variables, also by conducting specific scenario analyses and stress tests to assess the potential impacts in terms of profitability and capital adequacy. Although the situation is constantly evolving, leaving aside extreme scenarios of conflict escalation that could lead to outcomes that are difficult to assess, these analyses confirm the Group's ability to ensure compliance – also through the implementation of specific actions – with the regulatory requirements and the stricter limits set internally.
With specific regard to risk management, details concerning credit risk are provided in the paragraph "The valuation impacts for the ISP Group of the military conflict between Russia and Ukraine", and there continue to be no significant impacts of the Russian-Ukrainian conflict on the metrics for measuring the counterparty risk and market risks in the Group's trading book and banking book. Likewise, in light of the low exposure to Russian and Ukrainian counterparties, there were no significant impacts on the Group's consolidated liquidity position. With regard to foreign exchange risk, there continue to be no significant impacts due to the low exposures. With regard to operational risks, the additional costs incurred for business continuity and any losses resulting from physical damage to premises/branches located in the conflict zone form part of the monitoring of the exposure to the risk, including that relating to the Risk Appetite Framework. Lastly, with regard to the monitoring of insurance risks, the focus remains on exposures to countries involved in the conflict, which are still entirely residual in nature compared to the total assets.

Absorption of Economic Capital by type of risk and Business Unit

The following is an illustration of the breakdown of the Group's Economic Capital by type of risk and Business Unit.

The absorption of Economic Capital by Business Unit reflects the distribution of the Group's various activities and the specialisations of the business areas.

The majority of risk is concentrated in the "IMI Corporate & Investment Banking" Business Unit (32.3% of the total Economic Capital): this is attributable to the type of customers served (Corporate and Financial Institutions) and Capital Market activities. This Business Unit is assigned a significant share of credit risk and trading book risk. The "Banca dei Territori" Business Unit (18.6% of the total Economic Capital) is a significant source of absorption of Internal Capital, in line with its role as core business of the Group, serving Retail, Private and Small/Middle Corporate customers. It is assigned a sizeable portion of credit risk and operational risk. Most of the insurance risk is assigned to the "Insurance" Business Unit (14.4% of the total Economic Capital). The "International Banks" Business Unit is assigned 8.1% of the total risk, predominantly credit risk. In addition to credit risk, the "Corporate Centre" is attributed with the risks typical of this Business Unit, namely those resulting from investments, the risks pertaining to the exposures in default, the Banking Book interest rate and exchange rate risk, as well as the risks arising from the management of the Parent Company's FVOCI portfolio (21.8% of the overall Economic Capital).

Absorption of Economic Capital by the "Private Banking" and "Asset Management" Business Units is marginal (3.8% and 1.0%, respectively) due to the nature of their business, which is predominantly aimed at asset management activities.

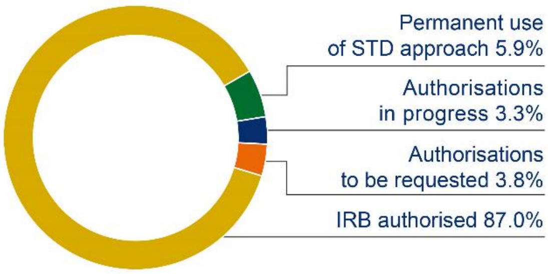
Basel Regulation and the Internal Project

To ensure ongoing compliance with the Basel Committee agreements, in 2024 the Intesa Sanpaolo Group implemented appropriate project initiatives to improve the measurement systems and the related risk management systems.

With regard to credit risk, there were no changes in the application of the internal models compared to December 2023.
The periodic updating and alignment to changes in regulations governing IRB systems and their extension continue in accordance with the Regulatory Roadmap agreed with the Supervisory Authorities.

With regard to the progress of the roll-out plan for the internal models for credit risk (IRB regulatory Roadmap), the share of exposures authorised for the IRB system is 87% of the loans portfolio. There are no pending authorisations on portfolios not yet validated, while requests to be made for the remaining portfolios of the Group's Italian and international banks represent 3.8% of the portfolio. For the residual component, equal to 9.2%, the permanent use of the Standardised approach has been reported to the Supervisory Authorities and authorisation has been received for 5.9% and is still being awaited for 3.3%.

Roll-out plan for internal models for credit risk(*) (**)



(*) Percentages calculated based on the full standard RWA amounts as at 31.12.2024. The portfolios are considered to be covered by IRB models when the authorisation has been received, from the Supervisory Authority, for use of the internal model for at least one of the risk parameters.
(**) The following are excluded from the Portfolio:
- risk-weighted exposures with counterparties classified as Sovereigns and DTAs;
- exposures to Group Companies that, based on the product classification in the Group Map at the monitoring reference date, do not come under one of the following categories: Banking Companies, Other Financial Intermediaries, and "Cards and Payment Systems" companies.

With regard to counterparty risk, the Banking Group has improved its measurement and monitoring by refining the tools required under Basel 3. For reporting purposes, the Parent Company is authorised to use the internal models approach for the capital requirement related to counterparty risk both for derivatives and for SFTs (Securities Financing Transactions, i.e. repos/reverse repos and securities lending/borrowing). This authorisation was obtained for derivatives from the first quarter of 2014, and for SFTs from the report as at 31 December 2016.
For management purposes, the advanced risk measurement approaches have been implemented for the OTC derivatives of the Parent Company since 2010 and were subsequently extended in 2015 to Securities Financing Transactions.
With respect to 31 December 2023, following the Targeted Review on Counterparty Risk for OTC derivatives and SFTs, which began in 2022 and ended in November 2024, new "active management" processes for counterparty risk have been introduced and formalised. In particular, a specific early warning system has been created for CCR, which includes the daily monitoring of indicators of potential credit deterioration (CDS spreads, equity value, and rating) and other alerts. If the established thresholds are exceeded, the Risk Management structures are required to contact the offices concerned, and, where necessary, based on the severity of the situation, organise a stakeholder conference call to assess the risk, mitigating it if possible, and, where appropriate, declaring the counterparty in default. Additionally, the default management process for counterparty risk has been formalised, and quarterly monitoring has been introduced for Non-Banking Financial Institutions (NBFIs) and High Risk counterparties, identified through stress analysis.

With regard to operational risk, the Group obtained authorisation to use the Advanced Measurement Approach (AMA – internal model) to determine the associated capital requirement for regulatory purposes, with effect from the report as at 31 December 2009. As at 31 December 2024, the scope of the Advanced Measurement Approach (AMA) was comprised of Intesa Sanpaolo (including the banks and companies merged into it) and the main banks and companies in the Private Banking and Asset Management Divisions, as well as of VUB Banka and Privredna Banka Zagreb.

The Basel 4 reform project, initiated by the Regulator in 2021 and culminating in the recent approval of the CRR3 Regulation, involved a major overhaul of the prudential framework, due to come into effect on 1 January 2025, with the first regulatory reporting on the reporting date of March 2025.
In accordance with the principles and guidelines formalised by the Basel Committee, in 2021 the European Commission put forward a coherent legislative proposal (the CRRIII/CRDIV package) aimed at implementing the standards set by the new Basel 4 framework, taking into account the specific features of the European banking sector and harmonising the supervisory regimes adopted by the Member States. The directive seeks to strengthen confidence in the representativeness of capital ratios and the resilience of the banking sector, also through measures aimed at reducing the volatility of the results of the internal models used by institutions. The final text was issued on 6 December 2023, following the completion of the negotiation in the trilogue between the European Commission, Parliament and Council, with the subsequent publication of Regulation (EU) 2024/1623 in the Official Journal of the European Union in June 2024.

The Intesa Sanpaolo Group has set up the compliance initiatives for the adoption of the regulatory provisions through a dedicated project (Basel 4 Project) in which the procedural frameworks have been identified and developed for the management of the information required by the measurement systems, with adaptations aligned to the governance processes.
Intesa Sanpaolo has implemented a multi-year work programme based on a specific project roadmap, starting with an assessment to identify the main changes introduced by the regulatory provisions and develop coherent methodological, organisational, and architectural approaches to adopt going forward. The activities continued steadily throughout 2024, including through systematic dialogue with the regulators, industry associations, recognised ECAIs, peers and consultancy firms, to organically introduce the required system of rules and measurement criteria, with modifications to IT architectures, application procedures, organisational processes, internal regulations and contractual relationships with customers. The work programme, which is constantly monitored with regular updates submitted to the Project Management, Control Functions and Management Bodies, is progressing smoothly in line with the scheduled timelines.

The new directive reconfigures the calculation of the capital requirements for all the major types of risk (credit risk, market and counterparty risk, operational risk), as well as the regulatory reporting processes, also introducing the concept of an “Output Floor” common to all the risk types, which involves applying a minimum threshold to the RWA values calculated through internal models compared to those determined using the standard approach.

With regard to the provisions concerning the determination of the capital requirements for credit risk, the main changes introduced involve the reduction of the scope of use of internal models and the introduction of a validation process, through internal due diligence, for the ratings obtained from ECAIs.

With regard to counterparty risk, the changes will impact the credit weightings for derivative and SFT counterparties. The developments needed for the implementation of the new CVA risk framework required by the new regulation are also being finalised.

With regard to operational risks, the new rules will change the way the Regulatory Capital Requirement is calculated, as well as the criteria for representing the main aggregates of the segment.

The annual Internal Capital Adequacy Assessment Process (ICAAP) Report, based on the extensive use of internal risk measurement methodologies, internal capital and total capital available, was approved and sent to the ECB in March 2024.

As part of its adoption of Basel 3, the Group publishes information concerning capital adequacy, exposure to risks and the general characteristics of the systems aimed at identifying, monitoring and managing them in a document entitled “Basel 3 - Pillar 3” or simply “Pillar 3”.
The document is published on the website (www.group.intesasanpaolo.com) each quarter.

Other risk factors

In addition to the above risks, the Intesa Sanpaolo Group is carefully assessing the aspect detailed below.

Interest Rate Benchmark Reform – General aspects
Launched in 2016, following the publication of the European Union Benchmark Regulation (Regulation EU no. 2016/1011), the interest rate benchmark reform in Europe can be considered completed, with the existence, to date, of two interest rates published on a daily basis, which fully comply with the Regulation: the Euribor rate for maturities of up to 12 months, administered by the EMMI (European Money Market Institute) and the €STR rate for overnight maturities, recorded and published by the ECB. Also outside the Eurozone, these have been identified and are operational for all the main currencies of risk-free interest rates (RFR) which gradually replaced the LIBOR rate. Specifically, the publication of synthetic USD LIBOR ceased at the end of September 2024.

The following is a summary overview of the main risk-free rates:

IBOR	Risk Free Rate	Administrator	Secured or Unsecured	Transaction
GBP LIBOR	SONIA	Bank of England	Unsecured	o/n wholesale deposits
USD LIBOR	SOFR	New York Fed	Secured	o/n UST repo
JPY LIBOR	TONAR	Bank of Japan	Unsecured	o/n call rate
CHF LIBOR	SARON	SIX Swisse Exchange Ltd.	Secured	interbank o/n report
EUR LIBOR	€STR	ECB	Unsecured	o/n wholesale deposits

Source: ICE Benchmark Administration, Intesa Sanpaolo

Interest Rate Benchmark Reform – Intesa Sanpaolo's activities
Since 2016, Intesa Sanpaolo has constantly worked to oversee and implement all necessary actions to comply with the changes in the benchmarks, closed its projects at the end of 2023, and, in 2024, it completed the ordinary management of the last positions to be transitioned within the various corporate functions involved.
With regard to the last benchmarks being wound down by 31 December 2024, the transition activities have been successfully completed for all these benchmarks (synthetic USD LIBOR and Canadian Offered Rate - CDOR).

SECTION 1 – RISKS OF THE CONSOLIDATED BOOK

In this Section, information is provided regarding the companies included in the consolidated book.

QUANTITATIVE INFORMATION

A. CREDIT QUALITY

For the purposes of quantitative information about credit quality, the term "credit exposures" is understood to exclude equities and quotas of UCI.

A.1. Performing and non-performing credit exposures: amounts, adjustments, changes and economic breakdown

A.1.1. Breakdown of financial assets by portfolio classification and credit quality (book values)

(millions of euro)

Portfolios/quality	Bad loans	Unlikely to pay	Non-performing past due exposures	Performing past due exposures	Other performing exposures	TOTAL
1. Financial assets measured at amortised cost	1,116	3,472	362	3,282	510,470	518,702
2. Financial assets measured at fair value through other comprehensive income	-	7	-	76	148,874	148,957
3. Financial assets designated at fair value	-	-	-	-	6	6
4. Other financial assets mandatorily measured at fair value	4	27	-	25	10,631	10,687
5. Non-current financial assets held for sale	34	8	-	-	-	42
Total 31.12.2024	**1,154**	**3,514**	**362**	**3,383**	**669,981**	**678,394**

B. INFORMATION ON STRUCTURED ENTITIES (OTHER THAN SECURITISATION VEHICLES)

In line with IFRS 12, the Group considers structured entities to be entities set up to achieve a narrow, well-defined objective, defined through contractual arrangements which often impose strict restrictions on decision-making powers of the entity's management bodies. In that sense, structured entities are designed so that voting or similar rights are not the dominant factor in deciding who controls the entity, as they refer to administrative tasks, while the relevant operating activities are directed by means of contractual arrangements agreed on at the time of structuring the structured entity, which are difficult to modify. The characteristics of a structured entity include:

- limited activities;
- a narrow and well-defined objective;
- insufficient equity to permit the structured entity to finance its activities without subordinated financial support.

The structured entities through which the Group operates are mainly Special Purpose Entities (SPEs) and UCIs.

B.1. Consolidated structured entities

There are no structured entities consolidated in the accounts other than securitisation companies that fall within the scope of the Intesa Sanpaolo Banking Group.

B.2. Structured entities not consolidated in the accounts

B.2.1. Prudential consolidation of structured entities

There are no structured entities consolidated for prudential purposes other than securitisation companies that fall within the scope of the Intesa Sanpaolo Banking Group.

B.2.2. Other structured entities

Qualitative information

As indicated above, the Group's operations through structured entities are also carried out through SPEs. To that end, SPEs are understood as legal entities established to pursue a specific, well-defined and limited objective:

- to raise funds on the market by issuing specific financial instruments;
- to develop and/or finance a specific business initiative, capable of generating, through an economic activity, cash flows which permit the complete reimbursement of the debt;
- to finance the acquisition of a target company which, through its economic activity, will be capable of generating cash flows for the SPEs which permit the complete reimbursement of the debt.

For the purposes of this section, operations carried out through securitisation vehicles, that is vehicles established to acquire, sell and manage specific assets, separating them from the financial statements of the Originator, for the purpose of carrying out securitisations of assets or for acquiring funding through self-securitisations and issues of Covered Bonds (CB), shall not be relevant. For those types of vehicle companies, reference should be made to section “C. Securitisations” and section “D. Sales” of Part E of the Notes to the consolidated financial statements.
In some cases, the Group sponsors the SPE by structuring the transaction to pursue specific objectives, such as raising funds, securitising its own assets also for the purposes of funding or offering financial services to customers.
In detail, the Group's operations are carried out through the following types of structured entities represented by special purpose entities (SPEs).

Project Financing SPEs

These are financing instruments for capital intensive projects, which are based on the economic or financial validity of the industrial or infrastructural project, and are independent from the standing/creditworthiness of the sponsors who developed the “entrepreneurial” idea. The financing of the initiative is based on the project’s capacity to generate positive cash flows, sufficient to reimburse loans received and guarantee an adequate risk-adjusted return on invested capital.
The Intesa Sanpaolo Group finances entities of this type, as normal borrowers, without acting as sponsor.

Asset Backed SPEs

These are transactions aimed at acquisition/construction/management of physical assets by SPEs financed by one or more entities. Their recovery prospects mostly depend upon the cash flows generated by the assets. The assets generate cash flows in their recurring operations (e.g. rentals, goods transportation contracts, etc.) or in their non-recurring operations (e.g. a real estate development or disposal plan). Generally, the assets are also the collateral for the financing disbursed to the vehicle.
The Intesa Sanpaolo Group finances entities of this type, as normal borrowers, without any direct equity investments or any other interests which might lead to presume the role of sponsor. The risk undertaken is always a normal credit risk and the benefits are represented by the return on the financing granted.

Leveraged & Acquisition Finance SPEs

This category includes exposures (loans granted and disbursed in relation to structured financing operations, normally medium/long-term) to legal entities in which the majority of share capital is held by private equity funds.

These are mainly positions in support of Leveraged Buy-Out projects (therefore with high leverage), i.e. linked to the full or partial acquisition of companies through recourse to SPEs. After acquisition of the target company's shares/quotas package, these SPEs are normally merged into the target. The target companies generally have good economic prospects, stable cash flows in the medium term and low original leverage levels. The Intesa Sanpaolo Group finances entities of this type, as normal borrowers, without acting as sponsor.

The Intesa Sanpaolo Group also has investments in/exposures to structured entities represented by UCIs.

The main cases include the Group's investments in several closed-end and reserved private equity as well as venture and seed capital funds.

The exposures to UCIs also include the investments in units of real estate funds deriving from transactions to contribute portions of the Group's real estate portfolio.

They also consist of investments in UCIs deriving from credit recovery operations or contributions of non-performing loans, together with other banking entities, to funds managed by specialist entities.

The investments in UCIs also include the units held in the Atlante Fund and the Italian Recovery Fund, alternative investment funds managed by the asset management company Quaestio Capital Management, involved in value enhancement of Non-Performing Loans of Italian banks.

Lastly, the Intesa Sanpaolo Group invests in hedge funds. For more information, reference is made to the specific section in Part E of the Notes to the consolidated financial statements.

The Group made further investments in UCIs through the subsidiary Eurizon Capital SGR and the companies controlled by it, in line with the financial portfolio management policies issued by the asset management company and its subsidiaries, in agreement with the Intesa Sanpaolo Group Guidelines. In detail, the asset management company and its subsidiaries have both temporary and structural available funds deriving from company equity that is not permanently invested in equity investments or other fixed assets, and from the ordinary cash flows. Based on that set out in the Guidelines for managing the financial portfolio, as part of liquidity management activities, structural and temporarily available funds linked to the trend in short-term and on demand cash flows make up the liquidity portfolio net of the amount held in current accounts or invested in term deposits. In relation to the activities carried out by the asset management company and its subsidiaries and the characteristics of the available funds in question, excess liquidity must be invested in assets with moderate risk that can be easily liquidated. That portfolio includes investments in short-term money market and bond funds, both specialising in the Eurozone, established and/or managed by Eurizon Capital SGR or by its subsidiaries. The Group's investments in UCIs managed by subsidiaries do not prejudice the operational autonomy and capacity of the asset management companies to act in the exclusive interest of investors, considering the specific provisions set out in sector regulations and by the Supervisory Authorities.

The table below summarises the accounting portfolios that the debit and credit transactions with unconsolidated structured entities are allocated to.

Quantitative information

(millions of euro)

Captions / Type of structured entity	Accounting portfolios under assets	Total assets (A)	Accounting portfolios under liabilites	Total liabilities (B)	NET BOOK VALUE (C = A-B)	Maximum exposure to risk of loss (D)	Difference between exposure to risk of loss and book value (E = D - C)
1. Special purpose vehicle		**2,217**		**551**	**1,666**	**2,607**	**941**
	Financial assets held for trading	98	Due to customers	462			
	Other financial assets mandatorily measured at fair value	-	Financial liabilities held for trading	89			
	Financial assets measured at fair value through other comprehensive income	19					
	Financial assets measured at amortised cost - Loans to customers	2,100					
2. UCI		**4,456**		**161**	**4,295**	**4,634**	**339**
	Financial assets held for trading	480	Due to customers	159			
	Financial assets designated at fair value	3,795	Financial liabilities held for trading	2			
	Assets measured at amortised cost Loans to customers	181					

The maximum exposure to risk, representing the maximum exposure of the Group to losses deriving from its interests in structured entities, is generally equal to the net book value, to which, where applicable, several types of off-balance sheet exposures are added (e.g. committed credit lines or guarantees given). The net book value equals the exposure in the financial statements net of value adjustments recorded during the current and previous years.
For UCIs, the maximum risk exposure also includes the Group's commitments, not yet called up by the fund, to subscribe additional units.

The table below shows the amount and type of revenues earned over the year by structured entities. The main component of the revenues recognised consists of fees deriving from the management and placement of the UCIs sponsored and managed by the Group's asset management companies and placed with customers. The fees in question are charged by the asset management company to the funds managed and partly reversed to the distribution network for the placement service.

(millions of euro)

SECTION 2 – RISKS OF THE PRUDENTIAL CONSOLIDATION

In this section the figures are shown gross of the transactions with the other companies included in the scope of the accounting consolidation. These figures usually also include the assets and liabilities, in proportion to the interest held, of the jointly-controlled banking, financial and operational companies consolidated proportionally for reporting purposes. Where the contribution of transactions between the companies included in the prudential consolidation and the other companies in the scope of the accounting consolidation is material, the details of those transactions are provided at the foot of the disclosure concerned.

The following table contains the reconciliation of the consolidated balance sheet with the banking regulatory-scope balance sheet.

Total Liabilities and Shareholders' Equity		**933,285**	**-174,071**	**759,214**

(*) The effects are attributable to:
- deconsolidation of companies that are not part of the Banking Group;
- proportional consolidation of the jointly controlled companies that are consolidated at equity in the financial statements.

1.1 CREDIT RISK

QUALITATIVE INFORMATION

1. GENERAL ASPECTS

The Group's strategies, Risk Appetite Framework, and Credit Granting Powers and Rules are aimed at:

- achieving a sustainable goal consistent with the Group's risk appetite and value creation objectives, whilst guaranteeing the quality of its lending operations;
- diversifying the portfolio, limiting the concentration of exposures to counterparties/groups, economic sectors or geographical areas;
- efficiently selecting economic groups and individual borrowers through a thorough analysis of their creditworthiness aimed at limiting the risk of insolvency and mitigating potentially associated losses;
- given the current economic climate, favouring lending business aimed at supporting the real economy and production system and at developing relationships with customers;
- constantly monitoring relationships and the related exposures, through the use of both IT procedures and systematic surveillance of positions that show irregularities with the aim of detecting any symptoms of deterioration in a timely manner.

Constant monitoring of the quality of the loan portfolio is also pursued through specific operating checks for all the phases of loan management.

It should also be noted that the 2022-2025 Business Plan includes specific initiatives aimed at massive NPL stock reduction and continuous pre-emption through a modular strategy.
As a result of the massive de-risking carried out in previous years, in 2024 a number of extraordinary disposals were carried out on portfolios amounting to 1.2 billion euro in terms of Gross Book Value (GBV), of which 0.2 billion euro had already been reclassified to IFRS 5 in December 2023. Added to these is around 0.1 billion euro of GBV from sales of single name loans. Additionally, in December 2024, a portfolio with a GBV of around 0.3 billion euro was classified under assets held for sale, for which the sale is envisaged in 2025.

In this regard, see also the paragraph "The 2022-2025 Business Plan" of the Report on operations.

1.1 The valuation impacts for the ISP Group of the military conflict between Russia and Ukraine

Details are provided below of the qualitative and quantitative aspects relating to credit exposures to counterparties resident in the countries in conflict, held in the portfolio of the two subsidiaries resident in Russia and Ukraine, Banca Intesa Russia and Pravex Bank (Ukrainian bank), or credit disbursed by other entities of the Group (cross-border exposures), with particular regard to their valuation.

As at 31 December 2024, the Group presented the following on-balance sheet exposures to counterparties resident in Russia and Ukraine (net of ECA guarantees and gross/net of value adjustments carried out).

(millions of euro)

	31.12.2024 (*)				31.12.2023 (**)

(*) In addition to the on-balance sheet exposures shown in the table, there are off-balance sheet exposures to customers for 29 million euro (25 million euro net) at Banca Intesa Russia, and 33 million euro (gross and net value) at Pravex, in addition to 20 million euro (book value nil in net terms) in cross-border off-balance sheet exposures to resident customers in Russia, net of ECA, and 8 million euro (gross and net value) to customers resident in Ukraine.
There is also 27 million euro (gross and net value) in cross-border off-balance sheet exposures to banks resident in Russia and 9 million euro (gross and net value) in cross-border off-balance sheet exposures to banks resident in Ukraine.
Lastly, the cross-border exposures to customers resident in Ukraine are, for the corporate part, backed by guarantees provided by European and US persons, while, for the household part, the amounts as at 31 December 2024 and the increase of around 15 million euro compared to 31 December 2023 mainly relate to exposures disbursed by the subsidiary VUB to households with permanent residence in Slovakia.

(**) In addition to the on-balance sheet exposures shown in the table, there are off-balance sheet exposures to customers for 46 million euro (39 million euro net) at Banca Intesa Russia, and 34 million euro (gross and net value) at Pravex, in addition to 24 million euro (book value nil in net terms) in cross-border off-balance sheet exposures to resident customers in Russia, net of ECA, and 25 million euro (24 million euro net) to customers resident in Ukraine.
There is also 66 million euro (gross and net value) in cross-border off-balance sheet exposures to banks resident in Russia and 10 million euro (gross and net value) in cross-border off-balance sheet exposures to banks resident in Ukraine.
Lastly, the cross-border exposures to customers resident in Ukraine are, for the corporate part, backed by guarantees provided by European and US persons, while, for the household part, mainly relate to exposures disbursed by the subsidiary VUB to households with permanent residence in Slovakia.

Starting in March 2022, among the areas receiving the greatest attention in terms of credit assessments in the emergency triggered by the conflict in Ukraine, a specific focus was dedicated to the Group’s exposure to counterparties resident in Russia and Ukraine. Specifically, customised measures were implemented to strengthen the oversight of credit risk, also by updating the assessment of creditworthiness, of counterparties with residency or parent companies in the Russian Federation, Belarus or Ukraine. In that context, the deterioration of specific positions was also acknowledged, which were classified among non-performing loans and, as a result, subject to analytical measurement.

As shown in the table, at the end of the year the remaining on-balance sheet exposures to the total counterparties resident in Russia and Ukraine amounted, in terms of gross values, to 126 million euro (71 million euro net) for Banca Intesa Russia and 421 million euro (338 million euro net) for cross-border exposures to customers resident in Russia (net of ECA guarantees). These were accompanied by exposures to banks and debt securities totalling 760 million euro (751 million euro net). Exposures to customers resident in Ukraine amounted to 193 million euro (138 million euro net), of which 54 million euro (book value nil in net terms) related to the subsidiary Pravex Bank. These were accompanied by exposures to banks of 72 million euro (72 million euro net) and in securities totalling 53 million euro (51 million euro net). The majority of the exposures to Russian[183] and Ukrainian counterparties essentially consist of loans to customers subject to measurement in accordance with IFRS 9 “Financial Instruments”.

[183] For these purposes, the small exposures to Belarusian counterparties have for simplicity been treated and disclosed together with the exposures to the Russian Federation.

During the year, the gross on-balance sheet exposure to total counterparties resident in Russia and Ukraine (customers, banks and securities) decreased by 264 million euro (-14%). That decrease mainly involved exposures to customers resident in Russia of 254 million euro, primarily as a result of repayments on various exposures and the exposure to customers of the investee Banca Intesa Russia of 71 million euro and was partly offset by the increase for amounts due from banks of 65 million euro (of which 53 million euro of the investee Banca Intesa Russia with the Russian Central Bank as the counterparty).
The overall net exposure (customers, banks, and securities) to counterparties resident in Russia and Ukraine, amounting to 1,421 million euro, decreased by 159 million euro (-10%) from 1,580 million euro on 31 December 2023.

As at 31 December 2024, the Group companies other than those operating in the countries involved in the conflict had a total of 9 million euro of on-balance sheet non-performing loans to counterparties resident in Russia, down by 15 million euro compared to the previous year due to the reduction in some exposures.
The non-performing loans of the Russian subsidiary amounted to 35 million euro (40 million euro as at 31 December 2023), while the classification of the entire portfolio of the Ukrainian subsidiary to bad loan status led to the recognition of 54 million euro in bad loans (62 million euro as at 31 December 2023).

In light of the above, specifically in relation to cross-border positions, for the financial statements as at 31 December 2024, the Group has maintained the main choices regarding the staging assignment and ECL calculation adopted for performing loans during 2022 and 2023. This was based on an approach highly influenced by emerging geopolitical risks and therefore applied according to the country of residence of the counterparties, both for determining the SICR and for calculating the ECL.

Specifically, with regard to the approaches used to determine the ECL, the cycle PD associated to the assigned rating is applied to the Core scope, without forward-looking conditioning. This approach was deemed more prudent, as the conditioning methodology, relating to the approaches currently adopted in the satellite models, would not represent the specific risk linked to the countries in conflict. In addition, a prudential buffer applied to the LGD has been calculated that ensures equivalence with the use of an estimated loss rate according to an approach based on the transfer of the risk of the country of residence under Pillar 2 modelling (unconditioned LGD of 55% set by the transfer risk model). Lastly, adjustments have been applied to a counterparty (increases in the ECL as calculated above) to capture potential expected losses not adequately measured by the estimates.
The banks of the IBD Division adopt the ratings of the Parent Company and the centrally determined “transfer risk” parameter of LGD on the Group’s common cross-border customers. For the other exposures, the ratings are determined by local models, in line with the instructions received from the Parent Company’s Group Rating Desk.

With reference to loans to customers disbursed by Pravex Bank, the choice adopted starting with the 2022 Financial Statements to classify loans to customers as non-performing loans (bad loans), with full write-down of the on-balance sheet component, has been maintained.

For Banca Intesa Russia, in line with previous years, an approach to classifying and measuring performing loans has been adopted that strongly considers the geopolitical risk deriving from the ongoing crisis. Therefore, the assessments carried out on the loans of the subsidiary, following their classification to Stage 2, included a centrally determined prudent factor that takes account of the impact of the continuation of the conflict and the increased isolation of the Russian economy. As a result of the provisions made, the total coverage of performing loans of the Russian subsidiary amounted to around 36.3% of their gross value (35% in December 2023). The Parent Company and two subsidiaries had also provided Banca Intesa Russia with loans to support the bank’s operations with a gross residual value as at 31 December 2024 of 124 million euro.

With regard to the valuation of the other balance sheet items, the remaining marginal positions in securities have been measured in line with the approach adopted in the 2023 financial statements. These essentially relate to Pravex in connection with the purchase of short-term government securities or securities issued by central banks as an investment of part of the liquidity from the reduction of the loan portfolio. The small real estate portfolio of the two subsidiaries has also been valued using the approach adopted in previous years.

The securities portfolio of the investee Banca Intesa Russia was reduced to nil (11 million euro as at 31 December 2023), as a result of the maturity and redemption of the securities. The securities portfolio of the subsidiary Pravex, amounting to 46 million euro (48 million euro as at December 2023), consisted of short-term government securities and securities issued by central banks as an investment of part of the liquidity from the reduction of the loan portfolio.

There were profit and loss impacts on the Russian and Ukrainian exposures as at 31 December 2024, gross of tax effects, totalling net charges of 273 million euro. Those charges mainly refer to additional provisions for risks and charges made on consolidation of the investee Banca Intesa Russia to write off its equity contribution to the Group’s consolidated financial statements, which was positive at the end of the full year 2024 due to the investees’ positive operating performance, with a total allowance of around 382 million euro as at 31 December 2024.

2. CREDIT RISK MANAGEMENT POLICIES

2.1 Organisational aspects

Within the Intesa Sanpaolo Group, a fundamental role in managing and controlling credit risk is played by the Corporate Bodies, which, to the extent of their respective competences, ensure adequate coverage of credit risk by setting strategic guidelines and risk management policies, verifying that they remain constantly efficient and effective and assigning tasks and responsibilities to the company functions and units involved in the processes.
The coverage and governance of credit ensured by the Corporate Bodies is reflected in the current organisational structure, which identifies areas of central responsibility attributable to:
– Chief Lending Officer Governance Area;
– Chief Risk Officer Governance Area;
– Chief Financial Officer Governance Area.
They ensure that risk control activities are managed and implemented, with an appropriate level of segregation, in addition to the establishment of the supporting processes and applications.

The Chief Lending Officer Governance Area, through its own structures:
– takes lending decisions, directly or submitting them to responsible corporate Bodies, that are significant in terms of Group's credit risk assumption and management, providing direct authorisation where appropriate, also through advisory opinions;
– ensures the correct classification and valuation for financial reporting purposes of positions under its responsibility that are classified as non-performing loans;
– ensures the proactive management of credit and guarantees the management and the monitoring of the Group's non-performing loans, within its area of responsibility;
– manages the stocks and flows of bad loans managed within the Group;
– defines and manages disposals of NPE individual exposures or portfolios and other assets within scope, with the collaboration of other competent functions;
– performs monitoring and control on outsourced activities, including the monitoring of the performance KPIs of outsourcers, directly making decisions, or submitting them to the Competent Bodies, regarding proposals exceeding the powers delegated to the outsourcers;
– contributes, within its area of responsibility, to the process of formulating Credit Strategy proposals for the Divisions, with the aim of incentivising new lending, through pricing adjustments, to the economic sectors and customer clusters with the greatest attractiveness in terms of risk-return profile, also taking into account the Group's ESG policies;
– contributes to establishing and evaluating the Group's Sector Framework, coordinating and supporting the Sector Working Group in defining sector performance indicators;
– analyses the evolution of the cost of credit within the Group, also taking into account the application of the aforesaid Credit Strategies;
– assigns and validates the ratings to the positions in scope, also providing support in defining rating allocation processes and tools;
– defines lending relevant regulations and requirements for credit tools development and contribute to the formulation of proposals for the assignment of credit granting and NPL management powers, notwithstanding the responsibility for the final decision belonging to the Chief Risk Officer Governance Area;
– promotes initiatives aimed at disseminating and developing a credit culture;
– ensures, consistently with the guidelines of the Chief Risk Officer Governance Area, the first level systematic supervision of the relevant loan portfolio, identifying phenomena referring to specific credit aggregates characterised by high levels of anomalies for which to activate the appropriate risk mitigation measures.

The Chief Risk Officer Governance Area is responsible for adapting the Risk Appetite Framework for the management of credit risk, in accordance with company strategies and objectives, as well as for measuring and controlling the Group's risk exposures. Specifically, the Chief Risk Officer Governance Area:
– establishes the metrics for the measurement of credit risk - also with regard to the collective measurement of performing loans and the measurement of non-performing loans on a statistical basis;
– provides risk-adjusted pricing models and ensures the measurement of portfolio risk in relation to Expected Loss, Economic Capital (ECAP) and RWAs;
– monitors the absorption of capital relating to credit risk, supporting the Chief Financial Officer Governance Area in the active management of capital;
– makes proposals for the assignment of Credit Powers;
– ensures the validation of the internal risk measurement systems;
– ensures the establishment and the oversight of the governance framework for model risk;
– performs II level monitoring and controls on credit quality, the composition and evolution of the various loan portfolios and the proper classification and measurement of single positions ("single name" controls).
The activities are performed directly by the Chief Risk Officer Governance Area for both the Parent Company and the main subsidiaries, using the centralised model.

With regard to the credit risk management policies, the Chief Financial Officer Governance Area:
– assists the Corporate Bodies in defining, in accordance with the Group corporate strategies and objectives, the guidelines and policies on: administration and tax, planning and management control, treasury and finance, studies and research, balance sheet optimisation from a risk-return perspective, relations with investors and rating agencies;
– oversees the balance sheet optimisation activities at Group level, supporting the Divisions in the active management of credit risk, with the aim of improving the risk-return profile of the loan portfolio in order to create value for shareholders;
– contributes to the development of the credit strategy framework;

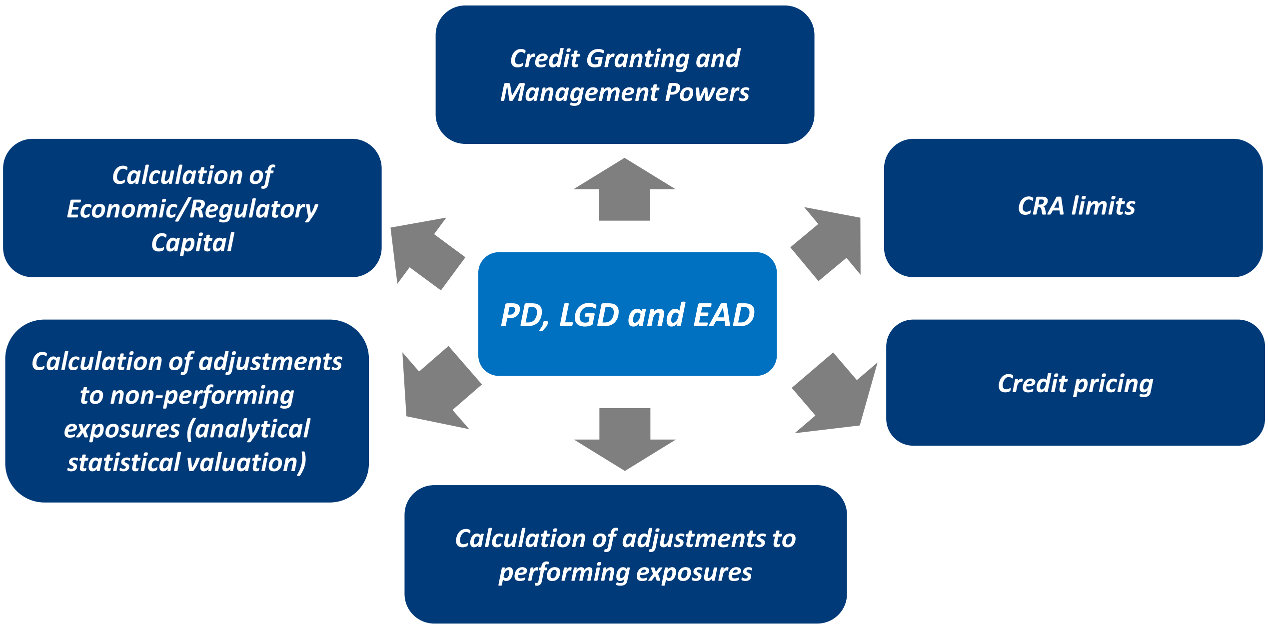
- monitors the evolution of the credit portfolios in order to propose the necessary corrective measures to achieve the established income and financial targets;
- coordinates and supports the analysis, drafting and annual review of the Group NPL Plan and related documents, also assessing their consistency with the Business Plan and the Risk Appetite Framework in cooperation with the other corporate functions involved, including for the purpose of preparing the communications concerning non-performing loans to the Risks and Sustainability Committee, the Board of Directors and the Authorities;
- monitors the progress of the Group NPL Plan, helping to identify any critical areas and corrective actions, through the constant alignment of the functions concerned.

The Chief Data, A.I. and Technology Officer establishes the model and oversees the Group's Data Governance and Data Quality system, ensuring its dissemination and implementation and coordinating the activities of the parties involved.

Lastly, as is the case for all the risk areas and above all for credit risk, the Chief Audit Officer performs internal audit activity aimed to identify violation of procedures and regulations and to periodically assess the comprehensiveness, adequacy, functionality (in terms of efficiency and effectiveness) and reliability of the internal control system and the IT system (ICT audit), at pre-established intervals depending to the nature and severity of the risks.

2.2 Management, measurement and control systems

Intesa Sanpaolo, as the Parent Company, has set out codes of conduct in relation to credit risk acceptance, in order to prevent excessive concentration of exposures, limit potential losses in adverse scenarios, and maintain credit quality in line with the objectives of capital and financial stability.
Expected Loss and Risk Weighted Assets are fundamental elements for the management, measurement and control of credit risk. These measures incorporate the effects of the exposure size (Exposure at Default - EAD), the relative riskiness of the customer (Probability of Default - PD), the loss estimate where insolvency conditions exist - taking into account the guarantees that mitigate the assumption of risk related to the credit facility (Loss Given Default - LGD) - and the duration of the exposure (maturity), as detailed in Paragraph 2.3.
The components that contribute to the determination of the Risk Weighted Assets are the key elements for the determination of the levels of the Credit Granting Powers, the limits of the Credit Risk Appetite (CRA), the credit pricing, the calculation of the adjustments on performing exposures and the analytical-statistical adjustments on non-performing exposures, as well as the calculation of the economic and regulatory capital.



The Credit Risk Appetite is aimed at optimising the risk/return profile of the assets. The "Rules on Credit Risk Appetite" define the methods for applying the CRA and the methods for calculating the CRA colour class, with associated exposure limits, in order to pursue a growth in lending consistent with the risk appetite defined for the Group.
The objective of the calculation of the pricing of transactions is to define the suitability of the economic conditions based on the value generation with respect to the expressed riskiness and all the components that contribute to the calculation of the value, also including the costs allocated to the structures.
The capital at risk is defined as the maximum "unexpected" loss that the Group may incur over a period of one year with a particular confidence level. It is estimated on the basis of the current situation and also at a forecast level, in line with the Risk Appetite Framework approved by the Group, based on the budget assumptions and the forecast macroeconomic scenario, and in relation to stress scenarios. Risk capital is a fundamental element in the assessment of the Group's capital adequacy and is calculated within the ICAAP process from both a regulatory and a management perspective.

The levels of Powers set in terms of RWA delimit the decision-making power in the granting phase, specifying the authorised professional profiles and the decision-making procedures for the loans for the individual counterparties. In particular, where the granting of loans by the Group's subsidiaries exceeds certain thresholds, a request for a "Compliance Opinion" is made to the competent bodies of the Parent Company.
The credit granting phase is also regulated by metrics that are complementary to the RWAs, which define coordination mechanisms and support tools for the ongoing exercise of guidance, coordination and control responsibilities, in implementation of the corporate governance provisions. In particular, the company regulations include the Credit Granting Rules, which specify the methods for taking on credit risk with customers, and the Rules on Credit Strategies, aimed at steering new business and dynamically managing investments as a proactive tool for portfolio rebalancing, with a single and forward looking view that aligns with the Plan Targets, risk appetite, and ESG goals.

The credit risk management processes also involve the periodic review of the credit positions by the competent centralised or decentralised units and the assessment of customers not only at origination, but also on a continuous basis, through a periodic monitoring process that interacts with the credit management and control processes and procedures to ensure timely assessment of any signs of impairment, with an impact on the level of risk of the exposures. Following the developments introduced in the 2022-2025 Business Plan, an Early Warning System (EWS) for detection and classification is now in place for the Corporate, Retail SME, Retail and Institutions portfolios. The models were also developed using the indicators identified in the Asset Quality Review and consist of a statistical part, a qualitative part and additional manual event triggers. The indicators are updated on a daily basis and, when they confirm a potential anomaly positions are detected and reported in specific management processes. The EWS models, as mentioned above, have been undergoing further development since the second half of 2021 for progressive integration into the credit processes. More generally, the Group continued to develop its own managerial models to support the credit granting, monitoring and management processes (e.g. affordability, digital decision making engines, and forecasting), in line with the 2022-2025 Business Plan, the credit digitalisation projects, and the applicable regulations. Lastly, sector-specific forecasting models support several corporate processes including RAF, credit strategies, and credit granting and monitoring activities/instruments, as well as managerial adjustments to the IFRS 9 models.

The valuation of the adjustments to the performing and non-performing exposures is based on methods consistent with IFRS 9, described in detail in Part A - Section "A.2 - Main financial statement captions" and in particular in the paragraph "*Impairment of assets".* The paragraph below "*2.3. Methods for measuring expected losses*" details the main applications used for the 2024 Financial Statements.

Country risk is an additional component of an individual borrower's insolvency risk, measured by credit risk control systems. This component is linked to losses potentially resulting from international lending operations caused by events in a country that are partly or entirely within the control of the government concerned, but not that of the individual residents of the country in question. Country risk therefore takes the form of both transfer risk for non-sovereign counterparties, due to the freezing of international payments, and sovereign risk, which is measured through an assessment of the sovereign states' creditworthiness. This definition includes all forms of cross-border lending to entities residing in a particular country.
The country risk component is used in the granting of credit to non-resident entities in order to obtain a preliminary evaluation of the absorption of the country risk limits set on an *ex-ante* basis. These limits, expressed in terms of economic capital, identify the maximum acceptable risk for the Group, set on an annual basis in the Group Risk Appetite Framework. It should also be noted that, as a result of the exceptional situation caused by the outbreak of the Russia/Ukraine conflict, the estimated transfer risk of the Russian Federation was taken as a reference for the determination of the LGD assigned to the cross-border counterparties as described in paragraph "1.1 The valuation impacts for the ISP Group of the military conflict between Russia and Ukraine".

Counterparty risk is a particular kind of credit risk associated with derivatives and SFTs (Securities Financing Transactions, i.e. repos/reverse repos and securities lending/borrowing), that refers to the possibility that a counterparty may default before the contract expires. This risk, which is often referred to as replacement risk, is related to the case in which the market value of a position has become positive and thus, in the case of default of the counterparty, the solvent party would be forced to replace the position on the market, thereby suffering a loss.
With regard to counterparty risk, the Banking Group has an internal model for measuring this risk both for regulatory (only for the Parent Company) and managerial purposes.
Potential Future Exposure (mean effective PFE 95%) has been adopted by the entire Banking Group for the measurement of the utilisation rate of credit limits for derivatives and SFTs exposures. The Business Units, Market & Financial Risks Management Coordination Area produces daily risk measurement estimates for counterparty risk, for the measurement of the utilisation rate of credit lines for derivatives and SFTs for the Parent Company and Fideuram - Intesa Sanpaolo Private Banking. The other Banks of the Group also use an internal model measurement approach, in simplified form, through internally estimated add-ons.
In addition, the following company processes were implemented to complete the risk analysis process for the exposure measures implemented over time following the developments discussed above:
– definition and periodic calculation of stress tests on market scenarios and joint market/credit scenarios on counterparty risk measures;
– definition and periodic analysis of Wrong-Way Risk, i.e. the risk of a positive correlation between the future exposure to a counterparty and that counterparty's probability of default;
– definition and monitoring of management limits;
– contribution of collateral inflow/outflow risk measures, calculated on the basis of the internal counterparty risk model, for OTC derivatives and SFTs with margining agreements (CSA, GMRA and similar);
– periodic reporting to the management of measures calculated using the internal exposure model, capital requirement, level of use of management limits, results of stress tests and analyses of wrong-way risk;
– definition and periodic calculation of back-testing analyses to monitor the predictive performance over time of the model with respect to the movements of the risk factors underlying the transactions in the portfolio.

The concentration risk arises from the exposure to counterparties, groups of related counterparties and counterparties in the same business segment or that engage in the same business or operate in the same geographical region. In the annual update of the Risk Appetite Framework, such counterparties are subject to stress tests aimed at identifying and assessing threats for the Group and the most appropriate mitigating actions:

- aimed at defining exposure limits for specific geographical areas and sets of counterparties (e.g.: the top 20);
- aimed at ex ante limitation of exposures with significant concentration effects, in particular with reference to "large exposures" and to credit lines subject to country risk;
- aimed at ex-post correction of the risk profile, through the secondary loan market, through specific judgement metrics based on the maximisation of overall portfolio value.

The Internal Validation & Controls Coordination Area, within the Chief Risk Officer Governance Area, carries out specific level II controls on credit quality and data governance.
The purpose of the credit controls is to verify the proper classification and the adequacy of the management process for individual exposures (so-called single names).
In general, the development of control activities includes the credit processes assessment, also to verify that suitable Level I controls are in place, including their proper execution and traceability. The potential areas of investigation to be examined through Single Name controls also consider the results of the monitoring carried out by the Level I Control Functions on different credit clusters.
It also assesses the compliance of the internal risk measurement and management systems over time as regards the determination of the capital requirements with the regulatory provisions, company needs and changes in the relative market.

The Group's lending activity is focused on Italian customers (almost 80% of the total) and is primarily aimed at households and small and medium enterprises.
The exchange of basic information flows between different Group entities is assured by the Group's Central Credit Register (exposure monitoring and control system) and by the "Posizione Complessiva di Rischio" (global risk position), which highlight and analyse credit risks for each counterparty/economic group both towards the Group as a whole and towards individual Group companies.
From the September 2018 monthly report – following the preparation of the input and generation architecture for the Anacredit reporting, aimed at supporting the "collection of granular credit and credit risk data" as defined by Regulation (EU) 2016/867 of 18 May 2016 – a new reporting system has been in place in compliance with the regulatory provisions established by the ECB and implemented by the related Central National Banks.

2.3 Methods for measuring expected losses

The expected loss is the product of exposure at default, probability of default and Loss Given Default.
In Intesa Sanpaolo, probability of default is measured by means of different rating models according to borrower segment (Corporate, Retail SME, Retail, Sovereigns, Public Sector Entities and Banks). These models make it possible to summarise the counterparty's credit quality in a measure, the rating, which reflects the probability of default over a period of one year, adjusted on the basis of the average level of the economic cycle.
A number of rating models are used for the Corporate segment, which use all available information sources and incorporate the opinions of credit analysts and relationship managers. In particular:

- models differentiated according to the company size are applied to most businesses, with the most up-to-date versions authorised in March 2023;
- specific models are in use for specialised lending, one for real-estate initiatives, one for project-finance transactions and one for leveraged buy-out/acquisition-finance and asset-finance transactions. The authorisation for the use of the most up-to-date versions was received in December 2023.

The models applied to the Retail portfolio are as follows:

- for the Retail SME segment, since May 2021, new automated rating models have been used: one dedicated to customers with traditional exposures and one specifically for the non-recourse exclusive factoring exposures. These models enable the real-time calculation of the rating. The segment was updated in October 2022 with effects for reporting purposes from June 2023, following receipt of the authorisation letter;
- for the Retail segment, the counterparty rating model in use since September 2018 was updated in August 2022, following the receipt of the authorisation letter, with effects for reporting purposes from September 2022. In May 2023, the Group received approval for the *ex-ante* UBI Retail notification sent in October 2022.

With regard to the Institutions portfolio:

- the models for banks (banks in mature economies and banks in emerging countries) are composed of a quantitative part and a qualitative part, differentiated according to mature and emerging countries, and a country rating component that, based on the bank/country connection, assesses any negative effect of the country on the counterparty credit risk or, vice versa, the support capacity in the event of difficulties of the bank being assessed;
- the models used for Municipalities and Provinces are default models, whereas shadow rating models based on agency ratings are used for the Regions. An approach to extend the rating (with the application of a downgrading) of the reference Entity (e.g.: Region) has been adopted for local healthcare authorities and other public sector entities. For the Sovereign portfolio, the structure of the rating model includes a quantitative module that takes into account the structural rating assigned by the main international agencies, the implicit risk in the market prices of sovereign debt, the macroeconomic assessment estimated with an econometric model, and a qualitative opinion component, which supplements the quantitative opinion with elements drawn from the broader scope of publicly available information concerning the political and economic structure of the individual sovereign countries. The Sovereign rating model is used solely for management purposes.

For the international subsidiary banks of the Group, PD models are used, which may be:
- developed by the international subsidiary banks in order to capture the specific features of the risk of the local counterparties;
- extended by the Parent Company;
- borrowed from the Parent Company and adapted to local situations.

Some of these models are used for reporting purposes and others only for management purposes.

The Loss Given Default (LGD) models are based on the concept of "Economic LGD", namely the present value of the cash flows obtained in the various phases of the recovery process net of any administrative costs directly attributable to the exposure as well as the indirect management costs incurred by the Group, and consists, in brief, of the following elements:
- estimate of a Bad Loan LGD Model: starting from the LGD observed on the portfolio, namely "Workout LGD", determined on the basis of the recoveries and costs, a regression econometric model of the LGD is estimated on variables considered to be significant for the determination of the loss associated to the Default event;
- application of the Danger Rate, a multiplying correction factor, used to recalibrate the Bad Loan LGD with the information available on the other default statuses, in order to calculate an LGD representative of all the possible default statuses and their evolution;
- application of an additional correction factor, known as "Final Settlement Component": this component is used as an add-on to the estimate recalibrated for the Danger Rate in order to consider the loss rates associated with positions not evolved to the Bad Loan status (Unlikely to pay or Past Due positions).

LGD is determined according to differentiated models, specialised by operating segment (Corporate, Retail SME, Retail, Factoring, Leasing, Public Entities and Banks). As in the case of the PD, the models that have been adopted for the LGD of the International Subsidiary Banks of the Group were developed by the banks themselves, extended by the Parent Company, using local parameters where necessary or changed by the Parent Company, with adaptations to each international subsidiary bank.
For the Banks model, the LGD calculation methodology partly diverges from the models developed for the other segments as the estimation model used is based on the market price of debt instruments observed 30 days after the official date of default and relating to a sample of defaulted banks from all over the world, acquired from an external provider. The model is completed by an econometric estimate aimed at determining the most significant drivers, in accordance with the practice in use for the other models, and a recalibration of the observed LGD levels on the bank's internal defaults.
Sovereign LGD is estimated by analysing historical recovery rates on sovereign defaults, split into five categories according to income levels and other specific characteristics the individual countries.
The LGD Sovereign model is used solely for management purposes.

The calculation of the Exposure at Default (EAD) uses differentiated models, specialised by operating segment (Corporate, Retail SME and Retail). Specifically, the methodology is based on data from the 12 months prior to the default event and differs according to whether or not there is a margin available at the observation date. In any case, corrective factors are applied in compliance with the regulatory requirements and in order to introduce a margin of conservatism on the estimates.
Regulatory parameters are currently used for the low default segments of the Banks and Public Entities and for the Leasing and Factoring products of the Corporate Portfolio.

Portfolio	PD - Model Type	LGD - Model Type	EAD - Model Type	Status
Sovereign	Shadow model based on agency rating	Model based on recovery rates estimated by rating agencies	Regulatory parameters	Used for management purposes only; Standardised approach for reporting purposes
Institutions	Default model (Banks) (4)	Market model (Banks)	Regulatory parameters (Banks)	AIRB authorised since June 2017
	Default model (Municipalities and Provinces) Shadow model (Regions) (4)	Workout model (Municipalities, Provinces, Regions)	Regulatory parameters (Municipalities, Provinces, Regions)	AIRB authorised since June 2017
Corporate	Default model (Corporate)	Workout model (Bank products; Leasing and Factoring)	CCF/K factor model (Bank products) Regulatory parameters (Leasing and Factoring)	FIRB authorised since December 2008, AIRB LGD authorised since December 2010, EAD authorised since September 2017 (1)
	Simulation models (Specialised Lending)	Simulation models / Workout models (Specialised Lending)	CCF/K factor model (Specialised Lending)	AIRB authorised since June 2012 EAD authorised since October 2023
	Expert-Based Model (Non-Banking Fin. Inst.)	Regulatory parameters (Non-Banking Fin. Inst.)	Regulatory parameters (Non-Banking Fin. Inst.)	Used for management purposes only; Standardised approach for reporting purposes
Retail	Default model (Retail)	Workout model (Retail)	CCF/K factor model (Retail)	IRB Other Retail authorised since September 2018, IRB Mortgage since December 2010 (2)
	Default model (Retail SME)	Workout model (Retail SME)	CCF/ K factor model (Retail SME)	IRB PD/LGD authorised since December 2012, EAD authorised since June 2021 (3)

1) ISP authorised for FIRB from December 2008, for LGD AIRB from December 2010 and for EAD from 2017, Banca IMI (2012, merged by incorporation into the Parent company since 2020), ISP Ireland (2010), VUB (2010), Intesa Sanpaolo Bank (2017), and ISP Luxembourg (2017). From 2017, the Corporate model has also been used to calculate the risk on the Banking book equity portfolio with LGD 65%/90%.
2) VUB authorised from June 2012 for PD and LGD of Retail Mortgage models and from December 2022 in reference to PD-LGD-EAD models of Other Retail.
3) VUB authorised from June 2014.
4) ISP and Banca IMI (merged by incorporation into the Parent company in 2020) authorised from 2017.

For the Group companies included in the roll out plan, the internal rating (PD), LGD and EAD models are subject to a second level control process carried out by the Validation function on the adequacy of the existing methodological framework, on an annual basis in accordance with the rules established by the Supervisory Authority, and a level three control by the Internal Audit Function. The control functions produce annual reports for the Supervisory Authority on the compliance of the models with the supervisory regulations, which also includes a verification on the deviations between estimates made and the actual figures, and they issue a compliance opinion when material model changes are made to the models. These reports, approved by the Board of Directors of Intesa Sanpaolo, confirm the compliance to the regulatory requirements.

The methodology for the estimation of the Expected Credit Loss (ECL), adopted for the determination of the impairment on the credit exposures in accordance with IFRS 9, is implemented at individual transaction or securities tranche level, based on the IRB modelling of the parameters of Probability of Default (PD), Loss Given Default (LGD) and Exposure at Default (EAD), to which appropriate adjustments are made to ensure compliance with the requirements of the standard. A detailed description of the methods adopted by the Group is provided in Part A - Section "*A.2 - Main financial statement captions*" and in particular in the paragraph "*Impairment of assets*", to which reference is made.
More specifically, the measurement of the financial assets reflects the best estimate of the effects of future conditions and in particular the economic conditions that affect the forward-looking PDs and LGDs. IFRS 9, also based on the guidance from the international regulators, gives particular importance to information on future macroeconomic scenarios in which the Bank may find itself and which clearly influence the situation of the debtors, with regard both to the "riskiness" of migration of exposures to lower quality classes (and therefore concerning the staging) and to the recoverable amounts (and therefore concerning the determination of the expected loss on the exposures). In terms of method, various possible alternative approaches designed to take account of these elements have been analysed. Of the various alternatives considered, the Intesa Sanpaolo Group has decided to adopt the "Most likely scenario+Add-on" approach. According to this approach, the macroeconomic conditioning of PD and LGD is carried out through a baseline scenario ("Most Likely", in line with the approach used for other business purposes such as, for example, the budget and business plans) and then corrected with an Add-On, calculated based on the distance between the baseline scenario and the alternative scenarios. If the overall impact of the Add-On on the risk parameters is positive, the decision has been made to neutralise the effect for both staging and ECL calculation purposes. As at 31 December 2024, the usual time series update and refinement were carried out for the satellite models adopted in the Core scope, and, following the update, the most significant variables and the methodological framework adopted in previous years for those models were confirmed.
The effectiveness of the IFRS 9 models is periodically monitored by the Validation function in accordance with the internal rules through specific backtesting of the risk parameters (staging criteria, PD, LGD and EAD models, and haircuts). In addition, in accordance with the internal regulations, the Validation function performs prior checks when significant changes are made to the relevant models. The results of the checks by the Validation function are submitted to the competent managerial committees and to the model owner functions and are presented in the annual report on the internal models used for management purposes, which is also sent to the Supervisor.

Macroeconomic scenario for forward-looking conditioning

For the purposes of forward-looking conditioning of the parameters for estimating the ECL – in accordance with the approach described in Part A - Accounting Policies and in particular in the paragraph "Impairment of assets" – Intesa Sanpaolo's policy involves the use of the macroeconomic scenario defined and updated by the Research structure of the Chief Financial Officer Area.

The table shows the main macroeconomic scenario variables used to determine expected credit losses from a forward-looking perspective, broken down by baseline, best-case and worst-case scenarios. These scenarios were applied in the measurement of loans according to the "Most-Likely scenario + Add-on" model described above.

		Baseline				Best-case				Worst-case

Scenarios produced in December 2024 by CFO-Research. Forecast data for the fourth quarter of 2024 (GDP, unemployment and real estate prices) or December 2024 (interest rates, inflation, exchange rates, stock market indices, and spreads) and for the years 2025, 2026 and 2027.

The geopolitical uncertainty is conditioning the 2025 scenario. The assumption underlying the baseline scenario is that the Trump Administration will only partially implement its electoral agenda, with consequences on global growth that will, in any case, need time to develop. In the first half of 2025, the impacts of US policy will be transmitted to the rest of the world mainly through the channels of confidence (which could be negatively influenced by the risk of a trade war) and of the financial markets (marked by opposing forces). Those effects could be partly offset by a more robust trend in US demand. It is assumed that the other significant geopolitical factor (the conflicts in the Middle East and Ukraine) will not compromise the availability of fossil fuels and will not have a more negative impact - as compared to the current one - on the climate of confidence in Europe.

The scenario envisages GDP growth in the Eurozone at 0.9% in 2025 and 1.2% in 2026, in view of the uncertainty stemming from the next US administration's trade policy, the structural difficulties weighing on German industry, the signs of a slowdown in the labour market, as well as political instability in France. However, the recovery in consumption, albeit at a slower pace than estimated in June, alongside the easing of monetary policy, should prevent recessionary pressures. The risks to growth are skewed towards the downside and largely depend on the evolution of trade tensions. Among the main economies, Spain is expected to continue to outperform in 2025 (with GDP growth of 2.2%), followed by Italy (1%), with weaker performance in Germany (0.4%) and France (0.7%). With inflation falling faster than expected and some downside risks to real growth materialising, the reduction in ECB official rates is expected to reach 2% in the coming months, assuming a 25 basis point cut at each meeting until June 2025. With regard to long-term interest rates, compared to those forecast in June, the projected levels on the euro curves are lower. Fiscal policies will be a little less accommodative, but public debt is expected to continue rising in several countries.

In Italy, the economy returned to stagnation in the summer quarter of 2024. For the full year 2024, the GDP growth estimate included in the baseline scenario is 0.5%, a level in line with the subsequently published ISTAT preliminary estimate. The growth, estimated at an annual average of 1% over the forecast period, is mainly driven by private consumption, supported by the recovery in real incomes (already underway) and a decrease in the propensity to save. The contribution of capital expenditure will be marginal, despite the expectation of an increase in spending flows related to the NRRP. Investments in productive capital will be held back by the uncertain outlook for demand and the threat of protectionist trade policies.

With regard to the NRRP, formal compliance with the plan deadline continues, but there are ongoing implementation delays that are hindering its contribution to domestic demand. Foreign trade is expected to dampen GDP growth in 2025, with downside risks for exports. Inflation could steadily fall to the ECB target as early as the first half of 2025, with more moderate trends for industrial goods, energy, and food compared to services. The scenario incorporates positive assessments on the trend in the BTP-Bund spread for the two-year period 2024-25, linked to the improvement in the deficit/GDP ratio. However, an expansion is expected over the medium/long-term due to the relatively unfavourable trend in debt.

The prospect of protectionist trade policies in the US and revisions in rate differentials suggest a stronger dollar over the 2025-28 horizon than in June.
For the United States, GDP growth estimates have been revised upwards to 2% for 2025, 2.3% for 2026, and 1.9% for 2027, due to the policies of the new administration, although these estimates have been made under the assumption of a "moderate" implementation of Trump's electoral platform. The upward pressures on inflation, however, concern the entire foreseeable horizon and stem from the announced immigration crackdown and potential tariffs. In view of the inflation forecasts, the endpoint for the FED rates in 2025 has been revised upwards to 3.75%-4.00%.
As described in Part A - Accounting Policies of these Notes to the consolidated financial statements, and in particular in the section "Impairment of assets", the methodology adopted by the Group includes taking into account alternative scenarios (best-case/worst-case), which mainly use external information (among others, the minimum and maximum forecasts of a fundamental variable such as GDP based on data from Consensus Economics).
The best-case scenario has been developed according to the standard methodology, based on the higher GDP growth forecasts in the Consensus Economics survey published in November 2024. The worst-case scenario was also developed using this approach (i.e., based on the lower GDP growth forecasts from Consensus Economics). However, some additional shock elements have been introduced with negative effects on economic growth linked to the initiation of trade wars by the United States and negative supply shocks due to an escalation of the conflict in the Middle East, also stemming from a more aggressive implementation of the Trump agenda.
With regard to the best-case scenario, the assumptions adopted yield a scenario with higher real growth rates (the distance of the growth rates from the baseline scenario is moderate between 0.3% and 0.5%, but stably positive), moderately higher inflation, and lower unemployment rates. Specific shocks are assumed for stock indices and real estate prices, in accordance with the methodological approach established, resulting in a more robust outcome than in the baseline scenario. Interest rates are higher across all maturities: higher growth is expected to lead the ECB to begin its tightening phase earlier than in the baseline scenario. Long-term rates are significantly higher than in the baseline scenario.
With regard to the adverse scenario, the assumptions described above result in GDP growth below that of the baseline scenario over the entire forecast horizon. In the Eurozone, growth is nearing a scenario of prolonged stagnation with an increase of around half a percentage point in the period 2025-26. Italy initially experiences stable growth at very low levels but then the scenario evolves towards a slight reduction in GDP and a significant increase in the unemployment rate, as a vicious circle is created between deteriorating public finances, confidence and economic performance. The worsening of public debt is reflected in an erosion of the rating and a widening of the BTP-Bund spread towards 200 basis points. Inflation falls significantly below the ECB's target during the period from 2026 to 2028, prompting the Central Bank to keep official interest rates in slightly accommodative territory (1.5%) throughout the forecast horizon, with a significant deviation from the baseline scenario, particularly towards the end of the forecasting period. The more accommodative monetary conditions are partially passed on to long-term rates: the 10-year IRS rate is 20-30 basis points lower than in the baseline scenario over the 2026-28 period. The euro/dollar exchange rate is weaker than in the baseline scenario in 2026-27. The low growth in global economic activity is reflected in lower commodity prices than in the baseline scenario, particularly for oil.
At the end of the year, the banks of the International Banks Division also updated their estimates on the basis of the forecast scenarios for their geographical scope.

ECL sensitivity analysis

The ECL, calculated in accordance with IFRS 9, was subject to sensitivity analysis aimed at analysing its variability with respect to the individual alternative scenarios in accordance with the ESMA recommendations.
That analysis was conducted on a portfolio of performing loans (Stage 1 and Stage 2) relating to the scope representing the Group (which includes the banks and companies in Italy, Intesa Sanpaolo Lux and Intesa Sanpaolo Ireland, which represent around 90% of the Group's total exposure).
As noted in the paragraphs above, the approach adopted by the Group to estimate the ECL for the macroeconomic conditioning of PD and LGD involves the use of a ("Most Likely") baseline scenario which is then adjusted with an Add-On calculated based on the distance between the baseline scenario and the best-case/worst-case scenarios. These are largely determined from the selection of the most optimistic/pessimistic assumptions of the Consensus Economics macroeconomic variables and therefore incorporate the forecasts made.
The sensitivity analysis is the difference between the ECL determined using the assumptions adopted for the alternative scenarios (best-case and worst-case) and the ECL derived from the model referred to above, which therefore already includes the alternative forecasts factored by means of their distance from the baseline scenario.
Based on the above, and the fact that the distance between the worst-case and best-case scenarios compared to the baseline scenario is small and broadly symmetrical, the application of the worst-case scenario would result in 0.8 billion euro of exposure sliding into Stage 2, an increase of around 28.4 million euro in the ECL, and a slight increase in the coverage ratio. On the other hand, the sensitivity of the portfolio to the best-case scenario would lead to a decrease of 17 million euro in the ECL, with a return to Stage 1 of 0.3 billion euro of exposures. The coverage ratio for performing exposures would remain essentially stable.
To take account of the forecast risk identified by both the Research structure and the other forecasters, as well as the greater uncertainty inherent in the forward-looking scenarios, the Group has included an adjustment (described in detail in the paragraph below) within the ECL of the performing loans recognised in the 2024 Financial Statements. The aim of this adjustment is to capture these elements of uncertainty by considering more extreme alternative scenarios that incorporate assumptions of significant deviations from the forecasts regarding the evolution of the macroeconomic situation. The adjustment for the extreme alternative scenarios, which resulted in a worsening of the ECL of around 260 million euro, is not incorporated in the sensitivity analysis described above. A further intervention, also described below, is aimed at capturing vulnerabilities that affect the individual economic sectors asymmetrically, which are not captured by the models being used and, therefore, cannot be directly linked to the forward-looking components subject to sensitivity analysis.

Managerial adjustments to the results of the models (in-model and post-model)

With regard to the methodologies for estimating impairment losses on performing credit exposures, in certain circumstances adjustments may need to be applied to the valuations, related to particularly complex and volatile macroeconomic situations, compared to the results of the models adopted. This may arise as a result of new events or risks of an unexpected nature that were not observed in the time series used for the models and cannot be reliably projected for the purposes of the forward-looking component required by IFRS 9.

These adjustments were applied by the Intesa Sanpaolo Group with the emergence of the Covid 19 pandemic starting from 2020 and maintained in subsequent years, although with different sizes, in relation to the Russian-Ukrainian conflict, the consequent effects on energy and commodity prices and the resulting rising inflation and monetary policy scenario. In 2023, in view of the continued high levels of uncertainty and volatility in the estimates, the Group strengthened the methodological framework supporting the adoption and implementation of the managerial adjustments applied to the statistical valuation of the performing loans.

Note that the framework adopted from December 2023 is made up of two complementary elements:

- the first element ("overlay from extreme scenarios"), defined under the responsibility of the CRO Area, is aimed at identifying an estimated adjustment to possible risk scenarios currently not captured by the IFRS 9 modelling. In specific economic periods, like the current one, characterised by high volatility, the risk that the forward-looking scenario may diverge from the range represented by the baseline, best-case and worst-case scenarios underlying the "most likely+add on" model is higher. As a result, the Group has decided to use more extreme alternative scenarios that are generally detached from the current phase of the cycle compared to those already used for the calculation of the add-on incorporated in the models. The managerial adjustment, calculated from a "volatility cone" of the above scenarios compared to the baseline scenario, allows for the incorporation of greater uncertainty about the prospective trajectory of macroeconomic dynamics into the valuation of the credit exposures;
- the second element ("risk sensitive overlay"), defined by the CLO Area, strengthens the methodological framework for identifying vulnerabilities of specific portfolios (across sectors, geographies and rating classes) most exposed to impacts from structural and/or emerging risk factors or a combination of those factors. The current economic environment is characterised by crises that affect individual product sectors asymmetrically. In such cases, the current modelling, statistically based on macro-sectors, often fails to capture these differences. The valuation results derived from the models are therefore supplemented with industry, sector and management assessments derived from credit monitoring activities. This overlay therefore prioritises the information obtained from the credit quality monitoring processes, using a framework based on granular data capable of combining the risk profile assessment derived from traditional modelling with the assessment of industrial, sectoral, operational and managerial credit metrics derived from the management, monitoring, rating assignment and customer relationship management at local level.

In July 2024, the ECB published a benchmarking exercise on overlays and model-adjustments ("ECB - IFRS 9 overlays and model improvements for novel risks. Identifying best practices for capturing novel risks in loan loss provisions"). An analysis carried out by the competent Group structures on Intesa Sanpaolo's positioning with respect to the best practices highlighted by the Supervisory Authority in the above document showed that the current framework substantially complies with the Regulator's expectations for the most significant aspects. Nevertheless, in 2024 the competent structures further examined the aspects most emphasised by the ECB to the banking system in the document, such as the consideration of climate risk and the expected greater sensitivity of staging allocation.

As a result of the analysis, a number of refinements were made to the framework for the 2024 Annual Report, based on the experience acquired over the year of use and in accordance with the Supervisory Authority's expectations, in addition to the ordinary updates:

- a new type of emerging risk (Climate Risk) was integrated into the risk-sensitive component, adding to the risk factors already identified during the initial setup ("Energy", "Supply Chain" and "Financial Tightening");
- the overlay based on extreme economic scenarios was extended, as an integral part of the IFRS 9 calculation framework, to the staging allocation, incorporating an adjustment to the "Significant Increase in Credit Risk" thresholds. This action allows the adjustment to be classified as an in-model adjustment, as it directly affects the PDs of the individual transactions for both ECL and staging purposes.

The banks of the International Banks Division have substantially confirmed the managerial adjustments already made in previous years, based on specific assessments of the current and future situation and the characteristics of their portfolios.

Overall, the adjustment allowances for performing exposures as of 31 December included managerial adjustments of 0.9 billion euro relating to both on-balance sheet and off-balance sheet exposures. This figure does not include the additional provisions made on exposures to Russian and Ukrainian counterparties, relating to cross-border positions, and those of Banca Intesa Russia and Pravex, already described in Chapter 1.1 of this Part E.

2.4 Credit risk mitigation techniques

During the credit granting and managing process, the acquisition of mitigating factors is encouraged for counterparties with non-investment grade ratings or for certain types of medium/long-term transactions.
The mitigating factors that have the greatest impact include pledges of financial assets and residential mortgages. Other forms of risk mitigation are pledges on non-financial assets and non-residential mortgages.
The strength of the personal guarantees issued by rated parties, typically banks/insurance companies, Credit Guarantee Consortia and corporations, is instead assessed on the basis of the type of guarantee and guarantor's credit quality.
Detailed processes govern the material acquisition of the individual collateral and guarantees, identifying the structure responsible as well as the methods for their correct completion, for archiving the documentation and for the complete and timely recording of the related information in the systems.
The set of internal regulations and organisational and procedural controls is aimed at ensuring that:

- all the requirements for the validity and effectiveness of credit protection are satisfied;
- a standard contractual framework is defined for guarantees and collateral of general and current use, accompanied by full instructions for its use;
- the methods for approving collateral and guarantee documents deviating from the standard by structures other than those in charge of commercial relations with the customer are identified.

The guidelines for the management of collateral and guarantees are the same for the entire Group. The management of collateral and guarantees received for the Parent Company and the Italian subsidiaries is carried out on a single platform, which is integrated with the register of assets and the portal that manages the immovable property valuations.
The granting of credit with the acquisition of collateral is subject to internal rules and processes – for the valuation of the asset, the acquisition of the collateral and the control of its value. The enforcement of the collateral is handled by specialist departments, which are responsible for credit recovery.
In any case, the presence of collateral does not grant exemption from an overall assessment of the credit risk, focused mainly on the borrower's ability to meet the obligations assumed, irrespective of the associated collateral.
Within the granting process, the assessment of the pledged collateral is based on the actual value, namely the market value for financial instruments listed on a regulated market, or, otherwise, the estimated realisable value. The resulting value is multiplied by the haircut percentage rates, differentiated according to the financial instruments accepted as collateral. For real-estate collateral, on the other hand, the prudential market value is considered, and for properties under construction, the construction cost is considered, net of prudential haircuts differentiated according to the intended use of the property.
Assets are appraised by internal and external appraisers. The external appraisers are included in a special list of professionals accredited on the basis of an individual verification of their capabilities, professionalism and experience. The valuation of residential properties used as collateral for mortgage loans to private individuals is mainly assigned to specialised companies. The work of the appraisers is monitored on an ongoing basis, by means of statistical verifications and sample checks carried out centrally.
The appraisers are required to produce estimates on the basis of standardised appraisal reports, differentiated according to the valuation method to be applied and the characteristics of the asset, in accordance with the "Rules on immovable property valuations for credit purposes" drawn up by the Bank. The internal rules are consistent with the main supervisory regulations on property valuations, including, to name but a few, the "Guidelines for the valuation of real estate properties securing credit exposures" promoted by the Italian Banking Association, the EBA "Guidelines on Loan Origination and Monitoring", the RICS "Global Valuation Standards" and the TEGoVA "European Valuation Standards".
Property valuations are managed through a specific integrated platform covering the entire appraisal phase, ensuring that assignments are properly awarded, on an independent basis and according to objective criteria, the workflow is thoroughly monitored, valuation standards are correctly applied and all information and documents regarding real estate are kept.
The prudential market value of the immovable property collateral is periodically recalculated through various statistical valuation methods, that make use of prices/coefficients provided by an external supplier with proven skills and a solid reputation for surveying and measuring the market prices of Italian real-estate assets.
Asset value is constantly monitored. The appraisers carry out inspections and verify the work progress for properties under construction. The valuation is duly updated in the event of restriction or splitting mortgage, of damage to the property, significant impairment losses reported by market indicators used to monitor fair value and, in any case, according to the due dates established for significant exposures, or when there are immovable properties securing non-performing loans.
In order to limit the risks of absence or termination of the protection, specific safeguards are in place, including: restoration of a pledge when the assets decrease below their initial value or, for immovable property collateral, the obligation of insurance cover against fire damage and the presence of adequate monitoring of the property's value. There is also an "umbrella" insurance policy that, with limited exceptions, covers damages on the entire portfolio of properties mortgaged as collateral for the loans granted. Collateral and guarantees are subject to accurate, regular control using a specific system, the CRM engine, in which a series of tests have been implemented to confirm the effective compliance with the requirements set by prudential supervision regulations.
The support system verifies whether the collateral and guarantees received are eligible with regard to the methods permitted by the regulations in relation to the various categories of collateral and guarantees for calculating capital requirements (Standardised and Internal Rating Based). Based on the specifics of each category, the eligibility results are defined at the level of individual guarantee for unfunded guarantees (usually personal guarantees) or, for collateral, for each asset or financial instrument.
The Bank uses two integrated platforms and guarantee management systems (PGA – Active Guarantees Portal and ABS – System Assets Archive) in order to improve the efficiency of collateral management. This has been accompanied by the development of a specific system for managing bad loans, to track the main legal actions and particularly those relating to the enforcement of real estate collateral (EPC - Ex Parte Creditoris).

In order to mitigate the counterparty risk associated with OTC (i.e., unregulated) derivatives and SFTs (Securities Financing Transactions, i.e. repos/reverse repos and securities lending/borrowing), the Group uses bilateral netting arrangements that allow the netting of claims and obligations if a counterparty defaults.

This is achieved by entering into International Swap Derivatives Association (ISDA) and International Securities Market Association/Public Securities Association (ISMA/PSA) agreements, which also reduce the absorption of regulatory capital in accordance with supervisory provisions.
In addition, the Group has collateral exchange arrangements in place, mainly with daily frequency, to hedge OTC derivatives transactions (Credit Support Annex), also due to the margin requirements for non-centrally cleared derivatives, established by the European Market Infrastructure Regulation (EMIR); also for SFTs, the Bank implements daily margining arrangements (GMRAs - Global Master Repurchase Agreements and GMSLAs - Global Master Securities Lending Agreements).
To mitigate the exposure to counterparties, mainly corporate customers, and the volatility arising from credit adjustments to derivative valuations (CVAs – Credit Value Adjustment), the Bank also buys protection through credit default swaps, both on individual companies and credit indices.

In 2024, the Parent Company continued its activities relating to the “GARC” (Active Credit Risk Management) Project, involving a platform for monitoring credit risk of performing portfolios. The initiative involves the systematic acquisition of both personal guarantees and collateral to support lending to companies.
The guarantees obtained provide hedging of default risk (past due, unlikely to pay and bad loan) of granular portfolios and freeing up of economic and regulatory capital, as envisaged by the current Supervisory Regulations on the matter (including Regulation (EU) 575/2013 and Bank of Italy Circular 285/2013).
For details of the transactions carried out in 2024 under the GARC Project, see the description provided in paragraph C. Securitisations of this chapter.
To optimise capital absorption, credit risk hedging transactions have also been undertaken through financial guarantees, insurance policies, and the acquisition of collateral (i.e., cash pledge) on positions existing in the Group’s Banking Book. Transactions hedging the risk of expropriation of the compulsory and unrestricted reserves of some of the Group banks operating in Egypt, Moldova, and Serbia have also been renewed.

3. NON-PERFORMING CREDIT EXPOSURES

3.1 Management strategies and policies

On 14 March 2024, the annual revision of the Group NPL Plan, carried out based on the ECB Guidance to banks on non-performing loans, in line with the baseline macroeconomic scenario and the budget process, was produced for the Board of Directors. The 2022-2025 NPL Plan is consistent with both the 2022-2025 Business Plan, approved by the Board of Directors in February 2022, and the Risk Appetite Framework, and takes into account the observations and recommendations of the Supervisory Authority.
The Group NPL Plan includes targets for the stock of non-performing loans, the detailed measures and enablers, as well as the related costs and investments required to achieve the targets set.
In the 2022-2025 Business Plan, the Group intends to pursue a structural de-risking strategy, which was mostly launched during the last Business Plan, placing it among the best in Europe in terms of non-performing loan ratio and stock and generating a net drop in the cost of risk.
At the end of 2024, non-performing loans before adjustments amounted to 9.7 billion euro, keeping the NPL ratio stable at 2.3% before adjustments and 1.2% net in comparison with December 2023. Based on the EBA methodology, the NPL ratio stood at 2% of gross and 1% net. As already described, this result was attributable to the ongoing de-risking initiatives, and also reflects an amount of non-performing loans classified as assets held for sale, having met the conditions for applicability based on IFRS 5, with a gross book value of 0.3 billion euro at the December 2024, scheduled for disposal in 2025 (see also the introductory chapter of the Report on operations regarding the de-risking initiatives). This process also continued to benefit from modest new inflows from performing loans due to the performance of the prevention initiatives.

Since November 2019, the Intesa Sanpaolo Group has adopted the New Definition of Default set out in the EBA Guidelines 2016/07 of 18/01/2017 on the application of the definition of default under Article 178 of Regulation 575/2013 (CRR), and in line with the additional clarifications introduced by Bank of Italy Circular 272. That definition of non-performing loans also coincides with the definition of “impaired” financial assets contained in IFRS 9, with the consequent recognition of all non-performing loans within Stage 3.
Intesa Sanpaolo Group adopts a “per borrower” approach in identifying non-performing exposures. Accordingly, the entire counterparty with credit relationship is assessed and subsequently classified, rather than the individual credit lines granted to that counterparty.

Based on the regulatory framework, according to the rules of the Bank of Italy, in line with IAS/IFRS and European Supervisory Regulations, supplemented by internal implementing rules, non-performing financial assets are classified into one of the three below mentioned categories, based on their level of severity:

- non-performing past due exposures: this category includes on-balance sheet exposures, other than those classified as bad loans or unlikely to pay that, as at the reporting date, are past due or overdrawn by over 90 days on a continuous basis. The total exposure to a debtor must be recognised as Past Due if, at the reference reporting date, the amount of the principal, interest and/or fees not paid when due exceeds both of the following thresholds (hereinafter, collectively, the "Relevance Thresholds"):
    - the absolute limit of 100 euro for retail exposures and of 500 euro for non-retail exposures (the "Absolute Threshold"), to be compared with the total amount past due from the borrower;
    - the relative limit of 1%, to be compared with the ratio of the total amount past due to the total amount of all on-balance sheet exposures to the same borrower (the "Relative Threshold”);
- unlikely to pay: exposures for which – according to the judgement of the creditor bank – full repayment is deemed unlikely (in terms of capital or interest), without considering recourse to actions such as enforcement of

collateral/guarantees. This assessment is conducted regardless of the presence of any amounts (or instalments) due and unpaid. As the assessment of unlikelihood of repayment is at the discretion of the Bank, it is not necessary to await an explicit symptom of anomaly (non-repayment), when there are elements that imply a risk of non-compliance by the borrower (for example, a crisis in the industrial sector in which the borrower operates). The overall on- and off-balance sheet exposures toward the same borrower in said situation is therefore classified under the category "Unlikely To Pay" (unless the conditions for classification of the borrower among bad loans exist). Loans classified as "Unlikely To Pay" should include exposures to issuers who have not regularly honoured their repayment obligations (in terms of capital or interest) relating to listed debt securities, unless they meet the conditions for classification as bad loans. To this end the "grace period" established by the contract is recognised or, in its absence, the period recognised by the market listing the security.

The Intesa Sanpaolo Group Rules on non-performing loans have also provided for a further classification within "unlikely to pay" exposures, identified as "forborne unlikely to pay", which may include counterparties that have at least one exposure subject to forbearance measures that are regularly respected or remain in the state of risk pending the start of the normally imposed cure period (minimum of 12 months);

– bad loans: on- and off-balance sheet exposures to borrowers in a state of insolvency (even when not recognised in a court of law) or in an essentially similar situation, regardless of any loss forecasts made by the Bank. This is irrespective, therefore, of whether any collateral or guarantees have been established to cover the exposures. Exposures whose anomalous situation may be attributed to Country risk are excluded from this category.

The type "exposures subject to concessions – forbearance" has also been established. These are exposures subject to renegotiation and/or refinancing due to financial difficulties (evident or in the process of becoming evident) of the debtor, which effectively constitute a subgroup of both non-performing exposures (non-performing exposures with forbearance measures) and performing exposures (other forborne exposures).

Non-performing exposures with forbearance measures do not represent a separate category of non-performing assets, rather, they are a sub-set of the above categories of non-performing assets.

Non-performing assets are subject to an assessment process resulting in the calculation of the expected loss for uniform categories (identified based on the risk status, duration of risk status and significance of the underlying exposure) and the allocation of the impairment adjustment for each position.

Non-performing loans are measured using two methods:

– analytical-statistical measurement: for exposures equal to or lower than certain thresholds, and for all non-performing past-due exposures, based on the use of specific LGD grids;
– specific analytical measurement: for exposures above certain thresholds based on write-down estimates defined by the relationship manager, following analyses and valuations based on pre-established criteria.

In addition to the assessment component determined through statistical valuation models or through individual expert evaluation, a component is calculated to take into account the evolution of the current operational variables, the future macroeconomic scenarios, the incremental risk of the counterparty as long as it remains in the specific risk status for unlikely-to-pay exposures (vintage), as well as the sales prospects if present.

The assessment of non-performing positions classified as assets held for sale is carried out based on the expected sales prices, less their costs to sell, supported by fairness opinions.

The assessment methods for non-performing loans are described in detail in Part A – Section "A.2 – Main financial statement captions" in these Notes to the consolidated financial statements and in particular in the paragraph "Impairment of non-performing financial assets", to which reference is made.

The assessments are carried out upon classification of the exposures as non-performing and are reviewed periodically.

The assessment of the loans is also reviewed whenever a new event occurs that could affect the prospects for recovery (e.g. change in the value of collateral, developments in ongoing litigation, etc.).

In order to timely identify such events, the information set relative to borrowers and guarantors is periodically monitored and the development of out-of-court agreements and the various phases of the judicial procedures under way are constantly monitored.

The management of the Group's non-performing loans may be carried out directly by the internal organisational structures or by/with external partners granted appropriate mandates (outsourcers), for which the Chief Lending Officer Area performs a supervisory role in the management of the stocks and flows outsourced and acts as an interface for the approvals beyond the limits of the powers delegated to them and for administrative, technical and operational activities envisaged in the processes of interaction with the outsourcers. The internal organisational structures are identified, on the basis of pre-determined relevance thresholds, as the local organisational units (at regional level) that perform specialist activities, or within the Head Office Departments, which are also responsible for the overall management and coordination of these matters.

The classification of positions to non-performing is performed on proposal of both territorial structures, owners of the commercial relationship, or of specialised central and local territorial structures in charge of the monitoring and recovery of non-performing loans. Classification may also be performed through automatic mechanisms when predefined objective default conditions arise. This refers, for example, to past-due loans continuously above certain thresholds for certain periods and forborne performing positions (performing forborne positions originating from non-performing forborne positions) that have not yet completed their 24-month probation period, if they meet the conditions envisaged by the applicable regulations for their reallocation to non-performing loans, based on the verification of objective parameters and, specifically, for transactions already designated as forborne, so-called reiteration (i.e. the granting of a further forbearance measure) and/or continuously over 30 days past due above certain thresholds, and transactions subject to distressed restructuring, granted on performing positions with a loss exceeding 1%.

Furthermore, automatic mechanisms detect any mismatches, thereby ensuring that material non-performing loans to counterparties shared between the Group's various entities are subject to the required uniform convergence of management decisions. Materiality is represented by exceeding a pre-established warning threshold for loans classified as at the greatest risk, with respect to the overall exposure.

Automatic mechanisms within the system also ensure that positions are allocated to the risk status most representative of their creditworthiness (bad loans excluded) as material default continues.

The return to performing status of non-performing exposures is governed by the Supervisory Authority and specific internal regulations, and takes place on the proposal of the Structures responsible for their management, upon verification that the critical conditions or state of default no longer exist.
Non-performing past-due exposures and unlikely to pay exposures, not subject to forbearance measures must continue to be classified as such for at least 3 months after they cease to meet the requirements for being classified as such. During this probation period the counterparty's conduct must be assessed in light of its financial situation (in particular, by verifying the absence of amounts past due exceeding the relevance thresholds).
For counterparties classified as forborne unlikely-to-pay, the application of the cure period of at least 12 months shall prevail. At the end of this period, the position may be reclassified as performing, provided that there are no past due exposures of the borrower and the borrower has repaid a significant amount of the principal or interest and, more generally, the criteria for the counterparties returning to performing status are met.
Exposures classified as past-due return automatically to performing when the above-mentioned 90-day probation period has passed. The same mechanism is applied to exposures of moderate amounts previously automatically classified as unlikely to pay when automatic mechanisms detect that the conditions that triggered the classification no longer apply.
The Internal Validation & Controls Coordination Area of the Chief Risk Officer Governance Area carries out level II controls on single counterparties in the various statuses of non-performing loan, randomly selected mainly with risk-based criteria in order to verify their proper classification and provisioning, as well as the adequacy of the management and recovery processes.

3.2 Write-offs

Lastly, with regard to non-performing loans, it is highlighted that the Intesa Sanpaolo Group uses the – full or partial – write-off/derecognition of unrecoverable accounting positions and, in the following cases, the consequent allocation to loss of the remainder that has not yet been adjusted:

- uncollectability of the debt, as a result of definite and precise elements (such as, for example, untraceability and indigence of the debtor, lack of recovery from realisation of securities and real estate, negative foreclosures, bankruptcy proceedings closed with no full compensation for the Bank, if there are no further guarantees that can be enforced etc.);
- waiver of the credit claim, due to the unilateral cancellation of the debt or residual amount as a result of settlement agreements;
- no waiver of the credit claim. With regard to the full or partial write-offs without waiver of the credit claim, in order to avoid maintaining loans on the balance sheet that have a very low possibility of recovery, despite continuing to be managed by the recovery structures, they are fully or partially written off due to uncollectability even if the legal proceedings have not been closed. The write-off can only involve the portion of the loan covered by provisions and, therefore, each loan can only be written off up to the amount of its net book value. Therefore, on a periodic basis, the Group identifies the bad loan portfolios to be subject to total or partial write-offs with the following macro-characteristics:
  - percentage cover of 100% and a vintage (understood as the period of time in "bad loan" status) of >1 year;
  - percentage cover of >95% and a vintage (understood as the period of time in "bad loan" status) of >5 years or >8 years, respectively, for non-mortgage and mortgage loans.

  Portfolios to be written off can also be identified that have similar characteristics that are different from those indicated above, but that relate to exposures that have a marginal possibility of recovering the amount of the provision, where the minimum amount of the provision (calculated taking into account the accumulated write-offs on the position, according to the same rule established at prudential level by the calendar provisioning framework) is at least equal to the amount needed to bring the value of the exposures up to their fair value estimated based on the prices recorded in the latest sales of bad loans made by the Group.

In 2024, the Group carried out write-offs on gross non-performing loans for around 744 million euro. Of these, around 571 million euro regarded bad loans, for the most part using the allowance already set aside. More than 57% of these write-offs related to derecognised positions that are still subject to enforcement procedures, for which any recoveries from collections after the write-off will be recognised in the income statement as recoveries.

3.3 Purchased or originated credit-impaired financial assets

According to IFRS 9, loans considered as impaired already upon initial recognition in the financial statements, due to the high credit risk associated with them, are defined as Purchased or Originated Credit Impaired Assets (POCI). If these loans fall within the scope of impairment in accordance with IFRS 9, they are valued by allocating allowances - from the date of initial recognition - to cover losses for the entire residual life of the loan (lifetime Expected Credit Loss). Since these are non-performing loans, they are initially recognised within Stage 3, subject to the possibility of being classified, over the course of their lives, to Stage 2 if, based on the credit risk analysis, they are identified as no longer being impaired.
POCI loans recorded in the Group's financial statements may derive from single renegotiations of non-performing exposures carried out as part of routine lending activity or be recognised following business combinations. With regard to the latter case, the acquisition of the former UBI Group during 2020 resulted in the recognition of a significant portfolio of non-performing loans, which, therefore, were initially recognised as POCI pursuant to IFRS 9 and posted in the financial statements at the fair value determined on Purchase Price Allocation, as the initial recognition value. More in detail, at the acquisition date (4 August 2020), the accounting records of the UBI Group had gross non-performing loans amounting to around 6.5 billion euro (8 billion euro in terms of credit claim). In light of the sales already carried out, the POCI loans referring to the former UBI Group recognised in the Parent Company's financial statements as at 31 December 2024 remain under assets measured at amortised cost for substantially residual amounts and further reduced compared to the end of 2023, totalling 131 million euro, consisting of 78 million euro of non-performing loans and 53 million euro of performing positions (total of 141 million euro, with 80 million euro of non-performing loans and 61 million euro of performing loans, as at 31 December 2023).

4. COMMERCIAL RENEGOTIATED FINANCIAL ASSETS AND FORBORNE EXPOSURES

Forbearance measures are concessions made to a borrower that is facing, or could face, situations of difficulty in meeting their contractual commitments that would prevent them from meeting their original payment obligations (troubled debt).
The term “forbearance measures” indicates contractual modifications granted to the borrower undergoing financial difficulties (modification), as well as the disbursement of a new loan in order to satisfy the pre-existing obligation (refinancing). “Forbearance measures” include the exercise of clauses, which may be freely requested by a borrower with regard to a contract already signed, but only if the lender deems that there are circumstances indicating that the borrower is in financial difficulty (the so-called “embedded forbearance clauses”). The concept of “forborne” therefore does not include renegotiations carried out due to commercial reasons/practices, which do not take into account the financial difficulties of the borrower.
In many cases, a situation of financial difficulty is accompanied by a situation of economic instability of the borrower, consisting of the inability of the core business to remunerate all the production factors that the company needs, through the usual sources of cash flow and at normal market conditions.
The identification of “forborne assets” or “forborne exposures”, in line with the provisions of the EBA regulations and unlike the “per borrower” approach used by the Intesa Sanpaolo Group for the classification of non-performing exposures, necessarily takes place on a “per transaction” basis. The term “exposure” in this context refers to the renegotiated individual contract, rather than to all the exposures to the same borrower.
More generally, Intesa Sanpaolo Group’s policy, based on the instructions provided by the Supervisory Authorities, envisages criteria for the identification of the financial difficulty (of the performing borrower) which, in the event of renegotiation/refinancing, entail the classification of one (or more) credit line(s) as forborne, if at least one of the following conditions applies:

- a significant deterioration in the debtor’s rating identified in the previous three months;
- detection within the proactive credit processes identified over the previous three months;
- past due beyond the materiality thresholds for over thirty consecutive days in the last three months or for more than twenty days as at the measurement date;
- Early Warning System (EWS) result, associated with a risky level.

A state of financial difficulty is always assumed in the case where the borrower is classified as non-performing.
The definition of forborne exposure applies transversally to the classification macro-categories (performing and non-performing). Forborne assets may be included in stage 2 (performing) or stage 3 (non-performing – forborne non-performing).
The forbearance measures granted are monitored for minimum predefined periods, differentiated based on the administrative status of the risk assigned to the counterparty. In detail:

- 24 months for performing positions (probation period);
- 36 months for positions classified as non-performing, represented by a cure period of 12 months and a probation period of an additional 24 months.

When a forbearance measure is granted to a performing counterparty, quantitative assessments (diminished financial obligation indicator set at 1%) and/or qualitative assessments are performed, as envisaged in the EBA Guidelines on the application of the definition of default pursuant to Article 178 of Regulation (EU) 575/2013, which could result in the possible classification to non-performing.
According to Intesa Sanpaolo Group’s interpretations, the identification of an exposure as forborne necessarily implies the existence of a “significant increase” in risk since the origination of the loan (and, therefore, implies also a classification in Stages 2 or 3 at the time of assignment of the forborne status).
Unlike the forbearance measures, which relate to loans to borrowers in financial difficulty, renegotiations for commercial reasons involve borrowers that are not in financial difficulty and include all transactions aimed at adjusting the cost of the debt to market conditions.
Transactions involving commercial renegotiations result in a change in the original conditions of the contract, usually requested by the borrower, which normally relate to aspects concerning the cost of the debt (or its duration), with a consequent economic benefit for the borrower. In general, whenever the bank carries out a renegotiation to avoid losing its customer, that renegotiation should be considered as substantial because, if it were not carried out, the customer would borrow from another intermediary and the bank would incur a decrease in expected future revenues.
These operations, under certain conditions, are treated for accounting purposes as an early repayment of the original debt and the opening of a new loan.

QUANTITATIVE INFORMATION

A. CREDIT QUALITY

For the purposes of quantitative information about credit quality, the term "credit exposures" is understood to exclude equities and quotas of UCI.

The term "on-balance sheet credit exposures" refers to all the on-balance sheet financial assets due from banks or customers, irrespective of the accounting portfolio they are allocated to (measured at fair value through profit or loss, measured at fair value through other comprehensive income, measured at amortised cost, or discontinued financial assets). On demand receivables due from banks and central banks come under the definition of on-balance sheet exposures but by convention are not included in the tables in Section 1, except in specifically identified cases where they must be considered.

The term "off-balance sheet exposures" refers to all the financial transactions that are not on the balance sheet (guarantees given, revocable and irrevocable commitments, derivatives, etc.) but entail the assumption of credit risk, regardless of the purpose of those transactions (trading, hedging, etc.). The off-balance sheet credit exposures also include the counterparty risk associated with any securities lending transactions. The counterparty risk associated with exposures relating to repurchase agreements, transactions involving the granting or assumption of goods on loan, and loans with margins falling within the notion of securities financing transactions defined by the prudential regulations, is also reported.

Non-performing credit exposures (on-balance sheet and off-balance sheet) do not include financial assets held for trading and hedging derivatives, which are therefore normally recognised as performing credit exposures.

A.1. Performing and non-performing credit exposures: amounts, adjustments, changes and economic breakdown

A.1.1. Prudential consolidation - Breakdown of financial assets by past-due brackets (book value)

(millions of euro)

Portfolios/risk stages		STAGE 1			STAGE 2			STAGE 3			PURCHASED OR ORIGINATED CREDIT-		
		Between 1 and 30 days	Between 30 and 90 days	Over 90 days	Between 1 and 30 days	Between 30 and 90 days	Over 90 days	Between 1 and 30 days	Between 30 and 90 days	Over 90 days	Between 1 and 30 days	Between 30 and 90 days	Over 90 days
1. Financial assets measured at amortised cost		1,540	208	246	758	352	173	246	196	2,782	10	1	84
2. Financial assets measured at fair value through other comprehensive income		-	-	-	-	-	-	-	-	-	-	-	-
3. Non-current financial assets held for sale		-	-	-	-	-	-	-	-	33	-	-	-
Total	**31.12.2024**	**1,540**	**208**	**246**	**758**	**352**	**173**	**246**	**196**	**2,815**	**10**	**1**	**84**

On 16 December 2022, the EBA repealed the Guidelines on reporting and disclosure of exposures subject to measures applied in response to the COVID-19 crisis, contained in EBA/GL/2020/07, with effect from 1 January 2023, following the change in the scenario related to the pandemic. However, the Bank of Italy, in the communication dated 14 March 2023, requested that certain financial statement disclosures be maintained, in free format, on transfers between the various credit risk stages which involved the loans subject to public guarantees issued in response to the COVID-19 situation.

In that regard, it is noted that the loans subject to COVID-19 public guarantees measured at amortised cost that were transferred from stage 1 to stage 2 in 2024 amounted to 1,269 million euro, while those transferred from stage 2 to stage 1 amounted to 477 million euro.
Transfers from stage 2 to stage 3 amounted to 160 million euro, from stage 3 to stage 2 amounted to 13 million euro, from stage 1 to stage 3 amounted to 320 million euro and, lastly, from stage 3 to stage 1 amounted to 3 million euro.

The dealings between the Banking Group and other non-banking companies included within the scope of consolidation amounted to:

- 10,073 million euro, adjusted by 7 million euro, included among gross performing on-balance sheet exposures to customers;
- 19 million euro, adjusted by 3 million euro, included among gross non-performing off-balance sheet exposures to customers;
- 7,468 million euro, adjusted by 15 million euro, included among gross performing off-balance sheet exposures to customers.

The exposures also include financial assets allocated to the assets held for sale accounting portfolio.

The On- and off-balance sheet credit exposures to customers classified as stage 2 mainly include the positions for which a change (behind specific thresholds) was found in the lifetime probability of default compared to the time of initial recognition of the financial instrument in the financial statements. For the purpose of classification in stage 2 – without prejudice to the materiality thresholds identified by the regulations - exposures that are past due by at 30 days or subject to forbearance measures are important. Activating a forbearance measure implies a minimum probation period of 24 month in Stage 2. Moreover, for the centralised scope (main Italian companies and international corporate banks), some of the indicators from the credit monitoring systems are considered for the purposes of the transfer between stages (early warning systems). Where signals of high risk (traffic light results) are identified for at least three consecutive months by such systems, a perimeter of potentially riskier counterparties is defined, to be classified in Stage 2.
To complement the above methodology, a “relative” threshold has also been established (tripling of lifetime PD at the observation date compared to the lifetime PD at the initial recognition date), which acts on a residual basis compared to the main methodology, i.e. the change in the lifetime probability of default. Therefore, if this threshold is exceeded, the position is automatically classified to Stage 2. In order to avoid the “sliding” into Stage 2 of particularly high credit quality positions, the threshold is only triggered for non-investment grade loans and securities, identified considering the definitions within the Group.

Finally, a staging allocation effect was identified in the in-model adjustment linked to the identification of extreme scenarios. This led to the stage 2 classification of the counterparties deemed most vulnerable to the aforementioned extreme scenarios in relation to the rating assigned.

The gross amount of loans subject to COVID-19 public guarantees as at 31 December 2024 came to 15,460 million euro, including the non-performing financial assets allocated to the assets held for sale accounting portfolio (amounting to 44 million euro). The aggregate comprised performing exposures of 14,437 million euro gross, with 46 million euro in adjustments and non-performing exposures of 1,023 million euro gross, with 402 million euro in adjustments. Performing exposures are broken down into (i) performing past due loans for 148 million euro gross, with 3 million euro in adjustments and (ii) performing loans not past due for 14,289 million euro gross, with 43 million euro in adjustments.

The “other increases” mainly include the collections of loans derecognised in full (through “recoveries on repayments”) and increases in the balances of allowances in foreign currency due to changes in the exchange rate.
The “other decreases” mainly include the portfolio of loans classified as “bad loans” and “unlikely to pay” sold during the year. This caption also includes the collections of overdue interest applied in previous years, losses on disposal not covered by the allowance, the decrease in allowances in foreign currency due to changes in the exchange rate and the reduction in the allowances for adjustment due to the passing of time.

A.2. Classification of exposures based on external and internal ratings

A.2.1. Prudential Consolidation - Breakdown of financial assets, commitments to disburse funds and financial guarantees given by external rating classes (gross amounts)

The Intesa Sanpaolo Group uses the ratings supplied by the following external rating agencies for portfolios subject to supervisory reporting: S&P Global Ratings, Moody's, Fitch Ratings and Morningstar DBRS. The ratings provided by those agencies are used in compliance with the authorisations received and the regulations in force for the different Group banks.
In compliance with the regulations, if there are two ratings for the same customer, the most prudential of the two is used, when three ratings are available, the middle rating is adopted, and when all ratings are available, the second-best is taken.

A.2.2. Prudential Consolidation - Breakdown of financial assets, commitments to disburse funds and financial guarantees given by internal rating classes (gross amounts)

As indicated above in the Qualitative Information, the Intesa Sanpaolo Group has a set of ratings for the various segments of the counterparties (Corporate, Corporate SME, Retail SME, Retail, Public Sector Entities and Banks).
The breakdown of exposures by internal rating classes shown in the following table is based on all ratings available in the credit risk management and control systems, in addition to ratings for validated models. These ratings include credit ratings assigned by external agencies for counterparties in customer segments for which an internal model is not available.
Unrated exposures account for 9.1% of all exposures to performing counterparties and refer to customer portfolios for which a rating model is not available, to counterparties for which the roll-out of rating models is still underway (mainly international subsidiaries), as well as to Group companies whose mission is not related to credit and loans, which have been integrated into the credit risk management system, or to marginal exposures.

When unrated counterparties and non-performing loans are excluded, there is a high concentration of investment grade classes (classes 1, 2 and 3, representing ratings between AAA and BBB-) at 70.6% of the total, whilst 22.8% fall within the BB+/BB range (class 4) and 6.6% fall under higher risk classes (of which 1% are below B-).

(millions of euro)

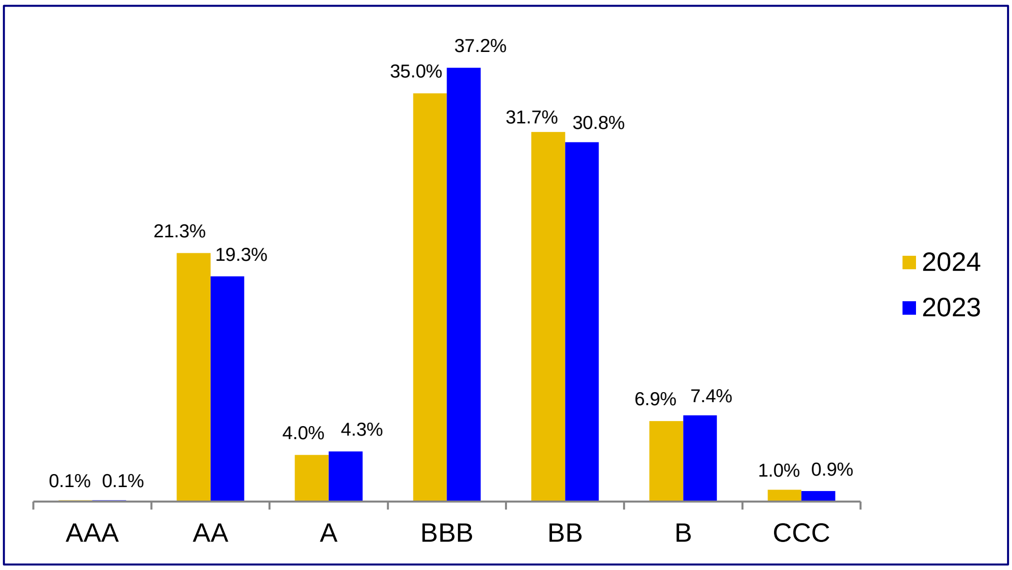
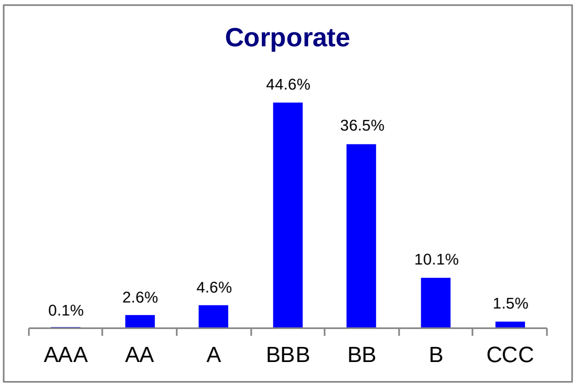
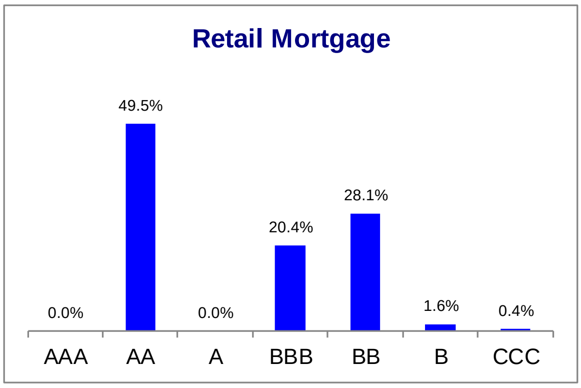
In addition to the tables required by the regulations, the rating allocation for performing loans to customers attributable to the main Group banks is shown below.
As at 31 December 2024, performing loans to customers assigned an individual rating internally or by an external agency accounted for 98% of the loans of the main Group banks.

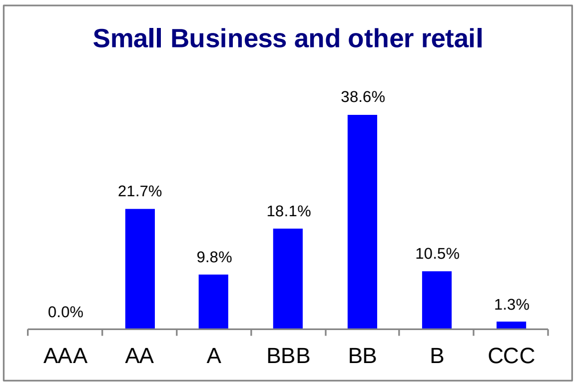


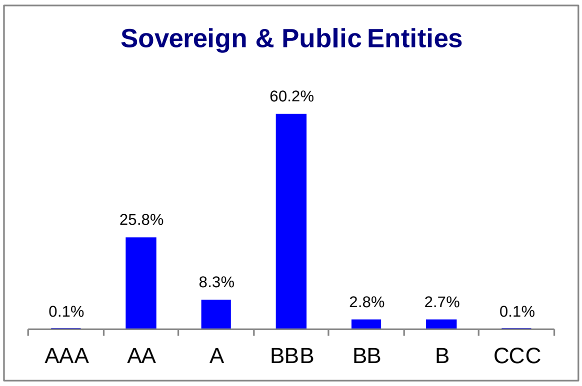
The allocation shows a level of investment grade exposures (from AAA to BBB inclusive), at 60.4%, down slightly on the previous year (60.9%), mainly due to the reduction/restructuring of the portfolio, which primarily affected the "BBB" component, partially offset by an improvement in the "AA" range. The same percentage calculated on the entire portfolio, net of Russian counterparties, came to 72.1%, unchanged from the previous year.

The breakdown of the following portfolios by rating is presented below: Corporate, Retail Mortgage (residential mortgages for individuals), Small Business and other retail, Sovereign & Public Entities.









Investment grade positions account for 51.9%, 69.9%, 49.6% and 94.4% of the above portfolios, respectively.

D.2. Other assets	-	-	-	-	-
Total 31.12.2024	**652**	**646**	**-249**	**397**	**9**
Total 31.12.2023	**768**	**795**	**-286**	**509**	**114**

For the Group, the assets seized (book value) are mainly represented by:
- Property and equipment used in operations: buildings (3 million euro) and land (1 million euro);
- Investment property: buildings (50 million euro); land (14 million euro);
- Property and equipment – Inventories: buildings (166 million euro), land (1 million euro) and other (1 million euro);
- Equities and debt securities:
  - equity investments for 1 million euro;
  - financial assets mandatorily measured at fair value of 110 million euro;
  - financial assets measured at fair value through other comprehensive income of 35 million euro.

  This amounts to financial assets not previously provided by the borrower as security for pre-existing loans, but acquired under bilateral agreements with the borrower, following which the Group has derecognised the credit exposure;
- Non-current assets held for sale and discontinued operations: buildings (11 million euro) and land (4 million euro).

B.4 Large exposures

Large exposures	
a) Book value (millions of euro)	213,890
b) Weighted value (millions of euro)	24,948
b) Number	11

Based on regulatory provisions, the number of large exposures presented in the table was determined by the reference to unweighted “exposures” in excess of 10% of Tier 1 Capital as defined by Regulation (EU) 876/2019 (CRR2) and Regulation (EU) 575/2013 (CRR). The “exposures” are defined as the sum of on-balance sheet assets at risk and off-balance sheet transactions (excluding those deducted from Tier 1 Capital) with a customer or a group of related customers, without applying weighting factors. These presentation criteria result in the inclusion in the financial statement table for large exposures of entities that – even with a weighting of 0% – present an unweighted exposure in excess of 10% of Tier 1 Capital for the purposes of large risks.

In accordance with the provisions of the EBA document "Guidelines on connected clients under Article 4(1)(39) of Regulation (EU) 575/2013", the supervisory reports have standard methods of presentation of groups of connected clients that (in the case of silos) require exposures to the central governments to be repeated within each corresponding economic group directly controlled by a central government or connected to it by economic dependence.
However, the amounts shown in points a) and b) and the number shown in point c) in the table above include the exposure to the various central governments, to which the Intesa Sanpaolo Group is exposed, only once.

C. SECURITISATIONS

This section does not include securitisations where the originators are Intesa Sanpaolo Group banks and all the liabilities (e.g. ABS securities, loans at the warehousing stage) issued by the vehicle companies are subscribed at the time of issue by one or more Group companies. For a description of these types of transaction, see the section on liquidity risk in Part E of the Notes to the consolidated financial statements.

Qualitative information

The securitisations carried out in 2024 are summarised below:

GARC Securitisations

Within the Active Credit Risk Management (GARC) transactions, Intesa Sanpaolo completed seven new synthetic securitisations during the year: GARC SME-12, GARC Leasing-3, GARC ESG & Circular Economy-2, GARC New Origination-2, GARC High Potential-3, GARC Commercial Real Estate -2, and GARC Corp-7. Specifically:

- for the GARC SME-12 transaction (second quarter), the mezzanine risk relating to a gross initial portfolio of around 1 billion euro (corresponding to around 0.9 billion euro net of risk retention) in loans to around 1,800 businesses in the Corporate and Corporate SME regulatory segment, valued using internal models (Advanced IRB), was sold to a specialist investor;
- for the GARC Leasing-3 transaction (second quarter), the junior risk of a total gross initial portfolio of around 1.5 billion euro (corresponding to around 1.1 billion euro net of risk retention) in finance leases to around 1,500 businesses in the Corporate and Corporate SME regulatory segment, valued using internal models (Advanced IRB), was sold to specialist investors;
- for the GARC ESG & Circular Economy-2 transaction (second quarter), the junior risk relating to a gross initial portfolio of around 4.8 billion euro (corresponding to around 2.5 billion euro net of risk retention) in loans to around 100 businesses in the Corporate and Corporate SME regulatory segment with a high ESG score and/or part of the circular economy, valued using internal models (Advanced IRB), was sold to specialist investors;
- for the GARC New Origination-2 transaction (third quarter), the junior risk associated with an initial portfolio, both gross and net of risk retention, of around 0.5 billion euro in loans to around 1,200 customers in the Corporate and Corporate SME regulatory segment, valued using internal models (Advanced IRB), was sold to a specialist investor. This portfolio is increased with new loans (including leases) on a quarterly basis during a ramp-up period not exceeding 12 months until a maximum portfolio of 2 billion euro is reached;
- for the GARC High Potential-3 (third quarter), the junior risk of a total gross initial portfolio of around 2.2 billion euro (corresponding to around 1.2 billion euro net of risk retention) in leverage/sponsor led financing to around 100 businesses in the Corporate and Corporate SME regulatory segment, valued using internal models (Advanced IRB), was sold to specialist investors;
- for the GARC Commercial Real Estate-2 (fourth quarter), the junior risk of a total gross initial portfolio of around 1.8 billion euro (corresponding to around 1.4 billion euro net of risk retention) in commercial mortgage loans to around 500 businesses in the Corporate and Corporate SME regulatory segment, valued using internal models (Advanced IRB), was sold to specialist investors;
- for the GARC Corp-7 transaction (fourth quarter), the junior risk relating to a gross initial portfolio of around 5 billion euro (corresponding to around 2.9 billion euro net of risk retention) in loans to around 400 businesses in the Corporate regulatory segment, valued using internal models (Advanced IRB), was sold to specialist investors. The transaction was structured in accordance with the STS (Simple, Transparent and Standardised) requirements established in Articles 26a to 26f of EU Regulation No. 2017/2402.

In compliance with the retention rule laid down by the supervisory regulations, for the above transactions Intesa Sanpaolo holds at least 5% of the securitised portfolio.

The portfolios of the transactions mainly consist of customers operating in Northern Italy.
In the second quarter of 2024, for the GARC New Origination-1 transaction, the ramp-up of the gross loan portfolio was completed for a total of around 1.9 billion euro (corresponding to around 1.8 billion euro net of risk retention) to around 1,700 businesses.
In the fourth quarter of 2024, for the GARC New Origination-2 transaction, the ramp-up of the gross loan portfolio was completed for a total (also net of risk retention) of around 2 billion euro to around 3,000 businesses.

– Commercial mortgage loans (****)	2,067	-1	6	-	25	-
TOTAL	**38,836**	**-33**	**81**	**-30**	**816**	**-**

(*) The entire amount refers to non-performing financial assets. "Loans to businesses (including SMEs)" refer to the Savoy, Kerma, Yoda, Sirio, Grogu, Kerdos, Organa and Andor securitisations (see the 2018, 2019, 2020, 2021, 2022 and 2023 Consolidated Financial Statements, respectively, for details about the transactions). "Residential mortgage loans" refer to the Maior and Iseo securitisations (deriving from the business combination with the former UBI Group).

(**) The amounts refer to the Portland securitisation relating to credit-impaired financial assets for amounts of 3 million euro – senior and 4 million euro – mezzanine, respectively (see the 2021 Consolidated Financial Statements for a description of the transaction) and the Teseo transaction relating to performing financial assets (see the 2022 Consolidated Financial Statements for a description of the transaction).

(***) The amounts include non-performing financial assets amounting to 18 million euro in mezzanine exposures. The performing exposures include the Chewbecca securitisation (described in the 2023 Consolidated Financial Statements for a description of the transaction).

(****) The captions also include performing amounts associated with the synthetic securitisations originated by the Intesa Sanpaolo Group.

Off-balance sheet

This type of exposure did not exist as at 31 December 2024.

C.2. Prudential consolidation - Breakdown of exposures deriving from the main "third-party" securitisations by type of securitised asset and by type of exposure

On-balance sheet

(millions of euro)

UBI Finance S.r.l. (f)	Milano	(e)	6,426	-	680		7,061	

(a) Consolidation method referring to the so-called "prudential" scope.

(b) Figures gross of any intragroup relations. The amounts shown under assets and liabilities refer to the total values reported in the financial statements of the special purpose vehicles.

(c) Self-securitisation vehicle described in Section 1.4 Banking Group - Liquidity Risk, Quantitative Information, paragraph 2 of these Notes to the consolidated financial statements.

(d) The amounts shown under assets and liabilities refer to the latest financial statement data available (31 December 2023).

(e) Vehicle consolidated at equity.

(f) Vehicle used for the covered bond issue by the Intesa Sanpaolo Group. For more information, see Section D in Part E of these Notes to the consolidated financial statements.

The securitisations structured by the Intesa Sanpaolo Group on its own assets include those named Towers, K-Equity, Savoy, Kerma, Yoda, Maior, Iseo, Sirio, Kerdos, Grogu, Portland, Organa, Andor, Teseo and Chewbecca, for which special purpose vehicles were used that are third-party and independent entities with respect to the Group, and in which the Group does not hold any investments. For that reason, these vehicles are not shown in the table above.

C.4 Prudential consolidation – Unconsolidated securitisation vehicles

This paragraph contains the disclosure on the unconsolidated securitisation vehicles, other than those used in self-securitisations, which the Intesa Sanpaolo Group does not hold any stake in the capital and those in which it holds a residual stake.

As at 31 December 2024, the structured entities in which the Intesa Sanpaolo Group held residual stakes included the vehicles Augusto and Diocleziano consolidated at equity. These vehicles are entities used in securitisations of assets, primarily land and public works financing, of a company subject to joint control sold in previous years. The Group holds a residual stake in these vehicles. There are no agreements in place which could result in the obligation of the Group to provide financial support to said vehicles.
The Intesa Sanpaolo Group controls the companies Romulus Funding Corporation and Duomo Funding Plc (included solely in the scope of consolidation pursuant to IFRS 10), which are used for transactions in which the Intesa Sanpaolo Group acts as sponsor and whose operations are described in Section 4 - Risks of other companies, of this Part E.

C.5. Prudential consolidation - Servicer activities – originated securitisations: collection of securitised loans and repayment of securities issued by the securitisation vehicle

SERVICER	SPECIAL PURPOSE VEHICLE	SECURITISED ASSETS (end-of-period figure) (millions of euro)		COLLECTIONS OF LOANS IN THE YEAR (millions of euro)		PERCENTAGE OF REIMBURSED SECURITIES (period-end figure)					
						Senior		Mezzanine		Junior	
		Non-performing	Performing	Non-performing	Performing	Non-performing	Performing	Non-performing	Performing	Non-performing	Performing
Intesa Sanpaolo	Brera Sec S.r.l. (*)	25	10,843	3	1,014	0%	31%	0%	0%	0%	0%
Intesa Sanpaolo	Clara Sec S.r.l. (*)	54	6,206	16	2,151	0%	0%	0%	0%	0%	0%
Intesa Sanpaolo	Giada Sec S.r.l. (*)	147	17,223	44	8,053	0%	0%	0%	0%	0%	0%
Intesa Sanpaolo	Teseo SPV S.r.l. (**)	51	2,427	4	708	0%	34%	0%	34%	0%	16%
Total		**277**	**36,699**	**67**	**11,926**						

During 2024, the Brera Sec the first self-securitisation, structured in 2017, was extinguished.

(*) Vehicle used for self-securitisations.

(**) Vehicle used for the traditional securitisation of performing lease receivables described in the 2022 Consolidated Financial Statements.

C.6. Prudential consolidation – Consolidated securitisation vehicles

There were no transactions that used consolidated securitisation vehicles during 2024.

D. SALES

A. Financial assets sold not fully derecognised

Qualitative information

For a description of the operations shown in the tables below, reference is made to the information shown below the relevant tables.

Conversely, for operations in debt securities against medium/long-term repurchase agreements, reference is made to the information in Part B of the Notes to the consolidated financial statements.

The table above does not include covered bond transactions in which the Intesa Sanpaolo Group is both the seller and lender for the vehicle issuing the debt securities.

The aggregates of the sales contracts with repurchase clauses relate to repurchase agreements entered into by the Group for assets sold and not derecognised. However, repurchase agreements relating to securities received under reverse repurchase agreements are not included in the related financial liabilities.

Prudential consolidation – Financial assets sold partly recognised and related financial liabilities: book value

These are not present in the Intesa Sanpaolo Group.

Prudential consolidation - Sales with liabilities having recourse exclusively on the assets sold and not fully derecognised: fair value

(millions of euro)

	Fully recognised	Partly recognised	31.12.2024	31.12.2023

The table above does not include covered bond transactions in which the Intesa Sanpaolo Group is both the seller and lender for the vehicle issuing the debt securities.

B. Financial assets sold fully derecognised with recognition of continuing involvement

This type of exposure did not exist as at 31 December 2024.

C. Financial assets sold and fully derecognised

Qualitative information

The disclosure is provided below regarding the multi-originator sale transactions involving loan portfolios – classified as unlikely to pay in particular – attributable to the sale of loans to a mutual investment fund with the assignment of the units in the fund to the selling intermediaries.

Back2Bonis Fund

In implementation of the derisking envisaged in the previous 2018-2021 Business Plan and the current 2022-2025 Business Plan, in the third quarter of 2020 the Intesa Sanpaolo Group begun the deconsolidation of a portfolio of credit exposures (including real estate assets and contracts) classified as unlikely to pay with real estate underlying held by the Parent Company, accompanied by their conversion into units of the securities fund called Back2Bonis. The transaction, the closing of which took place at the end of 2020, took the form for the Bank (including the transactions undertaken in 2019 and 2020 by UBI Banca, merged in 2021) of the sale of a portfolio of loans, short-term legal relationships and legal relationships and assets from lease receivables for a total gross amount of 351 million euro and net exposure of 164 million euro, accompanied by the subscription of the units of the Back2Bonis fund for an amount of 164 million euro, substantially in line with the net value of the loans and receivables sold. The transaction was completed through: (i) the sale to the securitisation vehicle Ampre S.r.l. of the bank receivables and the lease receivables; (ii) the sale to Ampre LeaseCo S.r.l. of the legal relationships and assets arising from the leases; (iii) the sale of the short-term revolving contracts and the related legal relationships and receivables of Intesa Sanpaolo S.p.A., together with the medium/long-term contracts with residual disbursements and the related legal relationships, other than the lease relationships and assets through the fronting bank provided by Banca Finanziaria Internazionale S.p.A.; (iv) the subscription by the Back2Bonis Fund of all the securities issued by the securitisation vehicle; and (v) the acquisition by Intesa Sanpaolo of the units of the Fund in exchange for the loans and receivables sold. In 2022, additional loans were sold, for a gross amount of 1 billion euro and net exposure of 216 million euro, accompanied by the subscription of units of the Back2Bonis fund, for an amount of 216 million euro, with the sale price offset against the subscription price of the Fund's units, without significant effects on the income statement for 2022.

The Back2Bonis fund, established in the form of a closed-end mutual fund whose units can only be subscribed by professional investors, is a multi-originator platform for the management of Real Estate Small & Medium Size loans classified as UTP, deriving from loans and credit lines granted to companies operating in the real estate sector or to real estate funds (including those not fully disbursed/drawn down at the time of sale). Following the completion of the transfer of the loans and receivables to the platform, Intesa Sanpaolo S.p.A. had deconsolidated the loans and receivables and recognised the Fund's units in place of those loans and receivables. The breakdown of the assigned debtors by economic sector was mainly concentrated in the following sectors:

– "Production companies" at 79.9%;
– "Construction companies" at 12.9%;
– "Real estate business" at 3.5%;
– "Financial and insurance business" at 2.6%;
– and a residual amount in other business sectors (Services, Transport and Manufacturing Activities).

The assets of the assigned debtors were broken down as follows by geographical area:

– 92.2% North-West;
– 3.5% North-East;
– 3.2% South and Islands;
– 1.1% Centre.

At 31 December 2024, the Parent Company held a 42.47% stake (with voting rights limited to 35%) in the Back2Bonis Fund, classified among investments subject to significant influence, for a book value of 344 million euro. The measurement of the Back2Bonis Fund yielded a negative effect for the year of 16 million euro.

FI.NAV. Fund SUB-FUND A - LOANS

In pursuit of the de-risking activities provided for in the previous 2018-2021 Business Plan and the current 2022-2025 Business Plan, in the fourth quarter of 2018 the Intesa Sanpaolo Group had launched the contribution to the FI.NAV. fund (a closed-end Italian securities umbrella fund) of a portfolio of non-performing secured and unsecured loans attributable to the shipping sector. The Fund, reserved for institutional investors, is managed by the asset management company IQ EQ Fund Management (Ireland) Limited, not a member of the Intesa Sanpaolo Group, based in Ireland, and is divided into two autonomous sub-funds: FI.NAV. Sub-Fund A – Loans, dedicated to including the loans contributed by the Intesa Sanpaolo Group and Unicredit, and FI.NAV. Sub-Fund B – New Finance, dedicated to including the capital of third-party investors to relaunch the repossessed ships. The transaction, formulated in 2018, was closed in 2019 through a sale of receivables without recourse for total gross consideration of 155 million euro and a net exposure of 102 million euro, equal to the sale price, set off against the price of subscription of the Fund units and, therefore, without any effects on the income statement for 2019. In the first quarter of 2020, a further tranche was sold without recourse for a gross amount of 37 million euro and a net value of 34 million euro, in line with the sale price and, therefore, with no impact on the income statement for 2020. Pursuant to IFRS 9, for the Intesa Sanpaolo Group the transaction entailed the derecognition of the loans sold since the Fund has become solely responsible for managing them following the sale; the Intesa Sanpaolo Group had therefore derecognised the loans concerned, while recognising the corresponding fair value of the units of the Fund assigned. The Group companies involved in the transaction were the Parent Company Intesa Sanpaolo and some of its subsidiaries merged in 2019 and 2020 (Cassa di Risparmio in Bologna and Mediocredito, both merged in 2019, and Banca IMI, merged in 2020). In December 2022 the sale of a loan portfolio was finalised for a gross amount of 74 million euro and net exposure of 37 million euro, accompanied by the subscription of the units of the fund for an amount essentially in line with the value of the exposure sold, without significant effects on the income statement for 2022. The economic sector of the assigned debtors was mainly concentrated in Transport. The transferred financial assets are primarily in the South and Islands area.

In 2023, a distribution by the fund was made in the amount of 54 million euro. Intesa Sanpaolo's pro rata share was 27 million euro. In 2024, two distributions by the fund were made for an overall total of 200 million euro. Intesa Sanpaolo S.p.A.'s pro rata share was 101 million euro. At 31 December 2024, the Parent Company held a 50.54% stake in the FI.NAV. fund, classified among investments subject to significant influence, for a book value of 65 million euro. The measurement of the FI.NAV. fund yielded a positive effect of 17 million euro and the recognition of a foreign exchange effect of 10 million euro allocated, in accordance with the IAS 28 investment policy, to a specific shareholders' equity reserve.

RSCT Fund – Loans Sub-Fund

As part of the de-risking envisaged in the previous 2018-2021 Business Plan and the current 2022-2025 Business Plan, the Intesa Sanpaolo Group had identified the opportunity to transfer assets (loans and securities) relating to non-performing positions to the closed-end RSCT Fund, in exchange for units of the fund. The project was managed by Pillarstone, which had selected a portfolio of industrial and commercial companies with the objective of helping each of them to identify a strategy for maximising the potential for debt recovery, also through injections of new finance. The transaction took place in May 2020 with the transfer of a portfolio of loans with 18 companies originated by the Group (Intesa Sanpaolo and Banca IMI, subsequently merged into Intesa Sanpaolo on 20 July 2020), Unicredit, BPER Banca and Crédit Agricole to the newly established closed-end alternative investment RSCT Fund, managed by IQ EQ Fund Management (Ireland) Limited, an alternative fund manager authorised by the Central Bank of Ireland. The RSCT Fund is made up of two separate sub-funds: sub-fund A for the management of loans acquired from the selling banks and sub-fund B for the management of the new finance. The May 2020 sale involved a portfolio of loans, Sirti notes and PS Reti equity instruments for a gross amount of 339 million euro (Intesa Sanpaolo and Banca IMI) at a net value of 255 million euro, substantially in line with the sale price. In July 2020, a further sale was completed of a loan position for a gross amount of 6.3 million euro at a value of 4.5 million euro, with the sale price offset against the subscription price of the Fund's units. In February 2021, a sale was completed of a loan position for a gross amount of 21.3 million euro at a value of 13.9 million euro, with the sale price offset against the subscription price of the Fund's units. In March 2021, a sale was completed of a loan position deriving from the absorption of UBI Banca for a gross amount of 3.1 million euro and a net exposure of 1.2 million euro, with the concurrent subscription of units of the RSCT Fund for 1.3 million euro, essentially aligned with the net value of the transferred loans. In June 2021, a further sale was completed of a loan position for a gross amount of 0.4 million euro at a value of 0.1 million euro, with the sale price offset against the subscription price of the Fund's units. By economic sector, the assigned debtors are 72% concentrated in "Companies that install electrical equipment", 18% in "Amusement and theme parks" and 10% in "Retail sale of footwear and accessories".

In 2024, a distribution by the fund was made for a total of 10 million euro with a pro rata share in favour of Intesa Sanpaolo of 7 million euro.

The transferred financial assets are primarily in the North-west area. At 31 December 2024, the Parent Company held a 70.07% stake in the RSCT fund, classified among investments subject to significant influence, for a book value of 257 million euro. The measurement of the RSCT fund yielded an overall negative effect of 7 million euro.

IDEA CCR Corporate Credit Recovery II Fund - Loans Sub-fund

In 2018, the Intesa Sanpaolo Group (specifically Intesa Sanpaolo and the banks subsequently merged into Intesa Sanpaolo: Cassa di Risparmio del Veneto, Cassa di Risparmio di Firenze, Cassa di Risparmio del Friuli Venezia Giulia, Cassa di Risparmio in Bologna, and Mediocredito) participated in the closed-end Italian fund IDEA CCR Corporate Credit Recovery II – Loans Sub-Fund, managed by Dea Capital Alternative Funds S.G.R. S.p.A. and dedicated to the recovery of mid-size Italian companies in situations of financial distress but with solid industrial fundamentals. The transaction, which was completed in 2018, was undertaken by contributing non-performing loans with a nominal value of 59 million euro and a net exposure to the sale price of 39.2 million euro, with the price of sale offset against the subscription price, of equal amount, of the units of the IDEA CCR Corporate Credit Recovery II fund - Loans Sub-Fund. In 2021, the Group's investment in the IDEA CCR Fund increased further, due to the merger of UBI Banca, which had sold loan positions to the IDEA CCR Corporate Credit Recovery II fund, Loans Sub-Fund, managed by Dea Capital Alternative Funds SGR, in 2020, 2019, 2018 and 2017 for a total gross amount of 231 million euro and a net exposure of 144 million euro, with concurrent subscription of the units of the IDEA CCR II fund for an amount of 148 million euro, with the price of sale offset against the price of subscription of the Fund units. The breakdown of the assigned debtors by economic sector was mainly concentrated in the following sectors:

– "Production Companies" at 70.7%;
– "Other collective investments undertakings" at 10.3%;
– "Non-financial companies of non-EU countries" at 10.1%;
– and, to a residual extent, other business sectors.

The assets of the assigned debtors were broken down as follows by geographical area:

– 33.3% Centre;
– 19.3% North-East;
– 18.1% South and Islands;
– 16.7% North-West;
– 12.6% Outside Italy.

In 2022, the investment of the Bank in the IDEA CCR fund changed due to: i) the inclusion of the stake held by UBI Leasing S.p.A., merged into Intesa Sanpaolo in May 2022, which had sold loan positions to the IDEA CCR Corporate Credit Recovery II Fund - Loans Sub-Fund in 2019 for a total gross amount of 5 million euro and a net exposure of 3 million euro, with the sale price offset against the subscription price, in the same amount, of the Fund units, and ii) the sale of A1 units held by Intesa Sanpaolo in the Fund to Banca Nazionale del Lavoro S.p.A. The receivable held by Intesa Sanpaolo in relation to the sale was settled by offsetting with the purchase of units of Back2Bonis.

In the second half of 2024, Intesa Sanpaolo transferred a loan portfolio for a total gross amount of 232 million euro, with payment of the price through the subscription of fund units recognised at an initial recognition amount of 201 million euro, with no significant impact on the 2024 income statement.

Following this transaction, Intesa Sanpaolo increased its holding in the fund and reclassified the interest from financial assets mandatorily measured at fair value to interests subject to significant influence.

As at 31 December 2024, Intesa Sanpaolo held a 35.23% stake in the IDEA CCR Corporate Credit Recovery II fund – Loans Sub-Fund, classified among interests subject to significant influence, for a book value of 226 million euro. The measurement of the IDEA CCR II fund yielded a negative effect for the year of 9 million euro.

UTP Italia fund – Loans Sub-Fund

The UTP Italia fund is an alternative closed-end Italian securities umbrella fund (AIF) in charge of managing loans classified as unlikely-to-pay (UTP) and whose target is credit exposures to small and medium-sized enterprises and individuals. In November 2022, the Group finalised the sale of a loan portfolio (mainly UTP) to the UTP Italia fund managed by Sagitta S.G.R., with Intrum Italy S.p.A. as special servicer. Specifically, the transaction entailed: i) the sale of loans owed for a gross amount at the cut-off date of 42 million euro and net exposure of 25 million euro, to Finn SPV S.r.l. (SPV 130), without significant effects on the income statement for 2022; ii) the recognition of the receivable of 25 million euro from the SPV 130; iii) the contribution to the UTP Italia fund of the receivable from the SPV 130 in exchange for units of the fund by way of price; and iv) issuance of Asset-Backed Securities (ABS) by the vehicle, subscribed by the Fund, derecognising the receivable from the SPV 130.

Effective 20 March 2023, Intesa Sanpaolo finalised the sale of a loan portfolio with gross exposure of 366 million euro and net exposure of 147 million euro to the securitisation vehicle Finn SPV S.r.l., with the sale price netting the subscription price of the Fund units.

Following this transaction, Intesa Sanpaolo had increased its holding in the fund and had reclassified the interest from financial assets mandatorily measured at fair value to interests subject to significant influence.

In the second half of 2024, Intesa Sanpaolo transferred a loan portfolio for a total gross amount of 180 million euro, with payment of the price through the subscription of fund units recognised at an amount of 82 million euro, with no significant impact on the 2024 income statement. Two distributions were made during the year for an overall total of 50 million euro. Intesa Sanpaolo’s pro rata share is 25 million euro.

The breakdown of the assigned debtors by economic sector was mainly concentrated in the following sectors:

- “Consumer Households” at 67.2%;
- “Production Companies” at 12.7%;
- and, to a residual extent, other business sectors.

The assets of the assigned debtors were broken down as follows by geographical area:

- 34.8% South and Islands;
- 29.4% North-West;
- 21.7% Centre;
- 14.1% North-East.

As at 31 December 2024, the Intesa Sanpaolo held a 55.02% stake (with voting rights limited to 35%) in the UTP Italia fund for a book value of 229 million euro. The measurement of the UTP Italia fund yielded a positive effect for the year of 17 million euro.

Efesto

Efesto is an alternative closed-end Italian securities fund (AIF). In July 2022, the sale of loans was finalised for a gross amount of 17 million euro and net exposure of 9 million euro, accompanied by the subscription of the units of the fund for an amount of 7 million euro, without significant effects on the income statement for 2022.

Effective 20 March 2023, Intesa Sanpaolo finalised the sale of a loan portfolio with gross exposure of 320 million euro and net exposure of 181 million euro to the securitisation vehicle Esino SPV S.r.l., with the sale price netting the price of subscription of the Fund units.

The breakdown of the assigned debtors by economic sector was mainly concentrated in the following sectors:

- “Consumer Households” at 51.9%;
- “Production Companies” at 38.4%;
- and, to a residual extent, other business sectors.

The assets of the assigned debtors were broken down as follows by geographical area:

- 31.7% North-West;
- 30.5% South and Islands;
- 27.8% Centre;
- 10% North-East.

Following this transaction, Intesa Sanpaolo had increased its holding in the fund and had reclassified the interest from financial assets mandatorily measured at fair value to interests subject to significant influence.

In the second half of 2024, Intesa Sanpaolo transferred a loan portfolio for a total gross amount of 223 million euro, with payment of the price through the subscription of fund units recognised at an amount of 194 million euro, with no significant impact on the 2024 income statement. Four distributions were made during 2024 for an overall total of 80 million euro. Intesa Sanpaolo’s pro rata share is 27 million euro.

As at 31 December 2024, Intesa Sanpaolo held a 43.19% stake in the Efesto fund for a book value of 336 million euro. The measurement of the Efesto Fund yielded an overall negative effect for the year of 4 million euro.

Lendlease MSG Heartbeat

In 2022, a complex transaction was initiated involving the Risanamento Group, as part of the “Starfighter Project” aimed at: i) enabling the implementation of the real estate project in the Milano Santa Giulia area; ii) enabling the company to meet the commitments made with the public and private parties; and iii) deconsolidating the on-balance sheet credit exposure of the banks involved to Risanamento.

The Board of Directors of ISP approved the transaction on 2 February 2023, which was completed on 30 June following the fulfilment of the conditions precedent attached to the Term Sheet General Framework Agreement. The complex transaction aimed at the financial and corporate restructuring of the Risanamento Group included:

- the establishment of a closed-end Alternative Real Estate Investment Fund;

- the commitment by Intesa Sanpaolo and the other banks involved, and by the other stakeholders involved in the transaction, to subscribe to the units of the Fund;
- the deconsolidation of Intesa Sanpaolo's credit exposure and shareholders' loan with the Risanamento Group through the discharge by the Fund and simultaneous offsetting of the related loans, due to Intesa Sanpaolo Group and the other banks, with the commitments made by the banks towards the Fund against the subscription of units;
- the disbursement of new performing loans to the Fund;
- the maintenance of Risanamento's business operations.

The economic sector of the assigned debtors was mainly concentrated in "Non-financial companies". The transferred financial assets are primarily in the North-West area.
The Bank's credit exposure to the Risanamento Group was offset against the latter's commitments made in exchange for the subscription of class A1 and B2 units of the Lendlease MSG Heartbeat Fund. Therefore, at the closing completed on 30 June 2023, Intesa Sanpaolo derecognised the loans due from Risanamento, including the shareholders' loan, recognising respectively the B2 and A1 units of the fund received at fair value, at a value substantially aligned with the net value of the loans sold.
As at 31 December 2024, the Parent Company held a 56.80% stake (with voting rights limited to 40%) in the Lendlease MSG Heartbeat Fund, classified among interests subject to significant influence, for a book value of 132 million euro. The measurement of the Lendlease MSG Heartbeat Fund yielded a negative effect for the year of 80 million euro.

Retail & Leisure Fund

As part of the de-risking, in 2024 Intesa Sanpaolo sold a loan portfolio for a total gross amount of 165 million euro with underlying real estate assets, owed by seven counterparties operating in the mall & hospitality sector with unsatisfactory performance, lack of available equity to support the relaunch plan, and consequent situation of substantial stalemate and difficulty in formulating sustainable financial measures. The "Retail & Leisure" fund is an Alternative Investment Fund, focused on acquiring and managing high-risk and non-performing credit exposures, primarily backed by real estate, and owed by companies in temporary financial distress operating in the mall and hospitality segments (shopping centres). The fund is managed by IQ-EQ Fund Management with the support of the advisor Pillarstone, which is tasked managing the positions and the underlying assets. Upon the initial subscription, in exchange for the sale, Intesa Sanpaolo received units representing 68% of the Fund, which, based on the economic and governance rights, were classified among interests subject to significant influence for a total of 126 million euro.
The breakdown of the assigned debtors by economic sector was mainly concentrated in the following sectors:

- "Production Companies" at 51%;
- "Other collective investments undertakings" at 44%;
- and, to a residual extent, other business sectors.

The assets of the assigned debtors were broken down as follows by geographical area:

- 67% North-West;
- 33% Centre.

As at 31 December 2024, the Parent Company held a 68.30% stake in the Retail & Leisure fund, classified among interests subject to significant influence, for a book value of 124 million euro. The measurement of the Retail & Leisure fund yielded a negative effect for the year of 2 million euro.

UTP Restructuring Corporate

As part of the de-risking, in 2024 Intesa Sanpaolo sold a loan portfolio for a total gross amount of 160 million euro to the newly established fund managed by Arrow (UTP Restructuring Corporate), with payment of the price through the subscription of fund units recognised at an amount of 137 million euro, with no significant impact on the 2024 income statement. The Fund is an Alternative closed-end Italian securities Fund (AIF), reserved for professional investors. The purpose of the Fund is to carry out professional management aimed at maximising the value of the assets forming part of the Fund's portfolio (this involves actively participating in turnaround procedures and/or restructuring agreements and/or debtor balance plans; managing and exercising of rights related to equity investments and holding other financial Instruments issued by the debtors, also through M&A or refinancing transactions; repossessions; and credit collection transactions).
The breakdown of the assigned debtors by economic sector was concentrated in the following sector:

- "Production Companies" at 100%;

The assets of the assigned debtors were broken down as follows by geographical area:

- 55% North-East;
- 45% North-West.

As at 31 December 2024, the Parent Company held a 58.07% stake in the UTP Restructuring Corporate fund, classified among interests subject to significant influence, for a book value of 136 million euro. The measurement of the UTP Restructuring Corporate fund yielded a negative effect for the year of 1 million euro.

Clessidra Restructuring Fund

Clessidra Restructuring Fund (CRF Fund) is an alternative closed-end investment fund reserved for institutional investors, dedicated to investing in loans classified as unlikely to pay to previously identified industrial companies. In September 2019, UBI Banca, which during 2021 was merged into Intesa Sanpaolo, had sold loans to five borrowers with a total gross amount of 17 million euro and a net exposure of 11 million euro, with concurrent subscription of the units of the CRF fund for an amount essentially in line with the net value of the transferred loans. The economic sector of the assigned debtors was mainly concentrated in "Manufacture of wooden doors and manufacture of furniture". The transferred financial assets are primarily in the North-west area.
As at 31 December 2024, Intesa Sanpaolo held a 4.34% stake in the CRF fund, classified among Financial assets mandatorily measured at fair value, for a book value of 8 million euro. The fair value measurement of the Clessidra Restructuring Fund yielded an immaterial positive effect during the year.

IDEA CCR Corporate Credit Recovery II Fund - Shipping Sub-fund

The Shipping Loans Sub-Fund refers to single-name, unlikely-to-pay non-performing loans with a sector focus on shipping companies. The Fund consists of three sub-funds: loans, new finance and shipping. Following the incorporation of UBI Banca in 2021, Intesa Sanpaolo also has a holding in the Shipping Sub-Fund against the sale of UBI loans with a total gross amount of 45 million euro and a net exposure of 31 million euro.
As at 31 December 2024, Intesa Sanpaolo held a 20.37% stake in the IDEA CCR II fund – Shipping Sub-Fund, classified among Financial assets mandatorily measured at fair value, with an immaterial book value.

Other information

For completeness, it should be noted that during the second half of 2023 Intesa Sanpaolo completed a transaction for the sale of performing on-balance sheet exposures (amounting to around 800 million euro in terms of Gross Book Value) to the Italian Commercial Real Estate sector, with a substantially neutral effect on the income statement. In summary, the transaction involved i) the transfer of part of the credit exposure to two Real Estate Funds, in exchange for units of the transferee funds, and ii) the conversion of the remaining exposure into newly issued Equity Instruments.
Lastly, in the first half of 2024 Intesa Sanpaolo completed a transaction for the sale of performing on-balance sheet exposures (amounting to around 80 million euro in terms of Gross Book Value) and Equity Instruments, with a substantially neutral effect on the income statement, by means of transfer of the Instruments to a Real Estate Fund in exchange for units of that fund.

Prudential consolidation - Covered bond transactions

Covered bond transactions where the selling bank and the lending bank are the same must be reported under this section. Intesa Sanpaolo uses covered bonds mainly as a type of funding through securities guaranteed by assets originated by Intesa Sanpaolo or by other companies of the Group.

Intesa Sanpaolo has three programmes for the issuance of Covered Bonds (CB).

The first Programme, launched in 2009, had a maximum amount of 20 billion euro (the original maximum amount was 10 billion euro) and was closed in 2024. The guarantor of the Covered Bonds is the vehicle **ISP CB Pubblico**, to which a portfolio of performing loans and securities to the public sector, originated by the former subsidiary Banca Infrastrutture Innovazione e Sviluppo, now Intesa Sanpaolo, was transferred. The Bank gradually sold the vehicle assets with a total original nominal value of 13.2 billion euro (net of retrocessions of assets of 1.7 billion euro). The last sale (amounting to around 1 billion euro) took place in April 2013.
At the end of November 2023, Intesa Sanpaolo had repurchased the entire portfolio of bonds segregated in the vehicle for an amount of 1.1 billion euro, while the remaining loan portfolio still segregated in the Vehicle was repurchased in March 2024 for a total amount of 1.85 billion euro. The programme was closed on 2 April, at the final payment date.
Against these sales of the assets to the vehicle, Intesa Sanpaolo carried out issuances of Covered Bonds, over time, for a total nominal value of 25.2 billion euro (of which 21.7 billion euro relating to issues acquired in full by the Parent Company and subject to early redemption or matured and 3.5 billion euro relating to an exchange offer to investors during 2012, of which 2 billion euro that matured in the second quarter of 2017 and the remaining 1.5 billion euro in January 2021).
As at 31 December 2023, a total residual nominal amount of 1.85 billion euro of issues made as part of the Covered Bond programme of the vehicle ISP CB Pubblico was outstanding, fully subscribed by the Bank.
In January 2024, the 13th and 14th series (both retained) were subject to total early redemption for an overall nominal amount of 1.85 billion euro, thereby eliminating all the Covered Bonds issued under the programme.

In the second Programme, launched in 2010, amounting to a maximum of 35 billion euro (the original maximum amount was 20 billion euro), the guarantor of the covered bonds is the vehicle **ISP CB Ipotecario**, to which Italian residential mortgage loans and, initially bonds issued by Adriano Finance S.r.l., originated by Intesa Sanpaolo, were transferred.
The Bank gradually sold the vehicle mortgage loans with an original total nominal value of 56.8 billion euro (net of retrocessions).
In 2024, the following additional transactions were also completed:
– in February, sale for an amount of 5.8 billion euro;
– in May, sales for an amount of 4.2 billion euro;
– in September, buyback of non-performing loans for 48.6 million euro.

As at 31 December 2024, the loans sold to the vehicle had a book value of 30 billion euro.
Over time, against the sale of assets to the vehicle, Intesa Sanpaolo has carried out issues of covered bonds for a total nominal value of approximately 48 billion euro (of which a total of 25.1 billion euro subject to early redemption or matured at 31 December 2024).
As at 31 December 2023, a total nominal amount of 18.9 billion euro of issues made as part of the covered bond programme of the vehicle ISP CB Ipotecario was outstanding, of which 8.4 billion euro placed with third party investors and 10.5 billion euro subscribed by Intesa Sanpaolo. Part of the latter was used in repurchase agreements for an amount of 5.8 billion euro.
During 2024, in March the 25th series matured for an amount of 1 billion euro, and in May the 21st retained series was redeemed early for an amount of 1.2 billion euro. In addition, five issuances of covered bonds were made for a total amount of 6.3 billion euro:
– in March the 34th retained series was issued for 1 billion euro, with a floating rate and a 5-year maturity;
– three retained series were issued in May:
    - the 36th for 1.4 billion euro, with a floating rate and a 4-year maturity;
    - the 37th for 1.7 billion euro, with a floating rate and a 9-year maturity;
    - the 38th for 1.7 billion euro, with a floating rate and an 11-year maturity;
– in June the 35th series was issued, consisting of a private placement for 500 million euro, with a floating rate and a 6-year maturity.

Accordingly, as at 31 December 2024, a total nominal amount of 23 billion euro of issues made as part of the covered bond programme of the vehicle ISP CB Ipotecario was outstanding, of which 7.9 billion euro placed with third party investors and 15.1 billion euro subscribed by Intesa Sanpaolo. Part of the latter is being used in repurchase agreements for an amount of 12.9 billion euro.
All the securities issued under the programme are listed on the Luxembourg Stock Exchange and have a Moody's Aa3 rating.

The third multi-originator Covered Bond issuance Programme, launched in 2012, has the vehicle **ISP OBG** as the guarantor of its securities. This programme is secured by mortgage loans for a maximum amount of 55 billion euro (the original maximum amount was 30 billion euro) and is aimed at realising the retained issues.
The portfolio used to collateralise the issues of Covered Bonds is composed of mortgages originated by Intesa Sanpaolo, Banco di Napoli, Cassa di Risparmio del Veneto, Cassa di Risparmio in Bologna and Banca CR Firenze (merged by incorporation into Intesa Sanpaolo between July 2018 and February 2019).
Over time, the Intesa Sanpaolo Group sold mortgages to the vehicle for an original total nominal value of 89.2 billion euro (net of retrocessions).
In 2024, Intesa Sanpaolo did not sell any mortgage loans to the vehicle, while the following were repurchased:
– in January, non-performing loans for 22.6 million euro;
– in September, non-performing loans for 171.4 million euro.
As at 31 December 2024, the loans sold to the vehicle by Intesa Sanpaolo had a book value of 38.7 billion euro.
Over time, against the sale of assets to the vehicle, Intesa Sanpaolo has carried out issues of covered bonds for a total nominal value of approximately 86.3 billion euro (of which 48.93 billion euro subject to early redemption or matured at 31 December 2024).
As at 31 December 2023, there were issuances made under the programme guaranteed by the vehicle ISP OBG for a total nominal amount of 41.8 billion euro, fully subscribed by Intesa Sanpaolo, a part of which was subsequently used in repurchase agreements for an amount of 5.8 billion euro.
During 2024, in February the 32nd retained series matured for an amount of 1.65 billion euro; in June, the 21st retained series was partially redeemed for 500 million euro and subsequently matured in August for the remaining amount of 1.25 billion euro; the 25th retained series was partially redeemed in June for 50 million euro and in December for an additional 1.2 billion euro.
Therefore, as at 31 December 2024, there were issuances made under the programme guaranteed by the vehicle ISP OBG for a total nominal amount of 37.15 billion euro, fully subscribed by Intesa Sanpaolo, part of which is being used in repurchase agreements for an amount of 5.8 billion euro.
All the securities issued as part of the programme are listed on the Luxembourg Stock Exchange and have a Morningstar DBRS A rating.

The fourth programme was launched by the former UBI Banca Group in 2008.
Former UBI Banca, merged into Intesa Sanpaolo S.p.A. during 2021, included two Covered Bond Programmes, run by two special purpose vehicles named **UBI Finance** and **UBI Finance CB2**, respectively. The latter was closed in January 2021.
The programme still provides Intesa Sanpaolo with the right to issue securities, targeted to institutional investors, for a maximum amount of 15 billion euro. The Programme includes residential mortgage loans assigned by the former UBI Group's network banks. These banks participated in the programme as Originator Banks and Lending Banks.
Following the incorporation of UBI Banca, Intesa Sanpaolo sold mortgage loans to the vehicle for an original total nominal value of 628 million euro (net of retrocessions).
In 2024, Intesa Sanpaolo did not sell any mortgage loans to the vehicle, while the following were repurchased:
– in January, non-performing loans for 22.7 million euro;
– in September, non-performing loans for 42.8 million euro.
As at 31 December 2024, the loans sold to the vehicle had a book value of 6.4 billion euro.
As at 31 December 2023 a total nominal amount of 6.45 billion euro of issues made as part of the covered bond programme of the vehicle UBI Finance was outstanding, of which 6.25 billion euro placed with third party investors and 0.2 billion euro retained.
During 2024, the 14th series matured in February for an amount of 1 billion euro and the 24th series matured in July for an amount of 750 million euro.
As at 31 December 2024 a total nominal amount of 4.7 billion euro of issues made as part of the covered bond programme of the vehicle UBI Finance was outstanding, of which 4.5 billion euro placed with third party investors and 0.2 billion euro retained.
As at 31 December 2024, the bonds under the programme were assigned an Aa3 rating from Moody's and AA (Low) from Morningstar DBRS.

The key figures for ISP CB Ipotecario, ISP OBG, and UBI Finance as at 31 December 2024 are shown in the table below.

(millions of euro)

COVERED BOND		VEHICLE DATA		SUBORDINATED LOAN (1)	COVERED BONDS ISSUED	
		Total assets	Cumulated write-downs on securitised portfolio	amount	Nominal amount (2)	Book value (2)
ISP CB IPOTECARIO	Residential mortgages	35,677	40	33,421	20,848	19,793
ISP OBG	Residential mortgages	44,453	114	43,979	5,848	5,491
UBI FINANCE	Residential mortgages	7,106	40	7,061	4,497	4,392

(1) This caption includes the subordinated loan granted to the vehicles for the purchase of the portfolio lodged as collateral for the CB. This loan is derecognised in the IAS-compliant separate financial statements. The amount of the loan refers to the issue already executed as part of an issue programme with a higher maximum amount.

(2) The nominal amount and the book value shown in the table are to be considered net of securities repurchased.

In addition to this type of Covered Bonds, provided for by Italian law (Law 80/2005), there are some mortgage bonds issued by the Slovak investee VUB. These are securities whose nominal value and returns are guaranteed by mortgage loans, i.e. loans to individuals with residual maturities up to 30 years, backed by a pledge on property located in the Slovak Republic, with a maximum loan-to-value of 80%.
Each issue has specific coverage, and the entire nominal value of the issue, including interest, must be backed by mortgage loans on local properties on at least 90% of their nominal value, and the remaining 10% possibly by liquidity or deposits with the National Bank of Slovakia, the European Central Bank, other European central banks or banks that meet the criteria set out in Art. 129(1)(c) of Regulation (EU) 575/2013.
To cover the negative net cash flows expected from the covered bonds at 180 days, the issuer must maintain high-quality liquid assets pursuant to Articles 10 and 11 of Regulation (EU) 61/2015.
As at 31 December 2024, the subsidiary VUB had issued 4.3 billion euro in this type of securities, booked in the financial statements at a value of approximately 4.2 billion euro.

E. PRUDENTIAL CONSOLIDATION - MODELS FOR THE MEASUREMENT OF CREDIT RISK

As of 31 December 2024, the expected loss on performing loans to customers (which takes into account cash and unsecured loans) was 0.33%, down from 0.38% in 2023. The decrease was attributable to the improvement in the quality of the loan portfolio.
As of 31 December 2024, the economic capital amounted to 2.00% of disbursed loans, down slightly, considering performing loans to customers only, on the figure for 2023 (+2.12%), in line with the above-mentioned improvement in the credit quality.
For the companies included in the roll out plan, the internal rating (PD), LGD and EAD models are subject to a second level control process carried out by the Validation function on the adequacy of the existing methodological framework, on an annual basis in accordance with the rules established by the Supervisory Authority, and a level three control by the Internal Audit Department. The control functions produce annual reports for the Supervisory Authority on the compliance of the models with the supervisory regulations, which also includes a verification on the deviations between estimates made and the actual figures, and they issue a compliance opinion when material model changes are made to the models. These reports, approved by the Board of Directors of Intesa Sanpaolo, confirm the compliance to the regulatory requirements.

1.2. MARKET RISKS

As already mentioned in the Introduction, the Intesa Sanpaolo Group policies on financial risk taking are defined by the Parent Company's Management Bodies, with the support of specific Committees, including the Steering Committee, chaired by the Managing Director and CEO and composed of the heads of the main corporate departments, and the Group Financial Risk Committee.
The Steering Committee, a Group body with a decision-making, reporting and consulting role, is also assigned the functions of assisting the Managing Director and CEO in the performance of his duties, strengthening the coordination and cooperation mechanisms between the various business, governance and control areas of the Group, with a view to sharing the main business choices, and helping ensure coordinated and integrated risk management and the safeguarding of business value at Group level, including the correct functioning of the internal control system.
The Group Financial Risk Committee, chaired by the Chief Risk Officer and the Chief Financial Officer, is responsible for setting out the methodological and measurement guidelines for financial risks, establishing the operational limits and assessing the risk profile of the Group and its main operational units. The Committee also sets out the strategies for the management of the banking book to be submitted to the competent Bodies and establishes the guidelines on liquidity, interest rate and foreign exchange risk. The Committee operates on the basis of the operating and functional powers delegated by the Corporate Bodies and coordination of the Steering Committee.
The Group's overall financial risk profile and the eventual necessary changes are examined periodically by the Group Financial Risk Committee.
The Market & Financial Risk Management structure, within the Parent Company Chief Risk Officer Governance Area, is responsible for the development of financial and market risk measurement and monitoring methodologies as well as for the proposals on the Group's system of operational limits. It is also responsible in outsourcing for the risk measurement for certain operating units on the basis of specific service contracts.

The table below shows the captions of the consolidated Balance Sheet that are subject to monitoring in relation to the managerial market risks, showing the positions for which managerial VaR is the main risk measurement metric (the managerial VaR is calculated on a wider scope that than subject to the Internal Model for market risks. For a more in-depth discussion, refer to the subsequent paragraph), along with those for which risks are monitored with other metrics. The latter mostly include the sensitivity analysis to the different risk factors (interest rate, credit spread, etc.).

(millions of euro)

	BOOK VALUE (supervisory scope)	MAIN RISK MEASUREMENT METRICS		
		VaR	Other	Risk factors measured using metrics included under Other
Assets subject to market risk	**661,950**	**118,321**	**543,629**	
Financial assets held for trading	41,465	41,465	-	Interest rate risk, credit spread, equity
Financial assets designated at fair value	6	5	1	Interest rate risk, credit spread, equity
Other financial assets mandatorily measured at fair value	5,994	89	5,905	Interest rate risk, credit spread, equity
Financial assets measured at fair value through other comprehensive income (ifrs 7 par. 8 lett. h))	77,296	75,990	1,306	Interest rate risk, credit spread, equity
Due from banks	38,463	-	38,463	Interest rate risk
Loans to customers	481,607	-	481,607	Interest rate risk
Hedging derivatives	6,469	772	5,697	Interest rate risk
Investments in associates and companies subject to joint control	10,650	-	10,650	Equity risk
Liabilities subject to market risk	**675,016**	**66,962**	**608,054**	
Due to banks	44,975	-	44,975	Interest rate risk
Due to customers	446,308	-	446,308	Interest rate risk

Financial liabilities held for trading	42,906	42,906	-	Interest rate risk
Financial liabilities designated at fair value (ifrs 7 par. 8 lett. e))	23,438	23,438	-	-
Hedging derivatives	4,363	618	3,745	Interest rate risk

REGULATORY TRADING BOOK

1.2.1. INTEREST RATE RISK AND PRICE RISK

Qualitative information

General aspects

The regulatory requirements for the trading book are established in Regulation (EU) 876/2019 (CRR2 - Part Three, Title I, Chapter 3, in Articles 102, 103, and 104 respectively). The combined provisions of those articles lay down the set of minimum requirements for the identification of the trading strategies and the measurement and control of the associated risks.
In accordance with the requirements of the applicable regulations, the Intesa Sanpaolo Group has established an internal policy that identifies the trading book based on:

- measurement at fair value through profit or loss of the instruments held for trading;
- the strategies defined;
- the risk-taking centres identified;
- the monitoring, limitation and management of the risks defined in accordance with the internal regulations on market risk.

In particular, the assets classified in the regulatory trading book coincide – apart from some specific exceptions – with the financial assets held for trading (Bank of Italy Circular 262). This association derives from the set of strategies, powers, limits and controls that feed and guarantee the adjacency and consistency between the accounting and prudential portfolios.

Among risks associated with trading activity, i.e. market risks deriving from the effect that changes in market variables may generate on the Group's various assets and liabilities, the latter are generally quantified through daily and periodic analysis designed to determine the vulnerability of the Intesa Sanpaolo Group's trading book. A list of the main risk factors to which the Group's trading book is exposed is set out below:

- generic interest rate risk (including inflation rate risk);
- specific interest rate risk (credit spread variability in relation to trading in credit derivatives, bonds and loans);
- generic equity risk;
- specific equity risk;
- incremental risk of migration and default (incremental risk charge);
- foreign exchange risk;
- risk of implied volatility on optional instruments;
- risk of illiquid factors (correlation, dividends, ABS, OtS loans, hedge funds);
- position risk for units of UCIs;
- commodity position risk.

For some of the risk factors cited above and included in the managerial VaR (Value at Risk) measurements, the Supervisory Authority has validated the internal models for the reporting of the capital requirement of Intesa Sanpaolo. More specifically, concerning market risk, the risk profiles validated are: (i) generic and specific on debt securities and on equities; (ii) position risk on quotas of UCI with daily liquidity and (iii) commodity risk.

Risk management processes and measurement methods

The allocation of capital for trading activities is set by the Parent Company's Board of Directors, through the attribution of operating limits in terms of VaR to the various Group units.
The structure of limits reflects the risk level deemed to be acceptable with reference to single business areas, consistent with operating and strategic guidelines defined by top management. The attribution and control of limits at the various hierarchical levels implies the assignment of delegated powers to the heads of business areas, aimed at achieving the best trade-off between a controlled risk environment and the need for operating flexibility. The functioning of the system of limits and delegated powers is underpinned by the basic concepts of hierarchy and interaction.
The application of such principles led to the definition of a structure of limits in which the distinction between first level and second level limits is particularly important:

- **first-level limits (VaR)**: the overall limits of the Group as well as those of the IMI C&IB Division and Group Treasury & Capital Management Area are included in the Group's Risk Appetite Framework (RAF). At the same time, the Board of Directors of the Parent Company defines the operating limits in terms of VaR for other Group companies which hold smaller trading books whose risk is marginal. Following approval, these limits are then allocated to the desks of the individual legal entities, considering the proposals by the business units. Limit absorption trends and the relative congruity analysis are periodically assessed by the Group Financial Risk Committee and Board of Directors within the framework of the Tableau de Bord for the Group's risks;
- **second level limits** (**sensitivity and greeks**): they have the objective of controlling operations of the various desks on the basis of differentiated measures based on the specific characteristics of traded instruments and operating strategies, such as sensitivity, greeks and equivalent exposures;
- **other significant limits**: they have the objective of monitoring particular transactions (e.g. limits of negative maximum exposure of the valuation reserve, ceilings for transactions with issuer risk).

Some of these limits may be managed under the RAF.

The Parent Company represents the main portion of the Group's market risks, while some other Group subsidiaries hold smaller trading books with a marginal risk (approximately less than 10% of the Group's overall management risk): in particular, the risk factors of the international subsidiaries' trading books are local government bonds, positions in interest rates, and foreign exchange rates relating to linear pay-offs.

A more detailed representation of the market risk metrics monitored in the limit structure is set out below:

Managerial VaR

Definition: Value at Risk is a monetary estimate of risk based on statistical techniques capable of summarising the maximum probable loss, with a certain confidence level, that a financial position or portfolio may suffer in a given period (holding period) in response to changes in the risk factors underlying the measurement models caused by market dynamics.
Method: the mathematical and statistical models that make it possible to calculate VaR can be divided into two general categories: parametric approaches (variance/covariance) and approaches based on simulation techniques, such as that in use at Intesa Sanpaolo.
Specifically, the approach used in Intesa Sanpaolo has the following characteristics:

- historical simulation model based on the mark-to-future platform;
- a 99th percentile confidence interval;
- disposal period of 1 day;
- full revaluation of existing positions.

Historical simulation scenarios are calculated internally on time series of one-year risk factors (250 observations). For management purposes, a non-equal probability of occurrence is associated with each scenario, decreasing exponentially as a function of time, to privilege the informational content of the most recent data. For regulatory purposes, scenarios are equally weighted when calculating the capital requirement.
Please note that, in the first quarter of 2024, on the ordinary annual update of the market risk managerial framework, the Board of Directors (as part of the 2024 Group Risk Appetite Framework) confirmed the specific limit for trading within an overall limit for trading and the hold to collect and sell (HTCS) business model.

Sensitivity and greeks

Definition: sensitivity measures the risk attributable to a change in the theoretical value of a financial position to changes of a defined quantity of risk factors connected thereto. It therefore summarises:

- the extent and direction of the change in the form of multipliers or monetary changes in theoretical value;
- without explicit assumptions on the time horizon;
- without explicit assumptions of correlation between risk factors.

Method: the sensitivity indicator can be constructed using the following techniques:

- calculation of prime and second derivatives of the valuation formulae;
- calculation of the difference between the initial value and that resulting from the application of unidirectional shocks independent of risk factors (delta, gamma, vega, CR01 and PV01).

Sensitivity measures make risk profiling more accurate, especially in the presence of option components. These measure the risk attributable to a change in the value of a financial position to predefined changes in valuation parameters including a one basis point increase in interest rates.

Level measures

Definition: Level measures, used also as ratios, are indicators supporting synthetic risk metrics which are based on the assumption of a direct relationship between the size of a financial position and the risk profile. In particular, level measures make it possible to monitor the nature of exposures to certain issuers and economic groups.
The main level measure indicators are nominal (or equivalent) position and average duration metrics; level indicators also include the Negative Maximum Exposure of the Valuation Reserve measures characteristic of the HTCS business model.
Method: nominal (or equivalent) position is determined by identifying:

- the notional amount;
- the mark to market;
- the conversion of the position of one or more instruments to that of a given benchmark (equivalent position);
- the FX exposure.

When determining the equivalent position, risk is defined as the value of the various assets, converted into an aggregate position that is "equivalent" in terms of sensitivity to the change in the risk factors investigated.
At Intesa Sanpaolo the approach is characterised by extended use of ceilings in terms of MtM, as representative of the value of the assets as recognised.

Stress tests

Definition: stress tests are conducted periodically to identify and monitor potential vulnerabilities in trading books upon the occurrence of extreme, rare events not fully captured by VaR models.

Method: Stress tests for management purposes are applied periodically to market risk exposures, typically adopting:

- sensitivity analysis, which measures the potential impact on the main risk metrics of a change in a single risk factor or simple multi-risk factors;
- scenario analysis, which measures the potential impact on the main risk metrics of a certain scenario that considers multiple risk factors.

The stress exercises conducted on trading books come under the scope of the Group Stress Testing Programme discussed in the Introduction to this Part E.

Stressed VaR

Definition: the stressed VaR metric is based on the same measurement techniques as VaR. In contrast to the latter, it is calculated by applying market stress conditions recorded over an uninterrupted 12-month historical period.

Method: that period was identified considering the following guidelines:

- the period must represent a stress scenario for the portfolio;
- the period must have a significant impact on the main risk factors for the portfolio of Intesa Sanpaolo;
- the period must allow real time series to be used for all portfolio risk factors.

While using the historical simulation approach for VaR calculation, the latter point is a discriminating condition in the selection of the holding period. Actually, in order to ensure that the scenario adopted is effectively consistent and to avoid the use of driver or comparable factors, the historical period must ensure the effective availability of market data.

As at the date of preparation of the 2024 Financial Statements, the period for the measurement of Stressed VaR for Intesa Sanpaolo was from 1 April 2022 to 21 March 2023.

For managerial purposes, the stressed VaR metric is calculated on the entire set of the Group's portfolios measured at fair value (trading and FVOCI in the banking scope) and the stressed period is revised at least annually, together with the annual update to the market risk management framework (Risk Appetite Framework).

Incremental Risk Charge (IRC)

Definition: The Incremental Risk Charge (IRC) is the maximum potential loss in the credit trading book resulting from an upgrade/downgrade or bankruptcy of the issuers, over a 1-year period, with a 99.9% confidence level. This measure, which is additional to the VaR, is applied to the entire trading book of Intesa Sanpaolo (just as for the other regulatory metrics, it is not applied to the sub-portfolios).

The IRC enables the correct representation of the specific risk on debt securities and credit derivatives because, in addition to idiosyncratic risk, it also captures event and default risk.

This measure applies to all financial products that are sensitive to credit spreads included in the trading book except for the securitisations.

Method: The simulation is based on a Modified Merton Model. The probabilities of transition and default are those observed through the historical matrices of the main rating agencies, applying a default probability minimum value greater than or equal to 0.01%. The asset correlation is inferred from the equity correlation of the issuers. The model is based on the assumption of a constant position with a holding period of one year.

A regular stress program is applied to the model's main parameters (correlation, and transition, default and credit spread matrices).

Quantitative information

Daily managerial VaR evolution

Below is a summary of the daily managerial VaR for the trading book only, which also shows the overall exposure of the main risk-taking centres.

Daily managerial VaR of the trading book

(millions of euro)

	average 4th quarter	minimum 4th quarter	maximum 4th quarter	average 3rd quarter	average 2nd quarter	average 1st quarter
Total Group Trading Book [(a)]	27.8	20.0	41.2	24.0	30.9	31.9
of which: Group Treasury & Capital Management	*14.4*	*12.3*	*16.2*	*12.1*	*13.1*	*6.2*
of which: IMI C&IB Division	*15.3*	*11.2*	*24.2*	*14.7*	*20.3*	*23.3*

The table shows the historical variability of the daily managerial VaR calculated on the quarterly time series of Intesa Sanpaolo Group (including the subsidiaries in the perimeter), Group Treasury & Capital Management and IMI C&IB Division respectively. The values calculated on the Group perimeter (average, minimum and maximum) do not correspond to the sum of the values of the individual columns, because they are recalculated on the aggregate time series which also includes the subsidiaries in the perimeter.

(a) The Group Trading Book figure includes the managerial VaR of Group Treasury & Capital Management, IMI C&IB Division (Trading Book perimeter) and the subsidiaries in the perimeter.

In the fourth quarter of 2024, as shown in the table above, compared to the average of the third quarter of 2024, there was an increase in the trading managerial risks (24 million euro in the third quarter of 2024 and 27.8 million euro in the fourth quarter of 2024) mainly attributable to the introduction of a new scenario in the distribution, primarily characterised by significant increases in the European interest rate curve affecting the interest rate exposure.

With regard to the overall performance in 2024, compared to 2023, there was a marginal reduction in the average trading managerial VaR mainly attributable to operations in credit indices and lower volatility on credit spreads during 2024.

Daily managerial VaR of the trading book - Comparison 2024 – 2023

(millions of euro)

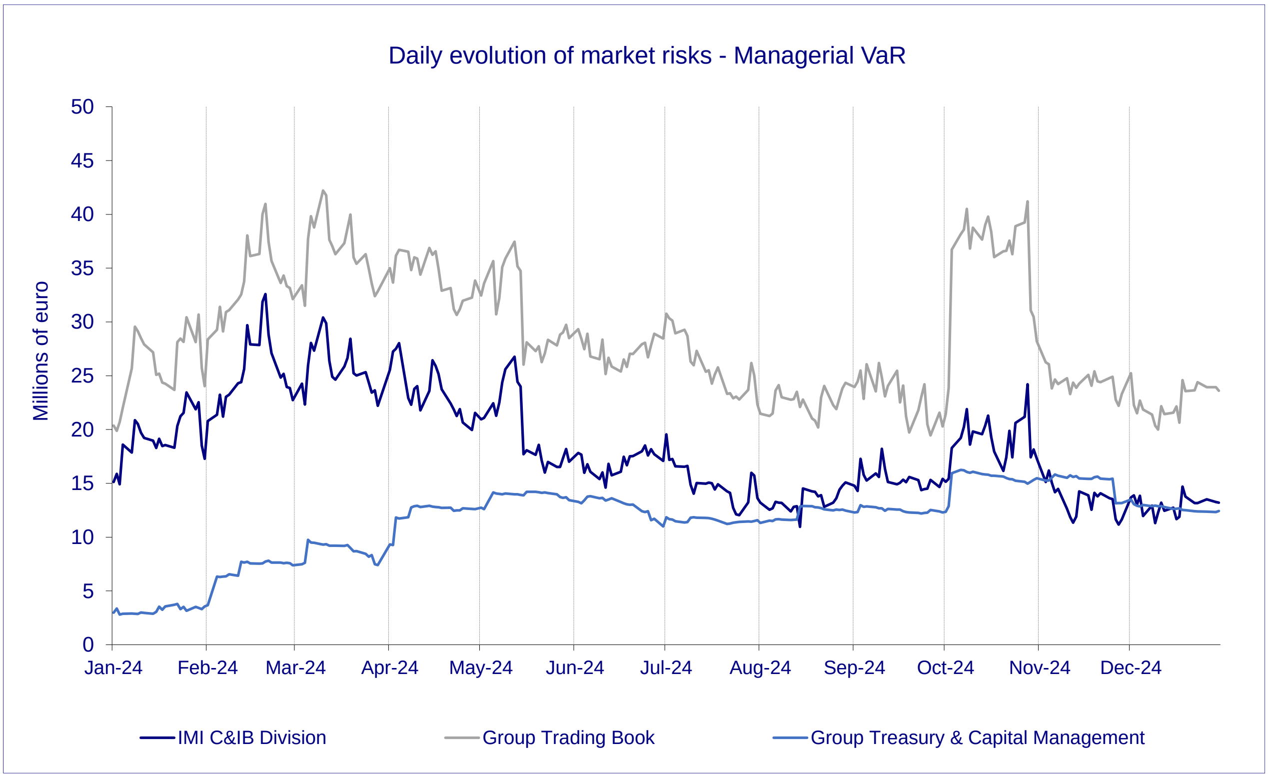
	2024				2023		
	average	minimum	maximum	last day	average	minimum	maximum
Total Group Trading Book [(a)]	28.6	19.4	42.2	23.6	30.8	16.3	45.9
of which: Group Treasury & Capital Management	*11.4*	*2.8*	*16.2*	*12.4*	*4.2*	*3.1*	*6.3*
of which: IMI C&IB Division	*18.3*	*11.0*	*32.6*	*13.2*	*28.3*	*14.3*	*43.7*

The table shows the historical variability of the daily managerial VaR calculated on the annual time series of Intesa Sanpaolo Group (including the subsidiaries in the perimeter), Group Treasury & Capital Management and IMI C&IB Division respectively. The values calculated on the Group perimeter (average, minimum and maximum) do not correspond to the sum of the values of the individual columns, because they are recalculated on the aggregate time series which also includes the subsidiaries in the perimeter.

(a) The Group Trading Book figure includes the managerial VaR of Group Treasury & Capital Management, IMI C&IB Division (Trading Book perimeter) and the subsidiaries in the perimeter.

The trading VaR during the fourth quarter of 2024 showed a rising trend, mainly attributable to the introduction of a scenario at the beginning of October characterised by significant increases in the European interest rate curve affecting the interest rate exposure. On the other hand, a scenario "rolling effect" can be seen at the end of October.

The movements are shown in the chart below:



The breakdown of the Group's risk profile in the trading book in the fourth quarter of 2024 shows a prevalence of interest rate risk and credit spread risk, accounting for 52% and 25% respectively, of the Group's total managerial VaR. The individual risk-taking centres, on the other hand, show a prevalence of interest rate risk and exchange rate risk for the Group Treasury & Capital Management (83% and 13%, respectively) and of credit spread and interest rate risk for the IMI C&IB Division (39% and 34%, respectively).

Contribution of risk factors to total managerial VaR

4th quarter 2024	Shares	Interest rates	Credit spreads	Foreign exchange rates	Other parameters	Commodities
Group Treasury & Capital Management	3%	83%	1%	13%	0%	0%
IMI C&IB Division	14%	34%	39%	4%	5%	4%
Group Total	**9%**	**52%**	**25%**	**9%**	**3%**	**2%**

The table sets out the contribution of risk factors considering 100% the overall capital at risk, calculated as the average of daily estimates in the fourth quarter of 2024, broken down between Group Treasury & Capital Management and IMI C&IB Division, in addition to the distribution of the Group's overall capital at risk (including the subsidiaries in the perimeter).

Risk control with regard to the activity of the Intesa Sanpaolo Group also uses scenario analyses and stress tests. The impact of selected scenarios relating to the evolution of stock prices, interest rates, credit spreads, foreign exchange rates, commodity prices and inflation at the end of December is summarised in the following table:

(millions of euro)

	EQUITY		INTEREST RATES		CREDIT SPREADS		FOREIGN EXCHANGE RATES		COMMODITIES		INFLATION	
	Crash	Bullish	+40bps	lower rate	-25bps	+25bps	-5%	+5%	Crash	Bullish	Up	Down
Total Trading Book	-3	28	-17	18	-33	34	22	-5	-7	7	1	2

In particular:
- for stock market positions, there would be potential losses of -3 million euro in the event of a sharp decrease in stock prices;
- for positions in interest rates, there would be potential losses of -17 million euro in the event of a 40 basis point rise in interest rates;
- for positions in credit spreads, a tightening of credit spreads of 25 basis points would result in an overall loss of -33 million euro;
- for positions in exchange rates, there would be potential losses of -5 million euro in the event of a 5% appreciation of the Euro against the other currencies;
- for positions in commodities, there would be a loss of -7 million euro in the event of a fall in prices of commodities other than precious metals;
- lastly, for positions linked to inflation, there would be no potential losses, either in the event of a decrease or an increase in inflation.

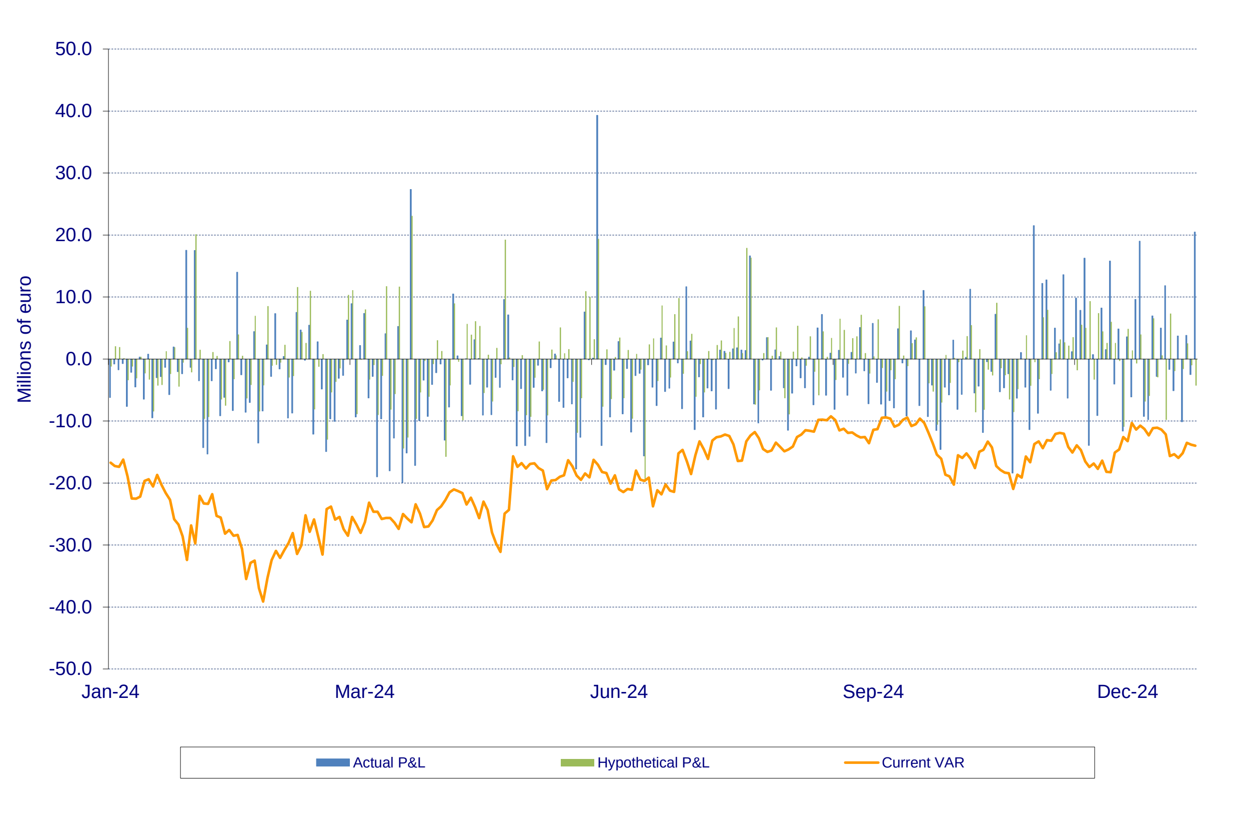
With regard to the use of the overall limit relating to trading and the Hold to Collect and Sell (HTCS) business model, there was an increase in market managerial VaR in the fourth quarter of 2024 from 137 million euro (average managerial VaR third quarter 2024) to 155 million euro (average managerial VaR fourth quarter 2024).

Backtesting

The soundness of the VaR calculation methods must be monitored daily via backtesting which, for the regulatory backtesting, compares:
- the daily estimates of value at risk;
- the daily profits/losses based on backtesting which are determined using actual daily profits and losses achieved by individual desks, net of components which are not considered in backtesting: these include, for example, fees and financial costs of managing the positions that are regularly reported within the managerial area.

Backtesting allows verification of the model's capability of correctly seizing, from a statistical viewpoint, the variability in the daily valuation of trading positions, covering an observation period of one year (approximately 250 estimates). Any critical situations relative to the adequacy of the internal model are represented by situations in which daily profits/losses based on backtesting highlight more than four occasions, in the year of observation, in which the daily loss is higher than the value at risk estimate. Current regulations require that backtesting is performed by taking into consideration both the actual and hypothetical P&L series.

During the last twelve months there were no backtesting exceptions[184] for the regulatory VaR measure of Intesa Sanpaolo.



[184] In the last 250 observations, the Bank has not recorded any Actual P&L exceptions and/or Hypothetical P&L exceptions. For the total calculation, in accordance with the applicable regulations, the maximum between Actual P&L and Hypothetical P&L exceptions is counted.

Issuer risk

Issuer risk in the trading portfolio is analysed through level measures, i.e. in terms of mark to market, with exposures aggregated by rating class and sector, and is monitored through a system of operating limits based on both sector/rating classes and concentration indexes.

Breakdown of exposures by type of issuer

	Total	Of which					
		Corporate	Financial	Emerging	Covered	Government	Securities.
Group Treasury & Capital Management	0%	0%	0%	0%	0%	0%	0%
IMI C&IB Division	100%	25%	3%	9%	6%	20%	37%
Total	**100%**	**25%**	**3%**	**9%**	**6%**	**20%**	**37%**

The table sets out in the Total column the contribution of the Group Treasury & Capital Management and the IMI C&IB Division to overall issuer risk exposures, breaking down the exposure by type of issuer. The scope corresponds to the trading portfolio with an issuer ceiling (excluding Italian Government bonds, AAA and own bonds) and including CDS.

The breakdown of the portfolio subject to issuer risk shows an exposure attributable solely to the IMI C&IB Division and mainly in the financial and securitisation, corporate and government segments.

BANKING BOOK

1.2.2 INTEREST RATE RISK AND PRICE RISK

Qualitative information

General aspects, interest rate risk and price risk management processes and measurement methods

The "banking book" is defined as the commercial portfolio consisting of all the on-balance sheet and off-balance sheet items that are part of the Intesa Sanpaolo Group's lending and deposit collecting activities. Therefore, the interest rate risk of the banking book (hereinafter "interest rate risk" or IRRBB) refers to the current and prospective risk of changes in the economic value and the net interest income of the Group's banking book due to adverse changes in interest rates, which reflect on both the economic value and the net interest income.
The banking book also includes the equity investments in listed companies not fully consolidated, mainly held by the Parent Company.
The internal system for measuring interest rate risk assesses and describes the effect of changes in interest rates on the economic value and the net interest income and identifies all significant sources of risk that affect the banking book:

- repricing risk, i.e. the risk associated with lags in maturity dates (for fixed-rate positions) or in the interest rate revision date (for floating-rate positions) of the assets, liabilities and off-balance sheet items;
- yield curve risk, i.e. the risk associated with changes in the inclination and shape of the yield curve;
- basis risk, i.e. the risk arising from imperfect correlation in the adjustment of lending and deposit rates on different instruments, but with otherwise similar repricing characteristics. As interest rates change, these differences can lead to unexpected changes in cash flows and yield spreads between assets, liabilities and off-balance sheet positions having similar maturities or rate revision frequencies;
- optionality risk, i.e. the risk associated with the presence of automatic or behavioural options in the Group's assets, liabilities and off-balance sheet instruments.

Intesa Sanpaolo's current measurement system also allows the risk profile to be examined on the basis of two distinct but complementary perspectives:

- **economic value perspective** (EVE – Economic Value of Equity), which considers the impact of interest rate fluctuations and the associated volatility on the present value of all future cash flows;
- **net interest income perspective** (NII - Net Interest Income), which aims to analyse the impact of interest rate fluctuations and their associated volatility on net interest income.

The economic value perspective assesses the medium-to-long term impacts of interest rate fluctuations, while the net interest income perspective provides a short-term assessment.
Interest rate risk is managed by setting limits to both perspectives. Said limits comprise:

- consolidated limits, which are defined in the RAF and approved by the Board of Directors, both in terms of change in EVE (sensitivity of the economic value or ΔEVE) and net interest income sensitivity (ΔNII). The consolidated ΔEVE limits reflect, consistent with the context and regulatory instructions, the average expected exposure of the Group's EVE. The expected average level is quantified within the RAF and defined as the average exposure that the Group expects to take during the year. The Group's consolidated sensitivity limits EVE and NII are accompanied by two risk indicators, which constitute an early warning threshold approved within the Risk Appetite Framework (RAF), which make it possible to control exposure to the risk of yield curve twists;
- individual shift sensitivity and net interest income sensitivity limits, which are part of the "cascading" process of the Group's RAF limit, and are proposed, after being shared with the operating structures, by Market & Financial Risk Management and approved by the Group Financial Risk Committee (GFRC).

These limits take account of the characteristics of the banks'/divisions' portfolios, with particular reference to intermediated volumes, average durations, the type of instruments traded and the Company's strategic mission within the Group.

Market & Financial Risk Management performs monthly checks that the limits and early warning level approved in the Risk Appetite Framework (RAF) are observed at the consolidated and individual level. In addition, the Group has adopted a specific internal policy document regarding interest rate risk (the IRRBB Guidelines) subject to approval by the Board of Directors, which governs the Group's entire interest rate risk management framework and in particular the aspects of governance, methods of use and formulation of scenarios.
The IRRBB Guidelines define the methods for measuring the financial risks generated by the Group's banking book:
- Sensitivity of economic value (ΔEVE);
- Net interest income sensitivity (ΔNII);
- Credit Spread Risk of the Banking Book (CSRBB);
- Value at Risk (VaR).

These measures are available for each relevant currency in the banking book.

The **sensitivity of the economic value** (or sensitivity of the fair value) measures the change in the economic value of the banking book and is calculated at individual cash flow level for each financial instrument, based on different instantaneous rate shocks and based on historical stress simulations aimed at identifying the worst and best cases. It reflects the changes in the present value of the cash flows of the positions already in the balance sheet for the entire remaining duration until maturity (run-off balance sheet). The cash flows used to determine the present value are developed at the risk-free rate (Euribor/Libor) and discounted according to risk-free discount curves.
To control the exposure and monitor the limits, the calculation involves determining the algebraic sum of the equivalent in euro of the sensitivities of the positions in the various currencies by applying a parallel shock of +100 basis points to the interest rate curves in the various currencies. The calculation for non-parallel shocks for the purposes of controlling the exposure and monitoring the early warning level is performed similarly. The sensitivity of the relevant currencies is then corrected, according to a "currency aggregation" management technique, to take account of the imperfect correlation with the rates of the main currency (the euro).

The **sensitivity of net interest income** focuses the analysis on the impact that changes in interest rates can have on the Group's ability to generate stable profit levels. The component of profits measured is represented by the difference between the net interest income generated by interest-bearing assets and liabilities, including the results of hedging activities through the use of derivatives. The time horizon of reference is commonly limited to the short and medium term (from one to three years) and the impact is assessed on a going concern basis. The change in net interest income is estimated under expected scenarios as well as under potential interest rate shocks and stress scenarios. Further assumptions are made regarding customer behaviour (differentiated according to interest rate scenarios) and market behaviour and the response of Group/Bank management to changes in the economy. Thus, the projection of the net interest income and its sensitivity to changes in market factors require a series of modelling assumptions for the development of volumes and rates (fixed/floating), the reference time horizon, the relevant currencies, as well as the behavioural models introduced (prepayment, core deposits, etc.) and the assumptions regarding the evolution of the portfolio (run-off, constant or dynamic balance sheet).
The net interest income sensitivity limits are set on the basis of an instantaneous and parallel interest rate shock of +/-50 basis points, with a reference time horizon of 1 year and assuming a constant balance sheet. The net interest income sensitivity limit is defined as the limit on the loss in the income statement and, therefore, is exclusively negative (limit on the potential reduction in the net interest income): the use of the limit is represented by the sensitivity that generates a greater reduction in net interest income in the two scenarios of a parallel rise and fall in interest rates. The total sensitivity exposure of net interest income is given by the algebraic sum of the exposure of individual currencies.
The limit assigned to each Company is defined consistently with the strategies and limits defined for the sensitivity of economic value.

Based on the definition by the EBA, **CSRBB** – **Credit Spread Risk of the Banking Book** is the risk driven by changes of the market credit spread and market liquidity spread, which respectively represent the credit risk premium required by market operators for a specific credit quality and liquidity premium, which stimulates the market appetite of investors, and by other potential characteristics of credit risk instruments which are not detected by other existing prudential frameworks. The CSRBB framework was introduced as a criterion to assess and monitor the risk deriving from market credit spreads and market liquidity spreads, which impact the EVE and the NII of the bank's non-trading assets.
The Group is committed to ensuring an appropriate governance process for CSRBB risk aimed at preserving the corporate economic capital and maximising shareholder value from fluctuations in market credit spreads.
The Group also pays particular attention to CSRBB risk positions arising from tradable assets and liabilities, focusing particularly on the bond portfolio of the banking book, as it is the risk area with the most severe potential impact under a market credit spreads stress scenario.

Value at Risk (VaR) is a probability-based metric that expresses the maximum potential loss of portfolio value that could be incurred within a specific time horizon, at a pre-defined confidence level. VaR is also used to consolidate exposure to financial risks of the various Group companies which perform banking book activities, also taking into account the benefits of diversification and the correlation between various risk factors and different currencies. This measure is calculated and monitored, for the entire scope, by Market & Financial Risk Management.

In calculating the above risk measures, Intesa Sanpaolo adopts behavioural models for representing capital items.

For mortgages, statistical techniques are used to determine the probability of prepayment, in order to reduce the risk of excess hedging in relation to real exposure to interest rate risk (overhedging) and liquidity risk (overfunding). The prepayment ratios for Retail mortgages and consumer loans are estimated through a Survival Analysis that expresses the repricing portfolio of each single mortgage, based on macroeconomic variables, personal details of the counterparty and financial variables.

For core deposits (customer current accounts), a financial representation model is adopted aimed at reflecting the behavioural features of stability of deposits and partial and delayed reaction to market interest rate fluctuations.

Both models are continuously monitored and periodically revised to promptly reflect changes in customer behaviour and characteristics over time, as well as in the relevant regulatory framework.

In order to measure the Group's vulnerability to market turbulence, the interest rate risk measurement system measures the impacts on the economic value and net interest income produced by strains on the market (“scenario analysis”), i.e. sudden changes in the general level of interest rates, changes in the relationships between fundamental market rates (basis risk), in the slope and shape of the yield curve (yield curve risk), in the liquidity of the main financial markets or in the volatility of market rates.
These analyses are conducted by subjecting the portfolio to various interest rate change scenarios:
- regulatory scenarios produced by the Supervisory Outlier Test (SOT), which introduces an early warning referring to changes in economic value of 15% of Tier 1, calculated with reference to the BCBS scenarios (Parallel shock up, Parallel shock down, Steepener shock, Flattener shock, Short rates shock up and Short rates shock down) and changes in net interest income equal to 5% of Tier 1, calculated solely with reference to the parallel scenarios (parallel shock up and parallel shock down);
- shocks diversified by reference curve of the main risk factors and calculated as the difference between the yields of the curves of the individual factors and those of a curve relating to the selected pivot parameter (basis risk);
- stress scenarios in historical simulation.

Stress tests on behavioural models are also carried out to verify the financial impact of alternative assumptions underlying the behavioural parameters estimated in the models. The methodological assumptions underlying the assumptions contained in the stress scenarios are duly described in the detailed methodologies. In addition, within the framework of the dynamic simulation of net interest income, an additional behavioural model is adopted to simulate the effects of potential renegotiations of the contractual conditions of medium/long-term assets. In terms of risks, renegotiations modify the duration of the portfolio of medium/long-term loans and entail a decline in net interest income due to the revision of the contractual rates/spreads to include conditions more advantageous to customers. Specific models have been estimated to ensure a proper representation of the renegotiations phenomenon in terms of the percentages of mortgage loans renegotiated and their financial characteristics.

Quantitative information

Banking book: internal models and other sensitivity analysis methodologies

In 2024, the interest rate risk generated by the Intesa Sanpaolo Group's banking book, measured through shift sensitivity of economic value (or fair value sensitivity), averaged -2,157 million euro, with a maximum value of -2,565 million euro reached at the end of December 2024, and a minimum value of -1,074 million euro, with the latter coinciding with the value at the end of January 2024. The amount at the end of December was up on the figure at the end of December 2023 which amounted -1,001 million euro (-1,564 million euro). The increase in sensitivity recorded in December 2024 compared to December 2023 reflected the implementation of a strategy to protect the net interest income from expected interest rate declines in the coming years. The increase was also driven by the rise in the exposure of the HTCS portfolio, mainly in the first half of 2024, along with the exposure of the Ordinary Management portfolio, which increased due to the repricing of floating-rate assets, more pronounced at the end of the year.

The sensitivity of net interest income – assuming a +50, -50 and +100 basis point change in interest rates – amounted to 13 million euro, -69 million euro and -24 million euro, respectively, at the end of December 2024. The latter figure was down (-639 million euro) on the amount at the end of 2023, reflecting the implementation of the strategy to protect the net interest income against falling interest rates, mainly achieved through hedging derivatives on demand deposits. The repricing of floating rate assets also contributed to the change in the measure. In all the scenarios reported, the changes in net interest income are very small, thanks to the already mentioned net interest income stabilisation strategies implemented by the Parent Company and the Group's banks. The lack of symmetry between the upward and downward rate shocks is due to the presence of contractual floors on demand deposits, reflected in the use of estimation parameters (betas) that predict an increase in reactivity as rates rise, and consequently in the cost of funding.

The table and charts below provide a representation of the performance of the sensitivity of economic value (or the sensitivity of fair value) and the sensitivity of net interest income.

(millions of euro)

Risk Measures	2024			31.12.2024	31.12.2023
	average	minimum	maximum		
Sensitivity of the Economic Value +100 bp	-2,157	-1,074	-2,565	-2,565	-1,001
Sensitivity of Net Interest Income -50 bp	-127	-52	-323	-69	-332
Sensitivity of Net Interest Income +50 bp	138	13	320	13	350
Sensitivity of Net Interest Income +100 bp	220	-24	564	-24	614

Interest rate risk, measured in terms of VaR, averaged 584 million euro in 2024, with a maximum value of 717 million euro, reached at the end of April, and a minimum value of 326 million euro, recorded at the end of January 2024, settling at 600 million euro at the end of December 2024. The latter figure increased by 327 million euro compared to a value of 273 million euro at the end of 2023. This change was substantially due to the increase in the banking book's exposure to upward scenarios in the medium to long-term segment, recorded in the first half of 2024.

Foreign exchange risk expressed by equity investments in foreign currency (banking book) and measured in terms of VaR averaged 84 million euro in 2024, with a minimum value of 75 million euro and a maximum value of 107 million euro, standing at 84 million euro at the end of December 2024, down by 34 million euro on the value of 118 million euro at the end of December 2023.

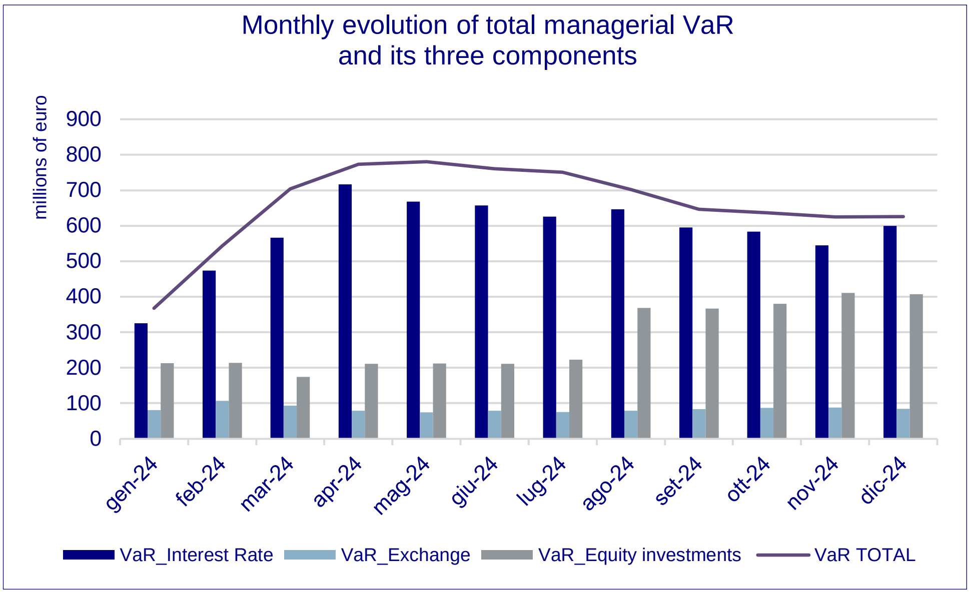
Price risk generated by the equity portfolio, measured in terms of VaR, recorded an average level during 2024 of 282 million euro, with maximum and minimum values of 411 million euro and 174 million euro, respectively, and came to 407 million euro at the end of December 2024, up by 160 million euro on 247 million euro at the end of December 2023. This change was mainly due to the increase in the price volatility of the equity portfolio in the third quarter of 2024.

Total VaR, consisting of the three components described above (Interest Rate VaR, Exchange VaR and Equity VaR) averaged 660 million euro in 2024, with a maximum value of 781 million euro and a minimum value of 367 million euro, reaching a figure of 626 million euro at the end of December 2024, up by 315 million euro on the value at the end of December 2023 of 311 million euro. This change was related to a lower diversification effect of the overall portfolio (Interest Rate, Exchange Rate, and Equity Investments).

The table and chart below provide a representation of the performance of total VaR and its three components (Interest Rate VaR, Exchange VaR and Equity Investments VaR).

(millions of euro)

	2024			31.12.2024	31.12.2023
	average	minimum	maximum		
Value at Risk - Interest Rate	584	326	717	600	273
Value at Risk - Exchange	84	75	107	84	118
Value at Risk - Equity investments	282	174	411	407	247
Total Value at Risk	**660**	**367**	**781**	**626**	**311**



Lastly, the table below shows a sensitivity analysis of the banking book to price risk, measuring the impact on Shareholders' Equity of a price shock of ±10% for the portfolio of quoted minority stakes, largely classified to the HTCS category.

Price risk: impact on Shareholders' Equity

		Impact on shareholders' equity at 31.12.2024	Impact on shareholders' equity at 30.09.2024	Impact on shareholders' equity at 30.06.2024	Impact on shareholders' equity at 31.03.2024	Impact on shareholders' equity at 31.12.2023
Price shock	10%	74	75	70	57	52
Price shock	-10%	-74	-75	-70	-57	-52

1.2.3. FOREIGN EXCHANGE RISK

Qualitative information

A. General aspects, foreign exchange risk management processes and measurement methods

With regard to the positions denominated in currencies other than the domestic currency in which the financial statements are prepared, "Foreign Exchange Risk" is defined as the potential adverse effect resulting from changes in the exchange rate between currencies that could have a negative impact on the valuation of the assets and liabilities in the financial statements and on the earnings and capital ratios. The appreciation or depreciation of a currency affects the capital ratio both through changes in capital (numerator of the ratio) and through changes in the risk weighted assets in foreign currency (denominator of the ratio).

Foreign exchange risks are traditionally divided into:

- *Structural Foreign Exchange Risk*: defined as the potential adverse effect of changes in the exchange rate between currencies that could have a negative impact on the Foreign Exchange Reserves that are part of the consolidated shareholders' equity, for Equity investments measured at cost (in the individual financial statements), or on the other comprehensive income (OCI) reserve for equity instruments measured at fair value through other comprehensive income (FVTOCI);
- *Transaction Foreign Exchange Risk*: the potential loss resulting from changes in the currencies exchange rate that may have negative impacts both on the valuation of the assets and liabilities in the financial statements when converted into the reporting currency and on the earnings from funding, lending and investment/disinvestment transactions in currencies other than the euro;
- *Transaction Foreign Exchange Risk associated with Structural Foreign Exchange Risk:* the Foreign Exchange Risk related to the approved Dividends of the Investments in associates and companies subject to joint control and the risk related to the management of Foreign Exchange Risk arising from Extraordinary Transactions related to the management of the Investments in associates and companies subject to joint control. It also includes the profits/losses of the international branches;
- *Translation Foreign Exchange Risk:* the foreign exchange risk arising from the translation into Euro (the Group's reporting currency) of assets and liabilities in foreign currency arising from the consolidation of investments in companies within the Group's scope of consolidation.

The Market & Financial Risk Management structure measures and controls the Parent Company and Group's exposure to Structural Foreign Exchange Risk and performs the management calculation of the optimal position, which represents the open position in foreign currency designed to neutralise the sensitivity of the capital ratio to foreign exchange movements. It also produces sensitivity analyses of the capital ratios for the control and monitoring of the Structural Foreign Exchange Risk, in addition to setting the proposed Transaction Foreign Exchange Risk within the VaR limits for market risks and the RAF limits for Structural Foreign Exchange Risk.

B. Foreign exchange risk hedging activities

The Intesa Sanpaolo Group's management of the Structural Foreign Exchange Risk assigns the Parent Company the related management and coordination powers in order to achieve a consistent Group strategy.
This choice, which is consistent with the Parent Company's role as the liaison with the Supervisory Authority, allows the activities to be performed based on the specific responsibilities set out in the prudential supervision regulations, in addition to suitably mitigating and/or managing this type of risk.
The monitoring and management of the Structural Foreign Exchange Risk are carried out at central level by the Parent Company Treasury Function, which manages it with a view to risk/return and to optimising capital requirements.

The monitoring and hedging of the Transaction Foreign Exchange Risk are carried out, at central level, by the Parent Company Treasury Function and the IMI Corporate & Investment Banking Division for the area of competence, and at local level by the individual treasury functions of the Group companies and banks.

As at the date of preparation of the financial statements, there were transactions hedging the Group shareholders' equity and operational hedges of the foreign exchange risk of the assets and liabilities in the financial statements.

As of 31 December 2022, the presentation of the “Breakdown by currency of assets and liabilities and of derivatives” has been aligned with the prudential approach in compliance with the new methodological framework introduced by the EBA Guidelines on the treatment of structural FX under Article 352(2) of Regulation (EU) No 575/2013 (CRR).

2. Internal models and other sensitivity analysis methodologies

As already noted, the management of Transaction Foreign Exchange Risk relating to trading activities is included in the operating procedures and in the estimation methodologies of the managerial VaR.
Foreign exchange risk expressed by equity investments in foreign currency (banking book) originated a VaR (99% confidence level, 10-day holding period) amounting to 84 million euro as at 31 December 2024. This potential impact would only be reflected in the Shareholders’ Equity.

1.3. DERIVATIVES AND HEDGING POLICIES

Starting from 2014, the Parent Company has been authorised to use EPE (Expected Positive Exposure) internal models to determine the capital requirement for counterparty risk. This approach is applicable to almost the entire derivatives portfolio (as shown in the table below, as at 31 December 2024 approximately 94% of the total EAD of financial and credit derivatives is measured using EPE models). Derivatives whose counterparty risk is measured using approaches other than internal models represent a residual portion of the portfolio (as at 31 December 2024 accounting for approximately 6% of overall EAD) and refer to:

– residual contracts of Intesa Sanpaolo to which EPE is not applied (in compliance with the immateriality thresholds set by the EBA);
– EAD generated by all other banks and companies in the Group which do not report using an internal model.

The table below shows the overall EAD of exposures in financial and credit derivatives, broken down by measurement approach.

(millions of euro)

Transaction categories	Exposure at default (EAD)			
	31.12.2024		31.12.2023	
	Standardised models	Internal Method (EPE)	Standardised models	Internal Method (EPE)
Derivative contracts	730	10,806	527	10,251

The EPE internal model considers the collateral collected to mitigate credit exposure and any excess collateral paid. The value of the guarantees received and included in the calculation of the EAD amounts to approximately 15.6 billion euro for the Parent Company, while the collateral provided to counterparties amounts to 15.9 billion euro (these amounts include the initial margins posted in connection with transactions with central counterparties and those received from bilateral counterparties and clearing service customers).

B.5. Credit derivatives associated with the fair value option: annual changes

The Intesa Sanpaolo Group does not hold credit derivatives associated with the fair value option.

1.3.2. Accounting hedges

Qualitative information

On first-time adoption of IFRS 9, the Intesa Sanpaolo Group exercised its option under the standard to continue to fully apply the rules of IAS 39 for all types of hedges (micro and macro hedges). As a result, the provisions of IFRS 9 on hedging do not apply.

A. Fair value hedging

The hedging carried out by the Intesa Sanpaolo Group is aimed at protecting the banking book from variations in the fair value of loans and deposits due to movements in the interest rate curve (interest rate risk).

The Group uses both micro fair value hedges and macro fair value hedges.
The micro fair value hedges mainly hedge bonds issued, debt securities under assets and loans to customers.
The macro fair value hedges are used for:

- core deposits, based on the applicable standards in the carved-out version of IAS 39 in accordance with the option provided by IFRS 9 to make use of the possibility of fully applying the provisions of IAS 39 on hedges;
- the already fixed portion of floating-rate loans, in which the macro fair value hedge is used to hedge the interest rate risk inherent in the floating-rate coupons of the loans granted, when the coupon rate is set;
- a portion of fixed-rate loans; for this type, in line with the carved-out version of IAS 39, an open-portfolio macrohedging model has been adopted according to a bottom-layer approach that, in accordance with the interest rate risk measurement method involving modelling of the prepayment phenomenon, is more closely correlated with risk management activity and asset dynamics.

The main types of derivative contracts used are plain and structured interest rate swaps (IRS), overnight index swaps (OIS), cross-currency swaps (CCS), forward sales and options on interest rates stipulated with third parties.
The derivatives are not listed on regulated markets but are traded in OTC (over the counter) circuits. The OTC contracts also include contracts entered into through clearing houses, which account for the majority of derivatives.

B. Cash flow hedging

The hedging carried out by the Intesa Sanpaolo Group is aimed at protecting the Group from the exposure to changes in future cash flows attributable to movements in the interest rate curve, associated with a particular asset/liability, such as variable future interest payments on a debt/loan or a highly probable expected future transaction.

The Group uses both micro cash flow hedges and macro cash flow hedges. The micro cash flow hedges mainly hedge bonds issued.
The macro cash flow hedges are used for:

- floating-rate funding;
- floating-rate loans.

The derivatives used are interest rate swaps (IRS) with third parties.
The derivatives are not listed on regulated markets but are traded in OTC (over the counter) circuits. The OTC contracts also include contracts entered into through clearing houses, which account for the majority of derivatives.

C. Hedging of foreign investments

The Group uses hedges, subject to hedge accounting, to neutralise the effects of structural foreign exchange rate fluctuations on positions not exempt for the purposes of calculating capital requirements for foreign exchange risk. These hedging relationships were entered into in respect of structural foreign exchange risk positions capable of generating an impact on the foreign exchange reserves that form part of the Group's consolidated shareholders' equity. In the Parent Company's financial statements these hedging relationships are accounted for as micro fair value hedges, whereas in the consolidated financial statements they are treated as hedges of a net investment in a foreign currency.

D. Hedging instruments

The main causes of ineffectiveness of the model adopted by the Group for verifying the effectiveness of the hedges are attributable to the following:

- misalignment between the notional value of the derivative and the hedged underlying recognised at the time of initial designation or generated subsequently, such as in the case of partial repayments of loans or the repurchase of bonds;
- application of different curves on the hedging derivative and hedged item for the purpose of carrying out the effectiveness test on fair value hedges. The derivatives, normally collateralised or entered into through clearing houses, are discounted on the overnight curves, while the hedged items are discounted on the indexing curve of the hedging instrument;
- inclusion in the effectiveness test of the value of the floating-rate cash flows of the hedging derivative, in the case of fair value hedges.

The ineffectiveness of the hedge is promptly recognised for the purposes of:

- the determination of the effect on the income statement;
- the assessment of the possibility of continuing to apply the hedge accounting rules.

The Group does not use dynamic hedges, as defined in IFRS 7, paragraph 23C.

E. Hedged items

The main types of hedged items are:

- debt securities under assets;
- debt securities issued and non-securities funding;
- fixed-rate loans;
- floating-rate loans;
- optional embedded component of floating-rate mortgages;
- already set coupon of floating-rate loans;
- modelled on demand deposits.
- net investments in foreign currency.

E.1 Debt securities under assets

The debt securities under assets are hedged by micro fair value hedges, involving the use of IRS (interest rate swaps), OIS (overnight index swaps) and CCS (cross-currency swaps) as hedging instruments.
The interest rate risk is usually hedged for the entire portfolio holding period of the debt instrument.
The Dollar Offset Method is used to verify the hedge effectiveness. This method is based on the ratio between the cumulative changes (from the inception of the hedge) in the fair value of the hedging instrument, attributable to the hedged risk, and cumulative changes in the fair value of the hedged item (fair value change), net of the accrual component of the earned interest.
Micro fair value hedges also include forward sales on debt securities in the Financial assets at fair value through other comprehensive income (HTCS) portfolio, carried out to hedge fair value risks from movements in credit spreads and interest rate curves. With regard to the forward sale contract, which is a derivative because it is a non-regular way transaction, the spot component is separated from the interest component by designating only the spot component as the hedging instrument in a fair value hedging relationship.

E.2 Debt securities issued and non-securities funding

The Group establishes micro fair value hedges in place on fixed- or structured-rate funding and micro cash flow hedges or macro cash flow hedges on floating-rate funding, using IRS (interest rate swaps), OIS (overnight index swaps) and CCS (cross-currency swaps) as hedging instruments.
The interest rate risk is usually hedged throughout the life of the bond.
For the micro hedges, the hedge effectiveness is verified using the Dollar Offset Method. This method is based on the ratio between the cumulative changes (from the inception of the hedge) in the fair value or the cash flows of the hedging instrument, attributable to the hedged risk, and cumulative changes in the fair value or the cash flows of the hedged item (fair value change), net of the accrual component of the earned interest.
For the macro hedges, the hedge effectiveness is verified by means of a capacity test. This test involves a comparison of the consistency between the hedged items, referring to existing and expected floating-rate funding (so-called highly probable future transactions), and the hedging instruments, which must always be confirmed throughout the life of the hedging relationship and for each time band. In this case, the hedged item is represented by the expected cash flows from funding that will arise over the life of the issues. The estimate of the expected upcoming and highly probable funding is subject to annual approval by the Group Financial Risks Committee.

E.3 Fixed-interest loans

The Group establishes micro fair value hedges for fixed-rate loans and macro fair value hedges for mortgage loans disbursed to retail counterparties, mainly using IRS (interest rate swaps) as hedging instruments.
In a micro fair value hedge, the interest rate risk is hedged throughout the life of the underlying.
For the micro hedges, the hedge effectiveness is verified using the Dollar Offset Method.
For the macro hedges, the loan portfolio hedged is open, i.e. it is dynamically composed of fixed-loans hedged, at aggregate level, through hedging derivatives entered into over time.
The effectiveness of the macro hedges on fixed-rate loans is periodically verified through specific prospective and retrospective tests aimed at demonstrating that the hedged portfolio contains an amount of assets whose sensitivity profile and changes in fair value due to interest rate risk reflect those of the derivatives used for the hedge.

E.4 Floating-rate loans

The Group establishes macro cash flow hedges on floating-rate loans, mainly using interest rates swaps (IRSs) as hedging instruments.
The hedge effectiveness is verified by means of a capacity test. This test involves a comparison of the consistency between the hedged items, referring to the floating-rate loans outstanding, and the hedging instruments, which must always be confirmed throughout the life of the hedging relationship and for each time band. In this case, the hedged item is represented by the expected cash flows originating from the loans that will arise over the life of the assets.

E.5 Optional embedded component of floating-rate mortgages

The Group hedges the optional embedded components (interest rate options) of floating-rate mortgages through micro fair value hedges, using options (cap, floor, collar) as hedging instruments.
The underlying assets may be partially or totally hedged, over time and in terms of amount.
The hedge effectiveness is verified using the Dollar Offset Method.

E.6 Already set coupon of floating-rate loans
The Group establishes macro fair value hedges on coupons already set for floating-rate loans using OIS (overnight index swaps) as hedging instruments.
The purpose of this type of hedge is to neutralise the interest rate risk generated by the coupons already set for floating-rate loans.
The Dollar Offset Method is used to verify the hedge effectiveness, while the actual consistency of the hedged items is verified through a capacity test.

E.7 Modelled on demand deposits
Modelled on demand deposits are hedged by macro fair value hedges, as required by the "carve out" of IAS 39, using IRS (interest rate swaps) and OIS (overnight index swaps) as hedging instruments.
The purpose of the hedge is to protect net interest income from possible falls in interest rates that reduce the spread generated by the Group's core deposits.
The model is subject to continuous monitoring and verification by Market and Financial Risk Management, in order to promptly incorporate changes in the main characteristics of the model (volumes, stability, reactivity) and make the necessary adjustments where appropriate.
The hedge effectiveness is verified using the Dollar Offset Method.

E.8 Foreign investments
The Group establishes hedges of net investments in foreign currency that use outright currency forward contracts as the hedging instruments.
The purpose of the hedging is to protect the Group from the effects of changes in the exchange rate that could have impacts on the foreign exchange reserves that are part of the Group's consolidated shareholders' equity.
Of the currency forward derivative contract, only the change relating to the spot exchange rate (spot component) is designated a hedge subject to hedge accounting; this change is separated from the total fair value of the instrument.
In the Parent Company's financial statements, these hedging relationships are accounted for as micro fair value hedges, whereas in the consolidated financial statements they are treated as hedges of a net investment in a foreign currency.
The Dollar Offset Method is used to verify the hedge effectiveness at the Parent Company level, while at the Group level the actual consistency of the hedged items is verified by a capacity test.

Quantitative information

A. Financial hedging derivatives

B. Credit hedging derivatives

B.1 Credit hedging derivatives: period-end notional amounts

B.2 Credit hedging derivatives: gross positive and negative fair value - breakdown by product

B.3 Over the counter credit hedging derivatives: notional amounts, gross positive and negative fair values by counterparty

B.4 Residual maturity of over the counter credit hedging derivatives: notional amounts

The Intesa Sanpaolo Group does not hold credit derivatives classified as hedges in its portfolio.

C. Non-derivative hedging instruments

C.1 Non-derivative hedging instruments: breakdown by accounting portfolio and type of hedge

The Intesa Sanpaolo Group has exercised the option, provided for on the introduction of IFRS 9, of continuing to fully apply the provisions of IAS 39 on hedge accounting (in the carved-out version endorsed by the European Commission) for each type of hedge (both for micro hedges and macro hedges).

For this reason, the Intesa Sanpaolo Group does not hold financial instruments to be shown in table “C.1 Non-derivative hedging instruments: breakdown by accounting portfolio and type of hedge”.

D. Hedged items

The Intesa Sanpaolo Group has exercised the option, provided for on the introduction of IFRS 9, of continuing to fully apply the provisions of IAS 39 on hedge accounting (in the carved-out version endorsed by the European Commission) for each type of hedge (both for micro hedges and macro hedges).

D.1 Fair value hedges

(millions of euro)

	Micro-hedges: book value	Micro-hedges – net positions: book value of assets and liabilities (prior to netting)	Micro-hedges			Macro-hedges: book value
			Cumulative fair value changes (hedged instrument)	Termination of hedging: residual cumulative fair value changes	Changes in value used to assess hedge ineffectiveness	
A. Assets						
1. Financial assets designated at fair value through other comprehensive income – hedging of:	**55,587**	**-**	**-323**	**-321**	**-285**	**-**

- positive net fair value	-	-	-	-
- negative net fair value	-	-	-	-
5) Other				
- notional amount	-	-	-	-
- positive net fair value	-	-	-	-
- negative net fair value	-	-	-	-
B. Credit derivatives				
1) Protection purchases				
- notional amount	-	-	-	-
- positive net fair value	-	-	-	-
- negative net fair value	-	-	-	-
2) Protection sales				
- notional amount	-	-	-	-
- positive net fair value	-	-	-	-
- negative net fair value	-	-	-	-

The table shows the values resulting from the offsetting in the balance sheet for the derivatives whose netting agreements meet the criteria set out in IAS 32 paragraph 42.
In particular, the above refers to over-the-counter (OTC) trading and hedging financial and credit in place with the legal clearing agent LCH Ltd., for which the fair values attributable to transactions on own account and transactions on behalf of customers have been offset separately in the financial statements.
The clearing amount, which had a total net negative value of 4,536 million euro (positive fair value of 56,991 million euro and negative fair value of 61,527 million euro), attributable to a negative result of 4,525 million euro from trading derivatives and a negative result of 11 million euro from hedging derivatives, is presented in Part B of the Notes to the financial statements for operations on behalf of customers (trading derivatives) under financial assets held for trading for 523 million euro, for operations on own account under financial liabilities held for trading for 5,048 million euro and in liabilities under financial hedging derivatives for 11 million euro.

1.4 LIQUIDITY RISK

QUALITATIVE INFORMATION

General aspects, liquidity risk management processes and measurement methods

Liquidity risk is defined as the risk that the Bank may not be able to meet its payment obligations due to the inability to obtain funds on the market (funding liquidity risk) or liquidate its assets (market liquidity risk).
The arrangement of a suitable control and management system for that specific risk has a fundamental role in maintaining stability, not only at the level of each individual bank, but also of the market as a whole, given that imbalances within a single financial institution may have systemic repercussions. Such a system must be integrated into the overall risk management system and provide for incisive controls consistent with developments in the context of reference.

Intesa Sanpaolo's internal control and management system for liquidity risk is implemented within the Group Risk Appetite Framework and in compliance with the tolerance thresholds for liquidity risk approved in the system, which establish that the Group must maintain an adequate liquidity position in order to cope with periods of strain, including prolonged periods, on the various funding supply markets, also by establishing adequate liquidity reserves consisting of marketable securities and refinancing at Central Banks. To this end, a balance needs to be maintained between incoming and outgoing funds, both in the short and medium-long term. This goal is implemented by the Group Liquidity Risk Management Guidelines approved by the Corporate Bodies of Intesa Sanpaolo, in implementation of the applicable regulatory provisions.

The provisions on liquidity introduced by the European Union in June 2013 and subsequently updated establish that banks must comply with: (i) the short-term liquidity coverage ratio (LCR > 100%) and (ii) the net stable funding ratio (NSFR >100%), as set out in Directive 2019/878/EU, Regulation (EU) No 575/2013, Regulation (EU) No 2019/876 and Delegated Regulation (EU) No 2015/61, as supplemented and amended. The regulatory framework is completed by the Implementing Technical Standards developed by the EBA and ECB Guidelines designed to increase regulatory harmonisation of the Union within the framework of the Single Supervisory Mechanism (SSM), which in the area of liquidity also establishes an Internal Liquidity Adequacy Assessment Process (ILAAP), to be conducted with annual frequency for the purposes of the Supervisory Review and Evaluation Process (SREP).

The "Group Liquidity Risk Management Guidelines" of the Intesa Sanpaolo Group – in addition to referring to the Bank of Italy's indications regarding liquidity risk contained in the "Supervisory regulations for banks" – have gradually incorporated all the above regulatory provisions, in implementation of the applicable regulatory provisions.
In this framework, the Group Liquidity Risk Management Guidelines approved by Intesa Sanpaolo's Corporate Bodies illustrate the tasks of the various corporate functions, the rules and the set of control and management processes aimed at ensuring prudent monitoring of liquidity risk, thereby preventing the emergence of crisis situations. To this end, they include procedures for identifying risk factors, measuring risk exposure and verifying observance of limits, conducting stress tests, identifying appropriate risk mitigation initiatives, drawing up emergency plans and submitting informational reports to company bodies.

The key principles guiding the internal control and management system for liquidity risk defined by those Guidelines are as follows:
- the existence of a liquidity management policy approved by senior management and clearly disseminated throughout the Bank;
- the existence of an operating structure that works within set limits and attention thresholds and of a control structure that is independent from the operating structure;
- the constant availability of adequate liquidity reserves in relation to the pre-determined liquidity risk tolerance threshold;
- the assessment of the impact of various scenarios, including stress testing scenarios, on the cash inflows and outflows over time and the quantitative and qualitative adequacy of liquidity reserves;
- the adoption of an internal fund transfer pricing system that accurately incorporates the cost/benefit of liquidity, on the basis of the Intesa Sanpaolo Group's funding conditions;
- liquidity management in crisis situations that takes into account the guidelines on the governance of crisis management processes within the Recovery Plan and the Resolution Plan.

The Group Liquidity Risk Management Guidelines set out the task assigned to the Corporate Bodies and allocate several important responsibilities to senior management, including approving measurement indicators, defining the main assumptions underlying the stress scenarios and composing the early warning thresholds used to activate emergency plans.

In order to pursue an integrated and consistent risk management policy, the Group's strategic decisions on liquidity risk governance and management are assigned to the Corporate Bodies of the Parent Company. From this standpoint, the Parent Company performs its functions of monitoring and managing liquidity not only in reference to its own organisation, but also by assessing the Group's overall transactions and the liquidity risk to which it is exposed. In order to maximise the coordination and integrated control of liquidity risk, the Group Liquidity Risk Management Guidelines identify the following scopes of companies: (i) the "Eurozone sub-consolidation scope", which comprises the Parent Company with its international branches and all the other Italian and international banks of the Group in the Eurozone for which the transfer of liquidity is not blocked or limited by regulatory constraints and which therefore contribute to the stability of the integrated management in the Eurozone, for which the Central Treasury function is directly responsible, subject to compliance with the limits set for each individual legal entity; and (ii) the "Other Banks/Group Companies" scope, which includes the Group's international subsidiaries, whose liquidity management is carried out by the Treasury/ALM functions of each subsidiary, under the guidance and monitoring of the competent structures of the Parent Company.

The corporate functions of the Parent Company responsible for ensuring the correct application of these Guidelines and the adequacy of the Group's liquidity position are the Group Treasury & Capital Management structure and the Planning & Control structure, responsible, within the Chief Financial Officer (CFO) Area, for liquidity management, and the Market & Financial Risk Management structure, which is directly responsible, within the Chief Risk Officer (CRO) Area, for measuring liquidity risk on a consolidated basis.

The Group's liquidity is managed by the aforesaid structures of the CFO area through thorough monitoring of cash flows and continuous liaison with the Business Units, within the framework of the relevant business plans drawn up in accordance with the following guidelines:
– constant attention to the level of customer loyalty, aimed at maintaining a high stock of stable deposits;
– monitoring of the deposit-lending gap of the Business Units, with respect to plan and budget targets;
– balanced use of the institutional market, with particular attention to diversification of segments and instruments;
– selective use of refinancing operations by Central Banks.

Market & Financial Risk Management is directly responsible for level two controls and, as an active member of the Managerial Committees, it performs a primary role in the management and dissemination of information on liquidity risk, helping improve the Group's overall awareness of the existing position. In particular, it ensures the measurement of the Group's current and future exposure to liquidity risks under normal and stressed conditions, verifying compliance with the limits and, if those limits are exceeded, implementing the reporting to the competent Corporate Bodies and monitoring the agreed correction actions in the event of any excesses.

The Chief Audit Officer assesses the functioning of the overall structure of the control system monitoring the process for measuring, managing and controlling the Group's exposure to liquidity risk and verifies the adequacy and compliance of the process with the requirements established by the regulations. The results of the controls carried out are submitted to the Corporate Bodies, at least once a year.

The liquidity risk measurement metrics and mitigation tools are formalised by the aforementioned "Group Liquidity Risk Management Guidelines" which establish the methodology used for both the short-term and structural liquidity indicators.

The short-term liquidity is aimed at providing an adequate, balanced level of cash inflows and outflows the timing of which is certain or estimated to fall within a period of 12 months, while ensuring a sufficient liquidity buffer, available for use as the main mitigation tool for liquidity risk. To that end, and in keeping with the liquidity risk appetite, the system of limits consists of specific short-term indicators, both of a regulatory nature with a holding a period of one month (Liquidity Coverage Ratio - LCR) and internally defined (Survival Period indicators).

The LCR indicator is aimed at strengthening the short-term liquidity risk profile, ensuring that sufficient unencumbered high-quality liquid assets (HQLA) are retained that can be converted easily and immediately into cash on the private markets to satisfy the short-term liquidity requirements (30 days) in an acute liquidity stress scenario. To this end, the Liquidity Coverage Ratio measures the ratio between: (i) the stock of HQLA and (ii) the total net cash outflows calculated according to the scenario parameters defined by Delegated Regulation (EU) 2015/61 and its supplements/amendments.

The Survival Period is an internal indicator designed to measure the first day on which the net liquidity position (calculated as the difference between available liquidity reserves and net outflows) becomes negative, i.e. when additional liquidity is no longer available to cover simulated net outflows. To this end, two different scenario hypotheses are considered, baseline and stressed, designed to measure, respectively: (i) the Group's independence from interbank funding on the financial markets and (ii) the survival period in the event of further tensions of a market and idiosyncratic nature, of medium-high severity, managed without envisaging restrictions on credit activity involving customers. For the Survival Period indicator, in stress conditions it is established that a minimum survival period must be maintained with the purpose of establishing an overall level of reserves covering greater cash outflows during a period of time that is adequate to implement the required operating measures to restore the Group to balanced conditions.

The Intesa Sanpaolo Group's structural Liquidity Policy has adopted the structural requirement provided for by the regulatory provisions - the Net Stable Funding Ratio (NSFR). This indicator is aimed at promoting the increased use of stable funding, to prevent medium/long-term operations from giving rise to excessive imbalances to be financed in the short term. To this end, it sets a minimum "acceptable" amount of funding exceeding one year in relation to the needs originating from the characteristics of liquidity and residual duration of assets and off-balance sheet exposures. In addition, the internal policy on structural liquidity also includes early warning indicators for maturities of more than 1 year, with particular attention to long-term gaps (>5 years).

The Group Liquidity Risk Management Guidelines also establish methods for management of a potential liquidity crisis, defined as a situation of difficulty or inability of the Bank to meet its cash obligations falling due, without implementing procedures and/or employing instruments that, due to their intensity or manner of use, do not qualify as ordinary administration.

By setting itself the objectives of safeguarding the Group's asset value and also guaranteeing business continuity under conditions of extreme liquidity emergency, the Contingency Liquidity Plan (CLP) ensures the identification of the early warning signals and their ongoing monitoring, the definition of procedures to be implemented in situations of liquidity stress, also indicating the immediate lines of action, and the intervention measures for the resolution of emergencies. The early warning indices, aimed at spotting the signs of a potential liquidity strain, both systematic and specific, are monitored with daily frequency by Market & Financial Risk Management. Within this framework, the Group Treasury & Capital Management structure was officially entrusted with drawing up the Contingency Funding Plan (CFP), which contains the various lines of

actions that can be activated in order to face potential stress situations, specifying the extent of the mitigating effects attainable in the short-term.
The CLP is part of the more general plan of Crisis Management (i.e. it is the first step of the escalation process envisaged in the management of liquidity emergencies) and the instruments envisaged in it represent a selection of recovery actions that are considered to be implementable in the short term and before other more radical measures, which are more extraordinary in nature or extent. To this end, intervention strategies and tools are defined according to the type, duration and intensity of the liquidity emergency, as well as the context in which the emergency is expected to occur.

Group liquidity position

The Group's liquidity position - supported by suitable high-quality liquid assets (HQLA) and the significant contribution from retail stable funding - remained within the risk limits set out in the current Group Liquidity Policy for all of 2024.
Both regulatory indicators, LCR and NSFR, were above the regulatory requirements. In 2024, the Liquidity Coverage Ratio (LCR) of the Intesa Sanpaolo Group, measured according to Delegated Regulation (EU) 2015/61, amounted to an average[185] of 154.8% (168.1% in 2023). The NSFR was also significantly higher than 100%, supported by a solid base of stable deposits from customers, in addition to adequate wholesale medium/long-term securities funding. As at 31 December 2024, the Intesa Sanpaolo Group's NSFR, measured in accordance with regulatory instructions, was 121.4% (121.1% at the end of 2023).

The surpluses of both regulatory indicators, LCR and NSFR, are mainly originated within the Eurozone sub-consolidation scope. For the purposes of the LCR indicator, individual surpluses recorded at some international subsidiaries are also sterilised on consolidation, in accordance with the applicable prudential supervisory regulations.
At the end of December 2024, the value of the total unencumbered HQLA reserves, at the various Treasury Departments of the Group, amounted to 127.4 billion euro (160.3 billion euro at the end of 2023). These reserves consisted of around 30% cash as a result of the temporary excess liquidity payments in the form of unrestricted deposits held at central banks. Adding the other marketable reserves and/or eligible reserves for Central Banks, including retained self-securitisations, the Group's total unencumbered liquidity reserves amounted to 207 billion euro (202.2 billion euro at the end of 2023), of which 83% held at the Parent Company's Central Treasury and 17% at decentralised treasuries, based on the local needs of the Group's various subsidiaries.
The Group's total available reserves increased primarily due to the higher liquidity surpluses stemming from the operations of the Group's Commercial Networks, with a change in composition: the HQLA Reserves decreased as a result of the full repayment of the TLTRO tranches during the year, which freed up non-HQLA collateral for use at the Central Bank.

(millions of euro)

	Unencumbered (net of haircut)	
	31.12.2024	**31.12.2023**
HQLA Liquidity Reserves	**127,378**	**160,309**
Cash and Deposits held with Central Banks (HQLA)	35,446	80,461
Highly liquid securities (HQLA)	81,064	68,522
Other HQLA reserves not included in LCR	10,868	11,326
Other eligible and/or marketable reserves	**79,621**	**41,877**
Total Group's Liquidity Buffer	**206,999**	**202,186**

Regular stress tests are carried out to assess the impact of negative events on the company liquidity position and on the adequacy of liquidity reserves, in relation to the current and prospective situation of the Group, the Bank and the market, to enable the Corporate Bodies to promptly recognise any unexpected vulnerability and to direct the activation of consequent corrective measures.

Considering the high amounts of unencumbered liquidity reserves (liquid or eligible), the stress tests, in a combined scenario of market and specific crises (with significant loss in customer deposits), yielded results in excess of the target threshold for the Intesa Sanpaolo Group, with a liquidity surplus capable of meeting extraordinary cash outflows for a period of more than 3 months.

Generally, Intesa Sanpaolo's funding strategy is based on maintaining diversity in terms of customers, products, maturities and currencies. Intesa Sanpaolo's main sources of funding consist of: (i) deposits from the domestic Retail and Corporate market, which represent the stable portion of funding, (ii) medium/long-term funding, mainly composed of own issues (senior debt securities in the euro and US markets, in addition to subordinated securities and covered bonds/ABSs), (iii) short-term funding on wholesale markets, largely consisting of repurchase agreements and CD/CP funding; and (iv) repurchase agreements on eligible retained assets.
The "Group Liquidity Risk Management Guidelines" require the regular monitoring of the concentration analyses for the funding (by counterparty/product) and for the liquidity reserves (by issuer/counterparty).

Adequate and timely information regarding the development of market conditions and the position of the Bank and/or Group was regularly provided to the corporate bodies and internal committees in order to ensure full awareness and manageability of

[185] The figure shown refers to the simple average of the last 12 months of monthly observations, as per Regulation (EU) 2021/637.

the risk factors. This report includes an assessment of the liquidity risk exposure, also determined based on the adverse scenarios. The Board of Directors of Intesa Sanpaolo is regularly involved in defining the strategy for maintaining an adequate liquidity position at the level of the entire Group.

The corporate assessment on the adequacy of Intesa Sanpaolo's liquidity position is reported in the ILAAP, which also includes the Group's Funding Plan. Within the annual approval process for this report by the Corporate Bodies of Intesa Sanpaolo, the Liquidity Adequacy Statement (LAS) approved by the Board of Directors, which also presents the main findings from the self-assessment of the adequacy of the liquidity position, taking into account the results and values shown by the main indicators, confirms that the management of the liquidity position is considered to be adequate and deeply rooted in the Group's culture and business processes. It also notes, including from a prospective standpoint, that the current system of rules and procedures appears adequate to ensure a prompt and effective reaction should the risks and challenges actually materialise in severe and adverse stress scenarios.

QUANTITATIVE INFORMATION

1. Breakdown by contractual residual maturity of financial assets and liabilities

The breakdown by maturity of financial assets and liabilities is shown in the tables below according to the rules set forth in the financial statement regulations (Bank of Italy Circular 262 and related clarifications issued by the Supervisory Authority), using accounting information organised by contractual residual maturity. Therefore, no operational data was used that would require, for example, the modelling of core deposits and the representation of on-balance sheet items according to their level of liquidability.

2. Self-securitisations

A brief illustration of the securitisations originated by Intesa Sanpaolo outstanding as at 31 December 2024 is shown below, in which the Bank subscribed all the securities issued by the related vehicle (self-securitisations), and which need not be shown in the tables of Part E, Section C “Securitisations” of the Notes to the financial statements.

Brera Sec S.r.l. (SEC 2)

In September 2019, a self-securitisation was structured, implemented through the sale of a loan portfolio originated by Intesa Sanpaolo to the vehicle company Brera Sec S.r.l. This transaction is the Group’s second Residential Mortgage Backed Security (“RMBS”) securitisation (the first Brera Sec S.r.l. securitisation was closed during the year).
Intesa Sanpaolo has acquired a minority interest (5%) in the newly established vehicle, purchased on the market, and control (95%) is held by a corporate entity outside the Group (Dutch-registered foundation known as a Stichting).
Intesa Sanpaolo takes care of the accounting management for the vehicle, whereas the corporate administration will be carried out by Securitisation Services S.p.A.
The transaction involved the issuance by the vehicle company of two tranches of securities: a senior tranche listed on the Luxembourg Stock Exchange, with a rating assigned by two rating agencies (Moody’s and Morningstar DBRS) and an unlisted junior tranche without rating.
Both the senior security and the junior security were subscribed by Intesa Sanpaolo.
The senior security issued through the transaction, with a Moody’s Aa3 and a Morningstar DBRS A (High) rating, can be used as collateral for refinancing operations in the Eurosystem.
The total sale consideration was 7.5 billion euro. The sale price of the portfolio was settled through the issuance of securities on 27 November 2019 for a total of 7.5 billion euro.
As at 31 December 2024, the value of the outstanding securities was 3,644 million euro for the senior securities and 860 million euro for the junior securities.

The transaction is due to be extinguished in the first quarter of 2025, with the full repurchase of the loan portfolio at the end of January for 4.4 billion euro, with completion of the closure on the payment date of 17 March 2025.

Brera Sec S.r.l. (SEC 3)

In October 2021, an additional self-securitisation was structured, implemented through the sale of a loan portfolio originated by Intesa Sanpaolo to the vehicle company Brera Sec S.r.l. This transaction is the Group's third Residential Mortgage Backed Security ("RMBS") securitisation.
Intesa Sanpaolo takes care of the accounting management for the vehicle, whereas the corporate administration will be carried out by Securitisation Services S.p.A.
The transaction involved the issuance by the vehicle company of two tranches of securities: a listed senior tranche, with a rating assigned by two rating agencies (Moody's and Morningstar DBRS) and an unlisted junior tranche without rating.
Both the senior security and the junior security were subscribed by Intesa Sanpaolo.
The senior security issued through the transaction, with a Moody's Aa3 and a Morningstar DBRS A (High) rating, can be used as collateral for refinancing operations in the Eurosystem.
The total sale consideration was 7.7 billion euro. The sale price of the portfolio was settled through the issuance of securities on 1 December 2021 for a total of 7.7 billion euro.
As at 31 December 2024, the value of the outstanding securities was 5,760 million euro for the senior securities and 725 million euro for the junior securities.

Clara Sec S.r.l.

In 2020, a self-securitisation was structured involving receivables arising from performing personal loans within the consumer credit area and disbursed to consumer households, originated by Intesa Sanpaolo to the vehicle company Clara Sec S.r.l.
The securitisation is a revolving transaction and Intesa Sanpaolo has the option to sell the vehicle further loan portfolios with similar characteristics and quality, which the Vehicle will purchase by drawing on the receipts generated by the portfolio segregated over time.
Intesa Sanpaolo has acquired a minority interest (5%) in the newly established vehicle, which was purchased on the market, and control (95%) will remain with an entity from outside the Group (Dutch-registered foundation known as a Stichting).
Intesa Sanpaolo takes care of the accounting management for the vehicle, whereas the corporate administration will be carried out by Securitisation Services S.p.A.
The transaction involved the issuance by the vehicle company of two tranches of securities: a listed senior tranche, with a rating assigned by two rating agencies (Moody's and Morningstar DBRS) and an unlisted junior tranche without rating.
Both the senior security and the junior security were subscribed by Intesa Sanpaolo.
The senior security issued through the transaction, with a Moody's A1 and a Morningstar DBRS AA (Low) rating, can be used as collateral for refinancing operations in the Eurosystem.
The total sale consideration was 7.6 billion euro. The sale price of the portfolio was settled through the issuance of securities on 23 June 2020 for a total of 7.2 billion euro.
In 2024, the following additional transactions were also completed:

- in January, buyback of non-performing loans for 8 million euro;
- in April, sale for an amount of 1.1 billion euro;
- in November, sale for an amount of 1.2 billion euro.

As at 31 December 2024, the value of the outstanding securities was 6,350 million euro for the senior securities and 824 million euro for the junior securities.

Giada Sec S.r.l.

In November 2020, a self-securitisation was structured, implemented through the sale of a portfolio of loans, disbursed to companies belonging to the small business, SME and Corporate segment and originated by Intesa Sanpaolo, to the vehicle company Giada Sec S.r.l.
The securitisation is a revolving transaction and Intesa Sanpaolo has the option to sell the vehicle further loan portfolios with similar characteristics and quality, which the Vehicle will purchase by drawing on the receipts generated by the portfolio segregated over time.
Intesa Sanpaolo has acquired a minority interest (5%) in the newly established vehicle, purchased on the market, and control (95%) is held by a corporate entity outside the Group (Dutch-registered foundation known as a Stichting).
Intesa Sanpaolo takes care of the accounting management for the vehicle, whereas the corporate administration will be carried out by Securitisation Services S.p.A.
The transaction involved the issuance by the vehicle company of two tranches of securities: a listed senior tranche, with a rating assigned by two rating agencies (Moody's and Morningstar DBRS) and an unlisted junior tranche without rating.
Both the senior security and the junior security were subscribed by Intesa Sanpaolo.
The senior security issued through the transaction, with a Moody's A1 and a Morningstar DBRS A (High) rating, can be used as collateral for refinancing operations in the Eurosystem.
The total sale consideration was 10.1 billion euro. The sale price of the portfolio was settled through the issuance of securities on 21 December 2020 for the same amount.
In 2024, the following additional transactions were also completed:

- in January, buyback of non-performing loans for 13.4 million euro;
- in June, sale for an amount of 1.3 billion euro;
- in September, buyback of non-performing loans for 113.6 million euro;
- in October, sale for an amount of 1.6 billion euro.

As at 31 December 2024, the value of the outstanding securities was 6,610 million euro for the senior securities and 3,485 million euro for the junior securities.

Giada Sec S.r.l. (GIADA BIS)

In October 2022, a new self-securitisation was structured, implemented through the sale of a loan portfolio originated by Intesa Sanpaolo, disbursed to small and medium enterprises ("SMEs"), including sole proprietorships and loans granted to corporate customers not belonging to the large corporate segment, to the special purpose vehicle Giada Sec S.r.l.
The securitisation is a revolving transaction and Intesa Sanpaolo has the option to sell the vehicle further loan portfolios with similar characteristics and quality, which the Vehicle will purchase by drawing on the receipts generated by the portfolio segregated over time.
Intesa Sanpaolo takes care of the accounting management for the vehicle, whereas the corporate administration will be carried out by Securitisation Services S.p.A.
The transaction involved the issuance by the vehicle company of two tranches of securities: a listed senior tranche, with a rating assigned by two rating agencies (Moody's and Morningstar DBRS) and an unlisted junior tranche without rating.
Both the senior security and the junior security were subscribed by Intesa Sanpaolo.
The senior security issued through the transaction, with a Moody's A1 and a Morningstar DBRS A (High) rating, can be used as collateral for refinancing operations in the Eurosystem.
The total sale consideration was 15.2 billion euro. The sale price of the portfolio was settled through the issuance of securities on 5 December 2022 for a total of 15.2 billion euro.
In 2024, the following additional transactions were also completed:

- in January, buyback of non-performing loans for 45 million euro;
- in April, sale for an amount of 1.6 billion euro;
- in September, buyback of non-performing loans for 228 million euro;
- in November, sale for an amount of 891 million euro.

As at 31 December 2024, the value of the outstanding securities was 10,250 million euro for the senior securities and 4,940 million euro for the junior securities.

During 2024, the Brera Sec S.r.l. self-securitisation structured in 2017 was extinguished.

OTHER INFORMATION ON FINANCIAL RISKS

SOVEREIGN RISK EXPOSURE BY COUNTRY OF RESIDENCE OF THE COUNTERPARTY

The following table illustrates the details of the net exposures of the Intesa Sanpaolo Group to sovereign risk in banking business, based on management data. Financial assets measured at fair value through profit or loss are posted net of short positions on debt securities (on-balance sheet payables included in financial liabilities held for trading).

(millions of euro)

Management data

(1) Debt securities from insurance business (excluding securities in which gathered amounts are invested from insurance policies where the total risk is borne by the policyholders) relating to Italy amounted to 46,761 million euro.

As illustrated in the table, the Banking Group's exposure to securities issued by Italian central and local governments at the end of 2024 totalled 21 billion euro (22.5 billion euro at 31 December 2023), in addition to around 8 billion euro represented by loans (8 billion euro at the end of 2023).

INFORMATION ON STRUCTURED CREDIT PRODUCTS

The risk exposure in structured credit products came to 6,100 million euro as at 31 December 2024, a net increase of 1,632 million euro compared to the stock of 4,468 million euro as at 31 December 2023. The exposure includes investments in CLOs (Collateralised Loan Obligations) of 2,918 million euro, in ABSs (Asset-Backed Securities) of 3,110 million euro and in CDOs (Collateralised Debt Obligations) of 72 million euro, which continued to be a marginal activity also in 2024.

In this disclosure, structured credit products include debt securities held by the Group divided into tranches upon issuance consisting of various degrees of subordination and not issued within transactions originated by entities of the Intesa Sanpaolo Group or by public entities, in addition to those issued within transactions where the Group finances its corporate and financial institution customers[186].

The performance of the portfolio in 2024 shows higher overall investments than disposals and redemptions, with a total increase of 1,632 million euro, mainly attributable to the operations of the IMI Corporate & Investment Banking Division.

Exposures measured at fair value (CLO and ABS debt securities) increased by 281 million euro, from 2,884 million euro in December 2023 to 3,165 million euro in December 2024. The increase was attributable to higher investments totalling 1,838 million euro, of which 851 million euro relating to financial assets held for trading and 987 million euro to financial assets measured at fair value through other comprehensive income, offset by redemptions and disposals totalling 1,557 million euro, of which 665 million euro relating to the first component, 889 million euro to the second component, and 3 million euro to other financial assets mandatorily measured at fair value.

Exposures classified among assets measured at amortised cost (CLO, ABS and CDO debt securities) amounted to 2,935 million euro in December 2024, compared with a balance of 1,584 million euro in December 2023, a net increase of 1,351 million euro, generated by higher investments of 2,074 million euro, only partially offset by disposals and reimbursements of 723 million euro.

From the perspective of the income statement, the overall profit of +15 million euro as at 31 December 2024 compares with a profit of +5 million euro as at 31 December 2023.

The performance of assets held for trading in the year amounted to +11 million euro and related to the CLO and ABS exposures (+9 million euro from realisation impacts and +2 million euro from valuation effects), whereas as at 31 December 2023 it amounted to +5 million euro, relating to exposures in CLO and ABS (+8 million euro from realisation impacts and -3 million euro from valuation effects).

Profits (losses) from financial assets mandatorily measured at fair value showed as loss of -1 million euro as at 31 December 2024, due to disposals, compared to a profit of +1 million as at 31 December 2023, also due to disposals.

The exposures to debt securities classified as assets measured at fair value through other comprehensive income recorded a net increase in fair value of +21 million euro in 2024 through a shareholders' equity reserve (from a reserve of -30 million euro in December 2023 to -9 million euro in December 2024), in addition to impacts from sales of +4 million euro (not present as at 31 December 2023).

On the debt securities classified as assets measured at amortised cost, the result as at 31 December 2024 was +1 million euro (from realisation impacts) compared to the result of -1 million euro as at 31 December 2023 (also substantially related to realisation impacts).

INFORMATION ON LEVERAGED TRANSACTIONS

In line with the ECB reference regulations, "Guidance on Leveraged Transactions", the scope of leveraged transactions includes exposures in which the borrower's level of leverage, measured as the ratio of total financial debt to EBITDA, is greater than 4, as well as exposures where the borrower is owned by one or more financial sponsors. Moreover, counterparties with Investment Grade ratings, private individuals, credit institutions, financial institutions and companies in the financial sector in general, public entities, non-profit entities, as well as counterparties with credit facilities below a certain materiality threshold (5 million euro), Retail SME counterparties and Corporate SME counterparties (the latter if not owned by financial sponsors) are explicitly excluded from that scope. Specialised lending transactions (project finance, real estate and asset financing) and certain other types of credit facilities, such as trade finance transactions, are also excluded.
As at 31 December 2024, for the Intesa Sanpaolo Group, the transactions that meet the definition of Leveraged Transactions as per the ECB Guidance amounted to 29.6 billion euro, relating to 2,254 credit lines. The geographical distribution shows that more than half of the transactions, in terms of volume, were with domestic counterparties (57%). The main economic macro-sectors of the counterparties concerned were the industrial, services and financial sectors.
In accordance with the requirements of the ECB Guidance, as part of the Credit Risk Appetite specific limits for the outstanding stock of leveraged transactions and on new transaction flows were submitted for approval to the Board of Directors, in line with the Bank's risk appetite on these types of operations.

INFORMATION ON INVESTMENTS IN HEDGE FUNDS

The Parent Company's hedge fund portfolio as at 31 December 2024 amounted to 245 million euro for the trading book and 204 million euro for the banking book for a total of 449 million euro, compared to 163 million euro and 184 million euro, respectively, for a total of 347 million euro as at 31 December 2023.
The investments in the banking book are recognised under financial assets mandatorily measured at fair value and pertain to funds that adopt medium- to long-term investment strategies and average redemption times that are longer than those of UCITS (Undertakings for Collective Investment Schemes in Transferable Securities) funds.
In 2024, there was an increase of 102 million euro on the end of the previous year, including greater investments of 82 million euro, increases in fair value of 29 million euro, and disposals of -9 million euro.
Specifically, investments of +71 million euro were made in the trading book euro, involving UCITS hedge funds that better meet the capital absorption requirements in accordance with the CRR2, in addition to investments in the banking book for +11 million euro. The positive changes in fair value were made up of +17 million euro for the banking book and +12 million euro for the trading book, while the disposals consisted of -8 million euro for the banking book and -1 million euro for the trading book.
In terms of effects on the income statement, as at 31 December 2024 there was an overall profit of +29 million euro, essentially attributable to the valuations of the financial assets mandatorily measured at fair value (+17 million euro) and financial assets held for trading (+12 million euro). In terms of effects on the income statement, as at 31 December 2023 there was an overall profit of +21 million euro, essentially attributable to the valuations of the financial assets mandatorily measured at fair value (+17 million euro) and financial assets held for trading (+3 million euro), in addition to the gains from financial assets mandatorily measured at fair value (+2 million euro) and from financial assets held for trading (-1 million euro).
In the Intesa Sanpaolo Group, as at 31 December 2024, Eurizon Capital SGR held hedge funds for a total of 14 million euro (exposure unchanged from 31 December 2023), with essentially a zero profit and loss impact (+2 million euro from realisations as at 31 December 2023). Hedge funds are held according to a seeding approach that involves setting up a service portfolio consisting of shares of mutual funds for which marketing has begun in support of the funds.

INFORMATION ON TRADING TRANSACTIONS IN DERIVATIVES WITH CUSTOMERS

Considering relations with customers only, as at 31 December 2024, the Intesa Sanpaolo Group, in relation to derivatives trading with retail customers, non-financial companies and public entities (therefore excluding banks, financial and insurance companies), presented a positive fair value, not having applied netting agreements, of 3,039 million euro (2,830 million euro as at 31 December 2023). The notional value of these derivatives totalled 47,654 million euro (40,555 million euro as at 31 December 2023).
In particular, the notional value of plain vanilla contracts was 43,606 million euro (37,575 million euro as at 31 December 2023), while that of structured contracts was 4,048 million euro (2,980 million euro as at 31 December 2023).
The positive fair value of contracts outstanding with the 10 customers with the highest exposures was 1,544 million euro (1,628 million euro as at 31 December 2023).
Conversely, the negative fair value referring to total contracts outstanding, determined with the same criteria, for the same types of contracts and with the same counterparties, totalled 2,417 million euro as at 31 December 2024 (3,545 million euro as at 31 December 2023). The notional value of these derivatives totalled 52,267 million euro (60,349 million euro as at 31 December 2023).
In particular, the notional value of plain vanilla contracts was 47,487 million euro (56,166 million euro as at 31 December 2023), while that of structured contracts was 4,780 million euro (4,183 million euro as at 31 December 2023).
The fair value of derivative financial instruments entered into with customers was determined considering, as for all other OTC derivatives, the creditworthiness of the single counterparty ("Bilateral Credit Value Adjustment"). With regard to contracts outstanding as at 31 December 2024, these led to a negative impact of 14 million euro under "Profits (Losses) on trading in the income statement" (negative impact of 18 million euro as at 31 December 2023).
As regards the methodologies used in determining the fair value of financial instruments, see the specific paragraphs in the Notes to the financial statements - Part A – Accounting policies.
Please note that the figures reported above do not include fair value of derivatives embedded in structured bond issues as well as the related hedges taken out by the Group

1.5. OPERATIONAL RISKS

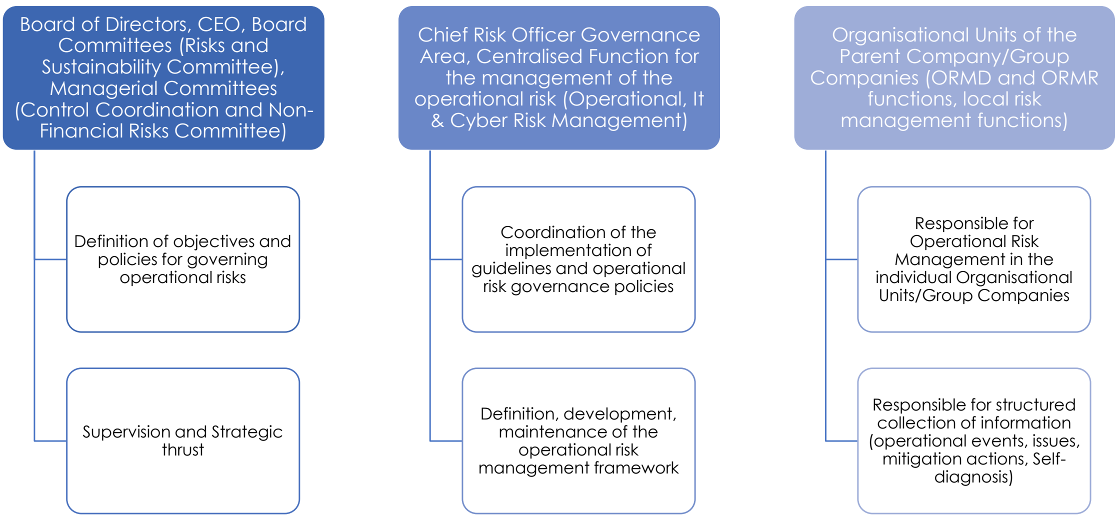
QUALITATIVE INFORMATION

A. General aspects, operational risk management processes and measurement methods

Operational risk is the risk of incurring losses resulting from inadequate or failed internal processes, people and systems or from external events[187].
The Intesa Sanpaolo Group adopts an undertaking and management strategy of operational risk based on prudent management principles and aimed at guaranteeing long-term solidity and continuity for the company. In addition, the Group pays particular attention to achieving an optimal balance between growth and profitability and the resulting risks.
In line with these objectives, the Intesa Sanpaolo Group has long since established an overall operational, ICT and security risk governance framework, by setting up a Group policy and organisational processes for measuring, managing and controlling these risks.
For regulatory purposes, the Group adopts the Advanced Measurement Approach (AMA), in partial use with the standardised (TSA) and basic approaches (BIA), to determine the capital requirement. As at 31 December 2024, the scope of the Advanced Measurement Approach (AMA) was comprised of Intesa Sanpaolo (including the former Banks and Companies merged into it) and the main banks and companies in the Private Banking and Asset Management Divisions, as well as of VUB Banka, VUB Operating Leasing and PBZ Banka. Of note, from June 2024, is the inclusion in the scope of the BIA approach of First Bank, whose consolidation into the ISP Group was completed in May 2024.

In 2025, the new regulation (Basel 4) will gradually come into force; it introduces, among other things, substantial changes to the methods of calculating regulatory capital and to the presentation criteria of the aggregates for the quantitative representation of operational risks. Specific details will be provided in the relevant disclosure, in line with the introduction of the changes.

Governance Model
An effective and efficient framework for managing operational, ICT and security risks must be fully integrated into decision-making processes and management of business operations. Accordingly, the Intesa Sanpaolo Group has chosen to involve the organisational units (business units, head-office/support structures) of the Parent Company, the banks and Group companies with direct responsibility in the Operational, ICT and Security Risk Management process.
The operational, ICT and security risk governance model has been developed with a view to:
- optimising and maximising organisational safeguards, interrelations and information flows between the existing organisational units and integration of the operational, ICT and security risk management approach with other company models developed for specific risks (Business Continuity, IT Security, etc.);
- guaranteeing transparency and spread of the models, methods and criteria of analysis, assessment and measurement criteria used to facilitate the process of cultural diffusion and comprehension of the logic underlying the choices made.



The Group has a centralised management function for operational, ICT and security risk in the form of the Operational, IT & Cyber Risk Management structure, which is responsible for the definition, implementation, and monitoring of the methodological and organisational framework, as well as for the measurement of the risk profiles, the verification of mitigation effectiveness and reporting to Top Management. In compliance with current requirements, the individual organisational units are responsible for identifying, assessing, managing and mitigating risks. Specific officers and departments have been

[187] As far as the financial losses component is concerned, operational risk also includes the following risks: legal, conduct, compliance, financial crime, fiscal, technological, cybersecurity, physical security, third-party, data quality, fraud, process and employer risk. Strategic and reputational risk are not included.

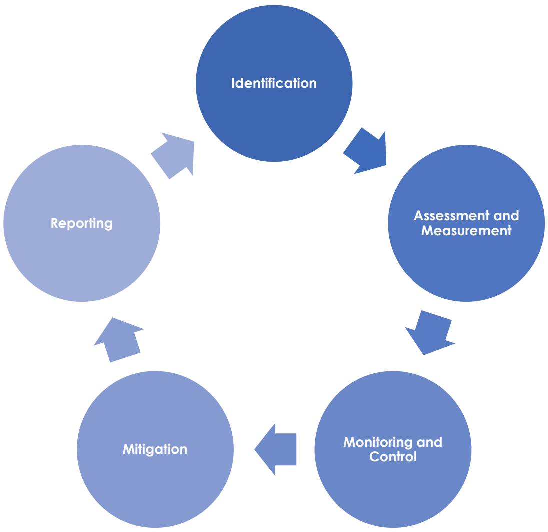
identified within these organisational units to be responsible for Operational, ICT & Security Risk Management (structured collection of information relative to operational events, detection of issues and related mitigation actions, scenario analyses and evaluation of the business environment and internal control factors). In order to support the operational, ICT and security risk management process on a continuous basis, a structured training programme has been implemented for employees actively involved in this process.

ICT and security risk

The Intesa Sanpaolo Group considers its information system a tool of primary importance to the achievement of its strategic, business and social responsibility objectives, including in the light of the critical nature of the company processes that depend on it. Accordingly, it undertakes to create a resilient environment and to invest in assets and infrastructure designed to minimise the potential impact of ICT and security events and to protect its business, image, customers and employees.
The Group has therefore adopted a system of principles and rules intended to identify and measure the ICT and security risk to which company assets are exposed, assess the existing safeguards and identify adequate methods of managing such risks, in accordance with the operational, ICT and security risk management process.
In line with the methodological framework established for the governance of operational risks, the ICT and security risk management framework has been developed with a view to integrating and coordinating the specific expertise of the structures involved.
ICT and security risk is defined as the risk of incurring losses due to breaches of confidentiality, lack of integrity and inadequacy of systems and data, unavailability of systems and data, or the inability to replace information technology within reasonable time and cost limits, in the event of changes in the requirements of the external environment or the business (agility). It also includes security risk resulting from inadequate or incorrect internal processes or external events, including cyber attacks, or an inadequate level of physical security. In the integrated view of corporate risk for supervisory purposes (ICAAP), this risk is considered, according to specific aspects, as operational, reputational and strategic risk.

Group Operational, ICT and Security Risk Management Process

The Intesa Sanpaolo Group's operational, ICT and security risk management process is divided into the following phases:



Identification

The identification phase includes the collection and classification of qualitative and quantitative information that allows to identify and describe the Group's potential areas of operational, ICT and security risk. Specifically, this phase involves the:
- collection and updating of data on operational events (Loss Data Collection), decentralised to the Organisational Units;
- identification of the company processes and components of the IT system at highest potential risk;
- determination of the applicability and relevance of the operational risk factors defined;
- identification of projects that will involve relevant changes to the IT system or changes to critical components of the IT system;
- identification of significant risk scenarios, also based on the external context (e.g., external loss data, regulatory development, emerging trends, strategic and threat intelligence);
- identification and analysis of issues affecting the Group's areas of operation.

Assessment and measurement

The assessment and measurement phase includes the process of qualitative and quantitative determination of the Group's exposure to operational, ICT and security risks.
It includes:
- at least annual performance of the process of self-assessment of exposure to operational, ICT and security risk (Self-diagnosis);
- performance of preventive analyses of operational, ICT and security risks deriving from agreements with third parties (e.g., outsourcing of activities), business operations or project initiatives, introduction or revision of new products and services, launch of new activities and entry into new markets;

- the definition of the relevance of identified issues;
- transformation of the evaluations collected (e.g., internal and external operational loss data, management levels of risk factors, probability and impact in the event of occurrence of risk scenarios) into synthetic risk measures;
- determination of economic and regulatory capital for operational risk, through the internal model and the simplified methods defined by the regulations.

Monitoring and control

The aim of the monitoring phase is the ongoing analysis and control of:

- the development of the exposure to operational, ICT and security risks on the basis of the structured organisation of the results of the identification, assessment and measurement processes and the observation of indicators that represent a valid proxy of the exposure to operational, ICT and security risks (e.g., limits, early warnings and indicators established within the RAF);
- the development of the risk profile inherent in the use of new technologies or in the implementation of significant changes to existing systems.

Mitigation

The mitigation phase includes activities aimed at containing the exposure to operational, ICT and security risks, defined on the basis of the results of the identification, measurement, assessment and monitoring phases. It includes:

- identification, definition and implementation of the corrective measures (mitigation actions) necessary to solve the identified gaps or to bring back the relevance of the identified issues within the defined risk tolerance;
- promotion of initiatives designed to spread a culture of operational risk within the Group;
- definition of strategies for transferring operational, ICT and security risks, in terms of optimisation of insurance coverage and any other forms of risk transfer adopted by the Group from time to time.

In this regard, in addition to a traditional insurance programme (to protect against offences such as employee infidelity, theft and damage, transport of valuables, computer fraud, forgery, cyber-crimes, fire and earthquake, and third-party liability), the Group has taken out an insurance coverage policy named Operational Risk Insurance Programme, in compliance with the requirements established by the regulations and to have access to the capital benefits provided for by the policy, which provides specific cover for Companies included in the AMA scope, significantly increasing the limits and transferring the risk of significant operational losses to the insurance market.

In addition, with respect to risks relating to real estate and infrastructure, with the aim of containing the impacts of phenomena such as catastrophic environmental events, situations of international crisis, and social protest events, the Group may activate its business continuity solutions.

Reporting

The reporting phase includes the preparation of appropriate information flows associated with operational, ICT and security risk management, designed to provide disclosures useful, for example, for:

- analysis and understanding of any dynamics underlying the trend in the level of exposure to operational, ICT and security risks;
- analysis and understanding of the main issues identified;
- defining the mitigation actions and intervention priorities.

Self-diagnosis

Self-diagnosis is the annual process through which the Organisational Units identify their level of exposure to operational, ICT and security risk. It includes the Operational Risk Assessment and the ICT & Security Risk Assessment, in turn consisting of:

- Business Environment Evaluation (VCO): activities used to identify significant risk factors and assess[188] the related management level, also through level II controls.
- Scenario analysis (SA): a method of prospective analysis that takes the form of a systematic process, which is typically repeated at predefined intervals, but which may also be conducted on an ad hoc basis, and which consists in imagining the occurrence of particular situations (or scenarios) and imagining their consequences. Once scenarios have been identified and appropriately characterised, they must be assessed: i.e., one must determine the probability of occurrence (frequency) and potential impact (average impact and worse case) in the event of occurrence of the situation described in the scenario.

The 2024 Self-Diagnosis identified a High level of control of operational risk at Group level, in line with previous years, both for the Operational Risk Assessment and the ICT & Security Risk Assessment.

Internal model for the measurement of operational risk

The Intesa Sanpaolo Group's internal model for calculating capital absorption is designed to combine all the main sources of quantitative information (operational losses: internal and external events, estimates deriving from the Scenario Analysis) and qualitative information (Business Environment Evaluation).

Capital-at-risk is therefore identified as the minimum amount at Group level required to bear the maximum potential loss (worst case). It is estimated using a Loss Distribution Approach model (actuarial statistical model to calculate the Value-at-risk of operational losses), applied to historical data and the results of the scenario analysis assuming a one-year estimation period, with a confidence level of 99.9%. The methodology also applies a corrective factor, which derives from the qualitative analyses of the risk level of the operational environment (VCO), to take into account the effectiveness of internal controls in

[188] The applicability and significance of risk factors are assessed, in the case of ICT and security risk, by the technical functions, cybersecurity functions and business continuity functions, and, with regard to operational risk, by the Decentralised Operational Risk Management functions.

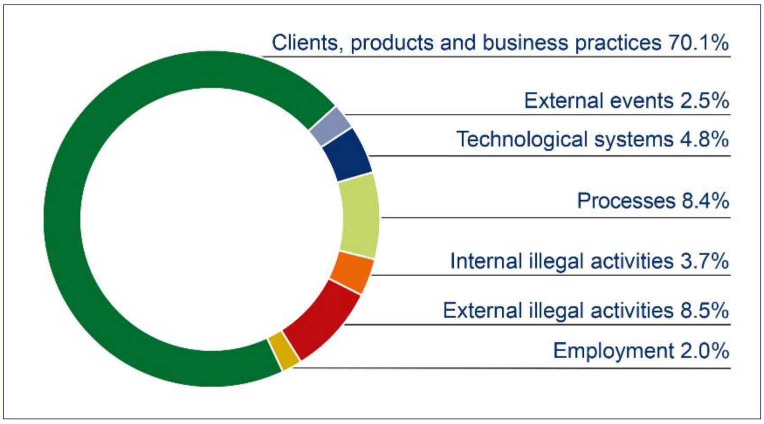
the various Organisational Units.
The internal model's insurance mitigation component was approved by the Bank of Italy in June 2013 with immediate effect of its benefits on operations and on the capital requirements.

QUANTITATIVE INFORMATION

To determine its capital requirements, the Group uses a combination of the methods (AMA, TSA and BIA) allowed under applicable regulations.
The capital requirement amounted to 2,487 million euro as at 31 December 2024, slightly up from 2,278 million euro as at 31 December 2023. The increase was partly due to the worsening of the risk class 'Clients, Products and Business Practices' due to the overall increase in the impact of the greater operational events incurred by the Group in the second half of the year and, partly, to the recalibration of the severity distribution, which gave greater weight to external loss data (collected by joining the ORX Consortium).

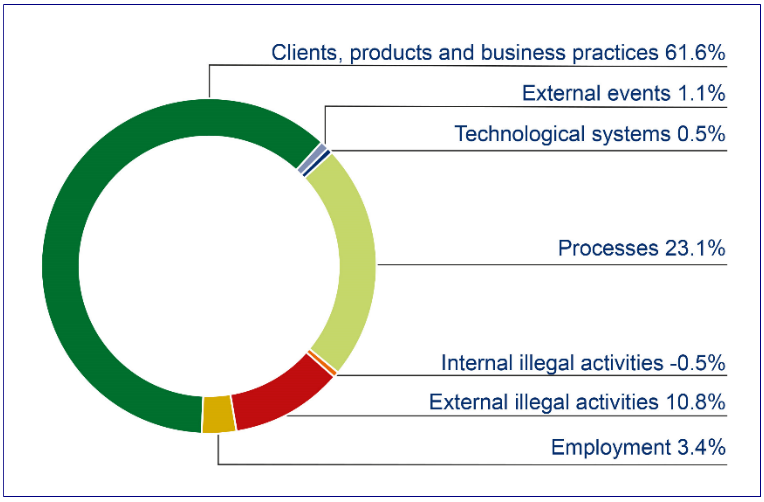
The capital requirement relating to the Advanced Measurement Approach (AMA), amounting to 2,108 million euro, broken down by type of operational event, is shown below.

Breakdown of 2024 capital requirement (Advanced Measurement Approach - AMA) by type of operational event



With regard to the sources of operational risk, the chart below shows the impact of the operational losses recorded during the year, based on event type.
In 2024, the most significant event type was *Clients, Products and Business Practices*, which included losses related to defaults connected with professional obligations towards customers, suppliers or outsourcers and to the provision of services and products to customers performed improperly or negligently.

Breakdown of operational losses recorded in 2024, by type of event



LEGAL RISKS

As at 31 December 2024, there were a total of around 11,400 non-tax related disputes – excluding those involving Risanamento S.p.A., which is not subject to management and coordination by Intesa Sanpaolo – pending at Group level (in addition to around 14,300 "mass" disputes at the international subsidiary banks, which limited aggregate represent a very small remedy sought), with a total remedy sought[189] of around 3,200 million euro. This amount includes all disputes for which the risk of a disbursement of financial resources resulting from a potential negative outcome has been deemed possible or likely and therefore does not include disputes for which risk has been deemed remote.
The risks associated with these disputes are thoroughly and individually analysed by the Parent Company and Group companies. Specific and appropriate provisions have been made to the Allowances for Risks and Charges in the event of disputes for which there is an estimated probability of a disbursement of more than 50% and where the amount of the disbursement may be reliably estimated (disputes with likely risk). Without prejudice to the uncertainty inherent in all litigation, the estimate of the obligations that could arise from the disputes and hence the amount of any provisions recognised are based on the forward-looking assessments of the outcome of the trial. These forward-looking assessments are, in any event, prepared on the basis of all information available at the time of the estimate.
The disputes with likely risk are about 22,300 (of which around 14,300 relating to the above-mentioned "mass" disputes) with a remedy sought of 1,701 million euro and provisions of 630 million euro. Compared to last year, there was a decrease in the number of disputes, which mainly concerned disputes on certain loan contractual topics relating to the subsidiary Banca Intesa Beograd, details of which are provided in a specific section. The component referring to the Parent Company Intesa Sanpaolo totals around 4,600[190] disputes, with a remedy sought of 1,386 million euro and provisions of 435 million euro. These include around 2,300 positions relating to disputes concerning anatocism, illustrated in greater detail below.
There were around 500 disputes relating to other Italian subsidiaries, with a remedy sought of 138 million euro and provisions of 72 million euro. There were around 17,200 disputes relating to international subsidiaries, with a remedy sought of 177 million euro and provisions of 123 million euro, impacted by the mass disputes: specifically, there were around 12,000 disputes referring to the subsidiary Banca Intesa Beograd, regarding two areas of litigation which are illustrated in the specific section.
The breakdown according to the main categories of disputes with likely risk shows the prevalence of cases related to the Group's ordinary banking and credit activities, involving claims relating to banking and investment products and services or on credit positions and revocatory actions, which account for around 75% of the remedy sought and 73% of the provisions. The remaining disputes mainly consist of other civil and administrative proceedings and labour disputes or criminal proceedings or proceedings related to operational violations.

The paragraphs below provide summary information on the significant disputes (mainly those with a remedy sought of more than 20 million euro and where the risk of a disbursement is currently considered likely or possible), together with the cases considered significant.

Disputes relating to anatocism and other current account and credit facility conditions, as well as usury

This type of disputes has for years made up a significant portion of the civil litigation brought against the Italian banking system. In 2024, disputes with possible or likely risk numbered around 3,000 with a remedy sought of 584 million euro and show a gradual reduction in claims compared to the previous year both in number and in total value.
The number of disputes, including mediations, with likely risk was down, at around 2,300. The remedy sought amounted to 445 million euro, with provisions of 154 million euro.
As is the case for the other civil disputes, the assessment of the risk related to this type of litigation is carried out individually, taking into account the claims made, the defences submitted, the progress of the proceedings and case-law decisions, for each dispute.
You are reminded that in 2014 and 2016, Article 120 of the Consolidated Law on Banking, which governs the compounding of interest in banking transactions, was amended with the establishment of the ban on anatocism and the delegation of the ICRC (Interdepartmental Committee for Credit and Savings) to regulate this matter. In February 2017, the Italian Antitrust Authority initiated proceedings against Intesa Sanpaolo for alleged unfair business practices involving, among other things, the methods used to request the authorisation from customers for the charging of the interest to the account imposed by the new regulations introduced in 2016. The Authority completed the proceedings in October 2017, ruling that the Intesa Sanpaolo had implemented an "aggressive" policy aimed at acquiring the above-mentioned authorisation. As a result, the Authority issued a fine of 2 million euro against Intesa Sanpaolo. The Bank appealed to the Regional Administrative Court of Lazio and, following the rejection of the appeal, appealed the decision to the Council of State, which, in a ruling of March 2024, rejected the appeal, upholding the fine. The judgment of the Council of State became final and rendered the penalty final.

Disputes relating to investment services

There were a total of around 656 disputes with likely risk relating to investment services. The total remedy sought amounted to around 379 million euro, with provisions of 105 million euro, and the most significant subgroup was disputes concerning derivatives. As is the case for the other civil disputes, the assessment of the risk related to this type of litigation is carried out individually, taking into account the claims made, the defences submitted, the progress of the proceedings and the case-law guidance, for each dispute. We also note approximately 19 disputes with a remedy sought of 98 million euro initiated by "wiped out" shareholders and subordinated bondholders of the former "Old Banks" of Banca delle Marche, Banca Popolare dell'Etruria e del Lazio and Cassa di Risparmio della Provincia di Chieti, deemed to be of possible risk. Those disputes are backed by the warranties and obligations to indemnify by the Seller (National Resolution Fund) for the benefit of the former

189 The figures for the remedy sought do not include claims of indeterminate value, i.e. those that do not contain a specific financial claim when the dispute is initiated; the value of these disputes is determined during the course of the proceedings when sufficient information emerges for the valuation.

190 These include disputes arising from the acquisition of certain assets, liabilities and legal relationships of Banca Popolare di Vicenza S.p.A. in compulsory administrative liquidation and Veneto Banca S.p.A. in compulsory administrative liquidation, so-called Excluded Disputes covered by public guarantee ("Indemnification Guarantee").

UBI Banca, and now Intesa Sanpaolo, and therefore also cover any liabilities arising from the activities carried out by the Banks (the "Old Banks") before they were subject to the resolution procedure, in relation to, *inter alia*, risks of a legal nature or generally related to ongoing or threatened disputes, or violations of the law and any potential liabilities.

Dispute regarding financial derivative instruments

With regard to derivative transactions, the legal risks linked to legal proceedings with local authorities, their subsidiaries and individuals continue to be subject to careful monitoring.

Specifically, 16 disputes are pending with local authorities, with possible or likely risk, for total claims of 135 million euro, and 5 disputes with subsidiaries of public entities, with total claims of 37 million euro. Disputes with individuals, assessed as having possible or likely risk, total 158, and of these, 42 positions also regard requests for refunds of amounts on other accounts held with the Bank. Net of those latter positions, the total value of the claims lodged in the proceedings regarding only derivatives amounts to around 87 million euro.

A summary of the most significant disputes with local authorities is provided below:

– Municipality of Venice: the dispute regards a derivative contract governed by the ISDA, with remedy sought of 71 million euro. By ruling filed on 13 December 2023, the Court of Appeal – in a total reversal of the first instance ruling of the High Court of Justice of London, which had held that the Municipality did not have the capacity to enter into speculative derivative contracts involving debt – declared that the derivative contracts were valid, effective and binding on the Local Authority, stating in particular that they:
    - were not speculative in nature (similarly to the previous transaction that the municipality had carried out with Bear Stearns and which Intesa Sanpaolo took over on a *pro rata* basis with Dexia);
    - could not be equated to debt transactions in breach of the limits set in Article 119 of the Constitution.

  As a result, the Local Authority was ordered to pay the outstanding differentials, to reimburse the amount paid for the legal expenses of the Municipality, and to cover the legal defence costs of the banks for both instances of proceedings.
  Against this last ruling, the Local Authority filed a Permission to Appeal which was rejected by the Supreme Court by final judgment.
  With regard to the second lawsuit with the Municipality before the Court of Venice, concerning alleged breaches of the mandate and investment service agreements, the examining magistrate ordered a technical expert's report.
  In the meantime, following extensive negotiations, a settlement agreement was reached with the Municipality of Venice on 23 January 2025 to settle the mutual claims.

– Municipality of Turin: in July 2024, the Municipality of Turin filed a civil action before the Court of Turin to challenge the derivative contract entered into in 2007 (2007 swap) governed by an ISDA agreement of 2004, subject to English jurisdiction and law. The contract was signed to renegotiate previous transactions carried out in 2003 and 2006, as part of the Entity's debt restructuring, an initiative in which other banks have also participated over the years.
  The Municipality has made two alternative claims:
    - as the main claim demand, for compensation for damages due to contractual breach related to an advisory agreement for the management of the Entity's debt of December 2003 and for pre-contractual liability concerning the preliminary phase leading to the signing of the derivatives agreements;
    - in the alternative, demand the nullity of the 2007 swap, on the one hand, due to the lack of indication in the MtM contracts of its calculation formula and the probability scenarios and, on the other, due to the failure to comply with the requirements established by the specific applicable regulations regarding the use of these financial instruments by Public Entities.
      The main claim is quantified at around 27 million euro.

  The Bank entered an appearance on 6 December 2024 rejecting all the Municipality's claims. At the hearing of 18 December 2024, the judge ordered the conversion of the court proceedings from simplified to ordinary and scheduled a hearing for 11 June 2025 for continuation of the proceedings.

With regard to the disputes with companies controlled by Public Entities, the following changes occurred during the year:

– in the proceedings brought by EUR S.p.A. concerning ISDA derivatives entered into in connection with a syndicated loan granted by Intesa Sanpaolo and other intermediaries, on 21 April 2023, the Court of Rome filed its ruling declaring the lack of jurisdiction of the Italian Court in favour of the English Court, with each party paying its own legal fees. The other party appealed the judgment before the Rome Court of Appeal. A settlement agreement with EUR was finalised in January 2025, with full settlement of the dispute between the parties.

Reference for a preliminary ruling to the Court of Cassation on the legitimacy of the fixed instalment repayment plan

On 29 May 2024 the Joint Divisions of the Court of Cassation (by ruling no. 15130) ruled on an important issue for banking operations: specifically, whether the failure to indicate in a fixed-rate mortgage loan agreement the fixed instalment repayment method (called French amortization method) and the compound capitalisation regime makes the purpose of the contract vague or impossible to determine.

The Joint Divisions set out the following approach to interpretation, also applicable beyond the case submitted to their examination (as per the role as guarantor of the uniform interpretation of the law): "Regarding fixed-rate bank mortgages with repayment of the loan in instalments governed by a standardised, traditional repayment plan, the failure to indicate the repayment method and compound capitalization of debt interest regime cannot give rise to partial nullity of the contract, either due to vagueness of or the inability to determine the purpose of the contract, or due to breach of the regulations on transparency of contractual conditions and relations between credit institutions and their customers".

This ruling will make it possible to significantly limit the risk of proliferation of disputes regarding objections to fixed instalment repayment methods.

Dispute relating to loans in CHF to the Croatian subsidiary Privredna Banka Zagreb Dd

As highlighted in the previous financial statements, Potrošač – Croatian Union of the Consumer Protection Association had brought proceedings against the subsidiary Privredna Banka Zagreb ("PBZ") and other Croatian banks, which had engaged in an unfair practice by allegedly using unfair contractual provisions on variable interest rate, which could be changed unilaterally by the bank, and by denominating the loans granted in Swiss francs (or indexing them to Swiss francs) without allegedly appropriately informing consumers of the risks prior to entering into the respective loan agreements.

The relevant contractual provisions were declared invalid.

Numerous individual proceedings have been brought by customers against PBZ, despite the fact that most of them voluntarily accepted the offer to convert their CHF loans into EUR denominated loans retroactively, in accordance with the Act on the Amendments to the Consumer Credit Act (Croatian Official Gazette 102/2015 – the "Conversion Law").

In March 2020, the Croatian Supreme Court, within model case proceedings (Supreme Court proceedings with obligatory effect on lower instance courts with the aim of unifying/harmonising case law), ruled that the conversion agreements concluded between banks and borrowers under the Conversion Law of 2015 produce legal effects and are valid even in the case when the provisions of the underlying loan agreements on variable interest rate and CHF currency clause are null and void.

In May 2022, the EU Court of Justice, in proceedings regarding reference for a preliminary ruling involving another intermediary, established that the Court of Justice has jurisdiction over the conversion agreements concluded under the Conversion Law, as they occurred after Croatia joined the European Union, and that the EU Directive on unfair terms in consumer contracts does not apply to those conversion agreements, whose content reproduces provisions of national law.

On 20 December 2022, the Civil Law Department of the Croatian Supreme Court provided an interpretation of the legal effects of the agreements for the conversion of loan agreements from CHF to EUR and on consumers' rights, according to which consumers that entered into a conversion agreement pursuant to the aforementioned Conversion Law of 2015 have the right to receive legal interest on excess amounts paid that the Bank calculated on converting the loans, from the date of each single payment up to the date of conversion.

This interpretation has not yet been recorded by the Court Practice Records Department and is therefore not binding at present.

The limitation period for bringing individual proceedings on the invalidity of the currency clause expired in June 2023. In the following period, summonses filed before the above-mentioned deadline were served and the number of new cases progressively decreased significantly.

At the end of 2024, the total pending cases amounted to a few thousand.

The development of the case law is being constantly monitored.

Dispute with the foreign subsidiary Banca Intesa Beograd (Serbia)

The following areas of the mass disputes that have impacted the entire Serbian banking system are shown below.

1) Processing fees

Legal dispute regarding processing fees applied by banks at the time of disbursing loans. The claimants, individuals and legal persons, are requesting the repayment of those charges, as they are deemed as not owed. The first claims arose in 2017 and a significant increase in lawsuits was recorded in the following years, though for modest amounts on average. At the end of 2024, Banca Intesa Beograd had been summoned in around 11,000 lawsuits deemed as having possible or likely risk (at the end of 2023, these amounted to around 15,200); the related total amounts of principal requested to be repaid by the Bank came to around 0.7 million euro. In September 2021, the Supreme Court of Serbia recognised the legitimacy of the costs and fees applied to loans at the time of their disbursement, provided they are indicated in the contract proposal. In 2024, there was a further significant reduction in the flows of new disputes. Most of the lawsuits closed during the year were either won by the Bank or abandoned by the plaintiffs.

2) NKOSK

Legal dispute relating to real estate loans insured through the National Housing Loan Insurance Corporation (NKOSK), whose premium is paid by the borrowers. The borrowers deem that, as the Bank is the Beneficiary of the insurance, the premium should be paid by the Bank. At the end of 2024, Banca Intesa Beograd had been summoned in around 1,000 lawsuits deemed as having possible or likely risk (at the end of 2023, these amounted to around 1,155); the related total amounts of principal requested to be repaid by the Bank came to around 1 million euro. In September 2021, the Supreme Court of Serbia recognised the legitimacy of requiring the insurance premium to be paid by the borrowers, provided that the obligation is clearly described to the borrowers during precontractual procedures. Most of the disputes closed during the year were either won by the Bank or abandoned by the plaintiffs.

Transfer of business lines to Isybank - Italian Antitrust Authority proceedings, representative action of the consumer association "Associazione Movimento Consumatori" and Italian Personal Data Protection Authority proceedings

In November 2023, the Italian Antitrust Authority (AGCM) announced the initiation of proceedings against Intesa Sanpaolo and Isybank aimed at verifying the existence of an unfair commercial practice regarding the transfer of relationships of around 2.4 million "predominantly digital" customers from Intesa Sanpaolo to Isybank as part of a transfer of business lines, with the accompanying unilateral amendment of the transferred contracts. The transfer of the first business line had already been made on 16 October 2023, while the transfer of the second business line was scheduled for 18 March 2024.

Again in November 2023, the AGCM ordered the suspension, on a precautionary basis, of the commercial practice considered unfair.

In December 2023, Intesa Sanpaolo and Isybank filed a report containing the measures envisaged to comply with the precautionary measure and submitted a proposal of commitments to the AGCM, which detailed what they had already outlined in the report of compliance with the precautionary measure, for the purpose of reaching a positive conclusion of the proceedings.

This proposal of commitments was supplemented in March 2024 with further measures in favour of the customers concerned.

By way of order dated 11 June 2024, the Authority accepted the commitments proposed by the two Banks, rendering them binding. The proceedings concluded, thus, without imposing a fine.

Also with regard to the transfer of business lines, the consumer association "Associazione Movimento Consumatori" brought a representative action against Intesa Sanpaolo and Isybank (with a petition served in January 2024) before the Court of Turin for alleged "violations of the collective interests of consumers".
The association asked the Court to prohibit the use of the new clauses in the transferred contracts, without the consent of the consumers, and the prohibition of the repetition of the unlawful conduct, as well as the adoption of appropriate measures to eliminate or reduce the effects of the violations if the unlawful conduct is confirmed.
The two banks filed their defence briefs, contesting the arguments of the Associazione Movimento Consumatori and requesting the rejection of the claims in consideration of the measures taken in the meantime in favour of the customers within the AGCM proceedings.
On 27 May 2024, the two Banks and the consumer association entered into a settlement agreement which settled the dispute. After the parties file with the Court the documents relating to the out-of-court settlement, at the hearing of 31 May 2024 the Court discontinued the proceedings.
By order of 3 January 2025, the Italian Personal Data Protection Authority - after having carried out a preliminary investigation in the context of which it had made a number of requests for information to the Bank, which were duly fulfilled - informed Intesa Sanpaolo that its conduct in the context of the transfer of the business lines to Isybank was in breach of certain provisions of the General Data Protection Regulation (GDPR), with regard to the identification of the legal basis for the processing of data aimed at identifying the "mainly digital" customers included in the branches being contributed and to the information provided to such customers.
With the same measure, the Authority announced the start of a procedure for the adoption of corrective measures and - if deemed applicable - the administrative penalties provided for by the GDPR.
ISP is currently analysing the measure and preparing defence briefs, which must be filed by 4 March 2025.

Unauthorised access to personal data - current judicial and administrative proceedings
In July 2024, the Bank notified the Italian Personal Data Protection Authority of certain accesses to customer data by an employee apparently not justified by service reasons and detected by the Bank's alert systems.
As a result of the investigations carried out, the employee was first suspended from duty and then dismissed for cause. The Bank also lodged a complaint with the Public Prosecutor's Office at the Court of Bari against the former employee for unauthorised access to a computer system. In the criminal proceedings against the former employee, the Bank, in addition to being the plaintiff and injured party, is under investigation as an entity pursuant to Legislative Decree no. 231/2001, even though, as things stand, the acts attributed to the former employee appear to have been committed to the detriment of the Bank and not to its benefit. The Bank received a number of requests for information and documents from the Public Prosecutor's Office, to which it responded providing full cooperation.
The Bank notified the customers whose data was accessed by the former employee of the data breach where such access could not be attributed with certainty to service needs, as required by the Italian Personal Data Protection Authority by measure of 2 November 2024.
In that measure, the Authority reserved "any other decision at the end of its investigation into the case". Once the Authority has communicated the outcome of its investigation, a clearer picture of possible developments of the proceedings will be available.

At the same time, as part of a process of continuous improvement of the systems in place to protect the confidentiality of personal data, also on the basis of a benchmarking test carried out with reference to the main market peers, a specific project has been launched, with the participation of the control and business structures in Italy, with the following aims:
– strengthen *ex-ante* and *ex-post* controls, including by introducing automated tools and specific protection systems for customers material to national security;
– strengthen the Risk Appetite Framework and the internal rules on data protection/reputational risk;
– carry out a comprehensive strategic review at Group level of the areas of visibility of customers' personal data, defined according to the corporate role and the reference customer segment, taking into account business logic processes and the analysis of service models and carrying out appropriate implementations where necessary.

Italian Antitrust Authority proceedings against Intesa Sanpaolo RBM Salute – now Intesa Sanpaolo Protezione.
In November 2020, the AGCM had initiated proceedings against ISP RBM for unfair business practices, which concluded in July 2021 with a fine of 5 million euro and a warning to cease the unfair practice. ISP RBM appealed the AGCM's decision before the Lazio Regional Administrative Court, which, in November 2022, after having considered the complaint made regarding the lateness of the Authority's intervention to be valid, upheld the appeal and annulled the penalty measure in full. The AGCM appealed the judgement of the Regional Administrative Court before the Council of State, which suspended the judgement in January 2024, pending the ruling of the Court of Justice of the European Union on a number of preliminary questions relevant to the judgement. Following the Lazio Regional Administrative Court's judgement, the Italian Antitrust Authority issued an order of "no grounds for further action" in the non-compliance proceedings, which it had initiated on the grounds that ISP RBM was not complying with the warning contained in the penalty measure. However, the Authority has reserved the right to defer any decisions until the outcome of the proceedings before the Council of State.
In May 2023, the AGCM initiated new proceedings against ISP RBM for alleged unfair business practices, purported to have been adopted from January 2023, aimed at hindering the exercise of consumers' rights arising from the contractual relationship, leading them to give up financial and welfare benefits provided by the insurance coverage held by them. In its communication dated 15 February 2024, the Authority issued its conclusions on the preliminary findings, based on which it upheld the claims made in the decision to initiate proceedings and also considered that the unfair business practice was still ongoing.
ISP RBM submitted a defence brief, in which it highlighted, among other things, the strategic and operational measures it had already taken prior to the commencement of the proceedings and the further improvements these measures had brought to the service levels provided to the policyholders.
With order dated 20 May 2024, the AGCM ruled that ISP RBM's conduct constituted an ongoing unfair business practice, prohibiting its dissemination or continuation, and imposing an administrative fine of 2.5 million euro.

On 19 July 2024, ISP RBM submitted an appeal to the Lazio Regional Administrative Court, requesting the annulment of the administrative fine. The case is still pending.
On 2 August 2024, ISP RBM submitted the plan to the AGCM for complying with the ban on continuing the prohibited conduct. On 22 October 2024, the Authority informed ISP RBM that it had acknowledged the documentation submitted regarding the measures adopted as compliance.

Disputes linked to Group acquisitions/integrations - former UBI Good Banks
In execution of the Share Purchase Agreement ("SPA") on 18 January 2017 and the Closing on 10 May 2017, UBI Banca acquired from the National Resolution Fund managed by the Bank of Italy (NRF), "Nuova Banca Marche", "Nuova Banca Etruria" and "Nuova Carichieti" (the "Target Bridge Institutions" or "Bridge Institutions" or "Good Banks").
Subsequently, those Bridge Institutions were incorporated into UBI Banca.
Following the incorporation of UBI Banca, Intesa Sanpaolo took over the management of the "Good Banks dispute", namely all the disputes regarding events or acts that occurred prior to 10 May 2017 and referring to the operations of the three banks impacted by the resolution orders (the "Old Banks") or "Good Banks", which were then acquired by UBI Banca.
Those disputes are backed by the warranties and obligations to indemnify by the Seller (NRF) for the benefit of UBI Banca in relation to the acquisition of the New Banks deriving from the resolution of Banca delle Marche, Banca Popolare dell'Etruria e del Lazio and Cassa di Risparmio della Provincia di Chieti and therefore also cover any liabilities arising from the activities carried out by the Banks (the "Old Banks") before they were subject to the resolution procedure, in relation to, *inter alia*, risks of a legal nature or generally related to ongoing or threatened disputes, or violations of the law and any potential liabilities.
On 27 May 2024, as part of wider negotiations, ISP and the Bank of Italy entered into an Agreement to simplify the management of the pending Good Banks dispute, in particular from an administrative point of view, also with regard to the management of disputes that have already been settled in court, but not yet indemnified, and to limit the guarantees (General Cap) with regard to a scope of pending disputes that has been accurately identified.
With regard to the development of the case law on the mis-selling of shares and subordinated bonds of the banks undergoing resolution, by favourable ruling no. 22115 of 5 August 2024 in the Fox Petroli case, the First Division of the Court of Cassation held that Intesa Sanpaolo lacked the capacity to be sued, confirming that the claims made relate to liabilities not transferred to the Bridge Institutions (the Good Banks), but remained with the banks under resolution (the Old Banks).

Isoldi Holding Bankruptcy
The Isoldi Holding Bankruptcy Receiver sued the former UBI Banca (which absorbed Nuova Banca Etruria and Centrobanca), Intesa Sanpaolo and five other banks in June 2020, before the Court of Bologna, claiming that they were liable, jointly and severally with the management body of Isoldi Holding, for a series of acts of diversion of assets that are claimed to have contributed to the company's artificial survival in the period June 2011 – June 2013, due to conduct claimed to have been implemented by preparing a turnaround plan pursuant to Article 67, para. 3, letter d), of the Bankruptcy Law based on unlawful acts and a connected agreement governing the disbursement of new finance, acts that are argued to have artificially deferred the company's crisis and concealed the irreversibility of its default.
The Isoldi Bankruptcy Receiver also formulated a joint claim against Intesa Sanpaolo (prior to the incorporation of UBI Banca) and MPS, claiming their liability, jointly with the Sole Director of Isoldi Holding, for allegedly unlawful conduct connected with the bail-in of Aedes, in which Isoldi Holding was interested in taking over the majority shareholding.
Intesa Sanpaolo and the former UBI Banca filed regular appearances and the assigned Court, with order dated 1 July 2021, declared that it lacked jurisdiction. The adverse party resumed the proceedings, submitting the same claims before the Court of Turin and the Bank duly filed an appearance.
In the meantime, a third company filed an application for a bankruptcy arrangement, which was then endorsed.
The case was adjourned to the beginning of 2024 for the performance of an expert assessment ordered by the court, which was made available in September 2024.
Having assessed the findings of the court-appointed expert's report, Intesa Sanpaolo settled the lawsuit by means of a settlement finalised in December 2024 and implemented in January 2025.

Società Italiana per le Condotte d'Acqua S.p.A. under Extraordinary Administration
By claim form and particulars of claim of 23 December 2022, Società Italiana per le Condotte d'Acqua S.p.A. (admitted to the "Marzano" procedure by way of Italian Ministerial Decree of 6 August 2018) asked the Court of Rome to order compensation for damages in the amount of 389.3 million euro (or a different amount that will arise during the proceedings), in addition to monetary revaluation, legal interest and expenses.
The claim has been filed, jointly, against Intesa Sanpaolo (also as the merging company of Mediocredito Italiano, Banca IMI and UBI Banca, as well as "the purchaser of" Veneto Banca and Banca Popolare di Vicenza), the members of the Management Board and the Supervisory Board of Condotte and numerous other banks and factoring companies.
The claim is based on the alleged conduct engaged in for various reasons by the defendants, considered a source of harm to the company's assets and its creditors. Specifically, the banks and factoring companies are allegedly liable for having unlawfully granted to and/or maintained credit for Condotte, thereby contributing to the continuation of its business at a loss and the worsening of its default.
The court case, which was interrupted at the first hearing due to the death of the counsel for one of the defendants, was resumed by the Procedure, and at the last hearing in April 2024, the Court ordered an adjournment to 2025, authorising the summonses requested by the defendants.
As things stand, it is not possible to estimate the risk attributable to Intesa Sanpaolo, also taking account of the different conduct claimed against the numerous defendants.
The Company has also promoted against Intesa Sanpaolo three bankruptcy revocatory actions before the Court of Rome, with a request to reimburse amounts of around 16 million euro, two of which were settled through favourable settlement agreements. In relation to the remaining revocatory action still pending, concerning a claim of around 3 million euro, the Bank raised an objection of invalidity due to the vagueness of the adverse claim.

Nuova Casar
A legal action was brought before the Court of Naples in 2002 against the Bank to obtain payment of around 7.2 million euro plus interest by Nuova Casar, in its capacity as the transferee of the credit from a mortgage loan of 11.3 million euro from 1991 provided by Sanpaolo di Torino to Finedilturistica (which became insolvent in 1997), with the credit secured by a mortgage and an independent guarantee issued by Banco di Napoli (now Intesa Sanpaolo) and two other banks, each covering up to 25%. At first instance, the case ended in 2013 with the rejection of Nuova Casar's claim, on the grounds that the guarantee issued by Banco di Napoli was null and void due to the invalidity of the loan granted by Sanpaolo di Torino. The decision was appealed by the counterparty before the Naples Court of Appeal, which in 2023 referred the case back for a technical accounting appraisal, following which negotiations for a settlement commenced and were concluded in the first ten days of October 2024.

Fondazione Cassa di Risparmio di Pesaro
In 2018, the Fondazione Cassa di Risparmio di Pesaro brought a compensation claim before the Court of Milan against the former UBI Banca (as the alleged successor to the issuer Banca delle Marche S.p.A.[191]) and PwC (the independent auditors that certified the financial statements and the figures presented in the prospectus relating to the 2012 capital increase of Banca delle Marche S.p.A.), alleging that the defendants published data and information regarding the financial performance and the income outlooks of Banca delle Marche S.p.A. that later proved to be totally incorrect and misleading. This information, contained in the financial statements as at 31 December 2010 and 30 June 2011 and included in the above-mentioned prospectus, is claimed to have led the Foundation to subscribe for the Bank's shares issued as part of the capital increase in March 2012. The value of these shares then fell to zero, resulting in a loss quantified by the adverse party at around 52 million euro.
During the trial the Bank of Italy joined the suit, upholding the lack of capacity to be sued invoked by UBI Banca, by virtue of the provisions of Legislative Decree 180/2015 governing the resolution procedure for Banca delle Marche.
The Court of Milan, in a ruling published in May 2023, having ascertained and declared the lack of capacity to be sued of Intesa Sanpaolo, as the company that absorbed UBI Banca, rejected the Foundation's claim and ordered that each party pay its own legal fees.
The Foundation appealed the first instance ruling before the Court of Appeal of Milan and the first hearing has been set for October 2025.

Fondazione Cassa di Risparmio di Jesi
In January 2016, Fondazione Cassa di Risparmio di Jesi brought a compensation claim before the Court of Ancona against UBI Banca (as the alleged successor to the issuer Banca delle Marche S.p.A.[192]) and PwC (the independent auditors that certified the financial statements and the figures presented in the prospectus relating to the 2012 capital increase of Banca delle Marche S.p.A.) alleging that the defendants published data and information regarding the financial performance and the income outlooks of Banca delle Marche S.p.A. that later proved to be totally incorrect and misleading. This information, contained in the financial statements as at 31 December 2010 and 30 June 2011 and included in the above-mentioned prospectus, is claimed to have led the Foundation to subscribe for the Bank's shares issued as part of the capital increase in March 2012. The value of these shares then fell to zero, resulting in a loss quantified at around 25 million euro by the adverse party.
During the trial the Bank of Italy joined the suit, upholding the lack of capacity to be sued invoked by UBI Banca, by virtue of the provisions of Legislative Decree 180/2015 governing the resolution procedure for Banca delle Marche.
By judgment rendered on 18 March 2020, the Court of Ancona granted the objection of lack of capacity to be sued raised by the Bank, rejecting the Foundation's claims lodged. In the appeal brought by the Foundation, the Court of Appeal of Ancona, by judgment filed on 17 July 2023, rejected the appeal and upheld the first instance judgment, ordering the appellant to pay the costs of the proceedings to Intesa Sanpaolo, as the absorbing company of UBI Banca. The Foundation challenged the second instance ruling before the Court of Cassation with an appeal submitted in February 2024. Intesa Sanpaolo and the Bank of Italy promptly filed a counter-appeal; the hearing in chambers is still to be scheduled.

Azzurro 2000 S.a.s. di Tilli Renzo & C.
In 2004, the company Azzurro 2000 brought a compensation claim before the Court of Santa Maria Capua Vetere (Caserta Divisional Section) against the former Sanpaolo Banco di Napoli for alleged unlawful reporting to the Central Credit Register, quantifying the claim at around 50 million euro.
The plaintiff's claim was rejected at both first and second instance.
Against the appeal ruling, the plaintiff filed (i) an appeal before the Court of Cassation and (ii) a revocation proceeding before the same Court of Appeal. The latter declared the request for revocation inadmissible and the plaintiff filed a further appeal before the Court of Cassation against this second ruling of the Court of Appeal.
The Supreme Court combined the two cases and upheld the first appeal, basing solely on one of the grounds of appeal, overturning the decision and referring the case back to the Naples Court of Appeal, and declared the request for revocation inadmissible.
The plaintiff then resumed the action and the Bank appeared before the Court. The hearing was scheduled in 2026 to refer the lawsuit to judgement.

[191] Note that this dispute is backed by the warranties and obligations to indemnify by the Seller (National Resolution Fund) for the benefit of the former UBI Banca in relation to the acquisition of the New Banks deriving from the resolution of Banca delle Marche, Banca Popolare dell'Etruria e del Lazio and Cassa di Risparmio della Provincia di Chieti and therefore also cover any liabilities arising from the activities carried out by the Banks (the "Old Banks") before they were subject to the resolution procedure, in relation to, *inter alia*, risks of a legal nature or generally related to ongoing or threatened disputes, or violations of the law and any potential liabilities.
[192] See the previous note.

Azienda Agricola Turelli S.S. Soc. Agricola
In 2017, as part of an objection to an order to pay obtained by Intesa Sanpaolo to recover its credit, Azienda Agricola Turelli S.S. and its members Attilio and Laura Turelli filed a counterclaim for compensation for damages quantified at a total of around 20 million euro, for alleged breach of the obligations of good faith and contractual fairness.
In August 2023, the Court of Brescia rejected the objection and the claim for compensation for damages, ordering the opponents to pay the legal fees to Intesa Sanpaolo. In the meantime, the credit covered by the order to pay was subject to two subsequent assignments.
In February 2024 the opponents lodged an appeal against the first instance ruling, with an initial hearing in September 2024. The Bank has lodged an appearance in the proceedings. The following parties also appeared:
- the second assignee, which also requested that Intesa Sanpaolo and/or the first assignee (its assignor) be ordered to return the price paid to purchase the credit, or to compensate for the (not specifically quantified) damages, as well as to hold it harmless and/or indemnified from any claim for reimbursement/compensation that may be recognised against the appellant, though it had not concluded any contracts with the Bank;
- the first assignee of the credit, and
- the member Chiara Turelli "*ad adiuvandum*".

The Court adjourned the case to January 2026 for the continuation of proceedings.

Auditors Italiana S.r.l. in compulsory administrative liquidation
In October 2023, the fiduciary and audit company Auditors Italiana S.r.l. in compulsory administrative liquidation brought a compensation claim against Intesa Sanpaolo (as the absorbing company of UBI Banca, which had previously acquired Nuova Banca dell'Etruria e del Lazio[193]) before the Court of Rome for alleged damages of over 32 million euro. According to the reconstruction by the plaintiff, those damages arose from wrongdoings committed by the former Banca Popolare dell'Etruria e del Lazio in relation to a current account in its name, which facilitated the diversion of sums to the detriment of the trustees and of the company, leading to its financial distress and consequent compulsory administrative liquidation.
The Bank filed an appearance in the proceedings, preliminarily asserting (i) its lack of capacity to be sued and (ii) the expiry of the limitation period, in addition to submitting a series of defence arguments on the merits. At the first hearing in March 2024, the judge appointed an expert to perform a technical assessment. The deadline for filing of the expert's report is July 2025 and the hearing for issue of the Court's decision is set for December 2025.

Armonia SPV S.r.l.
At the end of May 2024, Armonia SPV S.r.l. issued a formal notice claiming damages of around 98 million euro, plus arrears interest, additional damages and costs, alleging the non-existence of certain receivables purchased from UBI Factor (now Intesa Sanpaolo), which were subject to legal proceedings at the time of the 2019 sale.
The Bank responded to the notice by sending a communication rejecting the claims in full, and to date, no responses have been received.

SIM Bankruptcy
By claim form and particulars of claim served in October 2022, the receiver to SIM S.p.A. summoned Intesa Sanpaolo (along with other 7 banks) before the Court of Catania, with the first hearing scheduled for 31 March 2023.
This is a compensation claim brought for damages allegedly suffered by the company and its creditors due to conduct by the banks defined by the adverse party as "unlawful", which allegedly resulted in the unlawful granting of credit.
The claim for damages has been quantified at around 47 million euro, requesting that the defendant banks be jointly ruled against.
The Bank argued in Court lack of legal standing of the receiver and expiry of the limitation period, among other things, in addition to contesting the factual and legal grounds of the adverse party's claims, with a series of defence arguments on the merits. The President of the Court did not consider that the conditions had been met for the joinder of the action with another action brought by the receiver pursuant to Article 146 of the Bankruptcy Law against the directors of the bankrupt company SIM S.p.A.
The Judge therefore ordered the continuation of the proceedings.

Offering of diamonds
In October 2015, the Bank signed a partnership agreement with Diamond Private Investment (DPI) governing how diamond offerings were made by DPI to the customers of Intesa Sanpaolo. The aim of this initiative was to provide customers with a diversification solution with the characteristics of a "safe haven asset" in which to allocate a marginal part of their assets over the long-term. Diamonds had already been sold for several years by other leading national banking networks.
This recommendation activity was carried out primarily in 2016, with a significant decline starting from the end of that year.
A total of around 8,000 customers purchased diamonds, for a total amount of over 130 million euro. The marketing process was based on criteria of transparency, with safeguards progressively enhanced over time, including quality controls on the diamonds and the fairness of the prices applied by DPI.
In 2017, the AGCM instituted proceedings for alleged conduct in breach of the provisions on unfair business practices against the companies that sold diamonds (DPI and another company) and the Banks that recommended the services of those companies.
At the end of those proceedings, the AGCM issued penalties as a result of verifying that the alleged conduct of DPI and the banks breached the Consumer Code. The Authority issued a fine of 3 million euro against Intesa Sanpaolo, reduced from the initial fine of 3.5 million euro, after the Authority had recognised the value of the measures taken by the Bank since 2016 to strengthen the controls on the offering process. Intesa Sanpaolo appealed to the Regional Administrative Court of Lazio and, following the rejection of the appeal, appealed the decision before the Council of State, which, in a ruling of March 2024, rejected the appeal, upholding the fine. The judgment of the Council of State became final and rendered the penalty final.

[193] See the previous note.

From November 2017, the Bank:
- terminated the partnership agreement with Diamond Private Investment (DPI) and ceased the activity, which had already been suspended in October 2017;
- started a process that provides for the payment to customers of the original cost incurred for the purchase of the diamonds and the withdrawal of the stones, in order to satisfy the customers' resale needs which, due to the illiquidity that had arisen in the market, are not met by DPI;
- sent a communication in January 2018 to the diamond-holding customers reiterating the nature of the stones as durable goods, and also confirming the Bank's willingness to intervene directly in relation to any realisation needs expressed by the customers and not met by DPI.

Only a few dozen requests were received during 2024, showing that the phenomenon had essentially died out.
The preliminary investigations initiated by the Public Prosecutor's Office of Milan also concern four other banks (more involved) and two companies that sell diamonds.
In October 2019, the notice of conclusion of the investigation was served, which stated that two of the Bank's operators were being investigated for alleged aggravated fraud (in collusion with other parties to be identified) and other persons were being identified for allegations of self-laundering, while Intesa Sanpaolo was being charged with the administrative offence pursuant to Legislative Decree 231/2001 in relation to this latter predicate offence.
In January 2023, within the criminal proceedings pending before the Court of Milan, the filing was confirmed of the request to dismiss the case against the two relationship managers under investigation, on the grounds of "the act not constituting an offence". The request for dismissal was also made in respect of two other employees, on the grounds of "not having committed the act", as no evidence against them had emerged during the investigation.
With ruling dated 9 April 2024, the Preliminary Investigation Judge ordered the dismissal of the case against the two Intesa Sanpaolo relationship managers under investigation, on the grounds of "the act not constituting an offence", thus rendering the proceedings fully closed.

Private banker (Sanpaolo Invest SIM, incorporated into its parent company Fideuram - Intesa Sanpaolo Private Banking)
An inspection conducted by the Audit function identified serious irregularities by a private banker of the former Sanpaolo Invest SIM. The checks carried out revealed serious irregularities affecting several customers, including misappropriation of funds and reports with false incremental amounts.
On 28 June 2019, the Company terminated the agency agreement with the private banker and reported the findings to the Public Prosecutor's Office of Parma and the Supervisory Authority for financial advisors, which first suspended and then removed the private banker from the Register of Financial Advisors in December 2019.
Following the unlawful actions, the company received a total of 279 compensation claims (including complaints, mediation proceedings and lawsuits), for a total amount of approximately 62.9 million euro, mostly based on alleged embezzlement, losses due to disavowed transactions in financial instruments, false account statements and the debiting of fees relating to advisory service.
To date, 24 compensation claims are pending, including 18 in court and 6 out-of-court claims, with a current value of approximately 10 million euro.
The total amount of 9.6 million euro was recovered from the improperly credited customers (and already returned to the customers harmed) and there are currently attachment orders, on those customers, for around 1 million euro.
The criminal proceedings against the former private banker for fraud, embezzlement and theft aggravated by fraudulent means and abuse of function ended with a plea bargaining judgment on 4 April 2024. The private banker was sentenced to 4 years' imprisonment and a fine of 100,000 euro. Due to the procedure chosen, the civil liability case against Fideuram-ISPB was dropped.
Three civil actions for recovery were brought against private bankers, which ended with:
- judgment of 2 May 2023, whereby the Court of Parma ordered the private banker to pay Fideuram-ISPB the total amount of 175,000 euro plus legal expenses (recovery of receivables connected to the agency contract);
- judgment of 23 July 2024, whereby the Court of Parma ordered the private banker to pay to Fideuram-ISPB the total amount of 1.5 million euro plus legal expenses (labour lawsuit for the recovery of further receivables connected to the agency contract);
- order to pay by which the Court of Parma ordered the private banker to pay Fideuram-ISPB 604 thousand euro plus interest. The private banker filed an appeal against the order to pay, which is currently pending.

In response to the initiatives on the merits described above, Fideuram-ISPB took enforcement action through:
- precautionary attachment converted into foreclosure, as a result of which Fideuram-ISPB collected approximately 85,000 euro from various foreclosed third parties;
- registration of a judicial mortgage on the property co-owned by the private banker;
- a further 4 foreclosures (of movable property, from third parties and company shares) that were unsuccessful.

Adequate provisions have been set aside for the risks associated with the unlawful conduct discussed above, mainly for the damages verified relating to compensation claims and pending lawsuits.

Litigation against Fideuram concerning investment transactions
In October 2022, Fideuram - Intesa Sanpaolo Private Banking S.p.A. was summoned before the Court of Naples with a request for: (i) a declaration of the alleged invalidity of the current account and investment services master agreement entered into by the plaintiff with Fideuram, the consequent invalidity of all the investment transactions carried out and the alleged contractual and non-contractual liability of the Bank, and, as a result, (ii) an order for the Bank to pay compensation for the alleged damages suffered totalling around 29 million euro.
The Bank duly filed an appearance, contesting the factual and legal validity and admissibility of the claims made and confirming the correctness and compliance of its actions with the applicable regulations, also in terms of profiling and customer information.
The case was adjourned for closing arguments to the end of 2025.

Unicredit against Fideuram on the transfer of private bankers

In July 2023, Unicredit S.p.A. initiated legal proceedings against Fideuram - Intesa Sanpaolo Private Banking S.p.A. before the Court of Turin, seeking compensation for alleged damage of approximately 23 million euro, plus interest and revaluation. This claim is based on alleged acts of unfair competition by Fideuram, related to the resignation of several private bankers from Unicredit during the period 2022-2023, who were subsequently employed by Fideuram, as well as alleged unlawful acts committed by those private bankers in the course of their transition to the defendant, for which Fideuram is allegedly also liable.

Fideuram filed an appearance, fully contesting the adverse party claims and requesting the dismissal of the petitions on the grounds that they were baseless in both fact and law, also pointing out that the situations cited in the proceedings were common in the industry, which is characterised by strong competition and mobility of financial advisors, and that Fideuram itself was not immune to this phenomenon.

With regard to the compensation claim, it was fully contested both in terms of its basis and its quantification because it had been calculated using inappropriate methods based on a distorted representation of the profitability of the assets managed by the parties in dispute.

In November 2024, Fideuram and Unicredit settled the case out of court.

Iter Capital Partners S.r.l.

In November 2024, Iter Capital Partners S.r.l. and its Professionals sued before the Court of Milan Eurizon Capital SGR (hereinafter, also SGR) and Eurizon Capital Real Asset SGR (hereinafter, ECRA) with regard to an advisory agreement pursuant to which the plaintiffs had undertaken to carry out activities relating to the management of two investment funds by SGR. The plaintiffs brought the action against the two companies having regard to the different roles played by each in the management of the investment funds, namely: (i) Eurizon Capital SGR S.p.A., as the company that had set up the funds and as Iter's contractual counterparty, and (ii) ECRA, as the entity delegated by Eurizon Capital SGR S.p.A. to manage the funds.

Specifically, the plaintiffs asked the court to (i) determine that the termination of the advisory agreement by SGR in July 2024 with effect from 31 October 2024 was unlawful, (ii) find and declare the agreement terminated due to serious breach of contract by SGR, and (iii) order SGR and ECRA jointly and severally to pay compensation for all the damages allegedly suffered by the plaintiffs for a total of 88.8 million euro, plus interest and costs.

SGR and ECRA, believing that there were valid reasons in fact and in law for terminating the agreement, promptly entered their appearance, rejecting all the plaintiffs' arguments, including their calculation of damages, and asking the court to reject all the plaintiffs' claims. SGR also filed a counterclaim asking the court to find and declare that it had acted lawfully in terminating the agreement and exercising the consequent rights under the agreement.

Reyl & Cie (Switzerland) – Proceedings pursuant to Legislative Decree 231/2001 of the Public Prosecutor's Office of the Court of Milan

The Public Prosecutor's Office of Milan initiated criminal proceedings pursuant to Legislative Decree 231/2001 against Reyl & Cie (a Swiss subsidiary of Fideuram – Intesa Sanpaolo Private Banking) for the predicate offence of money laundering, allegedly committed by one of its former employees (dismissed in 2020), and ordered the seizure of securities owned by Reyl for around 1.1 million euro. The proceedings also involve the Swiss bank Cramer & Cie. Neither Fideuram ISPB nor ISP are currently involved in the proceedings. The circumstances alleged relate to events that took place in 2018, before Reyl & Cie joined the Intesa Sanpaolo Group in May 2021. According to the prosecution, the former employee, together with his brother, an employee of the bank Cramer & Cie, and an external advisor, allegedly engaged in practices aimed at facilitating tax evasion by Italian customers through the transfer of accounts from Switzerland to branches located in the Bahamas, in order to allow those customers to withdraw money from those accounts without the possibility of being traced by the Italian authorities. Although it is possible for Reyl to submit an application to revoke or reduce the attachment order, also considering that it was the Swiss company that reported the suspicious transactions to the Authorities, the Milan Public Prosecutor's Office has rejected a similar petition made by Banca Cramer.

Any consequential damages (for possible fines and/or confiscations) could be covered by the various warranties provided by the seller, for which a reserve claim was made within the terms of the Reyl acquisition agreement.

Within the criminal proceedings pursuant to Legislative Decree 231/01 pending before the Court of Milan for alleged money laundering offences, in February 2024 Reyl & Cie was notified of the indictment of the former employee and his brother, as well as Cramer & Cie and Reyl & Cie. The preliminary hearing was consequently set by the GIP (preliminary hearing judge) for 3 July 2024. On conclusion of discussion between Reyl's defence counsel and the Public Prosecutor at the hearing of 3 July 2024, with the view to avoiding a drawn out dispute, and without recognising any liability for the circumstances alleged, the bank filed a petition to apply a financial penalty (plea bargain), which was accepted by the Public Prosecutor.

At the following hearing on 24 September 2024, the Judge postponed the hearing to 24 October 2024 to allow the other parties involved (Banca Cramer, the former employee and his brother) additional time to reach an agreement with the Prosecutor to settle the case. With the other parties having failed to reach an agreement with the Prosecutor, at the hearing on 24 October 2024 the Public Prosecutor requested the issuance of an indictment order against the former employee and his brother and Banca Cramer. The Judge then deferred the decision to the hearing on 13 March 2025 regarding both Reyl's plea bargain request and the position of the other parties involved.

Lawsuit against two Hungarian subsidiaries of Intesa Sanpaolo
The lawsuit is connected with a lease agreement terminated by one of the subsidiaries in 2010. During 2011, the tenant initiated proceedings in civil court, and during 2021, it supplemented its initial claim, formulating new claims and, as a result, increasing the total of the claims to around 31 million euro.
In July 2022, the Court rejected all the plaintiff company's claims, finding that it lacked standing. The plaintiff filed an appeal against that decision.
In December 2022, the Court of Appeal partially upheld the adverse party's appeal, ordering one of the two defendant companies to pay around 9.5 million euro. The subsidiary filed an appeal with the Supreme Court, which overturned the second-instance judgment. Subsequently, the plaintiff brought an action before the Constitutional Court, which however found it inadmissible.
The plaintiff also brought an action for review before the ordinary courts, but this too was rejected as inadmissible by both the Court of First Instance and the Court of Appeal.
No further appeals were lodged and thus the Supreme Court's decision became final.

IMI/SIR
With regard to the IMI/SIR dispute, you are reminded that following the final judgment in 2006 establishing the criminal liability of the corrupt judge Metta (and his accomplices Rovelli, Acampora, Pacifico, and Previti), the defendants were ordered to pay compensation for damages, with the determination of those damages referred to the civil courts. Intesa Sanpaolo then brought a case before the Court of Rome to obtain an order of compensation for damages from those responsible.
In its ruling of May 2015, the Court of Rome quantified the financial and non-financial damages for Intesa Sanpaolo and ordered Acampora and Metta – the latter also jointly liable with the Prime Minister's Office (pursuant to Law no. 117/1988 on the accountability of the judiciary) – to pay Intesa Sanpaolo 173 million euro net of tax, plus legal interest accruing from 1 February 2015 to the date of final payment, plus legal expenses. The amount ordered took account of the amounts received in the meantime by the Bank as part of the settlements with the Rovelli family and with the adverse parties Previti and Pacifico.
In July 2016, the Rome Court of Appeal stayed the enforcement of the judgment of first instance with respect to the amount in excess of 130 million euro, in addition to ancillary charges and expenses. As a result of this decision, in December 2016 the Office of the President of the Council of Ministers credited Intesa Sanpaolo with the sum of 131,173,551.58 euro (corresponding to the 130 million euro of the order, in addition to legal interest and reimbursement of expenses). To avoid dispute, only the exact amount of the order, without applying the gross-up, was demanded and collected. On 16 April 2020, the ruling of the Rome Court of Appeal was filed, which essentially upheld the Court's ruling, while reducing the sum of non-financial damages to 8 million euro (compared to 77 million euro that had been awarded by the court of first instance), and set the amount to be paid at 108 million euro (instead of 173 million euro), to be considered net of tax, plus legal interest and expenses.
In the second quarter of 2020, the Bank filed a petition for the correction of a material error contained in the finding regarding the calculation of the damages liquidated; the Court of Appeal rejected the petition by ruling filed on 7 December 2020, holding that the error claimed by the Bank could be remedied by means of an appeal before the Court of Cassation. In May 2021, the Bank filed an appeal with the Court of Cassation against the Rome Court of Appeal's ruling of 16 April 2020 on the following main grounds:
– the reduction to 8 million euro of the non-financial damages made by the Court of Appeal, compared to the 77 million euro recognised in the first instance ruling was arbitrary and devoid of any sound legal or logical reasoning;
– even accepting the reduction under point a), the Court made a miscalculation when redetermining the amount of total damages. That aspect was already the subject of an application for material correction filed in 2020, rejected by the Court as it was deemed to be an issue that could be remedied through appeal.

By ruling no. 5682/2023, the Court of Cassation partially upheld the grounds of appeal filed by Acampora and the Prime Minister's Office, overturning the second instance ruling, in relation to the claims upheld, and referring the case back to the Rome Court of Appeal for the application of the principles of law set forth in the ruling. The outcome differs both from the rulings made at the previous instances and from the conclusions, consistent with them, filed last December by the General Prosecutor at the Court of Cassation.
The Court applied a rule of pre-emption according to which the action for revocation, aimed at obtaining the return of the sums unduly paid, should precede the exercise of the action for damages, in clear conflict with the principles set out in the criminal proceedings in 2006 according to which the independence and dissimilarity of the two actions (the action for damages and the action for extraordinary revocation) "rule out any interference between them and place each in its own sector, with the only limitation of not allowing the duplication of coinciding outcomes and, therefore, undue enrichment".
In addition, it introduced a further and unprecedented rule of a procedural nature according to which, without prejudice to the right to obtain lost earnings and non-pecuniary damage, in order to claim compensation from the perpetrators of the offence (i.e. Acampora, Metta and the Government liable for the latter by law) for the damage arising, the injured party, Intesa Sanpaolo, must prove that it had unsuccessfully enforced its claim against the party benefiting from the corrupt ruling.
On 19 May 2023, the Bank notified the other parties involved (Metta, the Prime Minister's Office and Acampora) of the application for resumption of proceedings, requesting:
i) as the main claim, on the merits, the award, in addition to the other damages, of the damage arising, subject to correction of the miscalculation made at the time by the Rome Court of Appeal, in consideration of the fact that the "prejudicial conditions" set out by the Court of Cassation had been met because the Bank had pursued the recovery, both in and out of court, of the sums paid to the beneficiary as a result of the revoked ruling. In the event that the main claim is not upheld, the Bank requested at least the award of the lost earnings and non-pecuniary damage;
ii) subordinately to the merits, a reference for a preliminary ruling to the Court of Justice of the European Union (CJEU) pursuant to Article 267 of the Treaty on the Functioning of the European Union (TFEU) for breach of the Treaty on European Union (TEU), highlighting the arbitrary limitation of the right to compensation provided for by the Special Law on damages caused by judges in the performance of their duties (Law 117/88) resulting from the application of the principles set out by the Court of Cassation in its recent ruling.

The Prime Minister's Office and Giovanni Acampora filed an appearance in the review proceedings, responding to the arguments submitted by the Bank. Following the first hearing, which took place in writing in October 2023, the Court declared Vittorio Metta *in absentia* and adjourned the case for closing arguments to October 2024, without ruling on the petitions from the parties.
On 11 September 2024, Giovanni Acampora's defence counsel filed a certificate attesting to the death of his client; consequently, the Court closed the proceedings.
The Bank resumed the case collectively and impersonally against Giovanni Acampora's heirs. At the hearing of 4 February, the Court took note that some of the heirs had renounced their inheritance and adjourned the case to 18 March for continuation of proceedings.
At the end of 2023, the Bank brought proceedings before the Tax Court to demand the refund of 33.2 million euro of withholding, previously paid as tax for overdue interest on the compensation for damages recognised under the 1994 ruling to Mrs Battistella, as Nino Rovelli's heir. By measure of 24 April 2024, the First Instance Tax Court of Rome rejected the action brought by the Bank, which decided to appeal this judgment. Following the appeal by the Bank, the case is now pending before the Court of Appeal.

Labour litigation
In line with the situation as at 31 December 2023, as at 31 December 2024 there were no significant cases of labour litigation from either a qualitative or quantitative standpoint. In general, all labour litigation is covered by specific provisions adequate to meet any outlays.

GOVERNANCE OF TAX RISK

In compliance with the Code of Ethics, the Group - in its entirety - is committed to observing principles based on values of honesty and integrity in the management of the tax variable, compliance with the tax regulations applicable in the countries in which the Group operates, and the maintenance of a collaborative and transparent relationship with the tax authorities, including through adherence to cooperative compliance schemes.

Intesa Sanpaolo recognises the importance of contributing to the communities of the jurisdictions where it operates by paying the right amount of tax and, to this end, it closely monitors the developments in both domestic and international tax legislation aimed at combating tax base erosion and profit shifting, with a constant commitment to upholding the related principles. The Group has strengthened the internal control system for tax risk, referred to as the Tax Control Framework ("TCF"), making it ideal for managing the strategic nature of tax risk and to meet the requirements for access to the cooperative compliance scheme introduced in Italy pursuant to Legislative Decree 128/2015. It also updated the Organisational, Management and Control Model, for the purposes of liability of institutions for tax offences, as prescribed by Legislative Decree no. 231 of 2001, in order to safeguard against the risk of tax fraud. On 10 December 2018, Intesa Sanpaolo was admitted by the Italian Revenue Agency to the Cooperative Compliance scheme, with effect from 2017, the year in which the application was submitted. Under this scheme, Intesa Sanpaolo and the Italian Revenue Agency can carry out joint assessments of situations likely to generate tax risks through constant preventive contacts aimed at resolving potential disputes in advance.

In keeping with its low tax risk appetite, the Intesa Sanpaolo Group aims to use the Tax Control Framework to ensure the level of risk appetite declared in the Principles of conduct in fiscal matters ("Principles"), adopting controls designed to preemptively manage tax risk, which ensure ongoing compliance with the tax and fiscal rules of the countries where it operates and safeguard the financial and reputational integrity of all the Group companies. The Principles are an integral part of the Tax Control Framework, designed and implemented in line with OECD standards. In particular, the Principles set out the guidelines to ensure a uniform management of taxation across all Group companies based on the logic of (i) correct and timely determination and payment of legally owed taxes and performance of the related requirements, (ii) containment of tax risk, understood as the risk of operating in breach of tax regulations or in conflict with the principles or purposes of the legal system in the various jurisdictions in which the Group operates, due to external factors (mainly uncertain interpretation caused by ambiguity or lack of clarity of tax legislation) or to internal factors (e.g., incorrect and/or late fulfilment of legal requirements, the failure to implement new legislation impacting the Group's taxation, the execution of transactions that may be deemed non-compliant by the tax authorities).

The founding values of the TCF, also stated in the aforementioned Principles, are the following:

- Corporate Responsibility: in compliance with the principle of Corporate Responsibility, the Group shall act in accordance with the values of honesty and integrity in managing its tax obligations, being aware that tax revenues are one of the main sources of contribution to the economic and social development of the countries in which it operates.
- Legality: the Group pursues a behaviour geared towards compliance with the tax rules applicable in the countries in which it operates and towards interpretations that allow it to responsibly manage tax risk, so as to satisfy the interests of all stakeholders and safeguard its reputation.
- Tone at the top: the Board of Directors defines the Group's principles of conduct in fiscal matters and ensures their application, thereby assuming responsibility for shaping and disseminating a corporate culture marked by the values of honesty and integrity and the principle of legality.
- Relationship: the Group, due to its role as taxpayer for its own taxes and as collaborator of the tax authorities for the taxation of its customers, considers it strategic to have an evolved, collaborative and transparent relationship with the tax authorities, to provide said authorities, among other things, with a full understanding of the facts underlying the application of tax rules. This also includes, were appropriate, providing the tax authorities with additional documents (e.g. under the transfer pricing legislation in the case of intragroup transactions). To this end, Intesa Sanpaolo promotes the participation in cooperative compliance schemes by the companies that meet the requirements of domestic legal frameworks, so as to strengthen relationships with the tax authorities. In the event of tax disputes, the Group assesses the options available on a case-by-case basis, resorting to litigation only if it believes that its view of the matter, although not shared by the tax authority, is well-founded and reasonable.

The Principles are adopted by Intesa Sanpaolo also in its capacity as Parent Company, and are approved by the Board of Directors; interpretation of the provisions of the Principles is the responsibility of the Parent Company which, through the Tax Function, also updates them. The Principles are revised at least once a year and any time there is a significant change in the external and/or internal context, and in light of the periodic report on the results of the monitoring of the Tax Control Framework and the assessment and management of any tax risks for the tax period in question. The Principles are published on Intesa Sanpaolo's institutional website and must be adopted by all Group companies, subject to a resolution of their bodies with strategic supervisory functions.

The adoption of the Principles means that each Group company must:

- comply with and apply all tax regulations of the countries in which it operates, and cooperate transparently with the tax authorities;
- fulfil tax obligations within the time and in the manner defined by law or by the tax authority, also using technological solutions to control the data underlying the calculation of taxes due by law;
- avoid forms of tax planning that may be deemed aggressive by tax authorities. In particular, each company must not locate assets, artificially and for the sole purpose of reducing the Group's tax burden, in countries included in the European Union's list of non-cooperative jurisdictions for tax purposes or in the OECD's list. Any presence of Group entities in such countries must be justified exclusively by business reasons;
- interpret the rules in a manner consistent with their spirit and purpose, without exploiting their literal wording;
- report the acts, facts and transactions undertaken so as to enable taxation consistent with the real economic substance of the transactions;
- enjoy the tax benefits and incentives provided by law only if they are in line with the business objectives and economic substance of the underlying business transactions;
- ensure transparency in its operations and in the determination of its income and assets by avoiding the use of structures,

including corporate structures, that may conceal the actual beneficiary of the income flows or the ultimate holder of the assets;
- comply with the provisions on the appropriate transfer pricing of intragroup transactions, in line with the arm's length principle, matching as correctly as possible the income generated with the location of value creation, and avoiding allocating revenues or costs in ways that may generate tax evasion/avoidance;
- avoid using artificial structures or companies, unrelated to the business activity, for the sole purpose of evading tax legislation;
- cooperate with the competent authorities to provide truthful and comprehensive information necessary for tax compliance and control;
- establish cooperative relationships with the tax authorities, inspired by transparency and mutual trust and aimed at preventing conflicts, thus reducing the possibility of disputes. To mitigate tax risk and obtain prior clarification on interpretative doubts, the Group promotes agreements with local tax authorities. On the other hand, the Group does not enter into tax rulings that grant preferential tax regimes or undue tax benefits;
- not offer customers products and services that allow them to obtain undue tax advantages not otherwise obtainable, and put in place appropriate safeguards to avoid involvement in non-tax-compliant transactions carried out by customers.

Intesa Sanpaolo and the Group companies also actively participate in industry associations that monitor and promote tax system developments. Directly or through these associations, they take part in public consultations and policymaker support activities, to ensure a rational and fair development of the tax system.

The Guidelines for the management of tax risk under the cooperative compliance scheme with the Italian Revenue Agency were also approved, setting out the criteria and processes that Intesa Sanpaolo must adopt to ensure the appropriateness and effectiveness of its Tax Control Framework, in addition to identifying the appropriate monitoring processes and consequent reporting to the Board of Directors, as well as the related Rules.
Intesa Sanpaolo has identified the following types of possible tax risks associated with its business processes:
- Tax compliance risks. These are operational risks and concern both business processes (namely risks of performing incorrectly the operational tasks necessary to ensure the correctness - i.e. completeness, accuracy and timely processing - of tax-relevant data), and specific tax compliance processes (spanning the phases of data collection, data processing, and preparing tax returns/tax payments/reports to the tax authorities). During 2024, during exchanges with the Italian Revenue Agency under the collaborative compliance scheme, the main Group entities shared the tax compliance risk map (duly updated on the basis of a risk catalogue shared within the Italian Banking Association - ABI), highlighting the controls in place and the level of residual risk.
- Tax interpretation risks on routine transactions/operations. This type of risk relates to uncertainty as to the actual meaning of tax law provisions and the classification of cases in relation to abstract types. It affects the following processes: regulatory alignment, advice provided to the Bank's structures and interpretative choices made in tax compliance processes.
- Tax interpretation risks on non-routine transactions. These are the risks that arise whenever non-routine transactions/activities are carried out, characterised by objective and specific uncertainty as to the risk of using interpretations that are incorrect or otherwise contrary to the principles and purposes of the tax system. Intesa Sanpaolo has put in place tax risk management processes and procedures, in compliance with the Principles of conduct in fiscal matters, which ensure, *inter alia*:
  - the correct allocation of roles, responsibilities and powers to each person involved, in whatever capacity, in processes with tax implications so as to ensure proper management of tax risk and minimise the likelihood of disputes;
  - the involvement of the tax function in business decisions. Intesa Sanpaolo's processes must ensure the full and constant involvement of the tax function in business decisions, so as to facilitate informed decisions in the event of material tax risk.
- Risks of tax fraud being committed by third parties. This refers to the risk of incurring tax violations as a result of fraudulent tax conduct by third parties (e.g. customers, suppliers, other counterparties). During the year 2024, no particular risk of tax fraud emerged.

For tax risks relating to the interpretation of rules, through prior discussions with the Italian Revenue Agency, carried out within the framework of the collaborative compliance scheme for the year 2024, the Group's main entities arrived at a common assessment of the facts underlying the significant tax risks. As a result of the discussions held, there are no doubts as to interpretation. In order to prevent any risk, for the discussions that are still ongoing the Group adopts the most prudent solution from a tax point of view.
Business Functions and Head Office Departments that carry out transactions with potential tax impacts must comply with the Principles of conduct in fiscal matters and the Guidelines in the performance of their activities. Where the clearing processes adopted by the Bank do not already provide for the involvement of the Tax Function, it is the responsibility of the Business Function (Division or Head Office Department) proposing/structuring the transactions to involve the Head of the Tax Function in advance to allow for an appropriate assessment of the tax effects and risks arising from their implementation.
The Group ensures that the tax functions involved have the organisational significance, material resources and human resources needed to achieve the objectives, and that the relevant personnel are constantly updated, through the use of up-to-date databases and specialised information sources as well as regular training initiatives. Furthermore, the Group provides for regular training activities on topics of particular importance and topicality for functions other than the tax functions (both business and operational).
In order to ensure that the Principles are implemented, the Group supports significant investments in technology aimed at adopting advanced digital solutions to control and streamline the management of direct and indirect taxation.

The Tax Function, in its tax risk management activities:

- provides assistance and advice to the Corporate Bodies and Business Functions called upon to approve transactions exposed to tax risks;
- operates with a view to maintaining an effective internal control system for tax matters, ensuring that it is constantly updated, as well as the ability to detect risks arising from changes affecting the company, regulations and practice, also taking into account case law;
- ensures the monitoring of the correct and effective functioning of tax processes and compliance with the relevant regulations, identifying any shortcomings and errors and the necessary corrective actions;
- coordinates with other corporate internal control functions to ensure the consistency and effectiveness of the internal control system on tax risk, in compliance with tax legislation, the obligations imposed by the collaborative compliance scheme, Bank of Italy Circular 285 and the Integrated Internal Control System Regulation;
- notifies the Italian Revenue Agency, in a timely and comprehensive manner, of situations involving a “significant” tax risk exposure (where it exceeds the shared threshold) or “material” tax risk exposure and is responsible for the Group’s discussions with the Italian Revenue Agency.

The Business Functions or Head Office Departments carrying out transactions with potential tax impacts:

- act in accordance with the instructions received from the Tax Function, with reference to tax-relevant matters;
- promptly inform the competent corporate functions of changes in operations that may entail revisions of corporate processes, so that the necessary analyses of possible tax risks can be initiated and appropriate measures can be taken to mitigate their effects;
- perform the expected first-level control activities in tax risk management;
- are responsible for implementing actions identified, in consultation with the Tax Control Office, to mitigate tax risks affecting processes within their remit.

The governance of tax risk, also following the logic set out in the Group Compliance Guidelines, is divided into the following macro-processes:

- regulatory alignment, aimed at monitoring external regulations and translating them into internal guidelines, processes and procedures, through:
  - the ongoing identification and interpretation of external regulations applicable to the Bank, through the continuous monitoring of external regulatory sources and the consolidation, in the event of regulatory developments, of an unambiguous and shared interpretation;
  - assessing the impact of applicable regulations on corporate processes and procedures and consequently proposing organisational and procedural changes aimed at ensuring appropriate monitoring of compliance risks;
- advice and assistance to Corporate Bodies and other structures of the Bank and prior assessment of compliance with applicable regulations (clearing) of (routine and non-routine) transactions, new products and services to be launched for marketing, innovative projects;
- discussions with the Italian Revenue Agency, in cases where the risk exposure values exceed the agreed materiality threshold. If the Italian Revenue Agency does not agree with the fiscal stance that Intesa Sanpaolo intends to adopt, its final adoption must be approved by the Board of Directors;
- monitoring of the Tax Control Framework (Assurance): the monitoring of compliance risk takes the form, in addition to preventive activities, of the subsequent verification of the appropriateness and effective application of internal processes and procedures and of the organisational adjustments suggested for risk prevention, as well as, more generally, through the control of the effective compliance with external and internal regulations by corporate structures. The Tax Control Framework is controlled by the Head of the Tax Control Office on the basis of an annual audit plan and according to the logic provided for by the Group Compliance Guidelines and the Integrated Internal Control System Regulation;
- dissemination of culture: tax risk is also monitored through the dissemination of a corporate culture resting on the principles of honesty, fairness and compliance with the spirit and letter of the rules;
- information flows to the Corporate Bodies: at least once a year, the Board of Directors, the Risks and Sustainability Committee and the Management Control Committee receive from the Head of the Tax Function all the information concerning the main tax-related policies and choices followed, the progress of discussions with the Italian Revenue Agency under the collaborative compliance scheme, as well as the results of the tax audit activities, including on the appropriateness of the TCF, carried out during the period by the Manager responsible for tax controls. The Head of the Tax Function shall also promptly notify the Corporate Bodies of any compliance issues and events considered of particular relevance;
- tax risk management process of an interpretative nature: regulatory alignment, advisory and clearing activities, as well as the preparation of tax returns, involve making interpretative decisions on the applicable legislation. In making such decisions, the Tax Function must assess the degree of certainty of the stance it intends to adopt. Where the interpretation presents a high degree of uncertainty and has a material impact on the company’s operations, the Tax Function measures the exposure to tax risk, the assumption of which is resolved, depending on materiality, according to the approval thresholds indicated in the Guidelines. The methodologies for assessing the degree of certainty of interpretation and the related impact on the Bank’s operations and for determining tax risk are defined by specific internal rules (Rules for the management of tax risk within the collaborative compliance scheme with the Italian Revenue Agency) and shared between the Tax Function and, to the extent of their competence, with the structures of the Chief Compliance Officer and Chief Risk Officer Governance Areas.

The Group controls tax risks through the adoption of the TCF, which includes processes, procedures, governance rules, ongoing maintenance activities and testing, as well as the use of technology to support the consistency of the data used in the calculation of taxes due by law.

The TCF makes it possible to monitor and measure tax risk, taking into account both tax compliance (compliance risk, managed in the risk maps where residual risk is highlighted) and the uncertainty arising from its application (interpretation risk, managed through the specific procedure leading to the measurement of the impact and materiality of tax uncertainty).

Tax risks spread throughout the Group are monitored and managed locally, but under the guidance and control of the Parent

Company.
For the main entities of the Group, which participate in the collaborative compliance scheme, a closing note for the compliance year is prepared and signed annually by the Italian Revenue Agency and the individual Group company, which contains the results of the controls on the Tax Control Framework and the discussions carried out on significant tax risks (this closing note is also disclosed to the Board of Directors in the periodic report on the TCF).
Intesa Sanpaolo, in adopting processes and procedures for the management of tax risk, in compliance with the above-mentioned Principles, ensures that the processes for the management of tax risk provide appropriate protection to internal and external stakeholders, in terms of risk mitigation (also in view of possible reputational impacts) and in the more general terms of safeguarding stakeholder value, understood as the stakeholders' interest in maintaining the company's value.
Intesa Sanpaolo, through a structured process on an annual basis, prior to the shareholders' meeting to approve the financial statements, ensures that shareholders have the opportunity to submit questions and queries, including with regard to tax issues, relevant to the items on the agenda. The questions asked and the answers given are published on Intesa Sanpaolo's website.
In addition, Intesa Sanpaolo has adopted, for all staff working in the Group and for certain stakeholders, a whistleblowing system for reporting acts or conduct that may constitute infringements of the rules relating to banking activities, as well as of the company's internal policies and/or procedures, or conduct giving rise to conflicts of interest. This system also applies to conduct that may involve infringements of tax principles and legislation.
Intesa Sanpaolo's commitment to good governance in taxation has also been implemented through the preparation of processes for the proper management of tax incentives, adopted by Italy to enable the ecological transition of the country's real estate assets and whose implementation the Group has actively supported by purchasing tax credits from customers, after carrying out controls to avoid fraud.

In 2024, the Group recognised income taxes of 4,048 million euro for the year, mostly in Italy, where most of the operating income was realised, as shown in the table "Breakdown by geographical area: income statement figures" (rows "Operating Income" and "Taxes on Income") in Part L of these Notes to the Financial Statements.

TAX LITIGATION

At the Group level at the end of 2024, the claim for tax disputes (total value of claims for taxes, penalties and interest) was 155 million euro, in line with 2023.
The Group's tax litigation risks are covered by adequate provisions to the Allowances for Risks and Charges (51 million euro in 2024; same amount in 2023).
The Parent Company had 429 pending litigation proceedings (459 as at 31 December 2023) for a claim of 108 million euro (in line with 2023), considering both administrative and judicial proceedings at various instances.
In relation to these proceedings, the likely risks were quantified at 40 million euro as at 31 December 2024 (41 million euro as at 31 December 2023).
Compared to 31 December 2023, for the Parent Company, the main events that gave rise to movements of the claim (+0.3 million euro) consisted of:

- an increase (about 7.1 million euro) from: i) 0.5 million euro in respect of a long-standing claim by the Portuguese tax authorities on the discontinued Sanpaolo IMI Bank International S.A. (based in Madeira), which was charged with having failed to apply withholding taxes in 2002, 2003 and 2004 on interest paid to foreign bondholders. The increase in the claim is due to the increase, taking effect on 1 January 2024, of the interest rate for arrears accruing under Portuguese law on the principal tax claim (the alleged omitted withholdings); ii) 1.6 million euro for new municipal property tax (IMU) claims on real estate from both terminated and current lease contracts; iii) 4.1 million euro for new registration tax claims, mainly (3.9 million euro) related to registration on judicial documents; iv) 0.6 million euro for interest accrued on pending litigation; v) 0.3 million euro for additional cases (mainly related to a mortgage and land registry tax assessment on a leased property and to notices of TARI (waste tax) assessment for the years 2020-2023 in the Municipality of Rome);
- a decrease (about 6.8 million euro), from: (i) 2.1 million euro for the closure of municipal property tax (IMU) claims on real estate from both terminated and current lease contracts; (ii) 3.6 million euro for the closure of registration tax claims relating to registration on judicial documents (1.8 million euro) as well as registration on restructuring agreements (0.6 million euro), registration on acknowledgement of debt (0.6 million euro), registration on lease agreements (0.1 million euro), registration on the reclassification of business transfers into business disposals (0.1 million euro), debit reservation of registration tax with reference to a civil judgment (0.2 million euro), and registration on cases with a small unit amount (0.2 million euro); (iii) 0.7 million euro for the settlement of claims concerning regional motor vehicle tax; (iv) 0.2 million euro for the closure of two cases concerning VAT on nautical leasing; and (v) 0.2 million euro for the closure of additional cases with a small unit amount.

Again with respect to 31 December 2023, for the Parent Company, the main changes in the Allowance for Risks and Charges including legal expenses (-1 million euro) were:

- an increase (around 1.9 million euro) attributable to: i) 0.5 million euro in respect of the above-mentioned long-standing claim by the Portuguese tax authorities on the discontinued Sanpaolo IMI Bank International S.A. (based in Madeira), which was charged with having failed to apply withholding taxes in 2002, 2003 and 2004 on interest paid to foreign bondholders. The higher provision became necessary due to the increase, taking effect on 1 January 2024, of the interest rate for arrears accruing under Portuguese law on the principal tax claim (the alleged omitted withholdings); ii) 0.8 million euro for municipal property tax (IMU) claims on real estate from both terminated and current lease contracts; iii) 0.5 million euro for legal expenses; and iv) 0.1 million euro for accrued interest on pending litigation;
- a decrease (around 2.9 million euro) attributable to:
  - use of provision (approximately 0.6 million euro) for: i) 0.2 million euro for the settlement of claims relating mainly to VAT on nautical leasing; ii) 0.4 million euro for payment of advisory fees;
  - releases of provision to the income statement (about 2.3 million euro) for: i) 2.0 million euro for the settlement of claims for municipal property tax (IMU) on real estate from terminated and current lease contracts; ii) 0.1 million euro for the release of fees no longer due; iii) 0.2 million euro for the settlement of claims concerning registration tax and VAT on lease contracts.

With regard to the Group's other Italian companies, tax disputes totalled 39 million euro as at 31 December 2024 (same amount as at 31 December 2023), covered by specific provisions amounting to 6 million euro (5 million euro as at 31 December 2023).
The change in the claim with respect to 31 December 2023, of an essentially stable amount (increase of 1.7 million euro and decrease of 2 million euro), refers to:

- +0.1 million euro for new tax assessments against Intesa Sanpaolo Protezione in relation to taxes on premiums for the years 2013-2018;
- +0.3 million euro for a new tax assessment against Intesa Sanpaolo Assicurazioni for withholding taxes (and related penalties and interest) for the year 2020 regarding the company merged by incorporation Bancassurance Popolari (BAP);
- +0.1 million euro for new tax assessments against SIREF for withholding taxes (and related penalties and interest) for the years 2016 and 2020;
- +0.6 million euro for interest accrued on the tax assessment against Intesa Sanpaolo Private Banking (ISPB) for the year 2016 regarding the tax deduction of the amortisation of goodwill arising from contributions received by ISPB in 2009, 2010 and 2013 and released by ISPB by using the option for the realignment of tax values to balance sheet values pursuant to Article 15, paragraph 10, of Decree Law No. 185/2008;
- +0.6 million euro for penalties imposed on Intesa Sanpaolo Assicurazioni (as the absorbing entity of Intesa Sanpaolo Life DAC) for the year 2018 on the topic of monitoring, commented below;
- -1.1 million euro for SIREF's tax dispute for Withholding Taxes as withholding agent filing form 770 for 2018, for which the Court issued a ruling in March declaring the matter ceased as a result of the removal of the disputed tax payment order;
- -0.7 million euro for the dispute of IW Bank (now Fideuram - Intesa Sanpaolo Private Banking) for the year 2007 concerning penalties for late payment of withholding taxes on interest income accrued on bank accounts, pursuant to Article 26 of Presidential Decree no. 600/1973, following favourable Court of Cassation judgements;
- -0.2 million euro for the decrease in penalties on the Cargeas dispute concerning taxes on premiums for 2011.

There were no significant events relating to the changes in the provision.

The tax disputes as at 31 December 2024 of the foreign subsidiaries involve relatively small amount of the claim, of 8 million euro (substantially unchanged from 31 December 2023) against provisions of 5.9 million euro (5 million euro as at 31 December 2023).
The change in the provision with respect to 31 December 2023, with an overall increase of 0.9 million euro, refers to:
- -0.4 million euro (also of claim) on Bank of Alexandria's outstanding dispute for stamp duty, due solely to the exchange rate difference (devaluation of the Egyptian pound against the euro);
- +0.3 million euro (also of claim) on disputes arising in 2023 and 2024 of Intesa Sanpaolo Bank Albania concerning withholding taxes;
- +1 million euro on litigation by Intesa Sanpaolo Banka D.D. Bosna I Hercegovina relating to VAT on certain services to which the VAT exemption regime was claimed not to apply as they are of a non-financial nature.

In the following paragraphs, information is provided regarding the most important ongoing disputes, and on several orders to file appearances and questionnaires served during the year.

Parent Company

Banco Sudameris Brasil - Direct taxes year 1995 (PDD1 dispute)
With regard to the dispute with the Brazilian tax authorities (claim of around 41.6 million euro), concerning taxes on income and social security contributions for the year 1995 for the company Banco Sudameris Brasil (now Banco Santander Brasil) – better known as the "PDD1 dispute" – the proceedings are pending in second instance. The proceedings were adjourned several times. Lastly, at the hearing of 18 December 2024 - for which the law firm assisting the Bank filed an explanatory brief - the hearing was adjourned to a date to be fixed in 2025 at the request of the Judge-Rapporteur in order to better examine certain documents of the case. For a detailed analysis of this dispute, see the Notes to the previous consolidated financial statements. The provision for risks relating to this case is 8.1 million euro.

Disputes regarding registration tax on the reclassification of business contributions and subsequent sale of the participations as sales of business units and the consequent assessment of a higher business unit value
These are disputes concerning the recovery of registration tax paid on business contributions and the subsequent sales of the equity investments, which were reclassified by the tax authorities as sales of business lines and then also subject to assessment of a higher value for the business line (total claim of 21 million euro). These disputes were not settled through the "tax amnesty" because the Bank had already provisionally paid the full amount assessed and as a result of the settlement would not have been entitled to the repayment of the sums in excess of the amount due for the settlement, or because there were sound prospects of a favourable outcome to the proceedings pending before the Court of Cassation. The provision for risks for these positions is approximately 2 million euro.

Dispute regarding the municipal property tax ("IMU") on real estate not repossessed following the termination of the related lease contracts
The dispute regarded the identification of the taxpayer liable for the municipal property tax (IMU) in relation to real estate assets owned by the lease companies or banks and leased out to third parties, where the lease was terminated early due to default by the lessee, or as a result of insolvency proceedings involving the lessee, but without the lessee having returned the asset to the lessor. Over the years a tax dispute arose on this matter (also affecting the former Mediocredito Italiano and Provis) relating to whether the lessee is (still) liable for the municipal property tax rather than (already) the lease company/bank in the period between the date of termination (or dissolution) of the lease and the date of physical return of the asset to the lessor. In 2020, the Court of Cassation settled on the view that the lease company/bank was liable for municipal property tax (IMU) from the date of legal termination of the contract, regardless of repossession of the asset. In addition, the 2020 Budget Law provided for the abolition of the single municipal tax (IUC), with regard to its components relating to the municipal property tax (IMU) and tax levy on indivisible services (TASI), and the unification of the two taxes into the new IMU. On 18 March 2020, the Ministry of the Economy and Finance – Finance Department – Tax Legislation and Tax Federalism Unit, with circular no. 1/DF, commenting on the latter changes, provided precise indications regarding the liability for the new IMU with regard to the date of termination of the lease contract in accordance with the prevailing case law. Accordingly, starting from 2020, the bank decided to proceed with the payment of municipal property tax for all leased real estate assets with terminated contracts, regardless of repossession of the asset, seeking recovery from the former users, where possible. It was also decided to gradually withdraw from all pending disputes on assessments relating to years up to 2019, following an attempt at settlement with the interested municipalities to quash the penalties and offset trial fees.
The total claim is 5 million euro, allocated in full to the allowance for risks.

VAT litigation on the reclassification of nautical lease contracts to loans
By notices of assessment relating to tax years 2005 (claim 3.9 million euro) and 2006 (claim 2.9 million euro), the Lombardy Regional Directorate claimed that Sanpaolo Leasint S.p.A. (merged by Mediocredito Italiano then merged into ISP) had misapplied the VAT rules in relation to certain lease contracts concerning pleasure boats ("nautical leasing").
The dispute is currently pending before the Lombardy Tax Court of Second Instance following the filing on 23 July 2024 of the order by which the Court of Cassation had referred the case back to said Tax Court for a new judgment on the merits of the entire dispute.
In a nutshell, the dispute still pending refers to 29 lease contracts and concerns the alleged misapplication of the VAT regime of financial leases of pleasure craft, determined by identifying a flat-rate taxable base on the basis of a time of use outside the territorial waters of the European Union estimated by the tax authorities in Circulars no. 76/E of 2001 and No. 49/E of 2002. According to the Regional Directorate, the application of that regime was unlawful because those lease contracts involved the typical effects of a direct transfer of the asset from the bank and the end user, the consideration for which, unlike the leasing fee, was fully and flat-rate VAT-taxable, as provided by the aforementioned circulars.
In the course of the proceedings, the Italian Revenue Agency's claim was reduced from an initial total of 7.8 million euro to 5.6 million euro, which the Bank has already paid in full by recognising a receivable from the Revenue Agency for "provisional collection" in the financial statements, prudentially making a provision for risks even though there are well-founded arguments

in law and in the case law of the Court of Cassation (Court of Cassation judgments nos. 5950 and 5951 of 5 April 2019) establishing the unlawfulness of the Italian Revenue Agency's claim.

Dispute concerning taxes due in Portugal on interest paid to foreign subscribers of bonds

In relation to the subsidiary Sanpaolo IMI Bank International S.A. Funchal, based in Madeira (Portugal) - dissolved in 2008 - a dispute is pending for the years 2002, 2003 and 2004 (claim 13.8 million euro). Originally, the disputed amounts totalled 28 million euro, which were reduced during the course of the proceedings to the current 13.8 million euro (of which 5.2 million euro of taxes and 8.6 million euro of interest).

On the merits, the local tax authorities disputed the non-taxation for local corporate income tax purposes of interest under the Euro Medium Term Note Programme (EMTN) bond issue programme, paid by the Portuguese subsidiary to beneficiary companies from which no evidence of non-tax resident status in Portugal had been provided.

No provisional payments have been made to the Portuguese tax authorities to date. On the basis of the local consultant's assessment of likely risk, this dispute is fully covered by a provision for risks.

* * *

As already reported in the Notes to the Consolidated Financial Statements of the 2023 Annual Report, between the end of last year and the beginning of the current year, ISP, as absorbing entity and/or consolidating entity, received several "invitations" and "questionnaires" from various Regional and Provincial Directorates of the Italian Revenue Agency for tax period 2017. Those documents set out IRES (Corporate Income Tax) claims regarding the tax treatment that the Italian companies of the Group applied to the income recognised through profit and loss at the time, against the commitment that the Parent Company unilaterally took on, to hold them harmless from the charges that would arise for those companies following the integration into the Group of Banca Popolare di Vicenza and Veneto Banca, the so-called "Venetian Banks" (these were charges for IT integration, charges for exit incentives for employees, and charges for the closure/merger of branches, etc.).

In the case in question, the subsidiaries considered IRES not applicable to that income, while the Directorates argued that it should have been taxed.

During numerous meetings held with the Italian Revenue Agency, first with the Collaborative Compliance Office and then with the Control Division and the individual Directorates, we set out the reasons why the alleged disputes should be considered entirely unfounded. At the end of the discussions, the following was agreed upon:

- as ISP had not paid any income to the subsidiaries during 2017, no voluntary correction was requested for that year;
- for subsidiaries merged before the contribution was received, the dispute should be permanently abandoned for both the subsidiaries and, correspondingly, for the absorbing company ISP;
- regarding the subsidiaries that received the contribution during the tax periods from 2018 to 2022, they must include the contribution in the calculation of their taxable income for IRES (corporate income tax) purposes (and the related surcharge, if due) in the year it is received, and, in the same year, ISP will deduct the corresponding cost for IRES and the related surcharge. In operating terms, that adjustment is defined through a voluntary correction of tax return pursuant to Article 13 of Legislative Decree no. 472 of 18 December 1997, filing supplementary tax returns "unfavourable" to the subsidiaries and "favourable" to ISP.

The overall regularisation activity for tax periods 2018 to 2022 was completed in December 2024.

The overall net impact at the Group level in terms of taxes, penalties and interest, to rectify the position of the companies involved for all the years concerned, was overall negligible, since the charges are offset by the benefit for ISP of deducting for tax purposes (i) the additional contributions paid to compensate the companies for the tax burden they had to pay to rectify their position and (ii) the contributions paid at the time in the period 2018-2022, against which no DTAs had been recognised.

* * *

With regard to disputes settled in the period, the main ones include: a) the dispute concerning registration tax on an order to pay issued by the Civil Court of Brescia, which, in ordering an industrial company to repay ISP the amount financed, referred to a standstill agreement that allowed the company to continue operating by postponing actions to recover the financial exposure. The Agency considered said agreement as an acknowledgement of debt and considered it subject to 1% registration tax (being a declaratory act relating to assets or relationships). The first-instance decision in favour of the Bank became final and the Revenue Agency reimbursed the entire amount that had been paid on a provisional basis (claim 0.6 million euro); b) the dispute with the Italian Revenue Agency - Provincial Directorate I of Rome concerning registration tax on the judgment of the Civil Court of Rome that upheld a request for claw-back in bankruptcy of bank account remittances, sentencing the Banco di Napoli to return to the plaintiff 14.4 million euro plus legal interest. The dispute ended on 18 March 2024, when the Tax Court of First Instance of Rome filed a ruling which acknowledged the Revenue Agency's recognition of the merits of the Bank's position and discontinued the matter at issue (claim of 0.2 million euro).

* * *

The following questionnaires were notified to ISP in 2024:

- former Mediocredito Italiano - questionnaire on tax return for the year 2018.
  On 11 March 2024 the Italian Revenue Agency - Lombardy Regional Directorate served a questionnaire to ISP for the incorporated entity Mediocredito Italiano, regarding the tax return for 2018 and, specifically, in relation to several tax credits, totalling 2.4 million euro, declared and used to offset the payment of VAT due for that period. ISP replied to the questionnaire on 15 March 2024, providing the information requested;
- former UBI Leasing S.p.A. - questionnaire on tax return for the year 2018.
  On 19 September 2024, the Lombardy Regional Directorate of the Italian Revenue Agency served a questionnaire on ISP for the merged UBI Leasing with regard to the year 2018, requesting in particular details and supporting documentation relating to certain decreases shown in the annual income tax return (line RF55 code 99). ISP answered the questionnaire on 18 October 2024. The Italian Revenue Agency communicated that no tax violations were found on the basis of the questionnaire.

* * *

As regards ISP's international branches, the following should be noted.
On 4 January 2023, the London branch received a questionnaire from the UK Inland Revenue regarding the year 2020. The questions mainly concerned international transfer pricing matters. During 2023, the British authority (HMRC) obtained extensive documentation from our branch in response to the questions raised. In February 2024, an in-depth meeting was held with the tax inspectors, following which the inspectors requested further documentation, mainly focused on the branch's industrial and organisational structure after Brexit and on the redefinition of the scope of operations with non-EU customers. In December 2024, the British tax authorities extended the audit to tax year 2022 as well. To date, they have found no irregularities.
With regard to the New York branch: (i) the tax audit, which began in January 2021 and was conducted by the Internal Revenue Service (IRS) with reference to the tax return filed for the 2018 tax year, was closed without any findings. The branch's request for a refund in the amount of approximately 4 million US dollars as a result of the recalculation of taxes owed in that period was also granted; (ii) the tax audit, notified in July 2021, conducted by the City of New York (NYC) on tax years 2018 and 2019 is in progress. No claims have been made for the time being.
A claim was also brought against the former New York representative office of CR Firenze for failure to file a tax return for tax year 2015 (estimated charge of approximately 1,600 euro). Since the representative office was closed down in tax year 2010, the New York branch of ISP initiated contact with the State of New York to have the claim cancelled.
It should be noted that the tax audit, initiated in 2021, on the Munich branch of the former UBI Banca for the years 2015 to 2018 is still in progress. After initially requesting general accounting documentation, in May 2024 the tax auditors requested documentation on itemised and lump-sum write-downs on intragroup receivables and service contracts for the years 2015 to 2017. After the required documentation was painstakingly collected, it was delivered to the local authorities on 6 December 2024. No claims have been made for the time being.
In June 2024, a tax audit was started for tax year 2019 on the Frankfurt branch. The tax auditors have not yet issued any findings.
In August 2024, a tax audit was launched for tax periods 2021-2023 on the Shanghai branch. No issues have been raised for the time being.

Group Companies

For Intesa Sanpaolo Private Banking ("ISPB") on the dispute relating to the notice of IRES (corporate income tax) and IRAP (regional production tax) tax assessment (also notified to ISP as consolidating entity for IRES purposes only) for the year 2016 - which challenged the tax deduction of the amortisation of goodwill arising from contributions received by ISPB in the years 2009, 2010 and 2013 and released by ISPB using the option to realign tax values to balance sheet values pursuant to Article 15, paragraph 10, of Decree Law no. 185/2008 - the Lombardy Second Instance Tax Court, by judgment filed on 5 September 2024, rejected the appeal (by ISP and ISPB) against the unfavourable first instance ruling (higher taxes of 4 million euro, plus penalties of the same amount and interest). The judgment will be appealed before the Court of Cassation within the time limit established by law.
The same dispute is ongoing for the year 2012 (higher taxes of 3.9 million euro, plus penalties of the same amount and interest), and is currently pending before the Court of Cassation.
For the other years (2011, 2013, 2014, 2015 and 2017), disputes were settled with the procedure under Law no. 197 of 29 December 2022 ("2023 Budget Law"), known as "tax truce".

On 28 December 2023, Fideuram ISPB Asset Management SGR (hereinafter, Fideuram SGR) received from the Italian Revenue Agency – Lombardy Regional Directorate an order to file an appearance regarding the year 2017 for IRES and IRAP, following the delivery of documentation in response to a questionnaire served on 4 August 2023 on the alleged transfer pricing issues arising in relation to the consideration for fees and commissions received by Fideuram SGR in delegated manager activities for investment funds performed in favour of the Irish associate Fideuram Asset Management Ireland – FAMI (principal). With specific regard to those management fees and commissions, the Agency has repeated the same adjustments made for the years 2011 to 2013 (which gave rise to tax settlement proposals) as well as for the year 2016, which Fideuram SGR accepted by signing the settlement proposal.
As a result of that order, adversarial proceedings were initiated, which resulted in the finalisation of the tax settlement proposal on 12 April 2024, which settled the payment of IRES and IRAP of 0.19 million euro plus interest of 0.04 million euro and, thus, for a total of 0.23 million euro (nothing for penalties, given that the transfer pricing documentation had been correctly prepared).
Moreover, after the answers provided following the request from the Lombardy Regional Directorate of the Italian Revenue Agency, received by Fideuram SGR in March, regarding documentation and information on calculation of the fees received in

2018 as investment funds delegated manager for the Irish subsidiary FAMI, on 11 November 2024, the company accepted the Department's proposal to correct the prices charged, increasing them by 907,000 euro, with corresponding taxes of approximately 268,000 euro, plus default interest of approximately 50,000 euro, for a total of 319,000 euro (in this case too, no penalties were applied, thanks to the correct preparation of transfer pricing documentation).

For Fideuram – Intesa Sanpaolo Private Banking (hereinafter Banca Fideuram), as a result of the Bank's appeal, three lawsuits are pending before the Court of Cassation concerning the failure to withhold 27% of the interest accrued in 2009, 2010 and 2011 on foreign bank accounts held at Fideuram Bank (Luxembourg) by two "historic" Luxembourg mutual funds (Fonditalia and Interfund SICAV), for which Banca Fideuram was only the placement bank and correspondent bank in the years in question (claim of 3 million euro). Since the Bank had been unsuccessful in all second instance court cases, it was deemed appropriate to set aside a provision for risks to cover the risk, including penalties and interest, in agreement with the legal counsel handling the cases pending before the Court of Cassation.

Cargeas Assicurazioni – merged into Intesa Sanpaolo Assicura, now Intesa Sanpaolo Protezione – underwent a tax audit by the Italian Revenue Agency, Lombardy Regional Directorate, Large Taxpayers Office, aimed at verifying the correct application, for the years from 2010 to 2018, of the tax rules on private insurance and life annuity contracts pursuant to Law no. 1216 of 29 October 1961.
As a result of the audit, the authorities issued a claim against the company that redundancy insurance policies (which are mandatorily associated with salary-backed loans and optional with other mortgages, loans and consumer credit), should not be subject to tax on insurance premiums at a rate of 2.5%, but should, in the opinion of the Italian Revenue Agency, instead be classified as credit risk insurance policies, subject to a tax rate of 12.5%.
In particular, Cargeas has so far received notices of assessment for the following years:

- 2010 (claim 5.7 million euro redetermined after internal review to 5.1 million euro). The dispute is pending at second instance since the Italian Revenue Agency appealed against the first instance ruling in the company's favour;
- 2011 (total claim 4.6 million euro reduced following internal review to 4 million euro). This too is pending at second instance on appeal by the Italian Revenue Agency;
- 2012 (claim 0.9 million euro). The case is pending at first instance;
- 2013 (claim 0.6 million euro). The case is pending at first instance;
- 2014 (claim 22 thousand euro). The case is pending at first instance;
- 2015 (claim 18 thousand euro). The case is pending at first instance;
- 2016 (claim 12 thousand euro). The case is pending at first instance;
- 2017 (claim 9 thousand euro). The case is pending at first instance;
- 2018 (claim 12 thousand euro). The case is pending at first instance.

The company believes that the risk of a negative outcome is possible, but not likely. Accordingly, it has not made any provision for taxes, penalties and interest, except for the cost of legal fees.

On 7 November 2024, Intesa Sanpaolo Assicurazioni was served a payment notice for withholding taxes (and related penalties and interest) for the year 2020 relating to the merged Bancassurance Popolari (BAP) totalling 0.3 million euro. In December 2024, the company first filed an application for annulment following an internal review and then, as no response was received, filed an action before the Tax Court. Although the information in the payment notice is rather unclear, the company considers the claim to be unfounded and therefore, has matched the provisional payment with a receivable from the tax authorities, without making any provision.
In late 2023, Intesa Sanpaolo Assicurazioni (formerly Intesa Sanpaolo Vita), the absorbing company of Intesa Sanpaolo Life DAC - an Irish insurance company which had been merged by incorporation (hereinafter ISL) - received from the Guardia di Finanza (Italian Tax Police) the request to submit, for tax periods 2018-2022, an explanatory report, accompanied by any supporting documentation, on compliance with the obligations directly attributable to the above-mentioned foreign insurance company, concerning tax monitoring, pursuant to Article 1 of Decree Law 167/1990, taking into account the contents of the Italian Revenue Agency's Resolution no. 62/E of 13 November 2023. After the submission of the report on 25 January 2024, the company met with the tax auditors on 1 March 2024, together with its advisor, and reiterated all the reasons why ISL was not subject to the tax monitoring obligation, the main reasons being the following:

- ISL, which relied on banking intermediaries resident in Italy to distribute life insurance policies, did not have tax monitoring obligations until 2022. Since the legislation identifies the parties having tax monitoring obligations by referring fully to the provision placing anti-money laundering obligations on banking and financial intermediaries, companies based in another Member State without a branch in Italy could not be considered to have tax monitoring obligations before 1 January 2022, the date from which, according to IVASS, said parties became subject to anti-money laundering obligations;
- even if ISL qualifies from 2022 as a company established in another Member State without a branch in Italy, nevertheless, in such capacity, it has no customer due diligence obligations, as it is already subject to such obligations under Irish anti-money laundering legislation;
- by using intermediaries resident in Italy for the distribution of life insurance policies, ISL in practice does not have tax monitoring obligations, since, in the tax periods from 2018 to 2022, it did not take part in the execution of transfers of means of payment subject to those obligations, having channelled the collection of premiums and the payments of sums for insurance benefits paid into a bank account opened by ISL itself with ISP, as intermediary in the distribution;
- ISL does not have tax monitoring obligations because the extension of such obligations to companies based in another Member State established in Italy without a branch infringes the EU principle of proportionality due to the fact that the data subject to the tax monitoring obligations must already be transmitted by Ireland to Italy under Directive 2014/107/EU (DAC 2), introducing the Common Reporting Standard and the related Irish implementing legislation. ISL has fully complied with its obligations under DAC 2 and, as a result, has enabled the Irish Revenue Commissioners to fulfil their obligation to report annually to the Italian Revenue Agency the data thus identified.

Therefore, the Guardia di Finanza – making reference to the Questionnaire prot. 613669 of 11 October 2022 sent to the former Intesa Sanpaolo Life DAC and responded to on 2 December 2022 with the information regarding insurance premiums collected and insurance benefits provided to the beneficiaries in the years 2017-2020 – in March 2024 requested the addition to the statements submitted in 2022, solely for the years 2018-2020 (as the year 2017 had since become time-barred), of the information relating to both the premiums collected and the amounts paid (relating to the insurance benefits provided) with detailed evidence of some further information. In addition, the same documentation provided for the years 2021 and 2022 was also requested for the years 2017 to 2020 accompanied by the same detailed schedules. The company responded to the requests by means of a communication in May 2024.
From 17 October to 6 December 2024, the Guardia di Finanza continued its audit activities, during which the company submitted an expert opinion drawn up by its consultant on 22 April 2024 on the lack of any obligation for ISL to provide the identification details of insured customers. Subsequently, the company also submitted a further defence brief by the legal counsel dated 7 November 2024, which further explained the reasons why the company believed (and still believes) to be exempt from the monitoring obligations. On 6 December 2024, the Guardia di Finanza served the company with a Tax Audit Report which claimed that in the tax periods from 2018 to 2022 ISL had failed to comply with its tax monitoring obligations, limited to transactions carried out on behalf or in favour of natural persons, non-business entities and partnerships and equivalent associations (“monitored entities”) if the amount is equal to or greater than 15,000 euro or, from 2021, 5,000 euro.
In particular, the Guardia di Finanza Tax Audit Report claimed that the transfers of premiums made by ISL with debiting of the current account of tax-monitored policyholders and crediting of the current account held by that insurance company in Italy and subsequent crediting of the current account held by it in Ireland constituted “transfers abroad’ and were hence subject to tax monitoring obligations, even though the transfers abroad were made on its own account. The Guardia di Finanza also argued that transfers of insurance benefits made by debiting the current account held by that company in Luxembourg and crediting the current account held by it in Italy and the subsequent crediting of the current account of the beneficiaries subject to monitoring constitute “transfers from abroad”, as such subject to tax monitoring obligations, only where such benefits did not include capital income liable for substitute tax (a case arising where benefits were of a lower value than the premiums paid).
The Guardia di Finanza forwarded the Tax Audit Report to the competent Provincial Directorate I of Milan of the Italian Revenue Agency which, on 13 December 2024, served on Intesa Sanpaolo Assicurazioni a tax assessment only for the year 2018 (whose assessment deadline expired on 31 December 2024), applying the administrative penalty of 0.6 million euro (10% on the highest single capital transfer).
Discussions will start shortly with the Italian Revenue Agency to ascertain whether there are margins to settle amicably - and at reduced cost - all the years included in the Tax Audit Report (2018 – 2022).
Finally, it should be noted that an amount of 0.2 million euro was prudentially set aside in the 2024 budget. This amount is one third of the penalty imposed for 2018, which is payable in a reduced amount if the company accepts the assessment without initiating litigation. Having also consulted with the legal counsel, the amount of the provision was also based on the circumstance that for the subsequent years no measure has been yet notified by the Italian Revenue Agency and that, at present, the amount of the penalty that can be imposed for the years 2019-2022 is highly uncertain because based on the discussions held, it seems likely that the Italian Revenue Agency will decrease significantly the amounts claimed.

On 22 December 2022, Eurizon Capital SGR S.p.A. (“EC ITA”) had received a summons to appear relating to IRES (corporate income tax) and IRAP (regional production tax) for 2016 - concerning the alignment to arm’s length values of the rates charged for the delegated management activity provided by EC ITA to the UCIs set up by its Luxembourg subsidiary Eurizon Capital S.A. (“EC LUX”). During 2023, intensive discussions took place with the Assessment Office, at the end of which the Office revised its initial position (for details, please see the full year reports as at 31 December 2022 and 2023, and the 2023 quarterly reports). On 27 March 2023, the Assessment Office informally submitted to EC Italia a draft settlement proposal, based on the following elements: higher Italian taxable income of 26.8 million euro (vs. the initial claim of 151.1 million euro) against EC LUX’s total of 208 million euro, resulting in higher IRES and IRAP taxes due of 8.8 million euro (vs. the initial 50 million euro), plus interest of 1.8 million euro (vs. the initial 9.6 million euro), without the application of penalties (vs. the initial 45 million euro), for a total of 10.6 million euro (vs. the initial claim of 104.6 million euro).
In the light of the above, and considering that it was to be expected that the negotiation between the Italian Tax Authority and the Luxembourg Tax Authority (which have opposite interests to the former) would result in determining the fair transfer price from EC LUX to EC ITA at a lower level than the one alleged by the Italian Tax Authority, EC ITA has accepted the Italian Revenue Agency’s proposal in the terms set out above. This made it possible to prevent a tax dispute for significant amounts and of uncertain outcome (as it concerned valuation issues which are therefore inevitably subject to margins of discretion) and which would have dragged on for several years. As a result, EC ITA concluded the dispute concerning its transactions in 2016 with its Luxembourg subsidiary EC SA by means of tax settlement agreement.
Following this settlement, the Italian Revenue Agency - Lombardy Regional Directorate sent EC ITA a new questionnaire concerning IRES and IRAP for the year 2017 “in order to check for any continuing tax issues related to intragroup transfer pricing in relation to the 2016 tax period”. EC ITA sent the “Master File” and “National Documentation” to the Agency on 22 June, followed by the requested documentation (audit report and summary statement of increases and decreases in IRES tax and IRAP tax) on 27 June.
Following the receipt of a similar questionnaire on 23 November 2023 for the year 2018, EC ITA also sent the Italian Revenue Agency - Lombardy Regional Directorate a copy of the “National Documentation” on the transfer pricing for the 2018 tax period, together with the audit report and the details of the increases and decreases for IRES tax and IRAP tax purposes for the 2017 tax period.

In addition, on 4 April 2023, the Italian Revenue Agency – Lombardy Regional Directorate – Large Taxpayers Office initiated a similar tax audit on Epsilon SGR S.p.A. (“Epsilon”) regarding the year 2017 and concerning direct taxes, IRAP, VAT and obligations of tax collection agents. During the audit, the verification was formally extended to the year 2018 solely for intragroup transactions with non-resident parties. In its tax audit report drawn up on 6 October 2023, in relation to the years 2017 and 2018 concerned, the Office i) found that the cross-border transaction concerning the UCI management service provided by Epsilon to its Luxembourg subsidiary EC LUX was not aligned with arm’s length conditions and ii) determined a

higher taxable amount of 29.6 million euro over the two years, calculated on the assumption that the correct transfer price corresponded to the third quartile of the price range applied in comparable transactions with independent parties, based on the same stance adopted by EC ITA in accepting the settlement agreement for the year 2016.
Discussions were then initiated with the Agency to ensure that the transactions between EC ITA, Epsilon SGR and EC LUX in the two-year period 2017-2018 were examined in a consistent and coordinated manner.
After many meetings, an agreement was reached with the Lombardy Regional Directorate to apply the median for 2017 and the first quartile for 2018, thus significantly lowering the reference values compared to the third quartile applied when closing the agreement of EC ITA for 2016 and for the finding in the tax audit report on Epsilon for 2017 and 2018.
The procedure ended with the signing of the acceptance of the IRES and IRAP tax assessments on 24 April 2024 and payment of the following amounts:

- for EC ITA, 9.6 million euro for 2017 and 2018, comprising higher IRES and IRAP taxes of 8.1 million euro and interest of 1.5 million euro;
- for Epsilon, 4.1 million euro for 2017 and 2018, comprising higher IRES and IRAP taxes of 3.4 million euro and interest of 0.7 million euro.

These amounts were fully covered by the provisions already set aside by the subsidiaries in their financial statements as at 31 December 2023.
Consequently, EC ITA and Epsilon commenced the procedures to recover the tax deducted by EC LUX in the three-year period 2016-2018 from the taxable amounts taxed in Italy. In particular:

- for the two-year period 2016 (EC ITA only) and 2017 (both Asset Management Companies - AMCs), on 27 December 2024, submitted to the Large Business Taxpayers and International Central Directorate of the Italian Revenue Agency a request to open a mutual agreement procedure pursuant to Article 26 of the double taxation treaty between Italy and Luxembourg with respect to the taxable amounts taxed in Italy. The amount of tax paid by EC LUX in the two-year period under review on the taxable amounts taxed in Italy totalled 3.9 million euro, of which 3 million euro relating to EC ITA's taxable amounts and 0.9 million euro relating to Epsilon's taxable amounts. The outcome of this recovery is quite uncertain;
- for the year 2018, the petition - soon to be filed - will be activated on the basis of the Directive (EU) 2017/1852, in force from 1 January 2018, on tax dispute resolution mechanisms in the European Union and will be aimed at recovering the 1.2-million-euro tax paid by EC LUX on the taxable amount taxed in Italy, of which 0.8 million euro relating to EC ITA and 0.4 million euro relating to Epsilon. The recovery of these amounts is deemed very likely by virtue of the application of a specific mechanism under EU law.

With regard to the international subsidiaries, details are provided below of the main outstanding disputes and tax audits in progress.
Intesa Sanpaolo Bank Albania is mainly concerned with: (i) a dispute pending before the Court of Cassation on the Bank's appeal, concerning the write-off of unrecoverable receivables which, according to the tax authorities, resulted in the unlawful reduction of the taxable base for direct tax for the years from 2003 to 2007 (claim 1.5 million euro); the risk of liabilities has been fully provisioned; (ii) a dispute concerning the former Veneto Banka pending at second instance concerning errors committed in the tax return for the 2013 tax period (claim 33 thousand, fully provisioned). In 2023, two withholding tax disputes arose for the year 2019 for a total amount of 0.16 million euro, which are currently pending in the first instance; the amount is fully provisioned.
In 2024, a dispute arose on withholding taxes for the year 2019 for a total amount of 0.15 million euro, which is currently pending in the first instance; the amount is fully provisioned.

Intesa Sanpaolo Brasil S.A. - Banco Multiplo, was audited by Receita Federal do Brasil (RFB). The audit was followed by a notice of assessment for direct taxes for the years 2015 and 2016. This dispute mainly concerns the improper use of tax losses carried forward pertaining to Indosuez W.I. Carr Securities Brazil Distribuidora de Titulos e Valores Mobiliarios S.A., which in the opinion of the Brazilian tax authorities could not be used, because they were generated before the reorganisation of Intesa Sanpaolo Brasil S.A. - Banco Multiplo, which would have modified the business activities carried out and the corporate structure. The tax assessment by RFB amounts (at the updated exchange rate) to 1.8 million euro in principal, plus interest of 0.6 million euro. The company has not made any provision to cover these sums, as it considers the risk of losing in court to be remote, also based on the local counsel's opinion. The first instance administrative proceedings ended unfavourably for the Bank, which appealed to the second instance administrative court on 14 December 2020.
The Brazilian company also underwent a tax audit by the Sao Paulo City Municipality, which resulted in tax assessments for Imposto Sobre Servicos (ISS) for the years 2016-2021. The total claim is 146,000 euro of principal (plus 15,000 euro of interest) against which the company has not made any provision, given that the risk of losing the case is considered to be low, based on the opinion of the local counsel and the circumstance that an independent consultant appointed by the court of first instance (where the case is pending) has considered the tax treatment applied by the company to be lawful.

Alexbank has a corporate income tax audit in progress concerning the 2018 and 2019 tax periods. At present no claims have been put forward.
In addition, there is a pending dispute concerning the non-payment of stamp duty with claim (at the updated exchange rate) of 0.8 million euro for tax periods 1984 – 2006. Compared to the exchange rate updated as at 31 December 2023 (1.2 million euro), there was a decrease of 0.4 million euro due to the devaluation of the Egyptian pound against the euro.
The calculation of the potential liability has been updated and is fully provisioned.
The tax audit on stamp duty relating to the tax period 2020 was closed with no findings.

Intesa Sanpaolo Banka D.D. Bosna I Hercegovina (hereinafter Intesa Sanpaolo Banka) underwent an audit by the Indirect taxes BiH office, which was followed by a VAT assessment notice for the period 1 April 2013 - 31 March 2018, served on 11 October 2018. The assessment concerns certain services that according to the tax authority are not VAT-exempt because they are non-financial, specifically: (i) international services rendered by VISA; (ii) services rendered to customers in connection with financial products (e.g. current account balances); (iii) legal services rendered by foreign suppliers. The dispute totals 0.1 million euro for VAT, penalties and interest. Intesa Sanpaolo Banka filed an appeal against the notice of assessment on 30 October 2018, which was rejected by the local tax authority. An appeal against the first instance decision was filed in March 2019. In 2021, the first instance tax authority rejected the bank's appeal and the bank appealed to the second instance tax authority, which was rejected by decision in February 2022. The bank filed a complaint with the director of the tax authority in February 2022, which was rejected by a decision of 23 May 2024. The bank appealed this decision on 19 July 2024 to the competent Court of Justice and is awaiting the scheduling of the hearing.
In addition, the Bank has two other Corporate Income Tax disputes pending for tax years 2004 - 2006, both of which are pending at second instance (the first instance in both cases ended unfavourably for the Bank). Contingent liabilities of 0.3 million euro arising from the second instance cases have been fully provisioned.
In October 2021, Intesa Sanpaolo Banka underwent a new VAT tax audit for tax periods 2018-2021 concerning certain services rendered by Mastercard and Visa in the payment card segment to banks based in Bosnia and Herzegovina, including our Group's bank, which had previously been considered, according to local law and practice, as financial services and consequently VAT exempt. During the audit, the Bosnian tax authority considered that the services in question could not be classified as financial services and were therefore to be fully taxed for VAT purposes. As a result of this decision, in May 2023 Intesa Sanpaolo Banka received a tax assessment of approximately 0.9 million euro for additional VAT for the period from April 2018 to August 2021, without default interest. In June 2023, the Bank filed an appeal, which was rejected by the same authority in the following August, and received a demand for payment of 0.4 million euro in default interest, which it promptly paid. The Bank appealed to the higher tax authority against the tax assessment of May 2023 and the demand for interest payment of August 2023. The disputed amounts (0.9 million euro for VAT and 0.4 million euro for interest) have been provisioned.
In light of the position taken by the Bosnian tax authority on the issue, in December 2023 the Board of Directors of Intesa Sanpaolo Banka resolved to set aside 1 million euro by way of additional VAT for the period from September 2021 to September 2023, plus default interest, and to allocate monthly provisions corresponding to the VAT accrued on services provided in the cards segment by Mastercard and Visa.
As a result, the updated provision totalled 2.8 million euro, of which 2.2 million euro for VAT and 0.6 million euro for interest.

Pravex Bank has had pending before the Court of Cassation since 2021, after the two lower courts ruled in its favour, the dispute concerning the non-recognition of the tax loss of approximately 4 million euro carried forward in 2018 from previous years. The tax dispute does not affect the profit and loss account because the company had not recognised deferred tax assets at the time.
For IMI SEC, the tax audit for direct taxes, covering the years 2015 and 2016, was closed without any findings. An audit conducted by the State of New York, also in relation to corporate income, is currently underway, covering the years 2015, 2016 and 2017. No findings are noted for the time being.

* * *

In connection with all the tax disputes outstanding as at 31 December 2024, for a claim, as stated above, of 155 million euro, of which 108 million euro relating to Intesa Sanpaolo, the Group has recognised receivables of around 44 million euro in its balance sheet assets to account for amounts paid on a provisional basis due to tax assessments, of which 13.2 million euro related to the Parent Company.
The portion of the allowance for risks, which relates to provisional tax assessments, amounts to around 20.6 million euro, of which 12.2 million euro for Intesa Sanpaolo.
The provisional payments in question were made in compliance with specific legal provisions, which provide for the mandatory payment based on an automatic mechanism totally independent of whether the related tax claims are actually founded and, thus, irrespective of the higher or lower level of risk of a negative outcome in the related proceedings. Thus, these payments were made solely because of the enforceable nature of the administrative acts that set forth the related tax claim, which does not lose its effectiveness even in the event of an appeal (no suspensive effect) and has no impact on the assessment of the actual risk of a negative outcome, which is measured using the criterion set forth in IAS 37 for liabilities.

SECTION 3 – RISKS OF INSURANCE COMPANIES

INTRODUCTION

The Insurance Division oversees management of the subsidiaries Intesa Sanpaolo Assicurazioni (formerly Intesa Sanpaolo Vita), Intesa Sanpaolo Protezione (from 1 December 2024 Intesa Sanpaolo Assicura absorbed Intesa Sanpaolo RBM Salute and became Intesa Sanpaolo Protezione), Fideuram Vita, InSalute Servizi and Intesa Sanpaolo Insurance Agency, with the mission of synergically developing the insurance product mix targeting customers of the Intesa Sanpaolo Group and expanding the concept of Bancassurance.
In managing insurance company risks, the Intesa Sanpaolo Assicurazioni Group (hereinafter, also the "Insurance Group") has set up an effective risk management system, proportionate to the nature, scope and complexity of the business conducted by the companies, which helps keep the risks the company is exposed to at an acceptable level, in line with the capital provisions.
The control system of risk management, for the entire scope of the Insurance Group, complies with the provisions of insurance supervisory regulations and is consistent with the corresponding internal regulations of the Intesa Sanpaolo Group on the control system, by setting out the reference principles and defining the responsibilities of the corporate bodies and control functions that contribute to the correct operation of the internal control system.
The Intesa Sanpaolo Assicurazioni Group risk management process is governed in line with the own risk profile self-assessment (Own Risk and Solvency Assessment – ORSA) and its Risk Appetite Framework (RAF), in accordance with the risk appetite of the Intesa Sanpaolo Group. The first level documentation above is joined by policies and operating guides regarding the processes for managing all the risks to which the Insurance Group is exposed.
There are four macro-stages of the risk management process:
– identifying and assessing risks;
– managing risks;
– monitoring risk exposure;
– reporting.

The specific risk assessment, in the first macro-stage, provides the top management with an immediate overview of risk exposure, making it possible to steer the decision-making processes and to define priorities for action, including at the strategic planning level.
The risk assessment process is composed of four stages to be carried out at least annually (or when specific events occur):
– analysis: includes all the activities of collecting information, identifying and surveying risks, associating them with an owner and involving other specialised functions to identify and assess the risk profiles that they directly oversee;
– assessment: includes the self-assessment of the probability, impact and mitigation of risk by the risk owner. At this stage, the owner identifies any actions to implement or already implemented to mitigate the risk;
– validation: includes the stage in which the risk owner validates the results of the analysis and the risk management function dialogues with the other fundamental functions to verify that the assessment result is in line with their evidence;
– risk map: includes the preparation of a dedicated report on the exposure to risk of each company in the Insurance Group and the Insurance Group as a whole.

This process also includes risks that are difficult to quantify but are deemed material for the Insurance Group, and mitigation actions may be proposed to manage them.

Once the risk assessment process is completed, the identified risks are managed according to the operational methods and limits of tolerance shown in the Risk Appetite Framework and in the policies that comprise the risk management framework.

The activities in the stage of monitoring risk exposure include performing several stress tests, consisting of a set of techniques used by the companies of the Insurance Group to:
– measure their vulnerability in the event of exceptional, but plausible events;
– enable the top management in understanding the relationship between the risk taken and the risk appetite of the company, as well as the adequacy of the available capital.

Where the results of the stress tests show the potential non-compliance with the minimum regulatory requirements and/or the inadequacy of the controls set up for each risk, the Internal Control, Risks and Sustainability Committee of the Insurance Group shall discuss and propose to Board of Directors of the companies any improvement measures to consolidate the company's capital stability, taking into consideration the solvency also at Insurance Group level.
This activity is joined by a structured process of gathering the information needed to calculate the indicators and metrics defined for the risk aspects in the Risk Appetite Framework to control the limits and early warning thresholds, developed based on and in compliance with the limits and the thresholds contained in the Intesa Sanpaolo Group's RAF.
Under the Risk Appetite Framework, the Insurance Group has set up limits and early warning thresholds on the main risk factors to which it is exposed. Specifically, the main limits and thresholds set out regard risks linked to:
– capital adequacy and solvency;
– liquidity;
– stability of profits;
– non-financial risks;
– reputational, ESG and climate change risks.

The Insurance Group also has a policy on the concentration of risks which defines the concentrations to deem material and their calculation methods, to mitigate the risk that they could have negative impacts on solvency and the financial situation.

Specifically, the objective is to define risk concentrations that are consistent with the risk management strategy and policy and the investment policies.
Risk concentrations are identified by assessing the impact they may have on company's financial position and solvency, following adverse scenarios on the main risk factors, both financial and technical.

3.1 INSURANCE RISKS

QUALITATIVE AND QUANTITATIVE INFORMATION

The typical risks of the Life insurance portfolio (managed through Intesa Sanpaolo Assicurazioni and Fideuram Vita) may be summarized into three main categories: premium risks, actuarial and demographic risks and reserve risks.
On the other hand, the typical risks of the Non-Life insurance portfolio (managed through Intesa Sanpaolo Protezione and, to a residual extent, Intesa Sanpaolo Assicurazioni) are mainly related to premium and reserve risks.

Premium risks are managed initially during definition of the technical features and product pricing, and over time through periodic verification on sustainability and profitability (both at product level and at portfolio level, including liabilities). With specific regard to the Life insurance portfolio, on defining a product, profit testing is used, aimed at measuring profitability and identifying any weaknesses beforehand, by means of specific sensitivity analyses.

Reserve risk is monitored on determining the expected contractual cash flows (Present Value of Future Cash Flows - PVFCF), both by correctly verifying the determination of the value representing the commitments to policyholders and by conducting appropriate checks on the projected cash flows, including performance and consistency checks in relation to any impact analyses/estimates carried out prior to the valuation date or in relation to the movement analysis.
With regard to risk assumption of policies in the Non-life portfolio, policies are checked when acquired through an automatic system aimed at detecting the underwriting parameters associated with the applicable tariff. The check, both formal and substantive, allows the identification of exposures in terms of capital and limits of liability, in order to verify that the portfolio matches the technical and tariff scheme agreed upon with the sales network. Subsequently, statistical checks are carried out to verify potentially anomalous situations (such as concentration by area or by type of risk) and to keep under control accumulation (with particular reference to policies covering accident and health risks). This is also carried out in order to provide suitable information for preparing the annual reinsurance plan.

Lastly, actuarial and demographic risks, typical of the Life business, arise when an unfavourable trend in the actual loss ratio is measured compared to the one estimated in the tariff construction and are reflected in the level of "reserves". The loss ratio refers not only to actuarial loss, but also to financial one (guaranteed interest rate risk). Each company operating in the Life business monitors these risks by means of systematic statistical analysis of the evolution of liabilities in its own contract portfolio, split by risk type, and through simulations of expected profitability of the assets hedging technical reserves.

The Insurance Group companies, pursuant to Article 1, letter r-bis of the Private Insurance Code as amended, adopt the "standard formula" for the calculation of the solvency capital requirement (Articles 45-quinquies to 45-undecies), with the additional use of company specific parameters for premium and reserve risk in the Non-life business. At Insurance Group level, the capital requirement is calculated by consolidating the data of the individual companies.
In carrying out the aforementioned calculation and in line with the reference regulations, the main elements of the requirement are defined as follow:

- underwriting risk, such as the risk of loss or adverse changes in the value of insurance liabilities due to inadequate assumptions regarding price setting (premium risk) or establishment of technical reserves;
- market risk, such as the risk of a loss or adverse change in financial position resulting, directly or indirectly, from fluctuations in the level and volatility of market prices of assets, liabilities and financial instruments;
- credit or counterparty risk, such as the risk of loss arising from counterparty default on deposits, derivative instruments and any credit exposures;
- operational risk, such as the risk of loss deriving from the inadequacy or incorrect functioning of internal procedures, human resources or systems, or due to external events. As far as the financial losses component is concerned, the operational risk includes: legal and compliance risk, conduct risk, IT and Cyber risk, physical security risk, business continuity risk, financial crime and financial reporting risk, third-party and model risk. Strategic and reputational risk are not included.

The table below summarises insurance liabilities (for which IFRS 17 principle is thus applied), both for direct and reinsurance business, gross of intercompany netting, broken down by product macro-type.

(millions of euro)

Concentration of underlying risks by product type	2024
Life	**124,389**
Multi-line	30,650
Separately managed account	73,197
Pure risk contracts	718
Unit-linked/Pension funds	19,824
Non-life	**1,692**
Motor	183
Non-Motor	1,509
Total	**126,081**

Below are the details of the breakdown by maturity of financial liabilities (measured in accordance with IFRS 9 principle) for the Life segment, before intercompany netting, represented by assets covering commitments arising under unit- and index-linked policies, other insurance products (specifically, the “Risparmio Insurance” product) and subordinated liabilities.

(millions of euro)

Breakdown of financial liabilities by maturity	Within 12 months	Over 12 months	Total as at 31.12.2024	Total as at 31.12.2023
Unit linked	36	51,436	51,472	52,038
Index linked	-	-	-	-
Other payables to insured parties	-	453	453	-
Subordinated liabilities	-	1,350	1,350	2,223
Total	**36**	**53,239**	**53,275**	**54,261**

The following tables show the results of the sensitivity analysis using the main insurance risk parameters on the main balance sheet items. The impacts on the Contractual Service Margin (CSM) and, as a result, on the financial position and income statement are provided.

The analysis has identified the risk factors that the companies in the Insurance Group are exposed to, identifying the operational assumptions to be stressed, as follows:

- for the Life business:
  - increase of 10% in expense assumptions (Expenses +10%);
  - increase of 10% in lapse assumptions (Lapse +10%).
- for the Non-life business:
  - increase of 5% in assumptions linked to the claims (Loss Ratio +5%);
  - decrease of 5% in assumptions linked to the claims (Loss Ratio -5%).

With regard to the Life business, the impact of the various stressed scenarios was exclusively determined gross of reinsurance, as the effect of this is considered insignificant. Conversely, for the Non-life business, the results are shown gross and net of reinsurance.

(millions of euro)

Sensitivity analysis		31.12.2024	
	CSM Change [(a)]	Net income [(b)]	Shareholders’ equity [(b)]

(c) Gross of reinsurance

(d) Net of reinsurance

3.2 FINANCIAL RISKS

QUALITATIVE AND QUANTITATIVE INFORMATION

These risks derive from the level or volatility of market prices of financial instruments that impact the balance sheet value of both assets and liabilities. The risk factors identified are as follows:

- interest rate risk: it impacts assets and liabilities whose value is sensitive to changes in the forward structure of interest rates or the volatility of interest rates;
- equity risk: it derives from the level or volatility of market prices of equities and impacts assets and liabilities whose value is sensitive to changes in equity prices;
- real estate risk: it derives from the level or volatility of market prices of real estate properties and impacts assets and liabilities sensitive to such variations;
- foreign exchange risk: it derives from changes in the level or volatility of foreign exchange rates;
- spread risk: it impacts assets and liabilities whose value is sensitive to adverse changes in credit spreads;
- concentration risk: reflects the risk of holding high percentages of financial assets of the same counterparty;
- liquidity risk: the risk that the Company is not able to liquidate investments and other assets to settle its financial commitments at the time of their maturity.

Investment portfolios

The investments of the insurance companies of the Intesa Sanpaolo Group (Intesa Sanpaolo Assicurazioni, Intesa Sanpaolo Protezione and Fideuram Vita) are made with their shareholders' fund and to cover contractual obligations with customers. These refer to traditional adjustable Life insurance policies, unit-linked and index-linked policies, pension funds and Non-Life policies.

As at 31 December 2024, the investment portfolios of Group companies, recorded at book value, amounted to 180,575 million euro. Of these, a part amounting to 93,071 million euro relates to traditional adjustable Life policies (the financial risk of which is shared with the policyholders by virtue of the mechanism whereby the returns on assets subject to separately managed account determined), Non-Life policies and shareholders' fund. The other component, whose risk is borne solely by the policyholders, consists of investments related to index-linked and unit-linked policies, and pension funds and amounted to 87,504 million euro.

In view of the different types of risk, the breakdown of the investment portfolios, provided below, focuses on the assets held to cover traditional adjustable Life policies, Non-Life policies, and the shareholders' fund.

Financial assets under segregated funds and shareholder fund

In terms of breakdown by asset class, net of derivative financial instruments, 84.58% of assets, i.e. approximately 78,626 million euro, were bonds, whereas assets subject to equity risk represented 2.22% of the total and amounted to 2,064 million euro. The remainder (12,271 million euro) consisted of investments relating to UCI, Private Equity and Hedge Funds (13.20%).

The carrying value of derivatives came to approximately 11 million euro, almost entirely relating to hedging derivatives, while the portion of effective management derivatives[194] is positive for approximately 22 million euro.

At the end of 2024, investments made with the shareholders' fund of Intesa Sanpaolo Assicurazioni and Fideuram Vita amounted to around 1,233 million euro at market value, and presented a risk, in terms of Value at Risk (VaR, 99% confidence level, 10-day holding period), of around 29 million euro.

[194] ISVAP Regulation 36 of 31 January 2011 on investments defines as "effective management derivatives" all derivatives aimed at achieving pre-established investment objectives in a faster, easier, more economical or more flexible manner than would have been possible acting on the underlying assets.

Interest rate risk exposure

The breakdown by maturity of bonds showed 7.41% short-term (under 1 year), 29.18% medium-term and 47.99% long-term (over 5 years).

(millions of euro)

Financial assets	Book value	%	Duration
Fixed-rate bonds	**66,345**	**71.37**	**6.40**
up to 1 year	6,616	7.12	
1 to 5 years	23,286	25.05	
over 5 years	36,443	39.20	
Floating rate/indexed bonds	**12,282**	**13.21**	**5.83**
up to 1 year	271	0.29	
1 to 5 years	3,840	4.13	
over 5 years	8,171	8.79	
TOTAL	**78,627**	**84.58**	**-**
Equities or similar capital securities	**2,064**	**2.22**	
UCI, Private Equity, Hedge Fund	**12,271**	**13.20**	
TOTAL AS AT 31.12.2024	**92,962**	**100.00**	

The sensitivity of the fair value of the portfolio of financial assets to interest rate movements, summarised in the table below, highlights the exposure of the portfolio: for example, a parallel shift in the yield curve of +100 basis points leads to a negative fair value change in the bond portfolios of 4,600 million euro.

(millions of euro)

	Book value	%	Fair value changes due to interest rate fluctuations	
			+100 bp	**-100 bp**
Fixed-rate bonds	66,345	84.38	-3,958	4,465
Floating rate/indexed bonds	12,282	15.62	-642	746
Interest rate risk hedging effect	-	-	-	-
TOTAL	**78,627**	**100.00**	**-4,600**	**5,211**

In accordance with IFRS 17, the Intesa Sanpaolo Assicurazioni Group defined a methodology for calculating discount rates for the measurement of insurance contracts. (for details, see the indications in Part A.2 – Main financial statement captions). The table below summarises the discount rates applied by the various companies in the Insurance Group.

Discount rates	2024					2023				
	1 year	**5 years**	**10 years**	**15 years**	**20 years**	**1 year**	**5 years**	**10 years**	**15 years**	**20 years**
	31.12.2024	**31.12.2024**	**31.12.2024**	**31.12.2024**	**31.12.2024**	**31.12.2023**	**31.12.2023**	**31.12.2023**	**31.12.2023**	**31.12.2023**
VFA	2.73%	2.65%	2.82%	2.94%	2.91%	4.09%	2.90%	2.90%	2.96%	2.89%
GMM/PAA	2.63%	2.55%	2.72%	2.84%	2.81%	3.86%	2.68%	2.68%	2.74%	2.67%

VFA – Variable Fee Approach
GMM – General Measurement Model
PAA – Premium Allocation Approach

The table below shows the results of the sensitivity analysis of interest rate risk on the CSM (Contractual Service Margin), on the statement of financial position and on the income statement.

The analysis in question identified the risk factors that the companies in the Intesa Sanpaolo Assicurazioni Group are exposed to, identifying the financial assumptions to be stressed for the Life business, as follows:
- parallel increase of the discount curve of 100 basis points (Interest Rate Up +100 basis points);
- parallel decrease of the discount curve of 100 basis points (Interest Rate Down -100 basis points).

(millions of euro)

Sensitivity analysis		31.12.2024	
	CSM Change [(a)]	Net income [(b)]	Shareholders' equity [(b)]
Life			
Interest Rate Up + 100 bps	-393	-19	-10
Interest Rate Down - 100 bps	308	7	-2

(a) Gross of tax

(b) Net of tax

With regard to the Life business, the impact of the various stressed scenarios was exclusively determined before reinsurance, as the effect of this was deemed insignificant. For the Non-life business, the sensitivity to changes in the discount rate levels is deemed immaterial.

Credit risk exposure

The table below sets forth the distribution of the bond portfolio by rating class: AAA/AA bonds represented 4.19% of total investments and A bonds approximately 10.90%. Low investment grade securities (BBB) were 67.15% of the total, while the portion of speculative grade or unrated was minimal (2.34%).
With regard to exposure to BBB rated securities, the majority of the exposure related to bonds issued by the Republic of Italy.

(millions of euro)

Breakdown of financial assets by issuer rating	Book value	%
Bonds	**78,625**	**84.58**
AAA	1,119	1.20
AA	2,779	2.99
A	10,131	10.90
BBB	62,424	67.15
Speculative grade	2,055	2.21
Unrated	117	0.13
Equities or similar capital securities	**2,064**	**2.22**
UCI, Private Equity, Hedge Fund	**12,271**	**13.20**
TOTAL	**92,960**	**100.00**

The analysis of the exposure in terms of the issuers/counterparties produced the following results: securities issued by governments, central banks and other public entities made up 70.59% of the total investments, whereas the securities of corporate issuers contributed around 29.41%.

The sensitivity values of the fair value of the bonds with respect to a variation in the creditworthiness of the issuers, namely a market credit spread shock of ±100 basis points, as at end of 2024, are shown in the table below.

(millions of euro)

	Book value	%	Fair value changes due to credit spread fluctuations	
			+100 bp	-100 bp
Government bonds	55,504	70.59	-3,948	4,529
Corporate bonds	23,123	29.41	-842	802
TOTAL	**78,627**	**100.00**	**-4,790**	**5,331**

In addition, the amount of receivables arising out of direct insurance operations as at 31 December 2024 came to 454 million euro, which receivables arising from reinsurance operations came to around 135 million euro.

Below is the breakdown of the amount of exposure to credit risk of the companies in the Insurance Group for outstanding reinsurance contracts.

	Insurance Group
Asset for remaining coverage	70
Asset for incurred claims	89
Receivables arising from reinsurance contracts (Non-Life)	91
Total	**250**

Reinsurance coverage was finalised with leading market operators, who meet the requirements on capital and financial position outlined in the guidelines of each company, and in compliance with IVASS Regulation No. 38 of 3 July 2018 on corporate governance systems.

Equity risk exposure

The sensitivity of the equity portfolio to a hypothetical deterioration in equity prices of 10% amounts to -206 million euro, as shown in the table below.

(millions of euro)

	Book value	%	Fair value changes due to stock price fluctuations
			-10%
Equities - Financial institutions	371	17.98	-37
Equities - Non-financial companies and other counterparties	1,693	82.02	-169
TOTAL	**2,064**	**100.00**	**-206**

Foreign exchange risk exposure

Approximately 97.92% of investments is made up of assets denominated in the EU currency. The residual exposure to foreign exchange risk was hedged by positions in derivative financial instruments, particularly forwards on BTPs, in the same currency.

Derivative financial instruments

Financial derivative instruments are used to hedge the financial risks of the investment portfolio or for effective management.
The table below shows the book values of the financial derivative instruments as at 31 December 2024.

(millions of euro)

Type of underlying	DEBT SECURITIES/ INTEREST RATES		EQUITIES, EQUITY INDICES, COMMODITIES, EXCHANGE RATES		TOTAL	
	Quoted	Unquoted	Quoted	Unquoted	Quoted	Unquoted
Hedging derivatives	-	-11	-	-	-	-11
Effective management derivatives	-	-	30	-8	30	-8
TOTAL	**-**	**-11**	**30**	**-8**	**30**	**-19**

3.3 LIQUIDITY RISK

Liquidity risk is the risk of not being able to fulfil obligations to the insured and to other creditors, due to the impossibility of transforming investments into liquidity, or the difficulty in carrying out that transformation without depressing future profits or incurring significant economic losses. Therefore, the Insurance Group conducts its assessments and steers its management so that they are capable of reflecting the characteristics of its insurance obligations, favouring the diversification of assets and sound management.

Firstly, the run-off of future cash flows as at 31 December 2024, both discounted and undiscounted, is shown below, broken down into the Life and the Non-life business. For the Non-life business, this includes both the Liability for Remaining Coverage (LRC) and the Liability for Incurred Claims (LIC). For the Life business, instead, this includes the LRC, as the LIC is a certain amount waiting to be paid to the insured.

(millions of euro)

Analysis of maturities	Release of non-discounted cash flows 31.12.2024					
	up to 1 year	1 to 2 years	2 to 3 years	3 to 4 years	4 to 5 years	over 5 years
Insurance contracts						
Life	11,631	10,632	11,706	10,310	11,925	93,574
Non-life	390	119	64	45	37	170

(millions of euro)

Analysis of maturities	Release of discounted cash flows 31.12.2024					
	up to 1 year	1 to 2 years	2 to 3 years	3 to 4 years	4 to 5 years	over 5 years
Insurance contracts						
Life	11,465	10,215	10,957	9,413	10,571	61,991
Non-life	363	112	59	42	34	159

The Insurance Group considers the forecasts of the maturities of liability flows in the process of investing in assets, assessing coverage of maturities and opportunities for returns.

The Risk Appetite Framework and the ALM management process consider prudential limits both on observing the cash flow matching and using liquidity coverage ratio type indicators. Those controls and monitoring are carried out in line with the Solvency II supervisory framework.

To manage specific conditions of stress and lack of liquidity, a Contingency Funding Plan has been defined. The plan requires an Extraordinary Investment Committee meeting be called which, based on the type (e.g. turbulence on the markets in relation to an inefficient composition of assets) and the expected duration of the situation of tension (e.g. temporary vs. structural), will directly take action on the asset portfolio or propose additional possible actions.

The tables below show the breakdown by maturity of discounted and undiscounted net cash flows of insurance contracts issued and reinsurance contracts held that are liabilities, for the Life and Non-Life segments, in accordance with the requirements of IFRS 17. For the Life business, net cash flows relating to the PVFCF LRC as at 31 December 2024 are shown, split between the VFA business (insurance contracts issued with direct participation elements) and the GM business (insurance contracts issued without direct participation elements), while the row relating to reinsurance contracts held is empty because there were no ARC liability cash flows.

Net discounted cash flows from insurance contracts issued and reinsurance contracts held that are liabilities: breakdown by maturity

(millions of euro)

Type/Residual Maturity	Up to 1 year	Between 1 and 2 years	Between 2 and 3 years	Between 3 and 4 years	Between 4 and 5 years	Over 5 years	Total
Life Segment							
1. Insurance contracts issued with direct participation features	11,416	10,173	10,921	9,382	10,545	61,891	114,328
2. Investment contracts issued with discretionary participation features	-	-	-	-	-	-	-
3. Insurance contracts issued without direct participation features	49	43	36	30	26	101	285
4. Reinsurance contracts held	-	-	-	-	-	-	-
Non-Life Segment							
1. Insurance contracts issued	403	122	64	45	37	167	838
2. Reinsurance contracts held	-40	-10	-5	-3	-3	-8	-69

Net undiscounted cash flows from insurance contracts issued and reinsurance contracts held that are liabilities: breakdown by maturity

(millions of euro)

Type/Residual Maturity	Up to 1 year	Between 1 and 2 years	Between 2 and 3 years	Between 3 and 4 years	Between 4 and 5 years	Over 5 years	Total
Life Segment							
1. Insurance contracts issued with direct participation features	11,602	10,596	11,677	10,285	11,903	93,494	149,557
2. Investment contracts issued with discretionary participation features	-	-	-	-	-	-	-
3. Insurance contracts issued without direct participation features	30	35	29	25	22	80	221
4. Reinsurance contracts held	-	-	-	-	-	-	-
Non-Life Segment							
1. Insurance contracts issued	432	130	69	48	40	179	898
2. Reinsurance contracts held	-42	-11	-5	-3	-3	-9	-73

The table below provides details of the liquidity risk associated with insurance contracts issued and reinsurance contracts held that are liabilities and have surrender options or early termination clauses, in accordance with IFRS 17, paragraph 132, letter c). The amounts payable on demand are determined by considering the surrenderable amounts net of any penalties as at 31 December 2024. Investment contracts with discretionary participation features have been reclassified under insurance contracts issued with direct participation features, while no figures are shown for insurance contracts issued without direct participation features and for reinsurance contracts held as liabilities, because they are not present.

Insurance contracts issued and reinsurance contracts held that are liabilities with surrender options: amounts payable on demand and carrying amount

(millions of euro)

Type/Amounts	Amounts payable on demand	Carrying amount
1. Insurance contracts issued with direct participation features	120,260	122,919
2. Investment contracts issued with discretionary participation features	-	-
3. Insurance contracts issued without direct participation features	-	-
4. Reinsurance contracts held	-	-

SECTION 4 – RISKS OF OTHER COMPANIES

The risks of other companies are essentially concentrated:
– in the companies Romulus Funding Corp. and Duomo Funding Plc., included on the scope of consolidation pursuant to IFRS 10;
– in the Risanamento Group companies, consolidated for accounting purposes starting in 2015, but not subject to management and coordination.

THE VEHICLES ROMULUS FUNDING CORPORATION AND DUOMO FUNDING PLC

Qualitative and quantitative information

These two special-purpose vehicles are the Intesa Sanpaolo Group's asset-backed commercial paper conduits, established to support Intesa Sanpaolo’s strategy of offering customers an alternative financing channel via access to the international asset-backed commercial paper market. The assets originated by European customers are purchased by Duomo, whereas Romulus is responsible for U.S. assets and fund-raising on the U.S. market through the issuance of asset-backed commercial paper. Nonetheless, due to the subsequent downgrading of Intesa Sanpaolo at the end of 2014, U.S. investors gradually divested without the vehicle being able to find new third-party investors with which to place the asset-backed commercial papers. The risks associated with these entities, and more specifically, the potential interest rate and exchange rate risks arising from the operations of the two companies, must be covered in accordance with the Intesa Sanpaolo Group policy for the management of these risks. Companies are not generally permitted to take foreign-exchange positions. As at 31 December 2024, the assets of Romulus included 5.2 billion euro in loans to the vehicle Duomo. Against those assets, the vehicle issued asset-backed commercial paper (ABCP) with a carrying amount of 5.2 billion euro, almost all of which has been subscribed by the Parent Company, Intesa Sanpaolo. With regard to the portfolio of the vehicle Duomo, at the end of 2024 this portfolio mainly consisted of securities of 7.69 billion euro.

The table below shows the information and figures for the above two vehicles as at 31 December 2024.

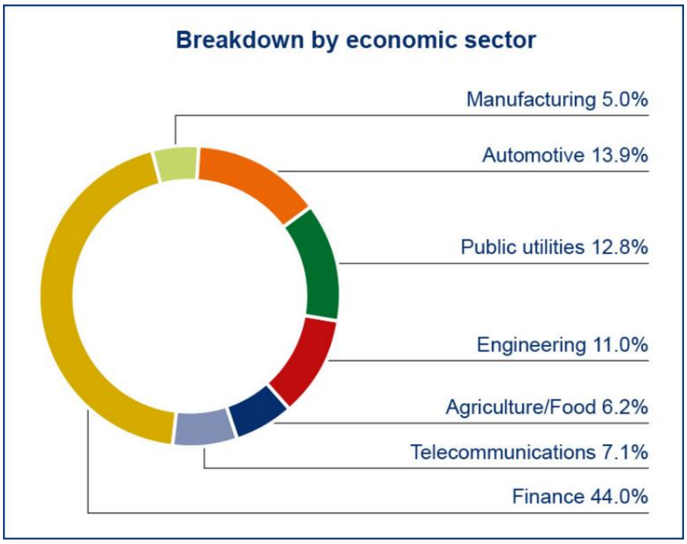
(millions of euro)

	Vehicle data		Liquidity lines (2)	Guarantees given		Securities issued	of which: held by the Group		
	Total assets	Cumulated losses		nature	amount	amount	amount	Accounting classification	Valuation
ROMULUS FUNDING CORP.	5,199 (1)	-	-		-	5,198	5,180	Fin. Ass. at amm. cost	Amortised cost
DUOMO FUNDING PLC	7,690	-	8,440		-	-	-		

(1) Entirely made up of loans disbursed to Duomo for transactions booked in the financial statements of the vehicle.

(2) These are Fully Supporting Liquidity Facilities issued by the Parent Company Intesa Sanpaolo, of which 8,440 million euro is committed out of an amount granted of 15,000 million euro.

The total assets of the conduits Romulus and Duomo, net of dealings between the two vehicles, made up approximately 1% of the total consolidated assets. The portfolio risk of the two vehicles is approximately 45.92% accounted for by trade receivables and the remainder by consumer loans (15.48%), loans deriving from factoring and lease contracts (2.57%), mortgage loans (0.01%), loans to SMEs (21.28%), loans/lease contracts to pharmaceutical companies (0.85%), and auto loans and leases (13.89%). The eligible assets held by the vehicles are mainly expressed in euro (94.50% of the total portfolio). The remainder is broken down into British pounds (4.27%), US dollars (0.63%), Mexican pesos (0.25%), Swedish kroner (0.19%), Polish zloty (0.13%), Australian dollars (0.01%), Swiss francs (0.01%) and Danish kroner (0.01%).
The following information is provided concerning the portfolio of eligible assets.



With regard to the rating breakdown of the loan portfolio, 98% does not have a rating and the remaining 2% is rated above "A".

With reference to the geographical distribution of the assets held by the two vehicles, approximately 86.7% of the debtors are located in Italy.

RISANAMENTO GROUP

Qualitative and quantitative information

Intesa Sanpaolo holds a 48.88% interest in the share capital of Risanamento, a property and development company listed on the Italian Stock Exchange, originally focused on the renovation and development of the strategic metropolitan area of Milano Santa Giulia (MSG), located in the south-east of Milan. Although Risanamento is included in the Group's accounting scope of consolidation, Intesa Sanpaolo does not perform management and coordination activity over Risanamento S.p.A. and its subsidiaries pursuant to Article 2497 et seq. of the Italian Civil Code. Additionally, Risanamento is not part of the Intesa Sanpaolo Banking Group, because the business conducted by the company is not related to the banking sector.

During the second quarter of 2023, a complex transaction (known as Project Starfighter) for the corporate and financial restructuring of the Risanamento Group was completed with Lendlease, a leading international operator in the infrastructure sector. The purpose of the transaction was to implement a real estate project in the MSG industrial area and maximise the value of the site and it included the debt discharge of the Risanamento Group and the conversion of the credit exposure held by Intesa Sanpaolo and other banks into units of an AIF managed by Lendlease (Heartbeat Fund), in addition to the transfer to the AIF of the surface rights of the MSG area by Risanamento, which retained the bare ownership, together with the commitment to complete the remediation and infill work on the area.

On 30 October 2024, the Board of Directors of Risanamento approved the Group's interim statement as at 30 September 2024, which showed a consolidated net loss of 27.5 million euro, a positive consolidated net financial position of 27.6 million euro, and a positive consolidated shareholders' equity of around 25.1 million euro. The report also noted that, with respect to the original schedule, some delays had accumulated in the implementation of the remediation works due to (i) the permits related to the pollutant treatment plant managed by the third-party contractor; (ii) the discovery of material containing asbestos on site; and (iii) the necessary modifications to align the original Remediation Operational Plan (ROP) to the new volumetric plan.

The company also stated in its Report that these events, which arose after the original plan, not only prevented adherence to the initially scheduled timelines, but also resulted in a series of additional costs that were still being determined at the time.

Additionally, on 24 January 2025, Risanamento published its financial calendar for the 2025 financial year, setting 19 March as the date for the approval of the annual financial statements and the consolidated financial statements for the 2024 financial year. This date, unlike in previous years, is after the date of 27 February 2025 when the Board of Directors of Intesa Sanpaolo approves the draft annual financial statements of the Parent Company and the consolidated financial statements for the year 2024.

By the date of approval of the Intesa Sanpaolo financial statements no board meetings of Risanamento had been held that approved the company's data as at 31 December 2024 and it was therefore not possible to include them in Intesa Sanpaolo's consolidated financial statements, in line with the Group policy which stipulates that the financial data of subsidiaries must be previously approved by their respective Boards of Directors in order to be included in the Group's consolidated financial statements. Consequently, the data of the Risanamento Group as at 30 September 2024 was used for the contribution to the consolidated financial statements of Intesa Sanpaolo as at 31 December 2024, in accordance with IFRS 10, which stipulates that the difference between the date of the subsidiary's financial statements and that of the consolidated financial statements must not be more than three months. The data as at 30 September 2024 of the Risanamento Group have also been adjusted, on a prudential basis and based on the currently available information, to account for the uncertainty mainly related to the additional costs for the remediation works, which had already been announced by Risanamento in its Interim Statement as at 30 September 2024, without any material effects on Intesa Sanpaolo's consolidated income statement.

Part F – Information on consolidated capital

SECTION 1 – CONSOLIDATED CAPITAL

A. Qualitative information

The control of capital adequacy both at consolidated level and at single entities level is ensured by capital management which defines the size and optimum combination of the different capital instruments in accordance with regulatory constraints and consistently with the risk exposure taken on by the Group.
The Intesa Sanpaolo Group assigns a primary role to the management and allocation of capital resources, considering this to be an instrument for strategic leverage, as well as a way to ensure consistency of the operating plans of the business units.
Once the Group's strategic profitability, capital strength and liquidity objectives have been defined, capital and financial resources are allocated to the business units through a process that evaluates their growth potential, capacity to generate value and financial autonomy.
The capital at risk considered is twofold:
– regulatory capital covering Pillar 1 risks;
– overall internal capital covering Pillar 2 risks, for ICAAP purposes.
Regulatory capital and overall internal capital differ from each other by definition and by their coverage of risk categories. The first arises from formats defined in supervisory provisions, the second from operational measurements.
Hence, the capital management activity comprises the management of current and prospective capital adequacy through careful control of both regulatory Pillar 1 constraints (in compliance with Basel 3 rules, effective from 1 January 2014) and operational Pillar 2 constraints. Projections are also produced under stress conditions in order to ensure that the available resources are adequate to cover all risks, even in adverse conditions. Furthermore, since 2013, the Group has been drawing up a Recovery Plan, in line with regulatory indications (directives "Bank Recovery and Resolution Directive – BRRD" - 2014/59/EU transposed in Italy through Legislative Decrees 180 and 181 on 16 November 2015 and "Bank Recovery and Resolution Directive – BRRD II" - Directive (UE) 2019/879, transposed into Italian law on 8 November 2021 by Legislative Decree 193, which entered into force on 1 December 2021), with international practice and in compliance with both the Group Risk Appetite Framework and the crisis management model adopted by the Bank.
As part of the process of defining budget targets, a projection compatibility analysis is conducted annually at Group level and at the level of individual entities in the Group. Depending on the expected performance of balance sheet and income statement aggregates, the appropriate capital management measures to ensure the required financial resources for the individual business units are already identified in this phase, if necessary. Compliance with the target levels of capitalisation is monitored on a quarterly basis, taking appropriate action when necessary.
Compliance with capital adequacy is sought via various levers, such as the dividend distribution policy, the definition of strategic finance operations (capital increases, issue of convertible loans and subordinated bonds, disposal of non-core assets, etc.) and the management of investments, particularly loans, on the basis of counterparty risk.
Further analyses for preliminary assessment of capital adequacy are performed during extraordinary operations (mergers, acquisitions, disposals, etc.) whether internal to the Group or changing the scope of consolidation of the Group.

Following the Supervisory Review and Evaluation Process (SREP), the ECB annually makes a final decision on the capital requirement that Intesa Sanpaolo must comply with at consolidated level.

On 30 November 2023, Intesa Sanpaolo announced that it had received the ECB's final decision concerning the capital requirement that the Bank has to meet, as of 1 January 2024.
On 26 April 2024, the Bank of Italy announced the introduction of the new Systemic Risk Buffer (SyRB) amounting to 1% of the risk-weighted exposures to credit and counterparty risks for residents in Italy. The target rate must be reached gradually by establishing a reserve equal to 0.5% of the relevant exposures by 31 December 2024 and the remaining 0.5% by 30 June 2025.

The overall capital requirement the Bank has to meet in terms of Common Equity Tier 1 ratio is 9.88%[195].
This is the result of:
- the SREP requirement in terms of Total Capital ratio of 9.50% comprising a minimum Pillar 1 capital requirement of 8%, of which 4.5% is CET1, and an additional Pillar 2 capital requirement of 1.50%, of which 0.84% is CET1 applying the regulatory amendment introduced by the ECB and effective from 12 March 2020[196];
- additional requirements, entirely in terms of Common Equity Tier 1 ratio, relating to:
  - A Capital Conservation Buffer of 2.5%;
  - an O-SII Buffer (Other Systemically Important Institutions Buffer) of 1.25%;
  - a Countercyclical Capital Buffer of 0.28%[197];
  - Systemic Risk Buffer of 0.51%.[198]

On 11 December 2024, Intesa Sanpaolo announced that it had received the ECB's final decision concerning the capital requirement that the Bank has to meet as of 1 January 2025, which was unchanged with respect to 2024.

With effect from 30 September 2019, following permission from the ECB, the Intesa Sanpaolo Group calculates capital ratios applying the so-called Danish Compromise, under which insurance investments, held indirectly through Intesa Sanpaolo Assicurazioni, are risk weighted instead of being deducted from capital.

As reported in Part E of these Notes, where additional information can be found, no changes were made with respect to 31 December 2023 to the scope of application of internal models for measuring credit risk, counterparty risk and operational risk.

As is now well-known, with regard to IFRS 9, the transitional period (2018-2022) provided for by Regulation (EU) 2017/2395 to mitigate the capital impacts of its introduction ended on 31 December 2022. Moreover, from June 2020 the Intesa Sanpaolo Group has not applied either the new transitional IFRS 9 rules (in force up to 31 December 2024), or the FVOCI prudential filter (ended on 31 December 2022), which were both introduced by Regulation (EU) no. 2020/873 (CRR Quick Fix) in the context of the pandemic.

Since December 2020, the Intesa Sanpaolo Group has applied Delegated Regulation (EU) 2020/2176 on the deduction of software assets from Common Equity Tier 1 items, which introduced the criterion of prudential amortisation applied to all software assets over a period of three years (regardless of their estimated useful life for accounting purposes). Specifically, the difference, if positive, between the prudential accumulated amortisation and the accounting accumulated amortisation (including impairment losses) is fully deducted from CET1 capital, while the remaining portion (the portion of the net carrying amount of each software asset that is not deducted) is included in the RWAs with a risk weight of 100%.

In addition, with regard to the regulatory provisions of Article 3 of the CRR ("Application of stricter requirements by institutions"), the voluntary deduction from CET1 relating to the calendar provisioning on exposures included in the Pillar 2 scope is included for the purposes of the calculation of Own funds as at 31 December 2024.[199]

Finally, in June 2024, Regulation (EU) 2024/1623 (also known as CRR3) amending Regulation (EU) 575/2013 (CRR) as regards requirements for credit risk, credit valuation adjustment risk, operational risk, market risk and the output floor was published in the Official Journal of the European Union. The regulation will apply generally commencing as of 1 January 2025, with the exception of some provisions of lesser import, for which their application was brought forward to 9 July 2024 (the date the regulation itself came into force) and the provisions on the Fundamental Review of the Trading Book (FRTB) framework concerning market risk, which instead will apply as of 1 January 2026.

---

[195] Fully loaded capital requirement; at the reporting date (31 December 2024), the ratio stood at 9.61%.

[196] The regulatory change establishes that the capital instruments not qualifying as Common Equity Tier 1 may be partially used to meet the Pillar 2 requirement.

[197] Countercyclical Capital Buffer calculated taking into account the exposure as at 31 December 2024 in the various countries where the Group has a presence, as well as the respective requirements set by the competent national authorities and relating to 2026, where available, or the most recent update of the reference period (requirement was set at zero per cent in Italy for 2024 and for the first quarter of 2025). The CCyB as at 31 December 2024 stood at 0.26%.

[198] SyRB calculated taking into account the exposure as at 31 December 2024 to residents in Italy and the fully loaded requirement as at 30 June 2025. The SyRB as at 31 December 2024 stood at 0.26%.

[199] The addendum to the ECB Guidance on non-performing loans of 2018 contemplates the possibility that banks "deduct" on their own initiative specific amounts from CET1, to anticipate supervisory requests, in the event of divergence between the prudential framework, which expects adjustments not based on credit risk measurement criteria, and the accounting framework.

B. Quantitative information

The table above indicates the components of net book value, adding those of the Group to those of third parties, broken down by the type of consolidated company. In further detail, the column for Prudential Consolidation indicates the amount resulting from the consolidation of the companies belonging to such group, gross of the effects on the income statement of transactions with other companies within the scope of consolidation. Subsidiaries other than those belonging to the Banking group and consolidated on a line-by-line basis are stated at equity. The columns Insurance companies and Other companies contain the amounts resulting from consolidation, gross of the effects on the income statement of transactions with companies belonging to the Banking group. The columns Netting and Adjustments on consolidation show the adjustments required to obtain the figure presented in the financial statements.

B.2. Valuation reserves of financial assets measured at fair value through other comprehensive income: breakdown

(millions of euro)

	Banking group		Insurance companies		Other companies		Netting and adjustments on consolidation		TOTAL	
	Positive reserve	Negative reserve	Positive reserve	Negative reserve	Positive reserve	Negative reserve	Positive reserve	Negative reserve	Positive reserve	Negative reserve

Trading on treasury shares

During the reporting year, Intesa Sanpaolo, under the shareholders’ resolution of 24 April 2024, and Group companies, under the specific authorisations of their respective competent corporate bodies, carried out the following transactions on parent company Intesa Sanpaolo shares:

Ordinary shares:		
Initial number	no.	64,054,748
Purchases	no.	507,799,512
subject to cancellation (buyback)	*no.*	*479,128,488*
Sales	no.	-507,683,589
subject to cancellation (buyback)	*no.*	*-479,128,488*
End-of-year number	no.	64,170,671

B.4. Valuation reserves relating to the defined benefit plans: annual changes

During the year, the reserves at issue recorded an increase of 11 million euro. Therefore, as at 31 December 2024 there was an overall negative reserve equal to approximately 178 million euro for defined benefit plans.

SECTION 2 – OWN FUNDS AND CAPITAL RATIOS FOR BANKS

Reference is made to the "Basel 3 Pillar 3" public disclosure as at 31 December 2024 for the disclosure on own funds and capital adequacy.

Part G – Business combinations

SECTION 1 – TRANSACTIONS CARRIED OUT IN THE YEAR

1.1 Business combinations

(millions of euro)

Companies	Date of the transaction (a)	Cost of the transaction	Equity stake %	Net interest and other banking income (b)	Net income / loss for the year (c)	Net income / loss recorded as of acquisition date (d)
1. Alpian S.A.	8-Aug-24	74	61.60	-1	-31	-16
2. First Bank S.A.	31-May-24	144	99.98	85	-20	4

(a) Date of acquisition of control.

(b) Net interest and othe banking income for the entire 2024 financial year

(c) Profit/Loss recorded by the entity for the entire 2024 financial year.

(d) Profit/Loss recorded by the entity after the acquisition date and included in the consolidated result of the Intesa Sanpaolo Group.

In addition to the business combinations accounted in accordance with IFRS 3 and presented in the previous table, several badwextraordinary intragroup transactions were carried out during the year, which had no impact on the consolidated financial statements. Such transactions, which are scoped out of IFRS 3, involved the transfer of business lines or legal entities between Intesa Sanpaolo Group companies or business combinations (under common control). Since the transfers were carried out for reorganisation purposes only, in accordance with the Group's accounting policy, these transactions were simply recorded applying book value accounting, without recognition of any economic effect. The main intragroup transactions completed during the year concerned:

- the merger by incorporation of IW Private Investments SIM S.p.A. into Fideuram – Intesa Sanpaolo Private Banking S.p.A.;
- the merger by incorporation of Intesa Sanpaolo RBM Salute S.p.A., a wholly-owned subsidiary of Intesa Sanpaolo Vita S.p.A. (renamed Intesa Sanpaolo Assicurazioni S.p.A.) into Intesa Sanpaolo Assicura S.p.A. (renamed Intesa Sanpaolo Protezione S.p.A.), another wholly-owned subsidiary of Intesa Sanpaolo Assicurazioni S.p.A.;
- the transfer of a business line consisting primarily of customer relationships (mainly current accounts) and amounts due from banks, from Intesa Sanpaolo to Isybank.

1.2 Other information

Alpian acquisition

Alpian S.A. (hereinafter "Alpian") is a Swiss digital bank established in 2019 in Geneva and engaged in private banking and financial advisory services for upper affluent/low private Swiss customers. Operating on the Swiss market since the third quarter of 2022, Alpian was the first Swiss private bank to provide a fully digital range of wealth management services for its customers, alongside conventional online banking services.

As at 31 December 2023, Alpian was 41.6% owned by Intesa Sanpaolo Group's Private Banking Division through Fideuram – Intesa Sanpaolo Private Banking (hereinafter "Fideuram"), which held a 28.1% stake, and Reyl & Cie S.A. (hereinafter "Reyl"), which held a 13.5% stake. The investment was recognised as an interest in entities subject to significant influence in accordance with IAS 28.

In December 2023, Alpian adopted a new business plan covering the period 2024–2029. In order to finance the new investments planned and to restore the minimum CET1 capital ratio required by the Swiss Financial Market Supervisory Authority (FINMA) to comply with prudential requirements, the plan envisaged a CHF 40 million recapitalization, considering an equity value of the entity, before the capital increase, of CHF 84 million. That value was based on a specific, independent valuation provided by an external advisor, which attested the economic-financial adequacy of the figure. For the purposes of impairment testing at 31 December 2023, the book value of the Alpian investment was adjusted to the pre-money value of the entity for the capital increase approved at the end of 2023, equal pro-rata to CHF 35 million (38 million euro).

Considering the strategic value of the asset, Fideuram Group chose to opt into the capital increase, both for its own quota and the totality of any unopted quotas, to guarantee the success of the financing operation. Accordingly, in March Fideuram subscribed the capital increase for a total of CHF 39 million, equal to its own pro-rata quota (inclusive of the quota for Reyl) and the unopted quota, with the remaining CHF one million subscribed by third-party shareholders. The capital increase was closed on 8 August 2024. On 10 September 2024, Fideuram and Reyl subscribed an additional capital increase of around CHF 2 million, linked to the exercise of anti-dilutive options negotiated by the shareholders in the previous capital increase.

By the end of all the financing rounds, Intesa Sanpaolo Group had raised its interest from 41.6% to 61.6% (51.1% held by Fideuram plus 10.5% held by Reyl), thereby obtaining control of the entity for IFRS 10 purposes, for which Alpian was scoped into the consolidation area of the Group.

Accounting treatment of the business combination and Purchase Price Allocation (PPA) process
IFRS 3 sets out the principles and requirements for how an acquirer is to recognise and account for a business combination. Having acquired control of Alpian through the subscription of the capital increase, the business combination was recognised according to the "acquisition method" envisaged by IFRS 3. This method involves three main steps: i) identification of the acquirer and the acquisition date; ii) determination of the purchase price; and iii) purchase price allocation (PPA).
Under the method, the acquirer is required to allocate the cost of the business combination by recognising the identifiable assets, liabilities and potential liabilities of the acquired entity at their fair value at the acquisition date.
Where the purchase price paid for the business combination is greater than the fair value of identifiable assets, liabilities and possible liabilities (including therein any intangible assets not previously recognised on the balance sheet of the acquired entity), the difference is to be recognised as goodwill. Whereas, if the fair value of the net identifiable assets of the acquired entity is greater than the purchase price paid, the resulting gain is to be recognised as negative goodwill in the income statement of the acquirer.
Considering the 41.6% interest already held by Fideuram Group before acquiring control of Alpian, the transaction qualified as a business combination achieved in stages. Accordingly, the purchase price was determined by taking into account the aggregate total consideration paid for the acquisition of control and the fair value of the interest already held, taken as the book value (CHF 29 million), given that it had already been adjusted to the pre-money valuation of the capital increase. In relation to the consideration transferred, the purchase price included, in addition to the CHF 39 million for the subscription of the capital increase, CHF 2 million for the exercise of the anti-dilutive options, given that it was strictly connected to the acquisition.
The total purchase price paid amounted to CHF 70 million, equal to 74 million euro.
The purchase price allocation was fully completed in the financial statements at 31 December 2024, exercising the option afforded by IFRS 3, which grants the acquirer 12 months from the acquisition date to complete the definitive PPA process, even though the acquisition date was 8 August 2024.
For the purposes of the 2024 financial statements, and with the support of an independent expert, analyses were brought to term for the measurement of the fair value of Alpian's assets and liabilities and the identification of any intangible assets not previously recognised on the entity's balance sheet. The analysis of the accounting situation at the acquisition date, determined conventionally at 31 July 2024, found only one accounting item that potentially could give rise to differences between the carrying amount and fair value, which was proprietary software, recognised at the acquisition date as an intangible fixed asset valued at 14 million euro.
The fair value of the software was estimated by the independent expert on the basis of the relief-from-royalty method. The valuation process determined the fair value of the software to be CHF 25 million (equal to 27 million euro), finding a difference of CHF 12 million (13 million euro) compared the carrying amount. In accordance with IAS 12, approximately CHF 2 million (equal to 2 million euro) of deferred tax liabilities were recognised, on the basis of the nominal Swiss tax rate, as a result of the revaluation made through the PPA process.
In relation to intangible assets linked to customers previously not recognised on Alpian's balance sheet, the amounts found by the analyses were not material and, as such, were not recognised on the balance sheet.

Summary of the purchase price allocation and goodwill calculation process
As required by IFRS 3, at the acquisition date the acquirer must recognise the goodwill acquired in a business combination as an asset and initially measure such goodwill as the residual amount of the acquisition cost, as it constitutes the amount by which the cost of the business combination exceeds the acquirer's interest in the net fair value of the assets, liabilities and contingent liabilities identified.
The purchase price paid of 74 million euro was compared to the pro-rata amount of the entity's net book value at the acquisition date, adjusted to fair value and equal to 46 million euro. The difference of 28 million euro to be allocated was recognised as goodwill. IAS 36 requires goodwill be allocated to the CGU that is expected to benefit from the synergies of the business combination. Accordingly, within the Intesa Sanpaolo Group, the goodwill was allocated to the Private Banking CGU.

The following table contains a summary of the purchase price allocation and final goodwill calculation process.

(millions of euro)

	Alpian
Final acquisition cost	**74**
Shareholders' equity at acquisition date	**61**
PPA effects	**11**
- of which software fair value change	*13*
- of which deferred taxes	*-2*
Shareholders' equity at acquisition date fair value	**72**
Shareholders' equity at at fair value attributable to ISP Group	**46**
Goodwill recognised	**28**

Finally, below we report the financial position of Alpian at the acquisition date, with the carrying amounts of the company compared to the fair value found by the PPA process.

First Bank acquisition

As part of the process of shoring up the International Banks Division's assets in central and south-eastern Europe ("CSEE Area"), on 31 May 2024 Intesa Sanpaolo closed its acquisition of 99.98% of First Bank S.A. (hereinafter "First Bank") from J.C. Flowers & Co. (hereinafter "JCF"), a US private investment firm. First Bank is a small/medium-sized Romanian bank with approximately 1.5 billion euro of assets and a loan portfolio of around one billion euro. It primarily serves the SME and Corporate segments (making up more than 60% of the portfolio), with a strong presence in the Retail segment (consumer lending accounts for 15% of the portfolio).

The agreement, signed by the parties on 28 October 2023, entailed the purchase of JCF's interests in the bank for an initial price of 130 million euro. That purchase price was based on a specific, independent valuation provided by an external advisor, which attested the economic-financial adequacy of the figure. Under the agreement, the consideration was to be adjusted to take into account changes in the assets and liabilities of the company between 31 March 2023 (acquisition date) and the closing of the transaction on 31 May 2024. The adjustment was determined on a spot basis, with the assistance of an external advisor, which verified and attested the financial position of the entity at the closing date, resulting in the addition of 14 million euro to the purchase price, settled in the fourth quarter of the year.

Accounting treatment of the business combination and Purchase Price Allocation (PPA) process

Having acquired control of First Bank under IFRS 10 through the acquisition of 99.98% of the share capital, the business combination was recognised according to the "acquisition method" envisaged by IFRS 3.

The purchase price paid was determined by summing the 130 million euro paid as consideration for the 99.98% interest in the share capital of First Bank at the closing of the transaction and the purchase price adjustment of 14 million euro paid in the fourth quarter. The total purchase price paid thus amounted to 144 million euro.

The purchase price allocation was fully completed in the 2024 financial statements, exercising the option afforded by IFRS 3, which grants the acquirer 12 months from the acquisition date to complete the definitive PPA process, even though the acquisition date was 31 May 2024.

For the purposes of the 2024 financial statements, and with the support of an external expert, analyses were brought to term for the fair value measurement of First Bank's assets and liabilities and the identification of any intangible assets not previously recognised on the entity's balance sheet.

With the net book value at the acquisition date found to be 191 million euro, the PPA process resulted in the recognition of 37 million euro of negative adjustments, net of the related tax effect. The adjustments consisted of:

– 23 million euro of adjustment additions to the loan portfolio (both performing and non-performing loans), of which 10 million euro to performing loans and 13 million euro to non-performing loans. Considering that IFRS 3 requires assets acquired to be recognised initially at fair value, the next step involved the determination by the expert of a fair value range for First Bank's loan portfolio, measured separately for the performing and non-performing portions. The fair value was measured using an income approach, starting from the information found in the bank's loan portfolio and maximising the use of observable market data as input, as required by IFRS 13. Considering that the net book value of the portfolio, net of adjustment additions, fell within the fair value range determined by the expert, it was taken as the amount of initial recognition at the acquisition date;
– 6 million euro of additions to provisions for ordinary litigation and unfair clauses and for staff incentive plans;
– in accordance with IAS 12, approximately 4 million euro of deferred tax assets were recognised in relation to the aforementioned adjustments, on the basis of the nominal Romanian tax rate;
– recognition of 12 million euro of deferred tax liabilities in relation to equity reserves subject to latent taxation.

In relation to intangible assets linked to customers previously not recognised on First Bank's balance sheet, the amounts found by the analyses were not material and, as such, were not recognised on the balance sheet.

Summary of the purchase price allocation and goodwill calculation process

As required by IFRS 3, any unallocated amount of the purchase price is to be recognised as goodwill, whereas any gain resulting from the accounting of the business combination as a bargain purchase is to be recognised in the income statement as negative goodwill.

The PPA process found a gain of 10 million euro between the purchase price paid (144 million euro) and the net book value adjusted to fair value (154 million euro), which was recognised as negative goodwill in the consolidated income statement, under the caption "Other operational expenses/income" in the official income statement and under the caption "Effects of purchase price allocation net of tax" in the reclassified income statement.

In order to ensure that measurements appropriately reflect consideration of all available information as of the acquisition date, IFRS 3 requires the acquirer to reassess whether it has correctly identified all of the assets acquired and liabilities assumed and that the methods and parameters used to measure the amounts were reasonable and not arbitrary, before recognising a negative goodwill gain in the income statement. Accordingly, a reassessment was conducted of the main measurements, with the support of the expert, taking into consideration the limited materiality of the negative goodwill resulting from the PPA process.

The following table contains a summary of the purchase price allocation and final negative goodwill.

(millions of euro)

	First Bank
Final acquisition cost	**144**
Shareholders' equity at acquisition date	**191**
PPA effects	**-37**
- of which adjustment of credit portfolio	*-23*
- of which adjustment of provisions for risks and charges	*-6*
- of which deferred taxes	*4*
- of which deferred tax recognition on reserves in tax suspension	*-12*
Shareholders' equity at acquisition date at fair value	**154**
Negative goodwill	**-10**

Finally, below we report the financial position of First Bank at the acquisition date, with the carrying amounts of the company compared to the fair value found by the PPA process.

SECTION 2 – TRANSACTIONS CARRIED OUT AFTER THE END OF THE YEAR

2.1 Business combinations

No business combinations within the scope of IFRS 3 have been undertaken since the end of 2024.

SECTION 3 – RETROSPECTIVE ADJUSTMENTS

No adjustments are recognised in the current year that relate to business combinations that occurred in previous reporting periods.

Part H – Transactions with related parties

A) TRANSACTIONS WITH RELATED PARTIES

1. Procedural features

The Board of Directors of Intesa Sanpaolo S.p.A. adopted, in compliance with the procedures set out by regulations, the Group Procedures regulating the conduct of Transactions with Related Parties of Intesa Sanpaolo S.p.A., Associated Entities of the Group and Relevant Parties pursuant to Art. 136 of the Consolidated Law on Banking.
These Procedures, most recently updated in December 2024, take into account both the rules issued by Consob, pursuant to Article 2391-bis of the Italian Civil Code, and the supervisory provisions introduced by the Bank of Italy on 12 December 2011 in terms of risk assets and conflicts of interest of banks and banking groups with respect to "Associated Entities", issued in accordance with Article 53, paragraphs 4 et seq. of the Consolidated Law on Banking and ICRC (Interdepartmental Committee for Credit and Savings) Resolution 277 of 29 July 2008, as well as the rules established by Article 136 of the Consolidated Law on Banking.

The Procedures apply to the entire Intesa Sanpaolo Group with respect to the following aspects:
- the criteria for identifying Related Parties and Associated Entities;
- the process of analysis, decision-making and information for corporate bodies in connection with transactions with Related Parties and Associated Entities;
- market disclosure for transactions with Related Parties;
- the prudential limits and periodic reporting obligations towards the Bank of Italy for at-risk assets in respect of Associated Entities;
- the rules governing organisational controls and safeguards;
- the general rules for disclosure and abstention about the management of the personal interests by management body members, employees and company staff, including other than Associated Entities.

Pursuant to the Procedures, the following are considered Related Parties of Intesa Sanpaolo: parties that exercise significant control or influence, subsidiaries and associates, joint ventures, pension funds of the Group, Management Body Members and Key Managers of Intesa Sanpaolo and their close family members and significant shareholdings.
The set of Associated Entities of the Group consists of the Associated Entities of each bank of the Group (including the Parent Company) and each monitored significant intermediary with own funds greater than 2% of the total of consolidated own funds. The following are considered to be Associated Entities for each bank or monitored significant intermediary of the Group: i) shareholders that exercise control, significant influence or that are required to request authorisation pursuant to Article 19 of the Consolidated Law on Banking or that may appoint a member of the management or strategic supervisory body and the relative corporate groups; ii) subsidiaries, associated companies subject to joint control and associates, as well as the companies they control, also jointly with others; iii) management body members and their relative close family members up to the second degree and significant shareholdings.

As a form of self-regulation, the Bank has extended the regulations on transactions with Related Parties, as well as on risk assets and conflicts of interest with Associated Entities to:
a) Intesa Sanpaolo shareholders and their groups that hold an equity investment in the share capital with voting rights of the Bank that exceeds the minimum threshold set out in regulations on the communication of significant investments in associates and companies subject to joint control in listed companies, calculated considering only shares owned or under management, as well as entities jointly controlled by them with others;
b) companies in which management body members of Intesa Sanpaolo or their close family members i) hold executive offices or the office of chair of the management body; ii) hold a qualifying equity investment equal to or exceeding 10% of the capital or voting rights of that entity, or a position of significant influence;
c) companies which the Group has notable investments in and financial links with, attributable to at least two of the following indicators:
   - the counterparty holds an equity investment in Intesa Sanpaolo's capital between 1% and the minimum threshold set out in regulations on the communication of significant investments in associates and companies subject to joint control in listed companies;
   - an entity of the Intesa Sanpaolo Group holds an investment in associates and companies subject to joint control in the counterparty exceeding 10% of the voting rights;
   - significant credit exposure of the Group to the counterparty.

This approach allows closer monitoring of transactions with the main entities in potential conflict of interest risk.

The Procedures set forth the assessment process that must be followed by the Parent Company and subsidiary companies when carrying out transactions with Related Parties of Intesa Sanpaolo, Associated Entities of the Group and Relevant Parties pursuant to Art. 136 of the Consolidated Law on Banking, to ensure appropriateness of the transactions. The Procedures also require detailed examination of the reasons and interests behind the transaction, their effects on financials and the terms of the transaction.

In line with the regulations implemented by Consob and by the Bank of Italy, a regime of full or partial exemptions from the application of the regulations is also envisaged.
With regard to the decision-making for transactions with Related Parties of Intesa Sanpaolo and Associated Entities of the Group, the procedure distinguishes between:

- transactions involving smaller amounts: with a value of less than or equal to 250 thousand euro for individuals and 1 million euro for persons other than natural persons (excluded from application of the regulations);
- less significant transactions: with a value higher than the small-amount thresholds (250 thousand euro for individuals and 1 million euro for persons other than natural persons) but lower than or equal to the most significant thresholds indicated below;
- most significant transactions: with a value higher than the threshold of 5% of the indicators defined by Consob and by the Bank of Italy (approximately 2.8 billion euro for the Intesa Sanpaolo Group);
- transactions attributed to the shareholders' meeting, in accordance with the law or with the Articles of Association.

The process for the approval of transactions with Related Parties of Intesa Sanpaolo and Associated Entities of the Group reserves an important role for the Committee for Transactions with Related Parties, which meets the independence requirements laid down in the Corporate Governance Code for Listed Companies and Article 148 of the Consolidated Law on Finance, as well as the independence requirements contemplated by applicable laws and regulations, including those specific to the banking sector (Ministerial Decree 169/2020). The Committee for Transactions with Related Parties can make use of independent experts, where considered appropriate, according to the degree of importance of the transaction, its specific economic or structural characteristics and the nature of the related party or associated entity.
For most significant transactions, the Committee must be promptly involved in the analysis and negotiation phases, receiving a complete and timely flow of information, with the right of the Committee to request additional information and make observations.
All transactions – that are not exempt based on the Procedures – undertaken by the Parent Company with one of its related parties or associated entities are subject to approval by the Board, after consulting the Committee for Transactions with Related Parties.
The Procedures set out specific controls in the event that a less significant or most significant transaction is approved in spite of a negative opinion of the Committee for Transactions with Related Parties.

Transactions undertaken by subsidiaries with Related Parties of Intesa Sanpaolo and Associated Entities of the Group must be approved by the Board of Directors of the subsidiaries concerned, subject to prior authorisation from the Parent Company released in accordance with the procedure described above.

The Procedures also define the general criteria for the information to be provided, at least quarterly – also pursuant to Article 150 of the Consolidated Law on Finance – to the directors and the control body regarding transactions with Related Parties and Associated Entities completed in the reference period by the Parent Company or by its subsidiaries. All of the above is aimed at providing a complete overview of the transactions of greater importance, as well as the volumes and the main features of all those delegated. Reports must include all transactions, even if exempt from the decision-making procedure, for amounts greater than the small-amount thresholds. Transactions of less significant importance in the form of intragroup loans and bank funding are excluded from this requirement (provided they do not regard a subsidiary with significant interests of another Related Party or Associated Entity and are not carried out at market or standard conditions). For ordinary intragroup less significant transactions carried out at market conditions, reporting is on an aggregate annual basis.

Transactions undertaken by Italian subsidiary banks with Related Parties and Associated Entities of the Group that have not been considered exempt must, subject to authorisation by the Parent Company, be approved by the relative Board of Directors, upon obtaining the opinion of a Committee of independent directors set up within the Board of Directors of the bank itself. Furthermore, specific reporting rules apply to transactions by the Bank's Bodies.

The Procedures also apply to transactions with Relevant Persons pursuant to Art. 136 of the Consolidated Law on Banking, which must be applied by all the Italian Banks of the Intesa Sanpaolo Group, including the Parent Company. This provision requires the adoption of a more thorough decision-making procedure (unanimous decision by the management body, excluding the vote of the interested member, and favourable vote of members of the control body) in order to allow the bank management body members to contract obligations, directly or indirectly, with the bank of which they act as management body members.
Furthermore, the requirements envisaged by the Italian Civil Code (Article 2391) and Article 53 of the Consolidated Law on Banking governing directors' personal interests are confirmed.
In particular, Article 2391 of the Italian Civil Code requires each Board Member to report every interest held, in his/her own name or on behalf of third parties, that may be significant in carrying out his/her management function, with reference to a specific transaction. In accordance with the abovementioned provision, the Board has jurisdiction over decisions regarding transactions – including those with Related Parties – in which the Managing Director possesses an interest on his/her own account or through a third party and must therefore abstain from the decision, entrusting the Board as per Article 2391 of the Italian Civil Code.
In addition, Article 53 of the Consolidated Law on Banking requires banks' directors to abstain from voting on resolutions where they have a conflict of interest on their own behalf or on behalf of third parties.
Finally, the regulation sets forth the documentation and disclosure requirements vis-a-vis competent authorities for information on loans provided to related parties by Group banks headquartered in a European Member State, as governed by European regulations (Article 88 of Directive 2013/36, as amended).

2. Information on balances with related parties

Receivable and payable balances with related parties as at 31 December 2024 within the consolidated accounts – other than those fully consolidated intragroup – amount to a total that is insignificant compared to the size of the Group's capital base. Likewise, the weight of income and charges with related parties on consolidated operating margin is insignificant.

	31.12.2024	
	Amount (millions of euro)	Impact (%)
Total financial assets (1)	8,186	0.9
Total other assets (2)	154	0.4
Total financial liabilities (3)	6,042	0.8
Total other liabilities (4)	754	0.5

(1) Includes captions 10, 20, 30, 40 and 70 of balance sheet assets.

(2) Includes captions 50, 60, 80, 120 and 130 of balance sheet assets.

(3) Includes captions 10, 20 and 30 of balance sheet liabilities.

(4) Includes captions 40, 50, 70, 80, 90, 100 and 110 of balance sheet liabilities.

	31.12.2024	
	Amount (millions of euro)	Impact (%)
Total interest income	103	0.3
Total interest expense	250	1.5
Total fee and commission income	38	0.3
Total fee and commission expense	22	0.8
Total operating costs (1)	280	2.3

(1) Includes caption 190 of the income statement.

In relation to associates, around 4.2 million euro of impairment losses were recognised on loans during the year.

The table below reports the main terms of reference of transactions with each category of related party, as classified by IAS 24, net of operations with fully consolidated entities, with the category of Significant Shareholders of Intesa Sanpaolo and their corporate groups (subsidiaries also controlled jointly with others, parent companies and companies subject to joint control) with an equity investment with voting rights in the Bank greater than the minimum threshold set out in regulations on communications of significant shareholdings in listed companies calculated only based on shares owned or under management, as well as with the additional subjects included in the scope set as a form of self-regulation.
The following table does not show the impact of related party transactions on the Group's cash flows, as this was not significant.
For greater clarity and in line with the reports sent to the Supervisory Authorities, note that the off-balance sheet items were detailed on two separate rows by grouping on one side the guarantees/commitments given and on the other the guarantees/commitments received. The first category also includes revocable commitments issued totalling 651 million euro.

(*) As a result of self-regulation, shareholders and their groups that hold a stake in the share capital that exceeds the minimum threshold set out in regulations on the communication of significant shareholdings in listed companies, calculated considering only shares owned or under management, as well as entities jointly controlled by them.

(**) As a result of self-regulation, companies that meet the conditions of at least two of these indicators: i) the counterparty holds a stake in Intesa Sanpaolo's capital with an amount between 1% and the minimum threshold set out in regulations on the communication of significant shareholdings in listed companies; ii) an entity of the ISP Group holds a stake in the counterparty exceeding 10% of the voting rights; iii) significant credit exposure of the Group to the counterparty. The amounts shown largely refer to the companies of the JP Morgan Group.

(***) As a result of self-regulation, companies in which management body members of Intesa Sanpaolo or their close family members i) hold executive offices or the office of chair of the management body; ii) hold a qualifying holding equal to or exceeding 10% of the capital or voting rights of that entity, or on which those persons may exercise a significant influence.

In the interest of completeness, the Group's most significant associates included in the category of related parties as defined by IAS 24 are: 1875 Finance Holding AG, Back2Bonis, Camfin S.p.A., Cassa di Risparmio di Fermo S.p.A., Digit'Ed Holding S.p.A., Efesto, Equiter S.p.A., FI.NAV Comparto A1 Crediti, Fondo UTP Italia Comparto Crediti, Idea CCR (Corporate Credit Recovery) II Comparto Crediti, Intrum Italy S.p.A., Lendlease MSG Heartbeat, Neva First – FCC, Penghua Fund Management Co. Ltd, Retail & Leisure Fund, Rexer S.p.A., RSCT Fund – Comparto Crediti, UTP Restructuring Corporate and Warrant Hub S.p.A.
The main joint ventures include: Mir Capital S.c.a. Sicar, Mooney Group S.p.A. and PBZ Croatia Osiguranje Public Limited for Company Compulsory Pension Fund Management.

3. Information on transactions with related parties

It is noted that transactions with fully consolidated intragroup related parties are not included in this document because they are netted at consolidated level.
For details of the transactions carried out by Intesa Sanpaolo S.p.A., see the information provided in Part H of Parent Company's Financial Statements.

Most significant transactions

During the year, the Intesa Sanpaolo Group did not carry out any transactions that qualified as non-ordinary "most significant transactions" and at non-market or non-standard conditions subject – in accordance with the Group Procedures regulating the conduct of Transactions with Related Parties of Intesa Sanpaolo S.p.A., Associated Entities of the Group and Relevant Parties pursuant to Article 136 of the Consolidated Law on Banking – to the obligation to publish a market disclosure document.
Please note that the most significant transactions in the period are those that exceed the threshold of 5% of Own Funds at consolidated level (approximately 2.8 billion) or of the other indicators defined by the Consob regulation.

Other significant transactions

The transactions undertaken by the Intesa Sanpaolo Group with related parties generally fall within the scope of the Group's ordinary activities and are generally entered into at market conditions, based on considerations of mutual economic interest, in line with the internal procedures mentioned above.

Relations between the Intesa Sanpaolo Group and the board members and general managers, key managers, their close family members and entities they have significant investments in refer to the Group's normal business activities and are defined applying, where conditions recur, the terms reserved to all employees, in full respect and transparency of terms applied.

With regard to the transactions with jointly-controlled subsidiaries or associates, as well as with significant investees due to the presence of important equity and financial ties, mention should be made of:

- the subscription by the vehicle Fondo Tematico Piano Urbani Integrati S.r.l. of new equity instruments issued by Euromilano S.p.A. for a total value of 30 million euro;
- ordinary credit transactions in favour of Alpian S.A. by Reyl & Cie S.A. for a total value of approximately 5 million euro;
- the signing of commercial agreements with Mooney S.p.A. by Isybank S.p.A.;
- the signing of advisory contracts by Eurizon Capital SGR S.p.A. and Eurizon Capital Real Asset SGR S.p.A. with Equiter S.p.A.;
- the subscription by Fideuram – Intesa Sanpaolo Private Banking S.p.A. of capital increases for approximately 40 million euro in favour of Alpian S.A. and for 2.5 million euro in favour of Asteria Investment Managers S.A.;
- technology asset rental transactions between Intesa Sanpaolo Rent Foryou S.p.A. and Mooney S.p.A. valued at approximately 6 million euro.

Other significant information

With regard to the companies carried at equity, a gain from the sale of investments in associates and companies subject to joint control was recognised attributable to the sale of shares of Bancomat S.p.A. and Euromilano S.p.A.

B) INFORMATION REGARDING COMPENSATION OF THE MEMBERS OF MANAGEMENT AND CONTROL BODIES AND KEY MANAGERS

The following table shows the amounts of the compensation paid in 2024 to the members of the Management and Control Bodies and the General Managers of the subsidiary companies, as well as the compensation paid to other Key Managers of the Parent Company who fall within the notion of "related party". This also includes the maximum amounts of the variable portion of remuneration which shall be paid in cash and/or shares of the Parent Company, based on the Group's remuneration and incentive policy, subject to the verification of achievement of the assigned targets and the decisions of the competent bodies of the Parent Company.

(millions of euro)

	MANAGEMENT BODIES/ CONTROL BODIES(1)		OTHER MANAGERS (2)		TOTAL as at 31.12.2024	
	Amount due	Amount paid	Amount due	Amount paid	Amount due	Amount paid
Short-term benefits (3)	19	14	63	48	82	62
Post-employement benefits (4)	-	-	4	3	4	3
Other long-term benefits (5)	-	-	12	1	12	1
Termination benefits (6)	-	-	3	-	3	-
Share-based payments (7)	-	-	28	-	28	-
Total	**19**	**14**	**110**	**52**	**129**	**66**

(1) Figures referring to 457 positions. The table does not include approximately 2 million euro relating to 67 positions in the Boards of Directors (or similar bodies), as this was fully transferred to other Group Companies.

(2) Figures referring to 121 positions. The table does not include approximately 12,1 million euro relating to 19 General Manager positions (or similar positions), as this was fully transferred to other Group Companies.

(3) Includes fixed and variable remuneration of Directors that may be treated as equivalent to labour cost and social security charges paid by the company for its employees.

(4) Includes company contribution to pension funds and provisions for employee termination indemnities pursuant to law and company regulations.

(5) Includes an estimate of provisions for employee seniority bonuses.

(6) Includes benefits due under the employment contract for termination of employment.

(7) Includes the cost referring to the variable portion of short-/long-term remuneration to be paid in Intesa Sanpaolo shares.

Detailed information on remuneration policies, pursuant to Art. 123-ter of the Consolidated Law on Finance, is published annually in the "Report on remuneration policy and compensation paid", which includes:

- the details of the remuneration paid to members of management and control bodies, to General Managers, and, in aggregate form, to other Key Managers;
- the details and the progress of the stock option plans for the members of the Management Body, General Managers and other Key Managers;
- the details and the progress of the incentive plans based on financial instruments other than stock options, in favour of the Managing Director and CEO and other Key Managers;
- the details of the monetary incentive plans in favour of the Managing Director and CEO and other Key Managers;
- the shares of the Parent Company and subsidiaries held by the members of the Management and Control bodies, Key Managers and other associated entities.

Part I – Share-based payments

A. QUALITATIVE INFORMATION

Description of share-based payments

Annual incentive plan based on financial instruments

The Supervisory Provisions regarding remuneration and incentive policies and practices in banks and in banking groups, issued on 30 March 2011 (now integrated in Circular 285 of the Bank of Italy) required, inter alia, that a portion of annual incentives paid to “Risk Takers” be granted through the assignment of financial instruments, over a multi-year time horizon. As a result, the Intesa Sanpaolo Group sets up annual incentive plans linked to performance. In fulfilment of these plans:

- with regard to the results for 2019, and in implementation of the Shareholders' Meeting resolution of 27 April 2020, on 16, 17 and 18 November 2020 the Group totally purchased - through its IMI Corporate & Investment Banking Division, in charge of the programme execution - 25,400,000 Intesa Sanpaolo ordinary shares (representing approximately 0.13% of the share capital of the Parent Company) at an average purchase price of 1.852 euro per share, for a total value of 47,046,279 euro. In addition, the purchase programme has been implemented in service of the 2018-2021 Incentive Plan for financial advisors of the Fideuram – Intesa Sanpaolo Private Banking and Sanpaolo Invest networks and to grant severance payments to Risk Takers upon early termination of employment, as envisaged by the Supervisory Provisions;
- with regard to the results for 2020, and in implementation of the Shareholders' Meeting resolution of 28 April 2021, on 13 and 14 September 2021 the Group totally purchased - through its IMI Corporate & Investment Banking Division, in charge of the programme execution - 20,000,000 Intesa Sanpaolo ordinary shares (representing approximately 0.10% of the share capital of the Parent Company) at an average purchase price of 2.391 euro per share, for a total value of 47,822,401 euro. In addition, the purchase programme has been implemented in service of the former UBI Banca Group's shared-based payment incentive system for Risk Takers in regard to 2020 and residual shares from the former UBI Banca Group’s incentive systems for previous years, as well as to grant severance payments to Risk Takers upon early termination of employment, as envisaged by the Supervisory Provisions;
- with regard to the results for 2021, and in implementation of the Shareholders’ Meeting resolution of 29 April 2022, from 12 to 14 September 2022 the Group totally purchased – through its IMI Corporate & Investment Banking Division, in charge of the programme execution – 46,216,652 Intesa Sanpaolo ordinary shares (representing approximately 0.24% of the share capital of the Parent Company[200]) at an average purchase price of 1.8932 euro per share, for a total value of 87,496,321.48 euro. In addition, the purchase programme has been implemented in service of the Privredna Banka Zagreb (PBZ) Group’s shared-based payment incentive system in regard to 2021 and the residual portions in financial instruments from previous plans, the Long-Term Incentive Plans reserved for the Financial Advisors of the Networks of the Fideuram - Intesa Sanpaolo Private Banking Group, as well as to grant severance payments upon early termination of employment;
- with regard to the results for 2022, and in implementation of the Shareholders’ Meeting resolution of 28 April 2023, from 11 to 13 September 2023 the Group totally purchased – through its IMI Corporate & Investment Banking Division, in charge of the programme execution – 32,000,000 Intesa Sanpaolo ordinary shares (representing approximately 0.18% of the share capital of the Parent Company) at an average purchase price of 2.4697 euro per share, for a total value of 79,031,462.67 euro. The purchase programme has also been implemented in service of the incentive systems of several subsidiaries (i.e. the 2022 Incentive System of the Private Banking Network belonging to the Italy Network of Intesa Sanpaolo Private Banking; the 2022 Incentive System of the Relationship Managers belonging to the International Commercial Networks of the Fideuram – Intesa Sanpaolo Private Banking Group; and the 2022 Incentive System of the non-employee Financial Advisors belonging to the Commercial Networks of the Fideuram – Intesa Sanpaolo Private Banking Group) and any payment of consideration granted in conjunction with early termination of employment (severance);
- with regard to the results for 2023, and in implementation of the Shareholders’ Meeting resolution of 24 April 2024, from 9 to 11 September 2024 the Group totally purchased – through its IMI Corporate & Investment Banking Division, in charge of the programme execution – 21,000,000 Intesa Sanpaolo ordinary shares (representing approximately 0.11% of the share capital of the Parent Company) at an average purchase price of 3.7154 euro per share, for a total value of 78,023,430.57 euro. The purchase programme has also been implemented in service of the incentive systems of several subsidiaries (i.e. the 2023 Incentive System of the Private Banking Network belonging to the Italy Network of Intesa Sanpaolo Private Banking; the 2023 Incentive System of the Relationship Managers belonging to the International Commercial Networks of the Fideuram – Intesa Sanpaolo Private Banking Group; and the 2023 Incentive System of the non-employee Financial Advisors belonging to the Commercial Networks of the Fideuram – Intesa Sanpaolo Private Banking Group) and any payment of consideration granted in conjunction with early termination of employment (severance).

[200] The percentage has been calculated, in compliance with the terms of the resolution approved at the Intesa Sanpaolo Shareholders’ Meeting of 29 April 2022, on the 19,430,463,305 ordinary shares without nominal value composing the share capital of 10,084,445,147.92 euro before the execution, on 30 June 2022, of the capital increase under the 2022-2025 LECOIP 3.0 Long-term Incentive Plan based on financial instruments (which raised the share capital to 10,368,870,930.08 euro divided into 19,977,435,963 shares) and, then, the annulment of the own shares purchased in execution of the buyback programme disclosed to the market on 24 June 2022 and launched on 4 July 2022 (the share capital composition changed following the reduction in the number of its constituent shares, while its amount remained unchanged at 10,368,870,930.08 euro). The shares purchased represented around 0.24% of the share capital when considering the 19,267,277,397 constituent shares at the time of purchase.

The above Shareholders' Meetings also authorised the sale on the regulated market of any shares exceeding requirements, or their retention for any future incentive plans.
The above shares shall be assigned to the beneficiaries in compliance with the implementing regulations set forth in the above incentive systems. Generally, according to these regulations, the beneficiaries must remain in service up to the time the shares are actually delivered to them, and the deferred portion (either in cash or in financial instruments) of the incentive is subject to an ex post correction mechanism – the "malus condition" – according to which the relative amount paid and the number of shares assigned, if any, may be reduced by the level of achievement, in the year to which the deferred portion refers, of specific income statement-balance sheet targets which measure the sustainability of the results achieved over time.

Long-Term Incentive Plans 2022-2025: Performance Share Plan and LECOIP 3.0 Plan
At the time of launching the 2022-2025 Business Plan, two new long-term incentive plans were launched targeting different clusters of employees:
- Performance Share Plan (PSP) reserved for the Group Management, including the Managing Director and CEO, the remaining Group Top Risk Takers and other Group Risk Takers (in Italy and abroad);
- LECOIP 3.0 Plan reserved for all the Professionals employed by the Group in Italy.

With regard to Management, Intesa Sanpaolo has adopted a plan specifically linked to the achievement of the Business Plan targets and with an adequate risk/return profile in respect of the role held and the levels of ambition and challenge of the Business Plan, and which envisages the adoption of Performance Shares as a financial instrument. Participation in the PSP was also offered until 31 December 2023 to newly hired managers and in the event of promotions to recognise career advancement.
In detail, the Performance Share Plan provides for the assignment of new Intesa Sanpaolo ordinary shares deriving from a capital increase without payment, upon achievement of key performance conditions of the Business Plan, subject to the application of de-multipliers based on sustainability targets, as well as subordinated to gateway conditions and individual access (compliance breach).
Any shares accrued will be paid out over a 4/5-year time horizon according to payout schedules established depending on the sub-cluster of the beneficiary, the amount of the total variable remuneration, and its weight compared to the fixed remuneration. The deferred portions are also subject to the verification of malus conditions, defined in a mirrored manner to the gateway conditions.
For Professionals, basically in line with the LECOIP 2.0 Plan, a retention plan called "LECOIP 3.0" has been structured with the aim of continuing the work of strengthening the personnel's identity and sense of belonging, consistently with the Group's inclusive organisational culture.
The LECOIP 3.0 Plan is assigned as certificates issued by JP Morgan, i.e. share-based financial instruments, and envisages:
- the assignment of newly issued ordinary shares of Intesa Sanpaolo deriving from a share capital increase without payment (Free Shares) for an amount equivalent to the Variable Result Bonus advance for 2022 (employees may opt to receive the advance in cash and, therefore, not to participate in LECOIP 3.0);
- the assignment, free of charge, of additional shares in exchange for the same share capital increase without payment (Matching Shares) based on the role held and seniority, and the subscription, in set proportions with respect to the free shares received, of newly issued ordinary Intesa Sanpaolo shares deriving from a share capital increase with payment reserved for employees, at a discounted issue price (Discounted Shares) against market value.

The Certificates reflect the terms of certain options that have Intesa Sanpaolo ordinary shares as their underlying instruments, and will allow employees to receive, at maturity, in the absence of trigger events, an amount in cash (or in Intesa Sanpaolo ordinary shares) that is equal to the original market value of the Free Shares and the Matching Shares, plus a portion of any appreciation, compared to the original market value, related to the amount of the Free Shares, Matching Shares and Discounted Shares.
In residual cases, the amount will be paid according to specific payout schedules that provide for deferral and payment of part of the bonus in financial instruments. These schedules are differentiated according to the cluster the beneficiaries belong to when the bonus is accrued, as well as the amount of the total variable remuneration, and its weight compared to the fixed remuneration.
The Performance Share Plan and the LECOIP 3.0 Plan were subject to the approval of the ordinary Shareholders' Meeting of 29 April 2022.
The extraordinary session of the Shareholders' Meeting resolved on granting a power of attorney to the Board of Directors to increase the share capital pursuant to Article 2443 of the Italian Civil Code, conducive to the implementation of the plans.
On 21 June 2022, ISP's Board of Directors exercised the authority granted to it by the Shareholders' Meeting for capital increases in favour of the Group's employees to service the implementation of the 2022-2025 LECOIP 3.0 Plan.
Both the long-term incentive plans in question (the Performance Share Plan and the LECOIP 3.0) fall within the scope of IFRS 2 and qualify as equity-settled share-based payment plans.
For the Performance Share Plan, the fair value of the equity instruments that are subject to the plan is calculated at the assignment date. The Plan envisages the presence of service and performance conditions, which must be considered in order to determine the number of shares for the measurement of the cost of the plan. These estimates will be subject to review during the accrual period and until the expiry. Additionally, the determination of the fair value of the plan needs to take into account the presence of "market" performance conditions.
The cost of the plan, so defined, is attributed to the income statement (as labour costs) pro rata temporis along the accrual period of the benefit, as a balancing entry for a specific shareholders' equity reserve. Upon the occurrence of the events that imply the loss of the rights to the benefits of the plan (performance targets, gateway conditions and the discontinuation of employment) for the employees, if the estimate made previously needs to be adjusted, ISP changes the cost of the plan with a corresponding adjustment to Shareholders' Equity.
With regard to the LECOIP 3.0 Plan, at the assignment date, the fair value of the equity instruments that are subject to the plan is calculated (equivalent to the sum of the fair value of the shares assigned free of charge and the fair value of the discount for the paid shares) and no longer modified.

The Plan envisages the presence of non-market service and performance conditions (trigger events), which must be considered in order to determine the number of shares for the measurement of the cost of the plan. These estimates will be subject to review during the vesting period and until the expiry. The cost of the Plan, so defined, is attributed to the income statement (as labour costs) pro rata temporis along the period of accrual of the benefit, as a balancing entry for a specific shareholders' equity reserve.
Upon the occurrence of the events that imply the loss of the rights to the benefits of the LECOIP 3.0. Certificate (trigger events and the discontinuation of employment) for the employees, Intesa Sanpaolo recognises a financial asset (the "transferred receivable" representing the Certificates) as a balancing entry in Shareholders' Equity. In particular, the Certificates entered in the Group's financial statements are classified, in accordance with the provisions of IFRS 9, under caption 20.c) "Financial assets measured at fair value through profit or loss: Other financial assets mandatorily measured at fair value". At the same time, if the estimate made previously needs to be adjusted, the cost of the plan is changed with a corresponding adjustment to Shareholders' Equity.

B. QUANTITATIVE INFORMATION

Evolution of the annual incentive plans based on financial instruments in 2024

	Number of shares	Average strike price (euro)	Residual life
Financial instruments outstanding as at 31 December 2023	32,901,693	-	2024/2028
Financial instruments granted during the year (a)	28,050,561	-	2024/2028
Financial instruments no longer assignable (b)	304,017	-	-
Financial instruments vested during the year and assigned	21,977,071	-	-
Financial instruments outstanding as at 31 December 2024	38,671,166	-	2025/2029
of which: vested and assigned as at 31 December 2024	-	-	-

(a) Including the shares deriving from corporate transactions.

(b) Shares no longer deliverable to the beneficiaries following the related employment agreement ceasing and/or due to the application of the so-called malus conditions.

In addition to the shares specified above, in accordance with the Provisions of the Bank of Italy regarding remuneration and the Remuneration and Incentive Policies of the Group, during 2024, 910,610 shares were assigned with reference to remuneration granted in the event of early termination (severance). The retention period of those shares, assigned over a multi-year time horizon, ends between January 2025 and January 2030.

Breakdown by residual life

Residual life (a)	Number of shares
2025	7,314,697
2026	14,207,800
2027	9,585,141
2028	5,499,371
2029	2,064,157

(a) End of retention period

Evolution of long-term share-based instruments: Performance Share Plan (PSP) and LECOIP 3.0

	PERFORMANCE SHARE PLAN (PSP)			
	Number of Performance Share at 31.12.2023	**Changes in the year (a)**	**Number of Performance Share at 31.12.2024**	**Fair value**
Total beneficiaries (all the Management, including the Managing Director and CEO, the other Group Top Risk Takers and the remaining Group Risk Takers – both Italian and foreign perimeter)	150,430,031	-4,583,932	145,846,099	1.0195

(a) Number of Performance Shares that will not be awarded to employees due to failure to meet the continuation of service or other vesting conditions.

	LECOIP PLAN 3.0												
	Free Shares at June 2022		**Matching Shares at June 2022**		**Discounted Shares at June 2022**		**Sell to cover shares at June 2022 (a)**		**Total number of shares assigned at June 2022**	**Number of LECOIP Certificates at 31.12.2023**	**Changes in the year (c)**	**Number of LECOIP Certificates at 31.12.2024**	**Average fair value 31.12.2024**
	Number of shares	Average unit fair value	Number of shares	Average unit fair value	Number of shares	Average unit fair value (b)	Number of shares	Average unit fair value (b)					
Total employees	33,745,462	1.7800	39,591,828	1.7800	386,972,658	0.3409	86,662,710	1.7800	546,972,658	71,283,863	-1,118,503	70,165,360	7.5200

(a) Assigned shares allocated to cover the payment relating to the employee's tax burden.

(b) Fair value of the subscription discount.

(c) Number of Certificates for which Intesa Sanpaolo shall take over the rights that would have been recognised to the employees by virtue of the Certificates due to failure to comply with the condition of continuation of employment for the duration of the Plan and other vesting conditions.

(a) Figures from the reclassified financial statements, as described in the Report on operations.

The groupings by geographical area are based on the location of the Group’s constituent entities. The International Branches are reported with reference to the country where the branches are located. As far as taxes on income are concerned, since Intesa Sanpaolo did not apply the option for the scheme of income exemption for international branches (known as Branch exemption), these branches’ income is also taxed in Italy. In compliance with applicable regulations, Intesa Sanpaolo also provides “Country by Country” disclosures which, in accordance with Bank of Italy rules, report net interest and other banking income, number of employees, profit or loss before tax, and taxes for the year for each country where the Group operates. The report can be viewed on the Intesa Sanpaolo Group website in the Governance section (or follow the link: https://group.intesasanpaolo.com/it/governance/risk-management/informativa-stato-per-stato).
In application of IFRS 15, in particular paragraphs 114 and 115, which require a breakdown of revenues from contracts with customers, the breakdown of fee and commission income and expense by geographical area is provided below.

(a) Figures from the reclassified financial statements, as described in the Report on operations.

Part M – Disclosure of leases

This section provides the information required by IFRS 16 that is not included in other parts of the financial statements, divided between lessee and lessor.

SECTION 1 - LESSEE

QUALITATIVE INFORMATION

The Intesa Sanpaolo Group essentially has real estate and car or other vehicle lease contracts in place. There are also other types of lease contracts, for residual amounts, relating to hardware and other assets.
As at 31 December 2024, there were 8,570 lease contracts (8,515 as at 31 December 2023), 4,748 of which (4,861 as at 31 December 2023) relating to real estate leases, for a total value of rights of use of 1,229 million euro (1,372 million euro as at 31 December 2023).

Real estate lease contracts include properties designated for use as offices or bank branches. These contracts, within Italy, normally have a term of more than 12 months and typically have renewal and termination options that can be exercised by the lessor and the lessee in accordance with the law or specific contractual provisions. These contracts usually do not include the option to purchase at the end of the lease or significant restoration costs for the companies. The lease contracts typically include an option for early release prior to the contractual maturity, and, in such cases, they do not impose any penalties on the Group. On the basis of the characteristics of the Italian lease contracts and the provisions of Law 392/1978, in the event of the signing of a new lease contract with a contractual term of six years and the option to automatically renew the contract after six years for another six years, the total term of the lease will be set at twelve years. This general rule is superseded if there are new elements or specific situations within the contract.
Within the international scope, contractual terms may vary according to local practice, while generally not exceeding a period of 5 years, subject to renewal. In the case of the international subsidiaries as well, these contracts do not provide for either an option to purchase at the end of the lease or significant restoration costs for the companies.

Contracts for vehicles are long-term rental contracts relating to the company fleet made available to employees (mixed use) or to the organisational structures of the individual companies. These contracts generally have a four-year term, with monthly payments, no renewal option and do not include the option to purchase the asset. The contract may be extended depending on the management of the car fleet and there may be a penalty in the event of early termination.

Lease contracts other than those relating to real estate and cars relate to hardware (84 contracts as at 31 December 2024, 60 as at 31 December 2023) and other residual contracts (274 as at 31 December 2023, 352 as at 31 December 2023) and are of immaterial amounts in relation to total property and equipment leased.

The amounts of the sale or leaseback transactions carried out in 2024 were insignificant.

Sub-leasing transactions are immaterial and are connected to intra-group transactions.

Lastly, the Group makes use of the exemptions allowed by IFRS 16 for short-term leases (i.e. with a term of less than or equal to 12 months) or leases of low value assets (i.e. with a value of 5,000 euro or less).

QUANTITATIVE DISCLOSURES

Part B - Assets in the Notes to the Financial Statements contains information on the rights of use acquired through leases (Table 9.1 - Property and equipment used in operations: breakdown of assets measured at cost and Table 9.4 - Investment property: breakdown of assets measured at fair value) and Part B - Liabilities contains information on the lease payables (Table 1.1 - Financial liabilities measured at amortised cost: breakdown of amounts due to banks and Table 1.2 - Financial liabilities measured at amortised cost: breakdown of amounts due to customers).
In particular, the rights of use acquired through leases amounted to 1,229 million euro (1,372 million euro as at 31 December 2023), of which 991 million euro relating to real estate leases (1,121 million euro as at 31 December 2023).
Lease payables amounted to 1,097 million euro (1,217 million euro as at 31 December 2023). See the abovementioned sections for more details.
Part C of the Notes to the consolidated financial statements contains information on the interest expense on lease payables and other charges connected to rights of use acquired through leases, and on the income from sub-leasing transactions. See the specific sections for more details.

The table below provides a breakdown of the amortisation and depreciation charges for assets consisting of the right of use among the various categories, in line with the disclosure of property and equipment/intangible assets.

(millions of euro)

Captions	31.12.2024	31.12.2023
Depreciation charges by asset class		
Property and equipment used in operations	**291**	**306**
a) buildings	188	198
b) forniture	13	-
c) electronic equipment	31	17
d) other	59	91
Property and equipment for investment	**-**	**-**
a) buildings	-	-
TOTAL	**291**	**306**

As at 31 December 2024, there was no property and equipment relating to commitments for leases not yet commenced.
There is no other information that needs to be reported in addition to that already contained in this section.

SECTION 2 - LESSOR

QUALITATIVE INFORMATION

The Intesa Sanpaolo Group undertakes lease transactions, as lessor, primarily through the Parent Company, Intesa Sanpaolo, and various international subsidiaries, specifically PBZ Leasing, VUB Leasing, CIB Leasing and Intesa Leasing Beograd.
The transactions primarily consist of finance leases of real estate and industrial and commercial assets. The companies are also present on the market with lease products relating to capital goods, industrial vehicles, boats and pleasure craft. The risks associated with the ownership rights to the leased assets within Italy are managed through the compulsory subscription of an all-risk insurance policy, either offered through concessionary agreements or taken out directly by the customer with their insurer.
Operating leases refer to both real estate and vehicles and equipment.
The Notes to the consolidated financial statements report the following:

- finance leases (Part B, Assets: Table 4.1 - Financial assets measured at amortised cost: breakdown of amounts due from banks and Table 4.2 - Financial assets measured at amortised cost: breakdown of loans to customers);
- assets leased under operating leases contained in caption 90 Property and equipment and described in Part B, Assets (Table 9.4 - Investment property: breakdown of assets measured at fair value); this consists of real estate no longer used in operations by the Group, which is leased to third parties or held for possible appreciation in value.

See the abovementioned sections for more details.
Part C of the Notes to the consolidated financial statements contains information on interest income on finance leases and other income from finance and operating leases. See the specific sections for more details.

2. Finance leases

2.1. Breakdown by time bands of payments to be received and reconciliation with finance leases recorded as assets

This table provides the breakdown by time bands of lease payments to be received and the reconciliation between lease payments to be received and finance leases in accordance with IFRS 16, paragraph 94. In particular, the lease payments to be received, representing the sum of the minimum payments due as principal and interest, are shown net of the adjustment allowances and the unguaranteed residual value due to the lessor. The reconciliation with finance leases, shown in the financial statements under financial assets measured at amortised cost, is performed by subtracting the unearned finance income and adding the unguaranteed residual value.

(millions of euro)

Time bands	31.12.2024 Payments to be received	31.12.2023 Payments to be received
Up to 1 year	1,643	1,808
Between 1 and 2 years	1,337	1,493
Between 2 and 3 years	1,125	1,247
Between 3 and 4 years	888	1,020
Between 4 and 5 years	646	767
Over 5 years	1,382	1,738
Total lease payments to be received	**7,021**	**8,073**
Reconciliation with loans	248	619
Not accrued gains (+)	1,357	1,823
Unguaranteed residual value (-)	-1,109	-1,204
Loans for leases	**6,773**	**7,454**

2.2. Other information

2.2.1 Classification of finance leases by type of leased asset

The table shows the classification of finance leases by credit quality (performing and non-performing) and by type of leased asset. The amounts are shown net of adjustments.

(millions of euro)

Finance leases	Performing exposures	Non-performing exposures
A. Real estate assets	**4,263**	**261**
B. Operating assets	**958**	**13**
C. Movable assets	**1,269**	**9**
- Motor vehicles	940	6
- Aircraft and rolling stock	204	2
- Other	125	1
D. Intangible assets	**-**	**-**
- Trademarks	-	-
- Software	-	-
- Other	-	-

2.2.2 Classification of assets under finance leases

The table below provides a breakdown by category of leased asset (not yet transferred to property and equipment) relating to lease receivables, net of adjustments.

(millions of euro)

	Unexercised assets	Assets withdrawn following termination	Other assets
A. Real estate assets	**1**	**5**	**4,518**
B. Operating assets	**-**	**-**	**971**
C. Movable assets	**89**	**-**	**1,189**
- Motor vehicles	67	-	879
- Aircraft and rolling stock	-	-	206
- Other	22	-	104
D. Intangible assets	**-**	**-**	**-**
- Trademarks	-	-	-
- Software	-	-	-
- Other	-	-	-
TOTAL	**90**	**5**	**6,678**

Unexercised assets are assets still held by customers, for which the repurchase option has not been exercised, related to positions that do not show any deterioration in credit quality. Assets withdrawn following termination relate to terminated contracts, where the customer has not yet been released from the contractual obligations, despite having returned the asset covered by the lease contract. The category "other assets" includes the assets underlying the other lease receivables not included in the previous columns.

3. Operating lease

3.1. Breakdown of payments to be received by time bands

This refers to lease instalments to be received for owned real estate assets.

(millions of euro)

Time bands	**31.12.2024** **Payments to be received for leases**	**31.12.2023** **Payments to be received for leases**
Up to one year	45	34
Over one year up to 2 years	10	15
Over 2 years up to 3 years	9	13
Over 3 years up to 4 years	12	12
Over 4 years up to 5 years	11	10
For over 5 years	40	25
Total	**127**	**109**

3.2. Other information

There is no other information that needs to be reported in addition to that already contained in this section.

Certification of the Consolidated financial statements pursuant to Art. 154 bis of Legislative Decree 58/1998

1. The undersigned Carlo Messina (as Managing Director and CEO) and Elisabetta Stegher (as Manager responsible for preparing the Company's financial reports) of Intesa Sanpaolo, taking into account the provisions of Article 154-bis, par. 3 and 4 of Legislative Decree 58 of 24 February 1998, do hereby certify to:
   - the adequacy in relation to the Company's features and
   - the actual application of the administrative and accounting procedures employed to draw up the consolidated financial statements during 2024.

2. Verification of the appropriateness and effective application of the administrative and accounting procedures employed to draw up the consolidated financial statements as at 31 December 2024 was based on methods defined by Intesa Sanpaolo consistently with the COSO and – as to the IT component – COBIT models, which are internationally accepted frameworks for internal control systems[201].

3. The undersigned also certify that:

   3.1 The Consolidated financial statements as at 31 December 2024:
   - have been prepared in compliance with applicable international accounting standards recognised by the European Community pursuant to European Parliament and Council Regulation 1606/2002 of 19 July 2002;
   - correspond to the results of the books and accounts;
   - give a true and fair presentation of the assets, liabilities, profit or loss and financial position of the issuer and of the companies included in the scope of consolidation.

   3.2 The report on operations includes a fair review of the development and operating margin, as well as of the position of the issuer and the companies included in the consolidation, together with a description of the main risks and uncertainties that they face.

27 February 2025

Carlo Messina	Elisabetta Stegher
Managing Director and CEO	Manager responsible for preparing the Company's financial reports

[201] The COSO Framework was prepared by the Committee of Sponsoring Organizations of the Treadway Commission, the U.S. organisation dedicated to improving the quality of financial reporting through ethical standards and an effective system for corporate governance and organisation. The COBIT Framework - Control OBjectives for IT and related technology is a set of rules prepared by the IT Governance Institute, the U.S. organisation whose aim is to define and improve the standards of corporate IT.

Certification of the Consolidated Sustainability Statement pursuant to Art. 154 bis of Legislative Decree 58/1998

The undersigned Carlo Messina (as Managing Director and CEO) and Elisabetta Stegher (as Manager responsible for preparing the Company's financial reports) of Intesa Sanpaolo, do hereby certify, pursuant to Article 154-bis, par. 5-ter, of Legislative Decree 58 of 24 February 1998, that the Consolidated Sustainability Statement included in the Report on operations has been prepared:

- in compliance with the reporting standards applied in accordance with Directive 2013/34/EU of the European Parliament and of the Council of 26 June 2013 and Legislative Decree No. 125 of 6 September 2024;
- using the specifications adopted in accordance with Article 8(4) of Regulation (EU) 2020/852 of the European Parliament and of the Council of 18 June 2020.

Independent auditor's report pursuant to article 14 of Legislative Decree no. 39, dated 27 January 2010 and article 10 of EU Regulation no. 537/2014

(Translation from the original Italian text)

To the Shareholders of
Intesa Sanpaolo S.p.A.

Report on the Audit of the Consolidated Financial Statements

Opinion

We have audited the consolidated financial statements of Intesa Sanpaolo Group (the "Group"), which comprise the consolidated balance sheet as at 31 December 2024, the consolidated income statement, the statement of consolidated comprehensive income, the changes in consolidated shareholders' equity and the consolidated statement of cash flows for the year then ended, and the notes to the consolidated financial statements, including material accounting policy information.

In our opinion, the consolidated financial statements give a true and fair view of the financial position of the Group as at 31 December 2024, and of its financial performance and its cash flows for the year then ended in accordance with IFRS accounting standards as issued by the International Accounting Standards Board as adopted by the European Union and with the regulations issued for implementing article 9 of Legislative Decree no. 38/2005 and article 43 of Legislative Decree no. 136/2015.

Basis for Opinion

We conducted our audit in accordance with International Standards on Auditing (ISA Italia). Our responsibilities under those standards are further described in the *Auditor's Responsibilities for the Audit of the Consolidated Financial Statements* section of our report. We are independent of Intesa Sanpaolo S.p.A. (the "Bank") in accordance with the regulations and standards on ethics and independence applicable to audits of financial statements under Italian Laws. We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our opinion.

Key Audit Matters

Key audit matters are those matters that, in our professional judgment, were of most significance in our audit of the consolidated financial statements of the current year. These matters were addressed in the context of our audit of the consolidated financial statements as a whole, and in forming our opinion thereon, and we do not provide a separate opinion on these matters.

Shape the future with confidence

We identified the following key audit matters:

Key Audit Matters	Audit Responses
Classification and measurement of loans to customers (loans) measured at amortised cost	
Loans to customers (loans) measured at amortised cost recorded in the financial assets, line item 40 b) (the "Loans"), amount to Euro 413,353 million as at 31 December 2024 and represent approximately 44.3% of total assets in the consolidated balance sheet. The breakdown of such loans is included in tables 4.2 and 4.3 in Part B, section 4, of the notes to the consolidated financial statements. The disclosure of the changes in the quality of the Loans, the classification and measurement criteria adopted is provided in the notes to the consolidated financial statements in Part A – Accounting policies, in Part B – Information on the consolidated balance sheet, in Part C – Information on the consolidated income statement and in Part E – Information on risks and relative hedging policies. The classification of the Loans in the appropriate stage and the related measurement are relevant for the audit both because the amount of such loans is significant to the financial statements as a whole and because they are determined by the Directors through the use of estimates. These estimates have a high degree of complexity and subjectivity, involve internally developed models and include subjective elements in order to identify and measure exposures that show evidence of a significant increase in credit risk since the date of initial recognition or evidence of impairment. The processes for the classification and the measurement of the Loans consider both internal and external information, including the historical performance of exposures and related collection histories, the borrowers' overall exposure to the banking system, expected cash flows and related estimated collection dates, the assessment of any guarantees, the impact	In relation to this matter, our audit procedures included, among others: - gaining an understanding of the policies, valuation models, processes and controls applied by the Group; - the assessment of the configuration and implementation of key controls, including those relating to the relevant IT applications, and the execution of tests of controls to test their operational effectiveness; - the analysis of the changes in the breakdown of the Loans compared to the previous year and the discussion of the results with management; - the performance of substantive procedures to verify, on a sample basis, the correct classification and measurement of credit exposures; - the assessment of the adequacy of the disclosures provided in the notes to the consolidated financial statements. The aforementioned procedures have been performed also with the support of our risk management, valuation, modelling and economics and information technology specialists.

of macroeconomic variables, any emerging risks, and future scenarios also related to Loans' sales and risks of the Group's customers' operating sectors.

Classification and measurement of financial assets and liabilities at fair value on a recurring basis (levels 2 and 3)	
Financial instruments measured at fair value on a recurring basis, classified as level 2 and level 3 of the fair value hierarchy, amount to a total assets balance of Euro 55,240 million and a total liabilities balance of Euro 112,997 million as at 31 December 2024. The related breakdown is included in table A.4.5.1, Part A of the notes to the consolidated financial statements. The disclosures on the classification and measurement is provided in the notes to the consolidated financial statements in Part A - Accounting policies, in Part B - Information on the consolidated balance sheet, in Part C - Information on the consolidated income statement and in Part E - Information on risks and relative hedging policies. The measurement of such financial instruments is relevant to the audit because their amount is significant to the financial statements as a whole and because of the multiplicity and complexity of the valuation models and parameters used as well as and for the subjective estimation elements considered by the Directors. The valuation of these financial instruments is performed by the Group through the use of complex models, consistent with the prevailing valuation practices, which are fed by directly observable inputs or, when not observable in the market, estimated internally based on qualitative and quantitative assumptions.	In relation to this matter, our audit procedures included, among others: - gaining an understanding of the policies, valuation models, processes and controls applied by the Group; - the assessment of the configuration and implementation of key controls, including those relating to the relevant IT applications, and the execution of tests of controls in order to verify their operational effectiveness; - the comparative analysis of the portfolio composition against the previous year and the discussion of the results with management; - the performance of substantive procedures to verify, on a sample basis, the correct classification and measurement; - the assessment of the adequacy of the disclosures provided in the notes to the consolidated financial statements. The aforementioned procedures have been performed also with the support of our risk management, valuation, modelling and economics and information technology specialists.

Shape the future with confidence

Responsibilities of Directors and of the Management Control Committee for the Consolidated Financial Statements

The Directors are responsible for the preparation of the consolidated financial statements that give a true and fair view in accordance with IFRS accounting standards as issued by the International Accounting Standards Board as adopted by the European Union and with the regulations issued for implementing article 9 of Legislative Decree no. 38/2005 and article 43 of Legislative Decree no. 136/2015 and, within the terms provided by the law, for such internal control as they determine is necessary to enable the preparation of financial statements that are free from material misstatement, whether due to fraud or error.

The Directors are responsible for assessing the Group's ability to continue as a going concern and, when preparing the consolidated financial statements, for the appropriateness of the going concern assumption, and for appropriate disclosure thereof. The Directors prepare the consolidated financial statements on a going concern basis unless they either intend to liquidate the Bank or to cease operations, or have no realistic alternative but to do so.

The Management Control Committee is responsible, within the terms provided by the law, for overseeing the Group's financial reporting process.

Auditor's Responsibilities for the Audit of the Consolidated Financial Statements

Our objectives are to obtain reasonable assurance about whether the consolidated financial statements as a whole are free from material misstatement, whether due to fraud or error, and to issue an auditor's report that includes our opinion. Reasonable assurance is a high level of assurance, but is not a guarantee that an audit conducted in accordance with International Standards on Auditing (ISA Italia) will always detect a material misstatement when it exists. Misstatements can arise from fraud or error and are considered material if, individually or in aggregate, they could reasonably be expected to influence the economic decisions of users taken on the basis of these consolidated financial statements.

As part of an audit in accordance with International Standards on Auditing (ISA Italia), we have exercised professional judgment and maintained professional skepticism throughout the audit. In addition:

- we have identified and assessed the risks of material misstatement of the consolidated financial statements, whether due to fraud or error, designed and performed audit procedures responsive to those risks, and obtained audit evidence that is sufficient and appropriate to provide a basis for our opinion. The risk of not detecting a material misstatement resulting from fraud is higher than for one resulting from error, as fraud may involve collusion, forgery, intentional omissions, misrepresentations, or the override of internal control;
- we have obtained an understanding of internal control relevant to the audit in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the Group's internal control;
- we have evaluated the appropriateness of accounting policies used and the reasonableness of accounting estimates and related disclosures made by the Directors;

EY
Shape the future with confidence

- we have concluded on the appropriateness of Directors' use of the going concern basis of accounting and, based on the audit evidence obtained, whether a material uncertainty exists related to events or conditions that may cast significant doubt on the Group's ability to continue as a going concern. If we conclude that a material uncertainty exists, we are required to draw attention in our auditor's report to the related disclosures in the financial statements or, if such disclosures are inadequate, to consider this matter in forming our opinion. Our conclusions are based on the audit evidence obtained up to the date of our auditor's report. However, future events or conditions may cause the Group to cease to continue as a going concern;
- we have evaluated the overall presentation, structure and content of the consolidated financial statements, including the disclosures, and whether the consolidated financial statements represent the underlying transactions and events in a manner that achieves fair presentation;
- we have obtained sufficient appropriate audit evidence regarding the financial information of the entities or business activities within the Group to express an opinion on the consolidated financial statements. We are responsible for the direction, supervision and performance of the group audit. We remain solely responsible for our audit opinion.

We have communicated with those charged with governance, identified at an appropriate level as required by ISA Italia, regarding, among other matters, the planned scope and timing of the audit and significant audit findings, including any significant deficiencies in internal control that we identify during our audit.

We have provided those charged with governance with a statement that we have complied with the ethical and independence requirements applicable in Italy, and we have communicated them all matters that may reasonably be thought to bear on our independence, and where applicable, the actions taken to eliminate relevant risks or the safeguard measures applied.

From the matters communicated with those charged with governance, we have determined those matters that were of most significance in the audit of the financial statements of the current period and are therefore the key audit matters. We have described these matters in our auditor's report.

Additional information pursuant to article 10 of EU Regulation no. 537/2014

The Shareholders of Intesa Sanpaolo S.p.A., in the general meeting held on 30 April 2019, engaged us to perform the audits of the consolidated financial statements for each of the years ending 31 December 2021 to 31 December 2029.

We declare that we have not provided prohibited non-audit services, referred to article 5, par. 1, of EU Regulation no. 537/2014, and that we have remained independent of the Group in conducting the audit.

We confirm that the opinion on the consolidated financial statements included in this report is consistent with the content of the additional report to the Management Control Committee in their capacity as audit committee, prepared pursuant to article 11 of the EU Regulation no. 537/2014.

Shape the future with confidence

Report on Compliance with other Legal and Regulatory Requirements

Opinion on the Compliance with Delegated Regulation (EU) no. 815/2019

The Directors of Intesa Sanpaolo S.p.A. are responsible for applying the provisions of the European Commission Delegated Regulations (EU) no. 815/2019 for the regulatory technical standards on the specification of a single electronic reporting format (ESEF – European Single Electronic Format) (the "Delegated Regulation") to the consolidated financial statements as at 31 December 2024, to be included in the annual financial report.

We have performed the procedures under the auditing standard SA Italia no. 700B, in order to express an opinion on the compliance of the consolidated financial statements as at 31 December 2024 with the provisions of the Delegated Regulation.

In our opinion, the consolidated financial statements as at 31 December 2024 have been prepared in the XHTML format and have been marked-up, in all material aspects, in compliance with the provisions of the Delegated Regulation.

Opinion and statement pursuant to article 14, paragraph 2, subparagraphs e), e-bis) and e-ter) of Legislative Decree no. 39, dated 27 January 2010 and pursuant to article 123-bis, paragraph 4, of Legislative Decree no. 58, dated 24 February 1998

The Directors of Intesa Sanpaolo S.p.A. are responsible for the preparation of the report on operations and of the report on corporate governance and ownership structure of Intesa Sanpaolo Group as at 31 December 2024, including their consistency with the related consolidated financial statements and their compliance with the applicable laws and regulations.

We have performed the procedures required under audit standard SA Italia no. 720B, in order to:

- express an opinion on the consistency of the report on operations and of specific information included in the report on corporate governance and ownership structure as provided for by article 123-bis, paragraph 4, of Legislative Decree no. 58, dated 24 February 1998, with the consolidated financial statements;
- express an opinion on the compliance with the applicable laws and regulations of the report on operations, excluding the section related to the consolidated sustainability statement, and the above mentioned specific information included in the report on corporate governance and ownership structure pursuant article 123-bis, paragraph 4, of Legislative Decree no. 58, dated 24 February 1998;
- issue a statement on any material misstatement in the report on operations and in certain specific information contained in the report on corporate governance and ownership structure pursuant article 123-bis, paragraph 4, of Legislative Decree no. 58, dated 24 February 1998.

In our opinion, the report on operations and the specific information contained in the report on corporate governance and ownership structure pursuant article 123-bis, paragraph 4, of Legislative Decree no. 58, dated 24 February 1998, are consistent with the consolidated financial statements of the Group as at 31 December 2024.

Shape the future
with confidence

Furthermore, in our opinion, the report on operations, excluding the section related to the consolidated sustainability statement, and the specific information contained in the report on corporate governance and ownership structure pursuant article 123-bis, paragraph 4, of Legislative Decree no. 58, dated 24 February 1998, comply with the applicable laws and regulations.

With reference to the statement required by article 14, paragraph 2, subparagraph e-*ter*), of Legislative Decree no. 39, dated 27 January 2010, based on our knowledge and understanding of the entity and its environment obtained through our audit, we have no matters to report.

Our opinion on compliance with applicable laws and regulations does not extend to the section of the Report on Operations related to consolidated sustainability statement. The conclusion on the compliance of this section with the applicable standards governing its preparation criteria and the compliance with the disclosure requirements pursuant to article 8 of (EU) Regulation 852/2020 are formulated by us in the attestation report pursuant to article 14-bis of Legislative Decree no. 39, dated 27 January 2010.

Intesa Sanpaolo S.p.A.

Conclusions

We have been appointed to perform a limited assurance engagement pursuant to Articles 8 and 18, paragraph 1, of Legislative Decree n. 125 dated 6 September 2024 (hereinafter the "Decree") on the consolidated sustainability statement of Intesa Sanpaolo Group (hereinafter the "Group") for the year ended on 31 December 2024, prepared in accordance with Article 4 of the Decree, included in the specific section of the report on operations.

Based on the procedures performed, nothing has come to our attention that causes us to believe that:

- the Intesa Sanpaolo Group consolidated sustainability statement for the year ended on 31 December 2024, has not been prepared, in all material respects, in accordance with the reporting principles adopted by the European Commission pursuant to European Directive EU 2013/34 (*European Sustainability Reporting Standards*, hereinafter "ESRS");
- the information included in the paragraph *"Reporting pursuant to the EU Taxonomy (Regulation (EU) 2020/852)"* of the consolidated sustainability statement has not been prepared, in all material respects, in accordance with Article 8 of European Regulation n. 852 dated 18 June 2020 (hereinafter the "Taxonomy Regulation").

Basis for conclusions

We have performed a limited assurance engagement in accordance with the Standard on Sustainability Assurance Engagement - SSAE (Italia) ("*Principio di Attestazione della Rendicontazione di Sostenibilità*"). The procedures performed in this type of engagement vary in nature and timing compared to those necessary for an engagement aimed at obtaining a reasonable level of assurance and are also less extensive. Consequently, the level of assurance obtained in a limited assurance engagement is substantially lower than the level of assurance that would have been obtained in a reasonable assurance engagement. Our responsibilities under this Standard are further described in the section "*Auditor's responsibility for the limited assurance engagement on the consolidated sustainability statement*" of this report.

We are independent in accordance with the ethics and independence rules and standards applicable in Italy to sustainability assurance engagements.

Our firm applies the International Standard on Quality Control 1 (ISQM Italia 1), and accordingly, is required to design, implement and operate a system of quality management including policy and procedures regarding compliance with ethical requirements, professional standards and applicable legal and regulatory requirements.

We believe that the evidence we have obtained is sufficient and appropriate to provide a basis for our conclusions.

A member firm of Ernst & Young Global Limited

Other Matters – Comparative information

The consolidated sustainability statement for the year ended on 31 December 2024 contains, in the specific section "Reporting pursuant to the EU Taxonomy (Regulation (EU) 2020/852)", the comparative information related to the year ended on 31 December 2023, which has not been subjected to an assurance engagement.

Responsibilities of the Directors and of the Management Control Committee of Intesa Sanpaolo S.p.A. for the consolidated sustainability statement

The Directors are responsible for the design and implementation of the procedures used to identify the information included in the consolidated sustainability statement in accordance with the requirements of the ESRS (hereinafter "materiality assessment process") and for the description of such procedures in the paragraph "*Double materiality assessment*" of the consolidated sustainability statement.

The Directors are also responsible for the preparation of the consolidated sustainability statement, which contains the information identified through the Materiality assessment process, in accordance with the requirements of Article 4 of the Decree, including:

- compliance with ESRS;
- compliance with Article 8 of the EU Taxonomy Regulation regarding the information contained in the paragraph "Reporting pursuant to the EU Taxonomy (Regulation (EU) 2020/852)".

This responsibility entails the design, implementation, and maintenance, as required by law, for that part of internal control that Directors consider necessary in order to allow the preparation of the consolidated sustainability statement in accordance with the requirements of Article 4 of the Decree, that is free from material misstatements, whether due to fraud or not intentional behaviors or events. This responsibility also includes the selection and application of appropriate methods to prepare disclosures and to formulate assumptions and estimates regarding specific sustainability information that are appropriate under the circumstances.

The Management Control Committee is responsible, within the terms provided by the law, for overseeing the compliance with the requirements of the Decree.

Intrinsic limitation in the preparation of consolidated sustainability statement

For the purposes of reporting forward-looking information in accordance with the ESRS, Directors are required to prepare such information on the basis of assumptions, described in the consolidated sustainability statement, regarding events that may occur in the future and possible future actions by the Group. Due to the uncertainty associated with the realization of any future event, both as regards to the materialization of the event and as regards to the extent and timing of its manifestation, the variations between the actual values and the prospective information could be significant.

Disclosures regarding Scope 3 emissions are subject to greater intrinsic limitations compare to Scope 1 and 2 emissions, due to the limited availability and relative accuracy of the information used to define Scope 3 emissions information, both quantitative and qualitative, relating to the value chain.

Shape the future with confidence

Auditor's responsibility for the limited assurance engagement on the consolidated sustainability statement

Our objectives are to plan and perform procedures to obtain a limited level of assurance that the consolidated sustainability statement is free from material misstatements, due to fraud or not intentional behaviors or events, and to issue a report containing our conclusions. Misstatements may arise from fraud or not intentional behaviors or events and are considered material if, individually or in aggregate, they could reasonably be expected to influence the decisions of users taken on the basis of the consolidated sustainability statement.

In the context of the engagement aimed at obtaining a limited level of assurance in accordance with the Standard on Sustainability Assurance Engagement - SSAE (Italia) ("*Principio di Attestazione della Rendicontazione di Sostenibilità*"), we exercised professional judgment and maintained professional skepticism throughout the duration of the engagement.

Our responsibilities include:

- considering the risks to identify the disclosures where a material misstatement is likely to occur, whether due to fraud or not intentional behaviors or events;
- designing and performing procedures to verify the disclosures where a material misstatement is likely to occur. The risk of not detecting a material misstatement resulting from fraud is higher than the risk of not detecting a material misstatement arising from not intentional behaviors or events, as fraud may involve collusion, forgery, intentional omissions, misrepresentations, or the override of internal controls;
- directing, supervising, and conducting the limited assurance engagement on the consolidated sustainability statement and assuming full responsibility for the conclusions regarding the consolidated sustainability statement.

Summary of the work performed

An engagement aimed at obtaining a limited level of assurance involves performing procedures to obtain evidence as a basis for formulating our conclusions.

The procedures performed on the consolidated sustainability statement were based on our professional judgment and included inquiries, primarily with the personnel of Intesa Sanpaolo S.p.A. and of the Group responsible for the preparation of the information included in the consolidated sustainability statement, as well as documents analyses, recalculations and other evidence-gathering procedures that are appropriate in the circumstances.

In particular, we performed the following procedures:

- understanding the Group's business model, strategies and the environment in which it operates concerning sustainability matters;
- understanding the processes underlying the generation, recording and management of the qualitative and quantitative information included in the consolidated sustainability statement;
- understanding the process adopted by the Group to identify and assess material impacts, risks, and opportunities based on the principle of double materiality, concerning sustainability matters, based on the information acquired therein, elaboration of considerations regarding any contradictory elements that may highlight the existence of sustainability matters not considered by the entity in the process of materiality assessment;

- identifying disclosures in which a material misstatement is likely to occur;
- designing and performing procedures, based on our professional judgment, to address the identified risks of material misstatement;
- understanding the process implemented by the Group to determine eligible exposures and determine their aligned nature based on the provisions of the EU Taxonomy Regulation, and verifying the related disclosures included in the consolidated sustainability statement;
- cross-checking the information reported in the consolidated sustainability statement with the information included in the consolidated financial statements pursuant to the applicable financial reporting framework or with the accounting records used for the preparation of the consolidated financial statements or with the accounting management figures;
- verifying the structure and presentation of the disclosures included in the consolidated sustainability statement in accordance with the ESRS;
- obtaining the representation letter.

(*) Regulation 1803/2023 of 13 August 2023, published in the Official Journal of the European Union (GUCE) of 26 September 2023, repealed and replaced the previous Regulation 1126/2008 which adopted the International Accounting Standards and related Interpretations issued or adopted by the IASB until 15 October 2008 and was subsequently subject to numerous amendments in order to include the Standards and related Interpretation issued or adopted by the IASB and adopted by Commission until 8 September 2022, in accordance with Regulation 1606/2002.
In order to simplify Union legislation on International Accounting Standards, for reason of clarity and transparency, Regulation 1126/2008 was repealed and replaced by Regulation 1803/2023 to which references to the repealed regulation are intended.
Therefore, Regulation 1126/2008 and subsequent amendments are no longer reported in this summary, as carried out until the 2022 Financial Statements, but only Regulation 1803/2023 and any subsequent amendments.

(1) Companies apply this Regulation at the latest as of the first financial year starting after 1 January 2025.

(*) Regulation 1803/2023 of 13 August 2023, published in the Official Journal of the European Union (GUCE) of 26 September 2023, repealed and replaced the previous Regulation 1126/2008 which adopted the International Accounting Standards and related Interpretations issued or adopted by the IASB until 15 October 2008 and was subsequently subject to numerous amendments in order to include the Standards and related Interpretation issued or adopted by the IASB and adopted by Commission until 8 September 2022, in accordance with Regulation 1606/2002.
In order to simplify Union legislation on International Accounting Standards, for reason of clarity and transparency, Regulation 1126/2008 was repealed and replaced by Regulation 1803/2023 to which references to the repealed regulation are intended.
Therefore, Regulation 1126/2008 and subsequent amendments are no longer reported in this summary, as carried out until the 2022 Financial Statements, but only Regulation 1803/2023 and any subsequent amendments.

The Parent Company Intesa Sanpaolo results

Introduction

The reclassified income statement and balance sheet of the Parent Company Intesa Sanpaolo S.p.A. as at and for the year ended 31 December 2024, accompanied by a brief comment on the income statement results and balance sheet aggregates are presented below.
For other information reference is made to the Report of the consolidated financial statements.

General aspects on the Reclassified Income Statement

The income statement is presented in a condensed reclassified format to enable a more immediate interpretation of the results. To guarantee comparison on a like-for-like basis, the income statement data referring to the previous periods have been restated, where necessary and if material, particularly in relation to changes in the scope of reference. This uniformity is achieved through restated figures, which include/exclude the values of the companies that entered or left the scope of reference.

As is known, as part of the larger project of creating a digital bank, set out in the 2022-2025 Business Plan of the Intesa Sanpaolo Group, the contribution of the first business line from Intesa Sanpaolo to Isybank S.p.A. was finalised with legal effect on 16 October 2023, executing the first wave of migration, which involved around 275 thousand customers, for around 1.7 billion euro in direct deposits. With effect from 18 March 2024, the transfer of the second batch of Intesa Sanpaolo customers to Isybank was also completed, involving around 78 thousand customers and approximately 436 million euro of direct deposits.
Given the immateriality of the related income statement effects, no restatements were made to the comparison period’s data.

Certain aggregations and reclassifications are then made with respect to the model envisaged in Circular 262 of the Bank of Italy. Breakdowns of restatements, aggregations and reclassifications are provided in separate tables included in the attachments, as also required by Consob in its Communication 6064293 of 28 July 2006.

The reclassifications and aggregations of captions in the reclassified income statement refer to:
- dividends relating to investments carried at equity, as well as those received and paid within the framework of securities lending, which have been reallocated to Profits (losses) on financial assets and liabilities at fair value;
- differentials on derivatives, classified to the trading book and contracted to hedge transactions in foreign currencies, which have been allocated among Net interest income owing to the close correlation;
- periodic fees and commissions on current accounts with positive balances applied to customers (excluding the retail customers and SMEs segment), in accordance with the provisions of the term sheets, which are accounted for as net interest income, inasmuch as they cover the financing cost incurred by the Bank;
- Profits (losses) on trading, Fair value adjustments in hedge accounting, Profits (losses) on other financial assets and liabilities measured at fair value through profit or loss, Profits (losses) on disposal or repurchase of financial assets measured at fair value through other comprehensive income and on disposal or repurchase of financial liabilities – for the portion contributed by the banking segment – which have been reallocated to the single caption Profits (losses) on financial assets and liabilities at fair value, except for any amounts relating to adjustments on portions of loans mandatorily measured at fair value which, as they relate to the measurements of credit positions, are reclassified to the caption Net adjustments to loans in order to permit unitary representation of the adjustments relating to the same position;
- the share of the premium on the issue of the certificates paid to the networks for their placement, which is reclassified from Profits (losses) on trading and Profits (losses) on other financial assets and liabilities measured at fair value through profit or loss to Net fee and commission income;
- the recoveries of expenses, taxes and duties, which have been subtracted from Other administrative expenses, instead of being included among Other income;
- the costs of several incentive systems for employees of the Group’s distribution networks, where funded by fee and commission income generated by the networks in question on the basis of deterministic quantification criteria correlated to the revenues concerned, which are reclassified from Personnel expenses to Fee and commission expense by analogy to the accounting treatment of incentive systems for non-employee financial advisors;
- Profits and losses on disposal or repurchase of financial assets measured at amortised cost (loans and debt securities representing loans), which have been allocated to Net adjustments to loans;
- Net losses/recoveries for credit risk associated with financial assets measured at amortised cost (loans and debt securities representing loans) and financial assets measured at fair value through other comprehensive income, the effects on the income statement of the changes in contracts and the net provisions for risks and charges for credit risk relating to commitments and guarantees given, attributed to the single item Net adjustments to loans. The caption also includes any amounts relating to credit risk adjustments to portions of loans mandatorily measured at fair value, which, as they relate to the measurement of credit positions, are reclassified to the caption Net adjustments to loans to permit unitary representation of the adjustments relating to the same position;
- the reversal in the time value of Employee termination indemnities and Allowances for risks and charges, which has been included among Net interest income, as a phenomenon deriving directly from the application of the amortised cost

criterion, in the absence of changes in projected future cash flows, in keeping with the treatment of the time value of financial assets measured at amortised cost;

- Net losses for credit risk associated with financial assets measured at amortised cost other than loans and net impairment losses on equity investments, as well as property and equipment and intangible assets (including property and other assets, also those resulting from the enforcement of guarantees or purchase at auction and intended for sale on the market in the near future), which have been reclassified to Other net provisions and net impairment losses on other assets. This last caption consequently includes – in addition to the provisions for risks and charges other than those relating to commitments and guarantees – the valuation effects of the assets other than loans, with the sole exception of impairment losses on intangible assets that have been reclassified to Impairment (net of tax) of goodwill and other intangible assets;
- realised profits (losses) on financial assets measured at amortised cost other than loans, on equity investments and on other investments, which have been reclassified to Other income (expenses). Accordingly, in addition to the income and expenses not strictly related to operations, this caption represents the summary of the effects from the realisation of assets other than loans. Profits (Losses) realised on debt securities represent an exception; in view of their business model, which involves management closely correlated with the other financial instruments, they are classified to Profits (Losses) on financial assets and liabilities at fair value;
- the amount paid by Intesa Sanpaolo to the National Resolution Fund under the settlement agreement signed by Intesa Sanpaolo (as the absorbing company of the former UBI Banca) and the Bank of Italy (as the managing entity of the National Resolution Fund) – aimed at regulating an aspect of the contract signed on 18 January 2017 between UBI Banca and the National Resolution Fund for the transfer from the Fund to UBI Banca of the entire share capital of Nuova Banca delle Marche S.p.A., Nuova Banca dell'Etruria e del Lazio S.p.A. and Nuova Cassa di Risparmio di Chieti S.p.A. – which was reclassified from Other operating expenses (income) to Taxes on income;
- Charges (net of tax) for integration and exit incentives, which are reclassified from Personnel expenses, Administrative expenses and other captions of the income statement to a separate caption;
- the Effects of purchase price allocation, net of tax, which are indicated in a specific caption. They normally represent adjustments to and any impairment losses on financial assets and liabilities as well as property, equipment and intangible assets which are measured at fair value as provided for by IFRS 3;
- Levies and other charges concerning the banking and insurance industry, with the latter relating to the contribution to the Life Insurance Guarantee Fund being set up, which have been reclassified, net of tax, to the specific caption;
- Impairment on goodwill, other intangible assets, and investments in subsidiaries, which are shown net of tax.

Figures restated, where necessary and material, considering the changes in the scope of reference.

The income statement for the year 2024 posted net income of 5,604 million euro, compared with 7,292 million euro for the previous year (-1,688 million euro; -23.1%), while gross income, amounting to 8,641 million euro, was down by 958 million euro (-10%) compared to 9,599 million euro in December 2023.

More specifically, the annual change in net income is attributable to:
- the decrease in Operating income of 1,191 million euro (-6%), attributable to lower Dividends (-2,243 million euro, -55.1%), and the decrease in Profits (Losses) on financial assets and liabilities at fair value (-209 million euro), only partly offset by the higher contribution from Net interest income (+761 million euro; +7.4%), Net fee and commission income (+448 million euro; +8.5%) and Other operating income (+52 million euro; +21.5%);
- higher Operating costs of 55 million euro (+0.6%), which include the increase in Personnel expenses (+78 million euro; +1.4%) and Depreciation and amortisation of property, equipment and intangible assets (+45 million euro; +4.1%), offset by the decrease in Administrative expenses (-68 million euro; -3%);
- a reduction in Net adjustments to loans of 253 million euro (-17.9%);
- a decrease in Other net provisions and net impairment losses on other assets of 64 million euro (-17.1%), of which 6 million euro due to higher Other net provisions, 83 million euro to lower net adjustments to securities measured at amortised cost and securities at fair value through other comprehensive income, and 12 million euro to higher Net impairment losses on other assets;
- lower Other income of 29 million euro (-13.7%);
- the tax effect related to the above changes and, in particular, the effect due to the lower contribution from dividends;
- the increase in Charges (net of tax) for integration of 303 million euro;
- a reduction in the charges connected to the Effect of purchase price allocation (net of tax) of 42 million euro;
- lower Levies and other charges concerning the banking and insurance industry (net of tax) of 154 million euro;
- greater negative effects in the caption Impairment (net of tax) of goodwill, other intangible assets and controlling interests of 45 million euro.

Net interest income, amounting to 11,103 million euro, increased by 761 million euro (+7.4%) on 2023 (+10,342 million euro).
Interest on financial assets amounted to 3,322 million euro, up 805 million euro (+32%), specifically due to the increase in the contribution from instruments measured at amortised cost which do not constitute loans (+174 million euro) and financial assets measured at fair value through other comprehensive income (+648 million euro).
The contribution from interbank transactions increased by 138 million euro (+15%), amounting to -1,059 million euro, compared to -921 million euro in December 2023.
The negative differentials on hedging derivatives also improved to -227 million euro, compared to -798 million euro at the end of 2023.
In contrast, customer dealing recorded a decrease of 972 million euro (-11.4%), mainly attributable to higher interest expense on securities issued (1,117 million euro), only partially offset by the increase in interest on relations with customers (145 million euro).
Finally, other net interest income, inclusive of that accrued on non-performing assets and other transactions with customers, made a positive contribution of +1,535 million euro, an increase of 496 million euro.

Net fee and commission income amounted to 5,700 million euro, up 448 million euro (+8.5%) on the previous year (5,252 million euro). The increase involved all the segments: commercial banking (+5 million euro; +0.2%), management, dealing and consultancy activities (+326 million euro; +13.1%), and other net fee and commission income (+116 million euro; +18.1%).
Within the commercial banking activities, there was an increase in fee and commission income on guarantees given and received (+31 million euro) and on collection and payment services (+28 million euro), partly offset by current accounts (-52 million euro), due to the Bank's reduction of the account maintenance fees charged to customers, and by fees and commissions on credit and debit cards (-2 million euro).
For the management, dealing and consultancy activities, the growth was mainly due to the higher contribution from dealing and placement of funds (+241 million euro), the increase in other management and dealing commissions (+45 million euro) and the higher contribution from the insurance segment (+32 million euro), partly offset by the lower contribution from the securities and derivatives segment (-4 million euro).
Lastly, for other net fee and commission income, the increase of 116 million euro was mainly due to the increase in fee and commission income on loans and the decrease in success fees paid.

Profits (losses) on financial assets and liabilities at fair value amounted to -102 million euro, compared to +107 million euro in the previous year (-209 million euro).
The change in the aggregate was seen in the net interest income with respect to the transactions in certificates, which generated positive effects on net interest income in terms of greater liquidity invested and negative effects on profits (losses) on trading related to the management of the financial risks of those instrument as a result of the market interest rate conditions, as well as the increase in average volumes of funding in certificates.
The decrease was specifically attributable to the fall in profits (losses) on trading and on financial instruments under fair value option (512 million euro, mainly due to the above-mentioned performance of certificates as well as the negative impact of the Own Credit Risk of those certificates) and the reduction in net gains from the repurchase of financial liabilities (-39 million euro), mainly relating to repurchases of own securities.
Conversely, positive contributions were provided by profits (losses) on dividends and on disposal of assets measured at fair value through other comprehensive income and disposal of assets at amortised cost (+60 million euro), also due to the disposal of mainly government HTCS and HTC debt securities, profits (losses) on hedges under hedge accounting (+66 million euro) and assets mandatorily measures at fair value through profit and loss (+215 million euro), mainly attributable to equity instruments and UCI units, including dividends, and to loans.

Other net operating income amounted to 2,120 million euro compared to 4,311 million euro in 2023, a decrease of 2,191 million euro (-50.8%). The aggregate includes dividends from investees, with the remainder comprised of sundry operating income. The change in the caption was almost fully attributable to the dividend component, which was down by 2,243 million euro (-55.1%). In particular, in 2024, dividends were recorded totalling 1,826 million euro, compared to 4,069 million euro in December 2023. Sundry operating income amounted to 294 million euro, an increase of 52 million euro compared to 2023 (+21.5%).

As a result of these changes, operating income amounted to 18,821 million euro, down 1,191 million euro (-6%) on the balance for the previous year, which was 20,012 million euro.

Operating costs amounted to 8,895 million euro, up slightly on December 2023 (+55 million euro; +0.6%), due to the increase in personnel expenses, which rose from 5,508 million euro to 5,586 million euro (+78 million euro; +1.4%), and depreciation and amortisation of property, equipment and intangible assets, which came to 1,142 million euro compared to 1,097 million euro at the end of 2023 (+45 million euro; +4.1%), partly offset by the decrease in other administrative expenses, which dropped from 2,235 million euro to 2,167 million euro (-68 million euro; -3%).

With specific regard to personnel expenses, the increase of 78 million euro (+1.4%) was mainly attributable to the impact of the fixed components of remuneration, offset by the lower decrease in variable components of remuneration.

For other administrative expenses, the decrease of 68 million euro (-3%) was mainly attributable to information technology expenses (38 million euro), management of real estate expenses (36 million euro), primarily correlated with the reduction in energy tariffs and the measures to contain consumption, and to indirect taxes and duties (18 million euro), partially offset by the growth in general structure costs (14 million euro) and legal and professional fees (11 million euro).

Lastly, the increase of 45 million euro (+4.1%) in depreciation and amortisation of property, equipment and intangible assets comprises 60 million euro (+8.8%) attributable to intangible assets, mainly due to technological investments focused on software. Conversely, property and equipment decreased by 15 million euro (-3.6%), mainly attributable to owned real estate assets involved in the periodic review of the residual useful life of clusters of owner-occupied properties, set out in Group policies.

The trends in operating income and costs described resulted in an operating margin of 9,926 million euro, compared to 11,172 million euro in the previous year, representing a decrease of 1,246 million euro, corresponding to -11.2%.
The cost/income ratio for December 2024 amounted to 47.3%, an increase on the figure for 2023 (44.2%).

Net adjustments to loans amounted to 1,158 million euro, down 253 million euro (-17.9%) on December 2023 (1,411 million euro).
The change in the caption was largely attributable to the decrease of 232 million euro in net adjustments to Stage 3 non-performing loans, as the result of a significant decrease in adjustments to bad loans (-286 million euro) and unlikely-to-pay loans (-8 million euro), against an increase for past due loans (+62 million euro).
Stage 1 loans recorded positive results, with greater recoveries for 93 million euro (95 million euro in recoveries as at December 2024, compared to 2 million euro of recoveries at the end of the previous year).
Those decreases are partially offset by higher net losses from changes in contracts without derecognition for 32 million euro (net losses of 8 million euro in December 2024, compared to net profits of 24 million euro at the end of 2023) and by higher net provisions relating to commitments and guarantees given for 40 million euro.
In December 2024, the ratio of gross NPLs to total loans stood at 2.3%, in line with the figure in December 2023 (2.3%). The cost of credit – expressed as the ratio of net adjustments to net loans – decreased in 2024 to 33 bps, compared to 38 bps in 2023. The reduction in the cost of credit was supported by a very low volume of inflows from performing to non-performing loans (2.2 billion euro net of outflows to assets held for sale and returns to performing status).
The coverage ratio of non-performing loans in December 2024 amounted to 47.7%, more or less in line with the figure in December 2023 (47.8%). Specifically, bad loans required net adjustments of 229 million euro, down from the figure for December 2023 (515 million euro), with a coverage ratio of 66.5%. Net impairment losses on unlikely-to-pay loans, totalling 690 million euro, were down slightly (-1.1%) compared to 698 million euro recorded in 2023, with a coverage ratio of 39%. Net adjustments to past-due loans amounted to 328 million euro (266 million euro in 2023), with a coverage ratio of 23.3%. The coverage ratio for forborne positions within the non-performing loan category was 42.6%. Finally, the coverage ratio of performing loans was 0.41% and incorporated the physiological risk inherent in the loan portfolio.

Other net provisions and net impairment losses on other assets amounted to 310 million euro, compared to 374 million euro in December 2023, a decrease of 64 million euro. These related to provisions for legal disputes and other charges (106 million euro), net adjustments to debt securities measured at amortised cost not treated as loans and to debt securities measured at fair value through other comprehensive income (14 million euro), and net impairment losses on other assets (189 million euro).

Other income (expenses), which include profits (losses) on financial assets measured at amortised cost other than loans, on equity investments and on other investments and other income and expenses not strictly linked to operations, provided a positive contribution of 183 million euro, benefiting from income relating to commercial agreements signed by the Bank. These compared to 212 million euro at the end of 2023, which included 230 million euro in gains on the sale of Zhong Ou Asset Management Company Limited.

Gross income amounted to 8,641 million euro, down 958 million euro (-10%) on the previous year (9,599 million euro).

Taxes on income calculated on the components contributing to gross income amounted to -2,246 million euro, compared to -1,668 million euro in the previous year. The caption also includes a benefit of 336 million euro from the recognition of deferred tax assets related to losses carried forward pertaining to the merged companies UBI Banca and Provis (352 million euro in 2023 pertaining to the merged companies UBI Banca, UBI Leasing and UBI Factor).

Charges (net of tax) for integration and exit incentives amounted to -442 million euro and related to personnel expenses (-292 million euro), essentially attributable to the charge relating to the exit incentive for personnel based on the trade union agreement of 23 October 2024, to depreciation and amortisation (-129 million euro), and other administrative expenses (-21 million euro). These compare with -139 million euro in December 2023, mainly attributable to depreciation and amortisation (-109 million euro), personnel expenses (-19 million euro) and other administrative expenses (-17 million euro).

The effect of purchase price allocation (net of tax) amounted to -68 million euro, compared to -110 million euro in December 2023. This caption comprises amounts attributable to valuations of loans, debts, real estate and the recognition of new intangible assets, in application of IFRS 3, upon recognition of acquisition of equity investments and/or aggregate assets.

Levies and other charges concerning the banking and insurance industry (net of tax) includes the levies imposed by legislative provisions and/or aimed at maintaining the stability of the banking and insurance industry and consequently outside the company management.
In 2024, those charges amounted to 249 million euro, compared with 403 million euro in 2023, which included 194 million euro in charges for the European Resolution Fund, which is currently funded for the EU countries in the banking union.
The charges recognised during the reporting period may be broken down as follows: 211 million euro attributable to deposit guarantee funds, 31 million euro from the write-downs of the Atlante Fund and the Italian Recovery Fund, as well as 7 million euro attributable to the new life insurance guarantee fund.

The impairment (net of tax) of goodwill, other intangible assets and controlling interests amounted to -32 million euro, primarily due to the write-down of several controlling interests.
As at December 2023, the caption stood at +13 million euro, with -31 million euro due to the write-down of several controlling interests, offset by +44 million euro resulting from the partial release of the provision made in 2022 to cover the indirect risks associated with the investment held in Pravex Bank Joint-Stock Company, in connection with the ongoing conflict, aimed at capturing the value of the equity contributed by the subsidiary to the Group’s Financial Statements.

General aspects relating to the Reclassified Balance Sheet

A reclassified condensed balance sheet has been prepared to permit a more immediate understanding of the assets and liabilities.
As already stated with regard to the income statement figures, it was not necessary to restate the balance sheet figures for the previous period on a like-for-like basis, due to the immaterial impact of the transfer of business lines from Intesa Sanpaolo to Isybank S.p.A., completed under the broader project for the creation of a digital bank, as set out in the Intesa Sanpaolo Group's 2022 – 2025 Business Plan.

Certain aggregations and reclassifications have been made with respect to the model provided in Circular 262/2005 of the Bank of Italy. Breakdowns of restatements, aggregations and reclassifications are provided in separate tables included in the attachments to this report, as also required by Consob in its Communication 6064293 of 28 July 2006.

The aggregations and reclassifications of the captions of the reclassified balance sheet related to:
- the separate presentation of financial assets constituting Due from banks and Loans to customers, regardless of the accounting portfolios to which they have been allocated;
- the separate presentation of financial assets not constituting loans, divided into financial assets measured at amortised cost, financial assets at fair value through profit or loss and financial assets at fair value through other comprehensive income, net of the amounts reclassified to Due from banks and Loans to customers;
- the aggregation in one single caption of Property, equipment and intangible assets, broken down into the sub-captions Assets owned and Rights of use acquired under leases;
- the inclusion of Hedging derivatives and Fair value change of financial assets/liabilities in hedged portfolios under Other assets/ Other liabilities;
- the separate presentation of Due to banks at amortised cost;
- the aggregation of Due to customers at amortised cost and Securities issued into one caption;
- the aggregation in one single caption (Allowances for risks and charges) of allowances for specific purposes (Employee termination indemnities and Allowances for risks and charges regarding: commitments and guarantees given, post-employment benefits and other allowances for risks and charges);
- the reclassification of Lease payables to a specific sub-caption of Other liabilities;
- the presentation of Reserves as an aggregate and net of any own shares.

Reclassified balance sheet

Figures restated, where necessary and material, considering the changes in the scope of reference.

Comments are provided below on the main balance sheet aggregates as at 31 December 2024 compared with those as at 31 December 2023.

As at 31 December 2024, loans to customers totalled 355 billion euro, down slightly on 367.5 billion euro for the previous year (-12.4 billion euro; -3.4%). This was mainly due to the decrease in commercial banking loans (-14 billion euro; -4.1%), in particular mortgages (-10.9 billion euro; -5.2%) and short-term loans in the form of advances and loans (-2.8 billion euro; -2.3%). Market interest rates, which remained high during the year, led businesses to limit their use of bank loans, relying instead on their own liquidity or alternative sources of funding. Additionally, the expiry of loans granted during the pandemic to support the economy using state aid has continued.
In contrast, there was an increase in repurchase agreements (+1.4 billion euro; +8.2%) and loans represented by securities (+0.3 billion euro; +5.6%).
Finally, net non-performing exposures were more or less stable, from 4.4 billion euro as at 31 December 2023 to 4.3 billion euro at the end of 2024.
The trends in the individual components show:
- an increase in bad loans from 773 million euro to 951 million euro (+23%), with a coverage ratio of 66.5%;
- a reduction in unlikely-to-pay loans, which fell from 3,244 million euro to 3,115 million euro, corresponding to -4%, with a coverage ratio of 39%;
- a decrease in past-due loans, which amounted to 278 million euro compared to 369 million euro as at 31 December 2023 (-24.6%), with a coverage ratio of 23.3%.

The non-performing assets percentage of total net loans to customers amounted to 1.2% (1.1% according to the EBA definition), stable on December 2023 (0.9% according to the EBA definition), with a coverage ratio for non-performing loans of 47.7%.
Net performing loans (not represented by securities) amounted to 344.9 billion euro, compared to 357.6 billion euro as at 31 December 2023, representing a decrease of 12.6 billion euro (-3.5%). The related average coverage was 0.41% (Stage 1 at 0.11% and Stage 2 at 4.29%) substantially in line with the figure as at 31 December 2023 (0.45%, of which Stage 1 at 0.15% and Stage 2 at 4.26%).
Within the non-performing loan category, forborne exposures, related to forbearance measures for borrowers experiencing difficulty in meeting their financial obligations, amounted to 1.6 billion euro, with a coverage ratio of 42.6%. Forborne exposures in the performing loan category amounted to 3.8 billion euro.

Financial assets measured at fair value through profit or loss - which included financial and credit derivatives and debt and equity securities held for trading and mandatorily measured at fair value - are analysed together with the financial liabilities held for trading and designated at fair value, net of certificates, included in the direct deposits. As at 31 December 2024, this aggregate amounted to +11.5 billion euro, compared to +6.7 billion euro in December 2023, representing a change of +4.7 billion euro (+70.7%). This performance was attributable both to financial assets held for trading, up 3.5 billion euro (+8.2%) mainly due to equity instruments (+5.7 billion euro) - which include investments correlated with financial trading derivatives on equity instruments and stock indices - partly absorbed by the decrease in debt securities (-2.2 billion euro), and the lower financial liabilities held for trading for 1.2 billion euro (-3.3%), whose change was mainly due to short selling (-1.4 billion euro).

Financial assets measured at fair value through other comprehensive income amounted to 57.7 billion euro. These assets, which consisted of debt securities of 56.4 billion euro and equity investments and private equity interests of 1.3 billion euro, increased by 6.5 billion euro (+12.8%), primarily due to non-structured debt securities. HTCS debt securities have primarily been classified to Stage 1 (99.4%).

Financial assets measured at amortised cost which do not constitute loans amounted to 56.5 billion euro, up by +2.6 billion euro (+4.8%) compared to the end of the previous year, mainly as a result of the increase in debt securities issued by governments (+4.2 billion euro) and banks (+0.5 billion euro), offset by the decrease in debt securities of other financial companies (-2.2 billion euro). HTC debt securities have primarily been classified to Stage 1 (93.2%).

Direct deposits, consisting of amounts due to customers at amortised cost and securities issued, as well as certificates, which are a form of funding not measured at amortised cost alternative to bonds, totalled 480.7 billion euro, up 6.2 billion euro (+1.3%) compared to 31 December 2023. The positive performance of the total funding was mainly driven by repurchase agreements and securities lending (+2.6 billion euro; +20.3%), used in the treasury management policies, bond funding (+6.4 billion euro; +6.9%) and certificates (+2.5 billion euro; +8.5%), partly offset by the decrease in current accounts and deposits (-5.1 billion euro; -1.6%). This trend should be understood in a context of interest rates that remain high, where businesses used their liquidity to reduce their use of bank credit, and private customers reallocated some of the amounts available on current accounts towards more remunerative investment products.

As at 31 December 2024, the net interbank position – calculated considering all the on-demand liquidity, both at Central Banks and at other banks, recognised under Cash and cash equivalents, and no longer just that with the ECB – showed a negative imbalance of 10.2 billion euro, compared to -13 billion euro at the end of 2023, representing a decrease of 2.7 billion euro, corresponding to -21.2%.
The change reflects a 39% reduction in liabilities, mainly attributable to the total repayment of the TLTRO III during the first half of 2024 (36 billion euro in March and 9 billion euro in June).
On the side of assets held at banks, there was also a decrease of 41.2%, mainly due to liquidity in on-demand deposits with central banks (-47 billion euro), and in particular with the ECB (-46.5 billion euro). Amounts due from banks grew by a total of 14.6%, which reflected the movements, also in opposite directions, of different technical forms through which normal interbank operations are carried out.

Equity investments, which amounted to 25.7 billion euro, included controlling interests in subsidiaries, associates and companies subject to joint control, and were up 1.6 billion euro from the end of the previous year (+6.7%).

Property, equipment and intangible assets amounted to 12 billion euro, down 0.4 billion euro (-3.5%) compared to 12.5 billion euro as at 31 December 2023.

Tax assets, net of tax liabilities, amounted to 11.1 billion euro, a decrease of 2 billion euro (-15.3%) compared to 31 December 2023.

Allowances for risks and charges amounted to around 3.9 billion euro, essentially in line with the 4 billion euro at the end of the previous year (-0.1 billion euro; -3.1%).

Non-current assets held for sale and discontinued operations and related liabilities contain assets and related liabilities which no longer refer to continuing operations as they are being disposed of.
As at 31 December 2024 assets held for sale amounted to 577 million euro, composed of: i) properties for 536 million euro, mainly referring to the transfer defined under the comprehensive agreement between the Bank and Coima, which is expected to be concluded during 2025; ii) non-performing loans for 34 million euro, to be sold on-balance sheet as part of a de-risking transaction approved in December 2024. The associated liabilities amounted to 5 million euro.
As at 31 December 2023 assets held for sale came to 139 million euro, referring to a portfolio consisting of both unlikely-to-pay loans and performing positions, almost all of which were sold on 15 April 2024, associated liabilities of 2 million euro and property and equipment for 39 million euro.

Shareholders' equity amounted to 54.4 billion euro, compared to 56 billion euro recorded as at 31 December 2023, which was impacted by interim dividends on the net income for 2023, paid in November 2023 (-2.6 billion euro).
This aggregate included the net income earned in the current year (5,604 million euro) and reflected the remaining dividend for 2023 paid in May 2024 (-2.8 billion euro) and the interim dividend from the 2024 income paid in November 2024 (3 billion euro).
As at 31 December 2024, the caption also included the deduction of 1.7 billion euro relating to purchases relating to the programme of purchase of own shares for annulment (buyback) - authorised by the ECB by decision notified on 11 March 2024 and concluded on 18 October 2024 - as well as the allocation to the Reserve pursuant to Article 26, paragraph 5-bis of Decree Law no. 104 of 10 August 2023, converted with amendments by Law no. 136 of 9 October 2023 (+2 billion euro) in line with the resolutions of the Shareholders' Meeting of 24 April 2024 on allocating the income for 2023.
The increase in Additional Tier 1 equity instruments is attributable to the issuance on 20 May 2024 of a fixed-rate perpetual bond denominated in euro for a total nominal amount of 1 billion euro and the early repayment of a perpetual bond on 16 May 2024 (for -0.2 billion euro).

Own funds amounted to 50.6 billion euro, while the Common Equity Tier 1 ratio stood at 11.1%, well above the minimum required.

Other information

Pursuant to article 2497 and subsequent articles of the Italian Civil Code, Intesa Sanpaolo exercises management and coordination activities for its direct and indirect subsidiaries, including companies which, on the basis of current laws, are not part of the Banking group, with the exception of Risanamento S.p.A. and its subsidiaries.
This Report on operations of Intesa Sanpaolo S.p.A. includes only a comment on the Bank's performance, as shown in the previous pages, and related Alternative Performance Measures. For all other information required by laws or regulations, reference should be made to the Notes to these Parent Company's financial statements or the Consolidated financial statements and to the related Report on operations, when illustrating specific themes.

Specifically, reference should be made to the Notes to these Parent Company's financial statements with regard to:

– information on the Bank's connections and transactions with related parties, which is provided in Part H. To enable a comprehensive understanding, Part H presents not only the information required by IAS 24 but also that required by Article 5, paragraph 8, of Consob Regulation 17221 of 12 March 2010 (adopted pursuant to Article 2391-bis of the Italian Civil Code);
– information on financial and operational risks, reported in Part E, which specifically illustrates the objectives and policies regarding the assumption, management and hedging of financial risks;
– the list of subsidiaries, companies subject to joint control and companies subject to significant influence, provided in Part B - Assets - Section 7;
– transactions with subsidiaries, companies subject to joint control and companies subject to significant influence, provided in Part H;
– information on capital, included in Part B - Liabilities - Section 12, and in Part F.

Reference should instead be made to the Consolidated financial statements with regard to:

– information on the main risks and uncertainties, illustrated in the chapter "Overview of 2024" of the Report on operations, which also includes the management's going concern assessment;
– the update on the disclosure on the control actions and main accounting issues related to the Russia-Ukraine risk, included in the above-mentioned chapter "Overview of 2024". Further information in this regard is provided in the Notes to the consolidated financial statements, in Part E - Information on risks and relative hedging policies, in the section on credit risk, where the exposures to Russia and Ukraine and the related valuation aspects are discussed. Such disclosure supplements and completes what already covered in Part A - Section 4 - Other aspects, of the Notes to the financial statements regarding several aspects of risks and uncertainties linked to the war;
– the information on sustainability pursuant to Legislative Decree 125 of 6 September 2024 (which implemented in Italy Directive 2022/2464/EU on corporate sustainability reporting) which, as permitted by the regulations, was provided at Group level and, therefore, included in a specific section of the Report on operations of the consolidated financial statements, called "Consolidated Sustainability Statement". That information is helpful in understanding the impact of the Intesa Sanpaolo Group on sustainability matters and how sustainability matters affect the Group's development, performance, and position;
– more in general, ESG (Environmental, Social and Governance) topics and climate-related topics, whose identification and control is discussed in Part A, Section 5 – Other aspects, of the Notes to the consolidated financial statements, which also summarises the characteristics and risk aspects of the financial instruments in the in the context of the Group's green financing activities , while Part E, Scope of risks, illustrates the integration of ESG risks, climate-related risk in particular, within the risk management framework;
– the certification of compliance, during the year 2024, with the conditions required by Article 15 of the Consob Market Regulation 20249/2017 (as amended) for the listing of shares of companies controlling companies established and regulated under the laws of non-EU countries, provided in Part E of the Notes to the consolidated financial statements, in the introductory section on the Manager responsible for preparing the Company's financial reports;
– the definition of and methods for constructing the Alternative Performance Measures used, provided in a specific chapter of the Report on operations of the consolidated financial statements.

For information on Intesa Sanpaolo's corporate governance and ownership structure of, required by Article 123-bis of the Consolidated Law on Finance, reference is made to the summary provided in the Report on operations of the consolidated financial statements (chapter "Corporate Governance and remuneration policies") and in the specific separate "Report on Corporate Governance and Ownership Structures" available in the Governance section of the Group's website, at www.group.intesasanpaolo.com.
Finally, the disclosure on remuneration pursuant to Article 123-ter of the Consolidated Law on Finance is summarised in the Report on operations of the consolidated financial statements (chapter "Corporate Governance and remuneration policies") and illustrated in the separate "Report on remuneration policy and compensation paid", published in the Governance section of the Group's website.

Forecast for 2025

In 2025, compared to 2024, for Intesa Sanpaolo it is envisaged:
- growth in revenues;
- decrease in operating costs;
- low cost of risk;
- lower levies and other charges concerning the banking and insurance industry due to no further contribution to the deposit guarantee scheme;
- increase in net income.

A strong value distribution is envisaged:
- cash payout ratio of 70% of the consolidated net income for each year of the Business Plan, with an increase in the dividend per share for 2025 versus the dividend per share for 2024[202];
- buyback of 2 billion euro to be launched in June 2025 (authorised by the ECB)[203];
- additional distribution for 2025 to be quantified when full-year results are approved.

The Board of Directors

Turin, 27 February 2025

[202] Subject to the approval from the Shareholders' Meeting.
[203] See the previous note.

Proposals to the Shareholders' Meeting

Distinguished Shareholders,

pursuant to Article 2364 of the Italian Civil Code and Articles 7.3 and 29.3 of the Company's Articles of Association, we hereby submit for your approval the financial statements of the Parent Company Intesa Sanpaolo S.p.A. as at and for the year ended 31 December 2024 and the related proposal for allocation of net income for the year and distribution of reserves.

The reclassifications made to the shareholders' equity items are described in section 12 of Part B - Liabilities of the Notes to the Financial Statements. You are also reminded that, pursuant to Article 6, paragraph 1, letter a) of Legislative Decree 38/2005 currently in force, a portion of net income corresponding to capital gains recognised in the income statement, net of the related tax charge and other than the gains from trading financial instruments and foreign exchange and hedging transactions, arising from application of the fair value criterion, must be recorded in an unavailable reserve. As at 31 December 2024, this portion amounted to 303,700,836.47 euro. Also as a result of the application of the above-mentioned article, following the realisation of gains or the recognition of losses, the unavailable reserve was reduced, through a transfer to the Extraordinary reserve, by 306,523,455.30 euro, making this amount available for distribution.

On 31 October 2024, in compliance with the provisions of paragraph 4 of Article 2433-bis of the Italian Civil Code, the Board of Directors approved the distribution of an interim dividend from the 2024 net income, totalling 3,022,396,312.63 euro[204], corresponding to a unit amount of 17.00 euro cents for each of the 17,778,801,839 ordinary shares outstanding on the record date of 19 November 2024. The dividend was paid out on 20 November 2024 (with coupon presentation on 18 November 2024).

Given the above, the following proposals are submitted for your approval:

	(euro)
Net income for the year	5,603,701,744.05
Allocation to the Reserve pursuant to Article 6 paragraph 1, letter a) of Legislative Decree no. 38/2005	303,700,836.47
Interim dividend for 2024 of 17.00 euro cents, as approved by the Board of Directors on 31 October 2024 and distributed on 20 November 2024, for each of the 17,778,801,839 ordinary shares outstanding on the record date of 19 November 2024, for a total of	3,022,396,312.63
Allocation of a dividend of 12.65 euro cents per share to the 17,803,670,501 ordinary shares currently constituting the share capital, for a total of	2,252,164,318.38
Assignment to the Allowance for charitable, social and cultural contributions	24,000,000.00
Assignment to the Extraordinary reserve of the residual net income	1,440,276.57
Distribution from the available portion of share premium reserve of a unit amount of 4.45 euro cents, totalling	792,263,337.29

Therefore, the dividend for the year 2024 – considering the interim dividend of 3,022 million euro already paid and the remaining dividend of 2,252 million euro yet to be paid – and the distribution of the available portion of reserves of 792 million euro would result in a total distributed amount of around 6,067 million euro, corresponding to a payout ratio of 70% of consolidated net income.
This distribution of reserves shall be subject to the same tax regime as the distribution of dividends.

If this proposal is approved[205], the consolidated capital requirements would show a Common Equity Tier 1 ratio of 13.3% and a Total Capital Ratio of 19.0%, both amply meeting the requirements of the EU Bodies and the Supervisory Authority. At Parent Company level as well, the capital requirements would be well above the minimum requirements.

We propose that the remaining dividend for 2024, as well as the distribution of reserves, be paid, in compliance with the legal provisions, with effect from 21 May 2025 (payment date), with record date pursuant to Article 83-terdecies of the Consolidated Law on Finance on 20 May 2025 and coupon presentation date on 19 May 2025.

Any own shares held by the Bank on the record date will not be entitled to dividends or distributions from the Share premium reserve, and the related amounts will be transferred to the Extraordinary reserve.

[204] It does not include the interim dividend on the 24,868,662 own shares held at the record date, equal to 4,227,672.54 euro.

[205] Considering a buyback amount of 2 billion euro authorised by the ECB, to be launched in June 2025, subject to the approval of the Shareholders' Meeting.

If the proposal submitted is approved by you, the shareholders' equity of Intesa Sanpaolo S.p.A. will be as shown in the table below.

(millions of euro)

Shareholders' equity	Annual report 2024	Changes	Share capital and reserves of Annual Report 2024 after the Shareholders' Meeting resolutions

(*) With regard to the disclosure required by par. 44 B of IAS 7, it is noted that the changes in liabilities deriving from financing activities amount to -44,389 million euro (cash flow from) and comprise -41,478 million euro in cash flows, +931 million euro in fair value changes and -3.842 million euro in other changes.

Notes to the Parent Company's financial statements

Part A – Accounting policies

A.1 – GENERAL CRITERIA

SECTION 1 – DECLARATION OF COMPLIANCE WITH IAS/IFRS

As set forth by Legislative Decree 38 of 28 February 2005, Intesa Sanpaolo's financial statements have been prepared in compliance with the IAS/IFRS issued by the International Accounting Standards Board (IASB) and the related interpretations of the International Financial Reporting Standards - Interpretations Committee (IFRS-IC) and endorsed by the European Commission as provided for by EC Regulation 1606 of 19 July 2002.
The financial statements as at 31 December 2024 have been prepared based on the "Instructions for the preparation of the separate and consolidated financial statements of banks and financial companies, which are parent companies of banking groups" issued by the Bank of Italy, in the exercise of powers set forth by Art. 43 of Legislative Decree 136/2015[206], with Regulation of 22 December 2005, which issued Circular 262/2005, and subsequent updates. Specifically, these financial statements have been prepared in accordance with the format and preparation rules of the 8th update of 17 November 2022.
These Instructions set out compulsory financial statement forms, as well as the contents of the Notes to the consolidated financial statements.
The financial statements have been prepared using the IAS/IFRS endorsed and in force as at 31 December 2024 (including the SIC and IFRIC interpretation documents) as listed in the attachments to the consolidated financial statements.

The table below shows the new standards or amendments to existing ones, together with the related European Commission endorsement regulations, which came into force in 2024.

IFRS endorsed as at 31.12.2024 in force since 2024

Endorsement Regulation	Amendments to Standards/Interpretations	Effective date
2579/2023	Amendments to IFRS 16 Leases - Lease Liability in a Sale and Leaseback	01/01/2024 First financial year starting on or after 01/01/2024
2822/2023	Amendments to IAS 1 Presentation of Financial Statements - Classification of Liabilities as Current or Non-current and Non-current Liabilities with Covenants	01/01/2024 First financial year starting on or after 01/01/2024
1317/2024	Amendments to IAS 7 Statement of Cash Flows and to IFRS 7 Financial Instruments: Disclosure - Supplier Finance Arrangements	01/01/2024 First financial year starting on or after 01/01/2024

As shown in the above table, the financial statements for 2024 reflect the provisions of Regulation no. 2579/2023 Amendment to IFRS 16 Leases – Lease Liability in a Sale and Leaseback
of 20 November 2023, Regulation no. 2822/2023 – Amendments to IAS 1 Presentation of Financial Statements – Classification of Liabilities as Current or Non-current and Non-current Liabilities with Covenants of 19 December 2023, and Regulation no. 1317/2024 Supplier Finance Arrangements – Amendments to IAS 7 and IFRS 7 of 15 May 2024. There were no significant aspects of this for the Bank. Below is a brief summary of their main content.

Regulation no. 2579/2023 - Amendments to IFRS 16 Leases – Lease Liability in a Sale and Leaseback
Regulation no. 2579/2023 of 20 November 2023 amends IFRS 16 Leases with respect to lease liabilities in a sale and leaseback transaction, published by the IASB on 22 September 2022.
The limited amendments introduced relate to the recognition of sale and leaseback transactions[207] by the seller-lessee in the event of variable lease payments and when the transfer of the asset is a sale pursuant to IFRS 15.
The amendment was requested by the IFRS-IC, which identified a gap in the rules governing the recognition of right-of-use assets and lease liabilities in sale and leaseback transactions with variable lease payments. Specifically, reference is made to variable lease payments that are not based on an index or rate, e.g., those based on a percentage of the lessee-seller's sales generated by the use of the asset.
The amendments clarify that:
– upon initial recognition, the seller-lessee shall also include variable lease payments, including those that are not based on an index or rate, in the measurement of the lease liabilities in sale and leaseback transactions;

[206] Art. 43 of Legislative Decree 136/2015 confirmed to the Bank of Italy the powers concerning the layouts of financial statements already previously attributed to the same Authority by Legislative Decree 38/2005.
[207] Sale and leaseback transactions are transactions in which an entity sells one of its assets and then immediately leases it back from the new owner.

– subsequent to initial recognition, the seller-lessee applies the provisions of IFRS 16 to subsequently measure lease liabilities in a way that ensures that no gains or losses are recognised on the part of the right of use retained.

The seller-lessee may adopt different approaches in order to comply with the new provisions. Indeed, in response to the feedback received following the publication of the Exposure Draft, the IASB decided not to introduce specific requirements to measure the lease liability in a sale and leaseback, leaving the definition of an accounting policy to individual entities.
The amendments are mandatory for annual reporting periods beginning on or after 1 January 2024. A seller-lessee applies the amendments retrospectively in accordance with IAS 8 to sale and leaseback transactions entered into after the date of initial application of IFRS 16, i.e., 1 January 2019.
These amendments are not particularly significant for Intesa Sanpaolo given the characteristics of its existing sale and leaseback agreements, which have no variable or insignificant variable payments.

Regulation no. 2822/2023 – Amendments to IAS 1 Presentation of Financial Statements – Classification of Liabilities as Current or Non-current and Non-current Liabilities with Covenants

Regulation no. 2822 of 19 December 2023 introduces some limited amendments to IAS 1 Presentation of Financial Statements. The clarifications aim to promote consistency in applying IAS 1 across companies to determine whether, in the statement of financial position, payables and other liabilities with an uncertain settlement date are to be classified as current (due or potentially to be paid within one year) or non-current.
Specifically, IAS 1 requires that an entity may classify a liability as non-current only where the entity has the right at the reporting date to defer settlement of the liability for at least twelve months. However, the right to defer settlement of a liability may be subject to covenants. The amendments to IAS 1 specify that covenants to be met after the reporting date (for example, a covenant based on the entity's financial position six months after the end of the reporting period), do not influence the classification of the payable as current or non-current at the reporting date.
On the other hand, the entity shall disclose information in the notes that enables users of financial statements to understand the risk that the liabilities could become repayable within 12 months after the reporting period.
Given the content of the amendment and the obligation to apply the formats set forth in Bank of Italy Circular no. 262/05, the limited amendments to IAS 1 are not significant for banks.

Regulation no. 1317/2024 Supply Finance Arrangements – Amendments to IAS 7 and IFRS 7

The amendments to IAS 7 Statement of Cash Flows and to IFRS 7 Financial Instruments: Disclosures aim to introduce new transparency requirements for supplier finance arrangements (also known as "supply chain finance" or reverse factoring). The new requirements aim to provide users of financial statements with information that enables them to assess the effects of those arrangements on the entity's liabilities and cash flows, to understand the effect of supplier finance arrangements on a company's exposure to liquidity risk and how the company might be affected if the arrangements were no longer available to it.
The proposed amendments introduced by Regulation no. 1317 of 15 May 2024 concern entities that enter into finance agreements in the role of purchasers, and not the financing entities. Therefore, the case has no direct effect for Intesa Sanpaolo, which acts solely as a financier in supply finance arrangements.

The table below shows the new standards and amendments to existing ones, together with the related European Commission endorsement regulations, which will become mandatory after 2024, and for which Intesa Sanpaolo has not exercised the option of early adoption.

IFRS endorsed as at 31.12.2024 applicable subsequent to 31.12.2024

Endorsement Regulation	Amendments to Standards/Interpretations	Effective date
2862/2024	Amendments to IAS 21 The Effects of Changes in Foreign Exchange Rates: Lack of Exchangeability	01/01/2025 First financial year starting on or after 01/01/2025

Regulation no. 2862/2024 of 12 November 2024 Amendments to IAS 21 The Effects of Changes in Foreign Exchange Rates - Lack of Exchangeability

Regulation no. 2862/2024 of 12 November 2024 amends IAS 21 specifying when a currency is exchangeable into another currency and how to determine the exchange rate when it is not and the disclosure required.
Specifically, the amendments:

– introduce the definition of "exchangeability"[208] and an application guidance to assist entities in determining when a currency is exchangeable (for example, by clarifying how to assess the time frame to obtain the currency);
– cover the estimate of the spot exchange rate when a currency is not exchangeable into another currency, using an observable exchange rate or another estimation technique. In this respect, the IASB opted not to provide specific requirements on how to estimate spot exchange rates - since such estimate may depend on circumstances specific to the entity and the relevant economic/legal environment. However, some examples are provided to assist practitioners in their assessments;
– cover the required disclosure that would enable users of the financial statements to evaluate how a currency's lack of exchangeability affects, or is expected to affect, its financial performance, financial position and cash flows. Furthermore, an entity shall disclose information about the estimation process and the risks to which it is exposed because of the currency not being exchangeable into another currency.

The amendments apply to annual reporting periods beginning on or after 1 January 2025.
As also noted by the IASB the cases subject to regulatory intervention are not frequent. Therefore, given the current context, these amendments are not expected to be particularly significant for Intesa Sanpaolo.

The table below shows the new international financial reporting standards or amendments to existing standards that have not yet been endorsed by the European Commission.

IFRS not endorsed as at 31.12.2024

New Standards/Interpretations		Date of issue
IFRS 18	Presentation and Disclosure in Financial Statements	09/04/2024
IFRS 19	Subsidiaries without Public Accountability: Disclosures	09/05/2024
Amendments to Standards/Interpretations		
IFRS 9	Amendments to the Classification and Measurements of Financial Instruments	30/05/2024
IFRS 7	Amendments to the Classification and Measurements of Financial Instruments	30/05/2024
Several IAS/IFRS (*)	Annual Improvements - Volume 11	18/07/2024
IFRS 9	Contracts Referencing Nature-dependent Electricity	18/12/2024
IFRS 7	Contracts Referencing Nature-dependent Electricity	18/12/2024

(*) The Annual Improvements relate to: Cost Method (Amendments to IAS 7), Credit Risk Disclosures (Amendments to Illustrative Examples accompanying IFRS 7), Determination of a 'De Facto Agent' (Amendments to IFRS 10), Disclosure of Deferred Difference between Fair Value and Transaction Price (Amendments to Illustrative Guidance accompanying IFRS 7), Gain or Loss on Derecognition (Amendments to IFRS 7), Hedge Accounting by a First-time Adopter (Amendments to IFRS 1), Lessee Derecognition of Lease Liabilities (Amendments to IFRS 9), Transaction Price (Amendments to IFRS 9)

As regards the IASB documents introducing new standards or amending existing accounting standards pending endorsement, the following is noted:

[208] IAS 21.8: "A currency is exchangeable into another currency when an entity is able to obtain the other currency within a time frame that allows for a normal administrative delay and through a market or exchange mechanism in which an exchange transaction would create enforceable rights and obligations."

IFRS 18 Presentation and Disclosure in Financial Statements

IFRS 18 Presentation and Disclosure in Financial Statements was issued by the IASB on 9 April 2024. Its application is mandatory for annual reporting periods starting from 1 January 2027 onwards but earlier application is permitted, subject to the completion of the endorsement process. Comparative information needs to be disclosed in respect of the previous period.

The standard will not affect how companies measure their financial performance, but only the presentation. Indeed, the following will be required:

- Introduce defined subtotals in the statement of profit or loss

Under IFRS 18, entities need to classify items of income and expense in 5 categories: operating, investing and financing - covered by the new definition introduced by IFRS 18 - in addition to income taxes and discontinued operations, which are unchanged.

With respect to specific operating segments, including the banking sector, items of income and expense that would normally be classified in the investing or financing categories contribute to the operating performance since for these entities, investing or financing to customers are the main business activity.

- Management-defined performance measures (MPMs)

Management-defined performance measures (MPMs) are the subtotals of income and expenses, other than those covered by IFRS 18 or specifically required by other IFRS, that an entity uses in public communications outside financial statements (including the report on operations) to communicate to investors management's view of an aspect of the financial performance of the entity. Under IFRS 18, an entity shall disclose information about its MPMs in a single note to the financial statements, including information that enables users of financial statements to understand them.

- Grouping (aggregation and disaggregation) of information

Finally, IFRS 18 provides application guidance on aggregating information in the primary financial statements and accompanying notes, which have complementary roles. With respect to the expense items to be included in the operating category, under IFRS 18, entities must present these items in a way that provides the most useful structured summary of them, by either the "nature" or "function" of the expense. However, a "mixed" (by both nature and function) presentation is also allowed by disclosing the specific expenses by nature in the notes to the financial statements.

Although the mandatory first-time adoption of this standard is not imminent (it will become mandatory for annual reporting periods starting from 1 January 2027), its provisions are currently being analysed in order to assess their relevance for Intesa Sanpaolo, specifically with respect to the presentation of the items comprising the statement of profit or loss (primary and reclassified). In any case, Italian banks will have to wait for the Bank of Italy's initiatives to adapt to the new standard, in particular, with reference to Circular 262/2005, also in order to assess the consequences on application systems.

Amendments to the Classification and Measurement of Financial Instruments — Amendments to IFRS 9 and IFRS 7

On 30 May 2024, the IASB published "Amendments to the Classification and Measurement of Financial Instruments - Amendments to IFRS 9 and IFRS 7" to address matters identified during the post-implementation review (PIR) of the classification and measurement requirements of IFRS 9 Financial Instruments.

The amendments cover the following aspects:

- Classification of financial assets

The application guidance provides clarification for assessing the characteristics of contractual cash flows, i.e., the so-called solely payments of principal and interest (SPPI) criterion which, if met, leads to the classification of assets at amortised cost.

This includes the amendments that clarify the treatment for the SPPI test of financial assets with features linked to Environmental, Social and Governance (ESG) factors which, upon achieving (or failing to achieve) specific ESG KPIs, provide for a variability of the interest rate which is contractually defined (usually the increase and/or decrease of a specific number of basis points). Under the proposed approach, contracts where the contingent event does not relate directly to changes in basic lending risks and costs (with an example of reduction of carbon emissions), the entity should define an internal policy in order to assess that the cash flows of the instrument are not significantly different from those of a financial instrument with identical contractual terms, but without such a contingent feature.

- Derecognition of financial liabilities settled through an electronic cash transfer system

Under the amendments, a financial liability is derecognised at the settlement date, unless the entity opts for the application of the new provisions whereby a financial liability can be derecognised at an earlier date if the cash transfer takes place through an electronic payment system and specific conditions are met. The amendment introduced by the IASB provides for the possibility (and not the obligation) to adopt an accounting policy to be applied consistently to all settlements made through a specific electronic payment system.

- New disclosure requirements

The IFRS 7 was amended to introduce additional disclosure requirements relating to:

- financial instruments with contractual terms that could change the amount of cash flows based on the occurrence (or non-occurrence) of a contingent event that does not relate directly to changes in basic lending risks and costs, e.g. in the case of ESG instruments;
- equity instruments designated at FVOCI.

The amendments are effective mandatorily for annual reporting periods beginning on or after 1 January 2026, subject to the completion of the endorsement process. Furthermore, earlier application is permitted or, alternatively, entities can decide to early adopt only the amendments related to the classification of financial assets and the related disclosures. The amendments are required to be applied retrospectively, in accordance with the requirements of IAS 8, though restatement of prior periods is not required (similarly to the first-time adoption of IFRS 9).

With respect to the issues of greatest interest to the Bank – the SPPI test for products with ESG features and the related disclosure - several analyses are currently underway in order to define the application methods and update corporate processes as part of a specific project that involves all the affected structures.

Contracts Referencing Nature-dependent Electricity - Amendments to IFRS 9 and IFRS 7

On 18 December 2024, the IASB published amendments to IFRS 9 and IFRS 7 – Contracts Referencing Nature-dependent Electricity, to help companies better report the financial effects of nature-dependent electricity contracts, which are often structured as power purchase agreements (PPA)[209]. The IASB acted swiftly in the light of the increased use of these contracts which help companies to secure their electricity supply from renewable sources such as wind and solar power, at a fixed price per unit of energy purchased or sold. The amount of electricity generated under these contracts can vary based on uncontrollable factors such as weather conditions and, at certain times (e.g. weekends or during the night), the entity may not consume all of the purchased energy, resulting in the need to resell it on the market, as energy cannot be stored.

The amendments include:

– clarifying the application of the "own-use" requirements;
  The aim of the amendments is to enable application of the exception envisaged by IFRS 9 for entities that enter into these agreements for the purpose of the receipt of energy in accordance with the entity's expected usage, thereby avoiding the classification as financial instruments to be measured at fair value;
– allow hedge accounting requirements when these agreements are used as hedging instruments (e.g. via a virtual PPA). These amendments essentially allow a cash flow hedge, avoiding the need to designate a specific amount by reference to the volume of the electricity transaction, as is normally required under IFRS 9 to promote the effectiveness of the hedging relationship;
– new disclosure requirements which enable investors to understand the effect of these agreements on the performance and cash flows of an entity. Specifically, entities are required to provide information about the terms and conditions of these agreements and quantitative and qualitative information about the agreements and their financial effect.

The mandatory effective date of the amendments is for annual reporting periods beginning on or after 1 January 2026, with earlier application permitted subject to the completion of the endorsement process.

The PPAs were also covered by ESMA in Priorities 2023 given the importance of these instruments, specifically in certain industries, in the context of climate-related policies. There are currently no significant instances applicable to Intesa Sanpaolo.

IFRS 19 Subsidiaries without Public Accountability: Disclosures

IFRS 19 Subsidiaries without Public Accountability: Disclosures was issued by the IASB in May 2024 and permits subsidiaries that are eligible to provide reduced disclosures instead of the disclosure requirements of other IAS/IFRS.

IFRS 19 does not apply to the preparation of Intesa Sanpaolo's separate financial statements and, overall, the scope of the standard is narrowed for banks, financial intermediaries and insurance companies (which often meet the public accountability criterion).

Annual Improvements - Volume 11

The IASB issued some narrow scope amendments to IAS/IFRS on 18 July 2024 as part of the annual improvements of financial reporting standards. All amendments will be effective for annual reporting periods beginning on or after 1 January 2026, with earlier application permitted subject to the completion of the endorsement process.

Given their limited nature, the amendments are not particularly important for Intesa Sanpaolo.

[209] Specifically, PPAs may refer to:

– the signing of a renewable power purchase agreement (physical PPA) whereby an entity undertakes to purchase a certain amount of electricity produced from renewable sources (e.g. all energy produced by a wind turbine) at a predetermined fixed price for a certain number of years (even a very long time, e.g. 20 years);
– virtual agreements (or virtual PPAs) whereby there is no physical delivery of energy; in these agreements, the difference between the fixed price determined in the PPA and the spot price at which energy can be purchased/sold in the market is settled.

SECTION 2 – GENERAL PREPARATION PRINCIPLES

The separate financial statements are made up of the Balance sheet, the Income statement, the Statement of comprehensive income, the Changes in shareholders' equity, the Statement of cash flows, the Notes to the financial statements and the related comparative information; the Report on operations prepared by the Directors, on the economic results achieved and on Intesa Sanpaolo's balance sheet and financial position has also been included. In compliance with the provisions of Article 5 of Legislative Decree 38/2005, the financial statements have been drawn up in euro as functional currency.
The amounts indicated in the financial statements and in the Notes to the financial statements as well as those in the Report on operations are expressed in millions of euro, unless otherwise specified.
The financial statements are prepared with the application of the general principles set out by IAS 1 and the specific financial reporting standards endorsed by the European Commission and illustrated in Part A.2 of these Notes to the financial statements, as well as in compliance with the general assumptions set forth by the Conceptual Framework for the preparation and presentation of Financial Statements issued by IASB.
No exceptions to the application of IAS/IFRS have been made.
The Report on operations and the Notes to the financial statements contain all information required by the IAS/IFRS, by current regulations, by the Bank of Italy, by Consob (Italian Securities and Exchange Commission) and by the European Securities and Markets Authority - ESMA, in addition to other information which is not compulsory but is nonetheless deemed to be necessary in order to give a true and fair presentation of the Bank's situation.

Where the conditions pursuant to IFRS 5 had been met the reclassified components held for sale, resulting from the balance sheet as of 31 December 2024 and the related details in the Notes to the financial statements, are the following: (i) properties, mainly consisting of those subject to transfer under the agreement between Intesa Sanpaolo and COIMA entered into on 19 April 2024, with a total value of around 0.5 billion euro, due to be completed in 2025; (ii) non-performing loans for 0.3 billion euro gross, due to be sold under a de-risking transaction approved in December 2024.
With respect to the non-performing loans included under assets held for sale as at 31 December 2023, comprising unlikely-to-pay loans and high-risk performing loans for a total of approximately 0.2 billion euro, almost the entire portfolio was sold on 15 April 2024, with marginal exposures remaining that will be sold in 2025.

The financial statement forms and the Notes to the financial statements show, in addition to the figures for the reference period, the comparative figures for 2023.

The Attachments include the reconciliation statements to the balance sheet and income statement originally published in the 2023 financial statements, together with specific reconciliations between the latter financial statements and the reclassified statements included in the Report on operations accompanying these financial statements.

Contents of financial statement forms

Balance sheet and income statement

The compulsory forms of the balance sheet and income statement are made up of captions, subcaptions and further detailed information (specified as the "of which" items in the captions and subcaptions).
In the interests of completeness, it should be noted that with regard to the compulsory forms defined by the Bank of Italy, captions which do not have amounts for the reporting year and the previous year have also been shown. In the income statement revenues are indicated without sign, whereas costs are preceded by the minus sign.

Statement of comprehensive income

The statement of comprehensive income shows, starting from the net income/(loss) for the year, the income components recognised as a balancing entry in valuation reserves, net of the tax effect, in compliance with international financial reporting standards.
Comprehensive income is represented by providing separate recognition of the income components that will not be reversed to the income statement in the future and those which, conversely, could later be reclassified to income/(loss) for the year under specific conditions. Similarly to the balance sheet and the income statement, with respect to the compulsory forms defined by the Bank of Italy, captions which do not present amounts for the reporting year and the previous year are in any case included. Negative amounts are preceded by the minus sign.

Changes in shareholders' equity

The statement of changes in shareholders' equity presents shareholders' equity accounts and changes which occurred in the reference year and in the previous year, broken down in share capital, reserves, reserves from retained earnings, valuation reserves and net income. Treasury shares are deducted from shareholders' equity. The table is presented by inverting the rows and the columns with respect to the same form provided for by the updating of Bank of Italy Circular 262/2005.

Statement of cash flows

The statement of cash flows registered in the reference year and in the previous year is prepared using the indirect method, on the basis of which cash flows from operating activities are represented by net income adjusted for the effects of non-cash transactions.
Cash flows are broken down into flows from operating activities, from investing activities and from financing activities.
In the form, cash flows generated in the year are indicated without sign, whereas cash flows absorbed are preceded by the minus sign.

Contents of the Notes to the financial statements

The Notes to the Parent Company's financial statements include the information provided for by International Financial Reporting Standards and Circular 262 issued by the Bank of Italy on 22 December 2005 and subsequently amended, applicable for the preparation of these financial statements.

SECTION 3 – SIGNIFICANT EVENTS AFTER THE REPORTING DATE

Reference is made to the similar disclosure in the Consolidated financial statements.

SECTION 4 - OTHER ASPECTS

RISKS, UNCERTAINTIES AND IMPACTS OF THE RUSSIAN/UKRAINIAN CRISIS

The extremely serious situation arising following the outbreak of the conflict between Russia and Ukraine on 24 February 2022 was immediately closely monitored and assessed by Intesa Sanpaolo, also in light of the related guidance provided by the regulators, given that the Group has:

– a direct presence with two subsidiaries in the warring countries, Pravex Bank Public Joint-Stock Company (Pravex) and Joint-Stock Company Banca Intesa (Banca Intesa Russia), and is therefore particularly exposed to the consequences of the conflict;
– cross-border exposures stemming from its corporate and investment banking activities.

In its lending activities, the IMI C&IB Division had over time financed counterparties resident in the Russian Federation. More than two-thirds of the loans to Russian customers disbursed before the conflict involved leading industrial groups, which have established commercial relationships with customers belonging to the main international supply chains, a significant amount of which derives from commodity exports.

At the outbreak of hostilities, loans to Russian customers represented around 1% of the Intesa Sanpaolo Group's total loans to customers, net of Export Credit Agency - ECA guarantees. Due to the existence of those guarantees, the credit risk on those exposures can be considered as not referring to either Russia or Ukraine.

That being said, in this section we note some information relating to the Russian and Ukrainian subsidiaries:

– Banca Intesa Russia: this is a Moscow-based corporate bank, 47% owned by Intesa Sanpaolo and 53% by Intesa Sanpaolo Holding International, part of the IMI Corporate & Investment Banking Division. It operates with 22 branches and 797 staff;
– Pravex is a small commercial bank, wholly-owned by Intesa Sanpaolo and based in Kyiv, part of the International Banks Division. It operates with 39 branches (mainly in the Kyiv region) and 612 staff.

Despite the objective constraints imposed by the current situation, particularly for Pravex, the two subsidiaries are continuing to operate with the support of the Parent Company structures while the overall exposure to the Russian Federation has decreased significantly over the past three years, as required by the European regulators and the ECB recommendations, the latest of which was issued in December 2024 ("Decision establishing prudential requirements relating to further reduction of the risks connected with the Supervised Entity's business in Russia"). The Decision Letter imposes restrictions on Intesa Sanpaolo directly aimed at the operations of Banca Intesa Russia, along with a recommendation regarding the Group's cross-border operations in Russia. The measures set out for Banca Intesa Russia consist of reducing i) the loan portfolio; ii) the volume of customer deposits; iii) the placement of deposits with financial institutions domiciled in Russia; and iv) payment activities originating from Russia, in currencies other than the rouble.

Also for the purposes of the 2024 Financial Statements, as previously illustrated in the 2023 Financial Statements, Intesa Sanpaolo's continuing control over the two entities has been confirmed, which can be evidenced from various points of view:

– in accounting/administrative terms, by acquiring the accounts for consolidation purposes. Specifically, as explained in greater detail in Part A: Section 3 - Scope of consolidation and consolidation methods, of the Consolidated financial statements, and also in line with the methodological choices made for the 2022 and 2023 Annual Report, for the Russian subsidiary, the accounts as at 31 December 2024 were acquired accurately and in a timely manner, while for Pravex, it was decided to maintain the accounts produced for consolidation as at 30 September 2024, valued at the exchange rate as at 31 December, considering the specific operating difficulties of the subsidiary, as well as in light of the substantial immateriality of its balance sheet figures at Group level;
– in terms of statutory regulations, with specific regard to the Russian subsidiary, the Bank was able to exercise its power to determine, in compliance with Russian regulations, the composition of the management body of Banca Intesa Russia at the Shareholders' Meeting of 26 June 2024. The turnover of officers was the result of appointments proposed by the Bank that passed the approval process of the Russian Central Bank. Also for the Ukraine subsidiary, there was routine turnover in the governance bodies in 2024, based on the nominations expressed by the Parent Company;
– in terms of steering the business, the two entities continue to move ahead with their business following the instructions of the Parent Company;
– in terms of coordination and control, as the Parent Company's control functions (including the support function of the Manager responsible for preparing the Company's financial reports, namely Administrative and Financial Governance) continue to carry out their roles through the regular receipt and analysis of the planned information flows, interacting with the structures of the subsidiaries through the communication channels available, in line with any limitations that may arise over time, also handled using contingency solutions.

Moreover, the conclusions regarding the maintenance of control over Banca Intesa Russia are not invalidated by the limitations currently set by Russian regulations which, substantially, impose restrictions to repayments and payments to parties resident in "unfriendly" countries. Aware of the restrictions imposed by the specific regulatory framework, Banca Intesa Russia credited to specific Russian accounts, as provided by law, the monetary resources for the repayment of exposures due to the Bank that matured in the meantime. The potential use of the resources credited to those accounts – equal to around 5 million euro at the end of December 2024 – is limited to several specific purposes within Russia. In this context, it must be considered that the current limitations do not constitute the "expropriation" of the amounts in any way (nor are they even indicators of a loss of control over the subsidiary's assets). Rather, they derive from the temporary legal "freezing" of the free availability of amounts which, based on economic rights, would otherwise be available for their owner.

Lastly, with regard to the valuation of equity investments, it is specified that:
- with regard to Banca Intesa Russia (equity investment 47% owned by Intesa Sanpaolo and 53% owned by Intesa Sanpaolo Holding International), due to the positive performance of revenues and the gradual decrease in its risk profile during 2024, the shareholders' equity amounted to around 382 million euro as at 31 December 2024. On preparing the Consolidated Financial Statements, 263 million euro was therefore added to the allowance for risks and charges made at the end of 2023 (114 million euro), and at the end of 2022 (80 million euro) to eliminate the contribution of the company to the Group's consolidated shareholders' equity. Nonetheless, as the value of the equity investment in Banca Intesa Russia had already been eliminated in these (separate) financial statements as at 31 December 2023, no additional provisions were made at the level of the Parent Company;
- the write-down in the interest in Pravex for 26 million euro offset the increase in the equity investment of the same amount, deriving from the payment of 26 million euro made in the second half of 2024 as a capital increase of the subsidiary. Note that, following the outbreak of the Russia-Ukraine conflict, in 2022 the value of the investment in the capital of Pravex Bank in Ukraine was eliminated, for an amount of 48 million euro. In addition to that impairment, a provision was recognised for 71 million euro, required to cover indirect risks regarding the controlling investment held in Pravex Bank in relation to the conflict. That provision, of which 44 million euro was partially released in 2023 to align the values with the contribution of the subsidiary to the Consolidated financial statements, was fully released in 2024 (the remaining 27 million euro).

Following the de-risking carried out in 2022 and 2023, the exposures to Russian and Ukrainian customers (and securities) remained marginal also at the end of 2024. There are mainly on-balance sheet exposures referring to Russian banking counterparties, for a net total of 123 million euro (150 million euro as at 31 December 2023), essentially to Banca Intesa Russia.

Lastly, it is also noted that, given the material nature of the issues in question, in the Report on operations of the Consolidated Financial Statements, a specific section was dedicated to "The military conflict between Russia and Ukraine". This section summarises the exposures of the Group due from entities resident in the two countries and the main related accounting issues, including those of measurement, in addition to the initiatives of the Intesa Sanpaolo Group in favour of Ukraine, as well as the aspects regarding the framework of sanctions against the Russian Federation and cybersecurity.

ADDITIONAL INFORMATION ON THE INTEREST RATE BENCHMARK REFORM

Based on the instructions in Circular 262, this section sets out the disclosure in accordance with IFRS 7, paragraphs 24 I and 24 J relating to the Interest Rate Benchmark Reform (IBOR Reform).

As at 31 December 2024, there were no longer any financial instruments – financial assets, financial liabilities and derivative contracts – indexed to interest rates that still had to transition to an alternative benchmark rate. The transitions for the last remaining positions on USD LIBOR were successfully completed, with its synthetic publication ceasing at the end of September 2024, and on the Canadian Offered Rate (CDOR), which ended on 28 June 2024.
The financial instruments linked to the Euribor were already subject to reform in November 2019, through the adoption of a hybrid calculation method, which fully meets the requirements for critical benchmarks set out in the Benchmark Regulation EU 2016/1011 and the IOSCO principles.

In view of the regulatory changes and the actions undertaken since 2016, the Bank completed the transition within the set deadlines. Specifically, to manage the stock of existing instruments, the Bank set out the mass adoption of the new Risk Free Rates (RFR) on the financial instruments newly subscribed, thus abandoning the use of the benchmarks impacted by the reform and stabilising the stock of transactions to be transitioned, on the one hand, while setting up the solutions for the transition to the new RFR, defined based on the main international recommendations, capable of minimising the financial impacts of the transition, on the other.

As at 31 December 2024, the Bank did not hold any hedges index-linked to benchmarks impacted by the reform.

OTHER ASPECTS

Option for the national fiscal consolidation provisions
Intesa Sanpaolo and the Group's Italian companies have adopted the "national fiscal consolidation", set forth by Articles 117-129 of the Combined Tax Regulations, introduced by Legislative Decree 344/2003. It provides an option, based on which the total net income or fiscal loss of every subsidiary taking part in the fiscal consolidation procedure – together with withholding tax, tax deductions and tax credits – is transferred to the parent company, which determines a single taxable income or loss carried forward (that is the result of the sum of its own income/loss and of the income/loss of the participating subsidiaries) and, consequently, a sole tax debit/credit. Based on this option, Group companies that opted for the "national fiscal consolidation" determine the tax charge pertaining to them and the corresponding taxable income is transferred to the Parent Company.

Set up of a VAT Group
Intesa Sanpaolo and all of the Group companies that meet the requirements for participation opted to set up the VAT Group, governed by Articles from 70-bis to 70-duodecies of Presidential Decree 633/1972.
This option takes effect from 1 January 2019 and has a duration of three years, automatically renewed each year, unless revoked.
As a result of this option, the tax will not apply to either the provision of services and sales of goods between participating parties, with a few exceptions. Sales of goods and provision of services by a participating party to an external party shall be considered made out by the Group. Sales of goods and provision of services by an external party to a participating party shall be considered made to the Group.

"Cooperative compliance" regime
Intesa Sanpaolo applied for and obtained from the Italian Revenue Agency admission to the "cooperative compliance" regime set out in Legislative Decree 128/2015. The admission is effective from the tax period 2017.
The purpose of this regime is to promote the use of enhanced forms of communication and cooperation based on the reciprocal trust between the tax authorities and the taxpayer, as well as favouring the prevention and resolution of tax disputes, in the common interest of the parties.
Under the regime, Intesa Sanpaolo is required to maintain an appropriate system of recognition, measurement and management of tax risk as well as act in a cooperative and transparent manner, and the Italian Revenue Agency is required to promote a relationship based on the principles of transparency, cooperation and fairness.
In addition to Intesa Sanpaolo, the following companies applied for admission and were admitted to the regime: Fideuram - Intesa Sanpaolo Private Banking S.p.A. (with effect from 2018), as well as Intesa Sanpaolo Assicurazioni (formerly Intesa Sanpaolo Vita), Intesa Sanpaolo Protezione (formerly Intesa Sanpaolo Assicura), Fideuram Vita, Eurizon SGR and Epsilon SGR (with effect from 2019). Intesa Sanpaolo Private Banking S.p.A., Fideuram Asset Management SGR and SIREF were admitted in 2021 with effect from 2020.

Certifications pursuant to Article 154 bis of the Consolidated Law on Finance and non-EU subsidiaries
Please refer to Part E of the Notes to the consolidated financial statements for information on the disclosure about the Certifications pursuant to Article 154 bis of the Consolidated Law on Finance and subsidiaries based in non-European countries that are considered significant on the basis of the Consob regulations.

Auditing
EY S.p.A. audited the Intesa Sanpaolo financial statements, in execution of the Shareholders' Meeting resolution of 30 April 2019, which appointed the company as independent auditor for the years from 2021 to 2029, included.

Other aspects
A reformulation of the rules on the transparency of government grants laid down in Article 1, paragraphs 125-129 of Law No. 124/2017 has been introduced in Article 35 of Decree Law 34/2019 (the "Growth" Decree), converted by Law 58/2019. This reformulation indicates that the scope of transparency obligations applies to information regarding grants, subsidies, advantages, contributions or aid, in cash or in kind, "not of a general character and which do not represent consideration, remuneration or compensation" effectively disbursed by public authorities and the entities indicated in Article 2-bis of Legislative Decree 33/2013.
In the light of this reformulation, additional interpretative clarification provided in Assonime Circular No. 32 of 23 December 2019 has confirmed that the transparency obligation applies to awards of economic benefits arising from a bilateral relationship between a public entity and a specific beneficiary. Sums received by a company as consideration for a service rendered, as remuneration for an assignment received or as compensation for damages are expressly excluded. Economic advantages received in application of a general regime, such as tax or contribution relief accessible to all parties who meet certain conditions, are also excluded.
In consideration of the above, there were no cases to report in 2024 for Intesa Sanpaolo.
In the interest of completeness, reference should also be made to the National State Aid Registry, available for public consultation on the relevant website, in which aid measures and the related individual aid packages granted and recorded in the system by the managing entities are published, although, given the foregoing, for Intesa Sanpaolo the circumstances indicated therein for the year 2024 are not subject to financial statement transparency obligations pursuant to paragraphs 125 and 125-bis.

A.2 – MAIN FINANCIAL STATEMENT CAPTIONS

To ensure uniformity in the accounting policies used for the financial statements, the Intesa Sanpaolo Group has adopted an internal set of rules and policies for the various operational and organisational areas.

The methodological document used for the application of the accounting standards is the "Group Accounting Policies", which describes the application models adopted by the Group, within the framework of the standards and the legislation applicable to the various companies/subsidiaries, and sets out the choices made when the regulations envisage alternative or optional accounting treatments.

With regard to the valuation processes, the Group, in the document "Guidelines for the valuation of Balance Sheet Items", has drawn up the principles and regulatory framework for the valuation of the balance sheet items and the roles and responsibilities of the Corporate Bodies, the Manager responsible for preparing the Company's financial reports and the Parent Company's corporate functions involved in the valuation process; the prerequisites for the existing valuation processes and the control system necessary to ensure proper valuation; the general valuation processes based on accounting standards specific to the various categories of balance sheet items being measured (assets and liabilities); and the rules for guidance and coordination of Group companies on the valuation of balance sheet items.

The guidelines and policies also include the Business Model Rules, the Rules on the measurement of Expected Credit Loss in accordance with IFRS 9 (Impairment Policy), and the "Rules for Valuation of Financial Instruments at Fair Value" (former Fair Value Policy), in addition to more specific documents relating to non-performing loans, equity investments, and the management of hedging financial instruments.

Finally, with regard to prudential supervision, the Group has drawn up a specific document called "Harmonised Prudential Supervision Rules".

In general, these documents are approved by the competent Corporate Bodies. They are updated by the management structures in response to needs arising both from external factors (e.g. changes in regulations) and from internal factors within the Group (e.g. new operations and products). Those documents are subject to a specific approval process, based on the significance and scope of the changes made.

1. Financial assets measured at fair value through profit or loss (FVTPL)

Classification criteria

This category contains the financial assets not classified as Financial assets measured at fair value through other comprehensive income or as Financial assets measured at amortised cost. This caption includes in particular:

- financial assets held for trading, essentially consisting of debt securities and equity instruments and the positive value of derivative contracts held for trading;
- financial assets mandatorily measured at fair value through profit or loss, consisting of financial assets that do not meet the requirements for measurement at amortised cost or at fair value through other comprehensive income. These are financial assets whose contractual terms do not solely envisage payments of principal and interest on the principal amount outstanding (SPPI Test not passed) or that are not held under a Hold to Collect business model or a Hold to Collect and Sell business model;
- financial assets designated at fair value, i.e. financial assets that are defined as such upon initial recognition and when the conditions apply. In relation to this case, an entity may irrevocably designate a financial asset as measured at fair value through profit or loss only if it eliminates or significantly reduces a measurement inconsistency.

This caption therefore includes:

- debt securities and loans that are included in an Other/Trading business model (i.e., that do not come under the Hold to Collect or Hold to Collect and Sell business models) or that do not pass the SPPI Test, including the portions of syndicated loans subscribed or other types of loans that are originally intended to be sold and are not part of a Hold to Collect and Sell business model;
- equity instruments – that do not qualify as investments in subsidiaries, associates or joint ventures – held for trading purposes or for which the option was not exercised, upon initial recognition, to designate them at fair value through other comprehensive income;
- quotas of UCI (Undertakings for Collective Investment).

This caption also includes the derivatives, recognised under financial assets held for trading, which are presented as assets if the fair value is positive and as liabilities if the fair value is negative. The positive and negative current values arising from transactions with the same counterparty – also between derivatives allocated to the trading book and hedging derivatives, as envisaged by the Bank of Italy Circular 262 – may be offset only when the legal right to offset amounts recognised for accounting purposes currently exists and the net settlement of positions subject to offsetting is carried out.

Derivatives also include those embedded in combined financial contracts – where the host contract is a financial liability – which are subject to separate accounting when:

- their economic characteristics and risks are not closely related to the characteristics of the host contract;
- the embedded instruments, even though separate, fully meet the definition of derivative;
- the combined instruments are not measured at fair value with changes in fair value recognised through profit or loss.

According to the general rules established by IFRS 9 on the reclassification of financial assets (except for equity instruments, for which no reclassification is permitted), reclassifications to other categories of financial assets are not permitted unless the entity changes its business model for those financial assets. In such cases, which are expected to be highly infrequent, the financial assets may be reclassified from those measured at fair value through profit or loss to one of the other two categories established by IFRS 9 (Financial assets measured at amortised cost or Financial assets measured at fair value through other comprehensive income). The transfer value is the fair value at the time of the reclassification and the effects of the reclassification apply prospectively from the reclassification date. In this case, the effective interest rate of the reclassified financial asset is determined based on its fair value at the reclassification date and that date is considered as the initial recognition date for the credit risk stage assignment for impairment purposes.
For more information regarding the classification criteria for the financial instruments see the paragraph below "Classification drivers for the financial assets".

Recognition criteria

Initial recognition of financial assets occurs at settlement date for debt securities and equity instruments, at disbursement date for loans and at trade date for derivative contracts.
On initial recognition, financial assets measured at fair value through profit or loss are recognised at fair value, without considering transaction costs or revenues directly attributable to the instrument.

Measurement criteria

After initial recognition, the financial assets measured at fair value through profit or loss are recorded at fair value. The effects of the application of this measurement criterion are recorded in the income statement.

For the determination of the fair value of financial instruments quoted on active markets, market quotations are used. If the market for a financial instrument is not active, standard practice estimation methods and valuation techniques are used which consider all the risk factors correlated to the instruments and that are based on market elements such as: valuation of quoted instruments with the same characteristics, calculation of discounted cash flows, option pricing models, recent comparable transactions, etc.. For equities and derivative instruments that have equities as underlying assets, which are not quoted on an active market, the cost approach is used as the estimate of fair value only on a residual basis and in a small number of circumstances, i.e., when all the measurement methods referred to above cannot be applied, or when there are a wide range of possible measurements of fair value, in which cost represents the most significant estimate.
For more information regarding the criteria for the determination of fair value, see the Section "A.4 – Information on Fair Value".

Derecognition criteria

Financial assets are derecognised solely if the sale leads to the substantial transfer of all the risks and rewards connected to the assets. Conversely, if a significant part of the risks and rewards relative to the disposed financial assets is maintained, they continue to be recorded in the financial statements, even though their title has been transferred.
When it is not possible to ascertain the substantial transfer of risks and rewards, the financial assets are derecognised where no control over the assets has been maintained. If this is not the case, when control, even partial, is maintained, the assets continue to be recognised for the entity's continuing involvement, measured by the exposure to changes in value of assets sold and to variations in the relevant cash flows.
Lastly, disposed financial assets are derecognised if the entity retains the contractual rights to receive the cash flows of the asset, but signs a simultaneous obligation to pay such cash flows, and only such cash flows, without significant delay to third parties.

2. Financial assets measured at fair value through other comprehensive income (FVOCI)

Classification criteria

This category includes the financial assets that meet both the following conditions:

- the financial asset is held under a business model whose objective is achieved both through the collection of expected contractual cash flows and through sale (Hold to Collect and Sell business model), and
- the contractual terms of the financial asset give rise on specified dates to cash flows that are solely payments of principal and interest on the principal amount outstanding ("SPPI Test" passed).

This caption also includes equity instruments, not held for trading, for which the option was exercised upon initial recognition of their designation at fair value through other comprehensive income.

In particular, this caption includes:
- debt securities that can be attributed to a Hold to Collect and Sell business model and that have passed the SPPI test;
- equity interests, that do not qualify as investments in subsidiaries, associates or joint ventures and are not held for trading, for which the option has been exercised of their designation at fair value through other comprehensive income;
- loans that are attributable to a Hold to Collect and Sell business model and have passed the SPPI Test, including the portions of syndicated loans subscribed or other types of loans that are originally intended to be sold and are part of a Hold to Collect and Sell business model.

According to the general rules established by IFRS 9 on the reclassification of financial assets (except for equity instruments, for which no reclassification is permitted), reclassifications to other categories of financial assets are not permitted unless the entity changes its business model for those financial assets.
In such cases, which are expected to be highly infrequent, the financial assets may be reclassified from those measured at fair value through other comprehensive income to one of the other two categories established by IFRS 9 (Financial assets measured at amortised cost or Financial assets measured at fair value through profit or loss). The transfer value is the fair value at the time of the reclassification and the effects of the reclassification apply prospectively from the reclassification date. In the event of reclassification from this category to the amortised cost category, the cumulative gain (loss) recognised in the valuation reserve is allocated as an adjustment to the fair value of the financial asset at the reclassification date. In the event of reclassification to the fair value through profit or loss category, the cumulative gain (loss) previously recognised in the valuation reserve is reclassified from shareholders' equity to net income (loss).
For more information regarding the classification criteria for the financial instruments see the paragraph below "Classification drivers for the financial assets".

Recognition criteria
Initial recognition of financial assets occurs at settlement date for debt securities and equity instruments and at disbursement date for loans. On initial recognition, assets are recorded at fair value, including transaction costs and revenues directly attributable to the instrument.

Measurement criteria
After initial recognition, the Assets classified at fair value through other comprehensive income, other than equity instruments, are measured at fair value, with the recognition in profit or loss of the impact resulting from the application of the amortised cost, the impairment effects and any exchange rate effect, whereas the other gains and losses resulting from a change in fair value are recognised in a specific shareholders' equity reserve until the financial asset is derecognised. Upon the total or partial sale, the cumulative gain or loss in the valuation reserve is transferred, in whole or in part, to the income statement.
Equity instruments, for which the choice has been made to classify them in this category, are measured at fair value and the amounts recognised in other comprehensive income cannot be subsequently transferred to profit or loss, not even if they are sold. The only component related to these equities that is recognised through profit or loss is their dividends.
Fair value is determined on the basis of the criteria already described for Financial assets measured at fair value through profit or loss.
For the equity instruments included in this category, which are not quoted on an active market, the cost approach is used as the estimate of fair value only on a residual basis and in a small number of circumstances, i.e., when all the measurement methods referred to above cannot be applied, or when there are a wide range of possible measurements of fair value, in which cost represents the most significant estimate.
For more information regarding the criteria for the determination of fair value, see the Section "A.4 – Information on Fair Value".

Financial assets measured at fair value through other comprehensive income – both in the form of debt securities and loans – are subject to the verification of the significant increase in credit risk (impairment) required by IFRS 9, in the same way as Assets measured at amortised cost, with the consequent recognition through profit or loss of a value adjustment to cover the expected losses. More specifically, for instruments classified as Stage 1 (i.e., financial assets at origination, when not impaired, and instruments for which there has not been a significant increase in credit risk since the initial recognition date), a 12-month expected loss is recognised on the initial recognition date and at each subsequent reporting date. For instruments classified as Stage 2 (performing for which there has been a significant increase in credit risk since the initial recognition date) and as Stage 3 (credit-impaired exposures), a lifetime expected loss for the financial instrument is recognised.
Equity instruments are not subject to the impairment process.
See the paragraph below "Impairment of financial assets" for more details.

Derecognition criteria
Financial assets are derecognised solely if the sale leads to the substantial transfer of all the risks and rewards connected to the assets. Conversely, if a significant part of the risks and rewards relative to the disposed financial assets is maintained, they continue to be recorded in the financial statements, even though their title has been transferred.
When it is not possible to ascertain the substantial transfer of risks and rewards, the financial assets are derecognised where no control over the assets has been maintained. If this is not the case, when control, even partial, is maintained, the assets continue to be recognised for the entity's continuing involvement, measured by the exposure to changes in value of assets sold and to variations in the relevant cash flows.
Lastly, disposed financial assets are derecognised if the entity retains the contractual rights to receive the cash flows of the asset, but signs a simultaneous obligation to pay such cash flows, and only such cash flows, without significant delay to third parties.

3. Financial assets measured at amortised cost

Classification criteria

This category includes the financial assets (in particular loans and debt securities) that meet both the following conditions:

– the financial asset is held under a business model whose objective is achieved through the collection of expected contractual cash flows (Hold to Collect business model), and
– the contractual terms of the financial asset give rise on specified dates to cash flows that are solely payments of principal and interest on the principal amount outstanding ("SPPI Test" passed).

More specifically, the following are recognised in this caption:

– loans to banks in their various forms that meet the requirements referred to above;
– loans to customers in their various forms that meet the requirements referred to above;
– debt securities that meet the requirements referred to above.

This category also includes the operating loans and receivables connected to the provision of financial activities and services as defined by the Consolidated Law on Banking and the Consolidated Law on Finance (e.g. for the distribution of financial products and servicing activities).

According to the general rules established by IFRS 9 on the reclassification of financial assets, reclassifications to other categories of financial assets are not permitted unless the entity changes its business model for those financial assets. In such cases, which are expected to be highly infrequent, the financial assets may be reclassified from the amortised cost category to one of the other two categories established by IFRS 9 (Financial assets measured at fair value through other comprehensive income or Financial assets measured at fair value through profit or loss). The transfer value is the fair value at the time of the reclassification and the effects of the reclassification apply prospectively from the reclassification date. Gains and losses resulting from the difference between the amortised cost of a financial asset and its fair value are recognised through profit or loss in the event of reclassification to Financial assets measured at fair value through profit or loss and under Shareholders' equity, in the specific valuation reserve, in the event of reclassification to Financial assets measured at fair value through other comprehensive income.

For more information regarding the classification criteria for the financial instruments see the paragraph below "Classification drivers for the financial assets".

Recognition criteria

Initial recognition of the financial asset occurs at settlement date for debt securities and at disbursement date for loans. On initial recognition, assets are recorded at fair value, including transaction costs and revenues directly attributable to the instrument.

In particular, for loans, the disbursement date is usually the same as the date of signing of the contract. Should this not be the case, a commitment to disburse funds is made along with the subscription of the contract, which will cease to exist upon disbursement of the loan. The loan is recognised based on its fair value, equal to the amount disbursed or subscription price, inclusive of the costs/revenues directly attributable to the single loan and determinable from inception, even when settled at a later date. Costs that, even with the aforementioned characteristics, are reimbursed by the borrower or are classifiable as normal internal administrative costs are excluded.

Repurchase agreements and reverse repurchase agreements are recognised as funding or lending transactions. Specifically, repurchase agreements are recognised as payables for the spot amount received, whereas reverse repurchase agreements are recognised as receivables for the spot amount paid.

Measurement criteria

After the initial recognition, these financial assets are measured at amortised cost, using the effective interest method. The assets are recognised in the balance sheet at an amount equal to their initial carrying amount less principal repayments, plus or minus the cumulative amortisation (calculated using the effective interest method) of the difference between this initial amount and the amount at maturity (typically attributable to costs/income directly attributable to the individual asset) and adjusted by any provision for losses. The effective interest rate is the rate that exactly discounts estimated future cash payments of the asset, as principal and interest, to the amount disbursed inclusive of the costs/revenues attributable to that financial asset. This measurement method uses a financial approach and allows distribution of the economic effect of the costs/income directly attributable to a financial asset over its expected lifetime.

The amortised cost method is not used for assets, measured at historical cost, whose short duration makes the effect of discounting negligible, or for assets without a definite maturity or revocable loans.

The measurement criteria, as described in more detail in the paragraph "Impairment of financial assets", are closely linked to the inclusion of these instruments in one of the three stages of credit risk established by IFRS 9, the last of which (Stage 3) consists of non-performing financial assets and the remaining (Stages 1 and 2) of performing financial assets.

With regard to the accounting representation of the above measurement effects, the adjustments for this type of asset are recognised in profit or loss:

– on initial recognition, for an amount equal to the 12-month expected credit loss;
– on subsequent measurement of the asset, when the credit risk has not increased significantly since initial recognition, in relation to changes in the amount of adjustments for the 12-month expected credit losses;
– on subsequent measurement of the asset, when the credit risk has increased significantly since initial recognition, in relation to the recognition of adjustments for expected credit losses over the contractually agreed remaining lifetime of the asset;

- on subsequent measurement of the asset, where – after a significant increase in credit risk has occurred since initial recognition – the increase is no longer "significant" due to the alignment of the cumulative value adjustments to take account of the change from a lifetime expected credit loss to a 12-month expected credit loss for the instrument.

These financial assets, when they are performing, are subject to an assessment, aimed at establishing the value adjustments to be recognised in the financial statements, at the level of individual loan (or "tranches" of securities), according to the risk parameters consisting of Probability of Default (PD), Loss Given Default (LGD) and Exposure at Default (EAD), derived from the AIRB models, and duly adjusted to take account of the provisions of IFRS 9.
If, in addition to a significant increase in credit risk, there is also objective evidence of impairment, the amount of the loss is measured as the difference between the carrying amount of the asset – classified as "non-performing", like all the other relationships with the same counterparty – and the present value of the estimated future cash flows, discounted using the original effective interest rate. The amount of the loss, to be recognised through profit or loss, is established based on individual measurement or determined according to uniform categories and, then, individually allocated to each position, and, as detailed in the paragraph "Impairment of financial assets", takes account of forward-looking information and possible alternative recovery scenarios.
Non-performing assets include financial assets classified as bad, unlikely-to-pay or past due by over ninety days according to the rules issued by the Bank of Italy, in line with the IAS/IFRS and EU Supervisory Regulations.
The expected cash flows take into account the expected recovery times and the estimated realisable value of any guarantees.
The original effective rate of each asset remains unchanged over time even if the relationship has been restructured with a variation of the contractual interest rate and even if the relationship, in practice, no longer bears contractual interest.
If the reasons for impairment are no longer applicable following an event subsequent to the registration of impairment, recoveries are recorded in the income statement. The size of the recovery must not lead the carrying value of the financial asset to exceed the amortised cost had no impairment losses been recognised in previous periods.
Recoveries on impairment with time value effects are recognised in net interest income.
In some cases, during the lifetime of these financial assets, and of loans in particular, the original contractual conditions may be subsequently modified by the parties to the contract. When the contractual clauses are subject to change during the lifetime of an instrument, it is necessary to verify whether the original asset should continue to be recognised in the balance sheet or whether, instead, the original instrument needs to be derecognised and a new financial instrument needs to be recognised.
In general, changes to a financial asset lead to its derecognition and the recognition of a new asset when they are "substantial". The assessment of the "substantial nature" of the change must be made using both qualitative and quantitative information. In some cases, in fact, it may be clear, without resorting to complex analysis, that the changes introduced substantially modify the characteristics and/or contractual flows of a particular asset while, in other cases, further analysis (including quantitative analysis) will need to be carried out to assess the effects of the changes and verify whether or not to derecognise the asset and recognise a new financial instrument.
The qualitative and quantitative analyses aimed at defining the "substantial nature" of contractual changes made to a financial asset must therefore consider:

- the purposes for which the changes were made: e.g. renegotiations for commercial reasons and forbearance measures due to financial difficulties of the counterparty:
  - the former, aimed at "retaining" the customer, involve a borrower that is not in financial difficulty. This category includes all renegotiations aimed at aligning the cost of the debt to market conditions. These operations involve a change in the original conditions of the contract, usually requested by the borrower and relating to aspects concerning the cost of the debt, with a consequent economic benefit for the borrower. In general, whenever the bank carries out a renegotiation to avoid losing its customer, that renegotiation should be considered as substantial because, if it were not carried out, the customer could borrow from another intermediary and the bank would incur a decrease in expected future revenues;
  - the latter, carried out for "reasons of credit risk" (forbearance measures), relate to the bank's attempt to maximise the recovery of the cash flows of the original loan. The underlying risks and rewards, following the changes, are not normally substantially transferred and, consequently, the accounting representation that provides the most relevant information for the readers of the financial statements (apart from the triggers discussed below) is "modification accounting" – which involves the recognition through profit or loss of the difference between the carrying value and the present value of the modified cash flows discounted at the original interest rate – rather than derecognition;
- the presence of specific triggers that affect the contractual characteristics and/or cash flows of the financial instrument (such as, for example, a change in currency or a modification of the type of risk the financial instrument is exposed to, when correlated to equity and commodity parameters), which are considered to result in derecognition due to their impact (expected to be significant) on the original contractual cash flows.

Conversely, the amendments to financial assets following the Interest Rate Benchmark Reform (so-called IBOR Reform), relating to the change in the basis for determining contractual cash flows (the replacement of the existing interest rate benchmark with an alternative benchmark rate), do not constitute a derecognition event, but are to be considered a modification from an accounting standpoint. Such amendments, if made as a direct consequence of the IBOR Reform and applied on equivalent economic bases, are represented with a prospective adjustment of the effective interest rate - by applying paragraph B5.4.5 of IFRS 9 instead of modification accounting, with impacts on net interest income in future periods.

Derecognition criteria

Financial assets are derecognised solely if the sale leads to the substantial transfer of all the risks and rewards connected to the assets. Conversely, if a significant part of the risks and rewards relative to the disposed financial assets is maintained, they continue to be recorded in the financial statements, even though their title has been transferred.
When it is not possible to ascertain the substantial transfer of risks and rewards, the financial assets are derecognised where no control over the assets has been maintained. If this is not the case, when control, even partial, is maintained, the assets continue to be recognised for the entity's continuing involvement, measured by the exposure to changes in value of assets sold and to variations in the relevant cash flows.
Lastly, disposed financial assets are derecognised if the entity retains the contractual rights to receive the cash flows of the

asset, but signs a simultaneous obligation to pay such cash flows, and only such cash flows, without significant delay to third parties.

4. Hedging transactions

Intesa Sanpaolo has exercised the option, provided for on the introduction of IFRS 9, of continuing to fully apply the provisions of IAS 39 on hedge accounting (in the carved-out version endorsed by the European Commission) for each type of hedge (both for micro hedges and macro hedges).

Classification criteria: type of hedge
Hedging transactions are aimed at neutralising potential losses on a specific item or group of items, attributable to a certain risk, if such a risk should actually occur.
The following types of hedging transactions are used:
- fair value hedge, which has the objective of covering exposure to changes in the fair value (attributable to the different risk categories) of assets and liabilities in the balance sheet, or on a portion of these, of groups of assets/liabilities, of binding commitments and portfolios of financial assets and liabilities, including core deposits, as permitted by IAS 39 endorsed by the European Commission. Fair value macro hedges are aimed at reducing fluctuations in the fair value, as a result of interest rate risk, of a sum of money flowing from a portfolio of financial assets or liabilities. Net amounts resulting from mismatches between assets and liabilities cannot be subject to macro hedges;
- cash flow hedge, which has the objective of covering exposure to variability in future cash flows attributable to particular risks associated with balance sheet captions. This type of hedge is essentially used to stabilise the interest flow on floating rate funding to the extent that the latter finances fixed rate investments. In certain circumstances, similar transactions are carried out with respect to some types of floating rate investments;
- hedges of net investments in foreign currency, which refer to the coverage of the risks of net investments in foreign operations expressed in their original currency.

Only hedging transactions which involve counterparties outside the Bank may qualify for hedge accounting.
The choice made by the Group to take advantage of the possibility of continuing to fully apply the IAS 39 rules for hedging relationships means that the equity instruments classified as Financial assets measured at fair value through other comprehensive income (FVOCI) cannot be measured as hedged items for price or exchange rate risk, since these instruments are not recognised through profit or loss, not even if they are sold (except for dividends that are recognised through profit or loss).

Recognition criteria
Hedging derivatives, like all derivatives, are initially recognised and subsequently measured at fair value.

A relationship qualifies as a hedging relationship, and is appropriately reported in the financial statements only if, all of the following conditions are met:
- at the inception of the hedge, the hedging relationship is formally designated and documented, including the company's risk management objectives and strategy in undertaking the hedge. This documentation includes the identification of the hedging instrument, the item or transaction hedged, the nature of the risk being hedged, and how the entity will assess the hedging instrument's effectiveness in offsetting the exposures to changes in the fair value of the item hedged or in the cash flows attributable to the risk hedged;
- the hedge is expected to be highly effective;
- the planned transaction hedged, to hedge the cash flows, is highly probable and has an exposure to changes in cash flows that could have effects on the income statement;
- the effectiveness of the hedge can be reliably measured;
- the hedge is measured on an ongoing basis and is considered highly effective for all the financial years in which it is designated.

Measurement criteria
Hedging derivatives are measured at fair value. In particular:
- in the case of fair value hedges, the change in the fair value of the hedged item is offset by the change in fair value of the hedging instrument. Offsetting is recognised via the registration in the income statement of the gains and losses referred to both the hedged item (with regard to the variations produced by the underlying risk factor), and the hedging instrument. Any difference, which represents the partial ineffectiveness of the hedge, is therefore the net economic effect. In case of fair value macro hedges, fair value changes related to the hedged risk of assets and liabilities in hedged portfolios are allocated to the balance sheet under caption 60. "Fair value change of financial assets in hedged portfolios" or under caption 50. "Fair value change of financial liabilities in hedged portfolios";
- in the case of cash flow hedges, changes in fair value of the derivative are recorded in equity, for the effective portion of the hedge, and these are registered in the income statement only when, with reference to the hedged item, there is a variation in the flows to be offset or if the hedge is ineffective;
- hedges of net investments in foreign currency are treated in the same way as cash flow hedges.

The effectiveness of the hedge depends on the extent to which changes in the fair value of the hedged item or the relating expected cash flows are offset by those of the hedging instrument. Therefore, effectiveness is appraised by comparing the aforementioned changes, considering the intent pursued by the entity at the time in which it entered the hedging transaction.
A hedge is effective when the variations in fair value (or cash flows) of the hedging financial instrument almost completely neutralise, that is within the 80-125% range, the changes in the fair value of the hedged item, for the type of risk being hedged.

Effectiveness is assessed at every close of annual or interim financial statements using:
- prospective tests, which justify the application of hedge accounting, since these prove the expected effectiveness of the hedge;
- retrospective tests, which demonstrate the effectiveness of the hedge for the reference period, or measure how much the effective results diverge from perfect coverage.

Fair value hedge accounting is discontinued prospectively in the following cases:
- the hedging instrument expires or is sold, terminated, or exercised;
- the hedge no longer meets the hedge accounting criteria described above;
- the entity revokes the designation.

If such assessments do not confirm hedge effectiveness, from that moment hedge accounting is discontinued, the derivative is reclassified in instruments held for trading and the hedged item is measured on the basis of its classification in the balance sheet. If the assets or liabilities hedged are measured at amortised cost, the higher or lower value resulting from the fair value measurement due to the hedge becoming ineffective is recognised through profit or loss, using the effective interest rate method. When a fair value macrohedging relationship is discontinued, the cumulative change in fair value losses carried under caption 60 "Fair value change of financial assets in hedged portfolios" or caption 50. "Fair value change of financial liabilities in hedged portfolios" are transferred to the income statement among interest income or expense over the residual life of the original hedging relationships, without prejudice to verification that the requirements have been met.

An entity must discontinue cash flow hedge accounting prospectively in each of the following circumstances:
- the hedging instrument expires or is sold, terminated, or exercised (for this purpose the replacement or exchange of one hedging instrument with another hedging instrument is not a conclusion or termination if that replacement or exchange forms part of an entity's documented hedging strategy). In this case the total profit (or loss) on the hedging instrument continues to be recognised directly in shareholders' equity until the end of the reporting period in which the hedge became effective and it continues to be recognised separately until the programmed transaction, being hedged, occurs;
- the hedge no longer meets the criteria for hedge accounting. In this case the total profit or loss on the hedging instrument is recognised directly in shareholders' equity starting from the reporting period in which the hedge became effective and continues to be recognised separately in shareholders' equity until the programmed transaction occurs;
- it is no longer considered that the future transaction will occur, in which case any related total profit or loss on the hedging instrument recognised directly in equity starting from the reporting period in which the hedge became effective must be recognised through profit or loss;
- the entity revokes the designation. For hedges of a programmed transaction, total profits or losses on the hedging instrument recognised directly in shareholders' equity starting from the reporting period in which the hedge became effective continue to be recognised separately in shareholders' equity until the programmed transaction occurs or it is expected that it will no longer occur.

As an exception to the provisions of IAS 39 discontinuation following an update of the documentation of the hedging relationship (due to modification of the hedged risk, the hedged underlying or the hedging derivative, or of the method for verifying hedge effectiveness) does not apply in the case of modifications required as a direct consequence of the Interest Rate Benchmark Reform (so-called IBOR Reform) and applied on equivalent economic bases.

5. Equity investments

Classification, recognition and measurement criteria

The caption includes investments in subsidiaries, companies subject to joint control and associates.
Entities are considered subsidiaries where Intesa Sanpaolo is exposed to, or has rights to, variable returns from its involvement with them, and has the ability to affect those returns by exercising its own power over the entities in question.
Entities are considered to be companies subject to joint control (joint ventures), if control is contractually shared between Intesa Sanpaolo and one or more other parties external to the Group, or where the decisions about the relevant activities require the unanimous consent of all the parties sharing control.
Companies are considered subject to significant influence (associates) when Intesa Sanpaolo holds 20% or more of the voting rights (including "potential" voting rights) or if it – with a lower equity stake – has the power of participating in the determination of financial and management policies of the company based on specific juridical relations, such as the participation in voting syndicates.
Certain companies in which Intesa Sanpaolo holds a stake exceeding 20% are not considered subject to significant influence since it solely has economic rights on a portion of the returns generated by the investment, but does not have access to management policies and may exercise governance rights limited to the safeguarding of its economic interests.

Equity investments are recognised at settlement date. On initial recognition equity investments are recorded at cost.
Equity investments are measured at cost, which may be adjusted if impairment losses are deemed to have occurred. If there is evidence of impairment, the recoverable amount of the investment is estimated, considering the present value of the future cash flows which may be generated by the investment, including the final disposal value.
If the recoverable amount is lower than the carrying value, the difference is recorded in the income statement.
If the reasons for impairment are no longer applicable following an event subsequent to the registration of impairment, recoveries are recorded in the income statement.

Derecognition criteria

Equity investments are derecognised when the contractual rights to the cash flows from the assets expire or when the investment is sold, substantially transferring all the risks and rewards connected to the assets.

6. Property and equipment

Classification criteria

Property and equipment include land, owner-occupied property, investment property, valuable art assets, technical plants, furniture and fittings and any type of equipment that are expected to be used during more than one period.
Property and equipment held for use in the production or supply of goods and services are classified as "Property and equipment used in operations", in accordance with IAS 16. Real estate owned for investment purposes (to obtain rental income or gains on the capital invested) is classified as "Investment property" based on IAS 40.
This caption also includes property and equipment classified in accordance with IAS 2 Inventories, which refer both to assets resulting from the enforcement of guarantees or from purchase at auction that the company intends to sell in the near future, without carrying out major renovation work, and which do not meet the requirements for classification in the previous categories.
Lastly, they include the rights of use acquired under a lease and relating to the use of an item of property and equipment (for lessees) and assets leased under an operating lease (for lessors).

Recognition criteria

Property and equipment are initially measured at cost which comprises in addition to their purchase price any costs directly attributable to the purchase and required for them to be operational.
Extraordinary maintenance expenses which lead to a rise in future economic benefits are attributed to increase the value of assets, while other ordinary maintenance costs are recorded in the income statement.

Measurement criteria

Property and equipment are measured at cost, net of depreciation and impairment losses, except for owner-occupied properties and valuable art assets, which are measured according to the revaluation model.
The investment properties are measured with the fair value method.
For the property and equipment subject to assessment according to the revaluation model:

– if the carrying value of an asset is increased following a revaluation, the increase must be recognised in the Statement of comprehensive income and accumulated in the shareholders' equity under the caption revaluation reserve; conversely, in the case where an impairment loss on the same asset recognised previously in the income statement is recovered, it must be recognised as income;
– if the carrying value of an asset is decreased following the revaluation, the decrease must be recognised in the Statement of comprehensive income to the extent in which there are possible credit balances in the revaluation reserve referring to this asset; otherwise, this reduction is recorded in the Income statement.

Property and equipment are systematically depreciated, adopting the straight-line method over their useful life. The depreciable amount is the cost of the goods (or the net value recalculated if the method adopted for the valuation is the revaluation model) net of the residual value at the end of the depreciation period, if significant. Buildings are depreciated for a portion deemed to be suitable to represent their deterioration over time following their use, considering extraordinary maintenance expenses, which are recognised in the carrying value of the assets. In order to determine the useful life of the various types of assets and the corresponding depreciation rates, the Group's real estate assets have been divided into four clusters: (i) Historical and particularly prestigious properties (useful life of 65 years), (ii) Entire buildings (useful life of 33 years), (iii) Banking branches (useful life of 20 years) and (iv) Other properties (useful life of 20 years). These clusters do not include the New Intesa Sanpaolo Headquarters in Turin, for which the useful life was estimated through a specific analysis which considered the peculiar architectural features of the building. Other property and equipment is depreciated based on the following useful lives: furniture from 5 to 10 years, plants from 4 to 10 years, hardware and IT equipment for a period from 4 to 8 years and, lastly, other assets from 3 to 13 years.

The following are not depreciated:

– land, irrespective of whether acquired individually or embedded in the value of buildings, since it has an indefinite useful life;
– the valuable art assets, the other historical, artistic and decorative assets, since their useful life cannot be estimated and their value is normally destined to increase over time;
– the investment properties, as required by IAS 40, are measured at fair value through profit or loss and therefore they must not be depreciated.

If there is some evidence that property and equipment measured at cost may have been impaired, the carrying amount of the asset and its recoverable amount are compared. Any impairment losses are recorded in the income statement.
If the reasons for impairment cease to exist, a value recovery is recorded and may not exceed the value that the asset would have had, net of depreciation, determined in the absence of previous impairment losses.

With regard to the property and equipment recognised in accordance with IAS 2, these are measured at the lesser of cost and net realisable value, without prejudice to the comparison between the asset's carrying amount and its recoverable amount where there is an indication that the asset may have been impaired. Any impairment losses are recorded in the income statement.

Property and equipment consisting of the right-of-use of assets subject to leases

According to IFRS 16, a lease is a contract or part of a contract that conveys the right to use an asset (the underlying asset) for a period of time in exchange for consideration.

According to IFRS 16, leases are accounted for on the basis of the right of use model, where, at the initial date, the lessee has a financial obligation to make payments due to the lessor to compensate for its right of use of the underlying asset during the lease term.
When the asset is made available to the lessee for use (initial date), the lessee recognises both the liability and the asset consisting of the right of use.
In particular, the right of use acquired with a lease is measured as the sum of the present value of the future payments over the term of the contract, the lease payments made at or before the commencement date, the lease incentives received, if any, the initial direct costs and any estimated costs of dismantling or restoring the underlying asset.
The financial liability recognised corresponds to the present value of the payments to be made for the lease.

With regard to the discount rate, based on the requirements of IFRS 16, the Group uses the implicit interest rate for each lease contract, when it is available. For leases from the lessee's point of view, in some cases, for example for rental agreements, the implicit interest rate cannot always be readily determined without using estimates and assumptions (the lessee does not have enough information about the unguaranteed residual value of the leased asset). In these cases, the Group has developed a methodology for setting the incremental interest rate as an alternative to the implicit interest rate and has decided to adopt the Funds Transfer Pricing (FTP) method. This is based on an unsecured and amortising rate curve, which envisages lease payments for the lease contract that are typically constant over the lease term, rather than a single payment upon maturity. The FTP method takes into account the creditworthiness of the lessee, the term of the lease, as well as the economic environment in which the transaction takes place and is therefore in line with the requirements of the standard.

The lease term is determined taking into account:
- periods covered by an option to extend the lease if the lessee is reasonably certain to exercise that option;
- periods covered by an option to terminate the lease if the lessee is reasonably certain to exercise that option.

During the course of the lease term a lessee shall:
- measure the right-of-use at cost less accumulated depreciation and accumulated impairment losses determined and recognised based on the provisions of IAS 36 "Impairment of assets", adjusted to take account of any remeasurement of the lease liability;
- increase the liability arising from the lease following the accrual of interest expense calculated at the interest rate implicit in the lease or alternatively at the incremental borrowing rate, and decrease it for payments of principal and interest made.

If changes are made to the lease payments, then the lease liability must be remeasured and the impact of the remeasurement of the liability is recognised against the right-of-use asset.

Derecognition criteria
Property and equipment are derecognised from the balance sheet on disposal or when the asset is permanently withdrawn from use and no future economic benefits are expected from its disposal.

7. Intangible assets

Classification criteria
Intangible assets consist of goodwill and other intangible assets governed by IAS 38. They may include the rights of use acquired under a lease and relating to the use of an intangible asset (for lessees) and assets leased under an operating lease (for lessors).
Intangible assets are recognised as such if they may be identified and stem from legal or contractual rights. Intangible assets include goodwill, which represents the positive difference between purchase price and fair value of assets and liabilities pertaining to the acquired company.

Recognition and measurement criteria
Intangible assets are recognised at cost, adjusted for any accessory charges only if it is probable that the future economic benefits attributable to the assets will be realised and if the cost of the asset may be reliably determined. If this is not the case, the cost of the intangible asset is recorded in the income statement in the year in which it was incurred.
For assets with finite useful life, the cost is amortised on a straight-line basis or in decreasing portions determined on the basis of the economic benefits expected from the asset. Assets with indefinite useful life are not subject to systematic amortisation, but are periodically subjected to impairment testing.
If there is any indication that an asset may have suffered impairment losses, the asset's recoverable amount is estimated. The impairment loss, which is recorded in the income statement, is equal to the difference between the carrying value of the assets and the recoverable amount.

In particular, intangible assets include:
- technology-related intangible assets, such as software applications, which are amortised mainly on the basis of their expected technological obsolescence or, if lower, their expected use, and in any case generally no longer than a period of seven years. An exception are the core banking system platforms, whose useful life is estimated on a case-by-case basis, and, as a result, amortised over longer periods (from 10 to 15 years). Moreover, the costs incurred for the development of software are considered as intangible assets and are recognised under assets only when all the following

conditions are met: i) the cost attributable to the intangible asset during its development can be measured reliably, ii) there is the intention, the availability of financial resources and the technical ability of making the intangible asset available for use or sale, iii) the future economic benefits to be generated by the asset can be demonstrated. Software development capitalised costs only comprise the costs directly attributable to the development process. Capitalised software development costs are amortised systematically over the estimated useful life of the relevant product/service so as to reflect the pattern in which the asset's future economic benefits are expected to be consumed by the entity from the beginning of production over the product's estimated life;

– customer-related intangibles mainly represented, in business combinations, by asset management relations, non-financial activities related to provision of services and insurance portfolios classified as investments. Such assets, with a finite life, are originally measured by the discounting, using a rate representing the time value of money and the asset's specific risks, of the income margins on the ongoing relations at the time of the business combination over a period which expresses their residual, contractual or estimated life. For asset management relations and non-financial activities related to provision of services, they are amortised on a straight-line basis over the period of greater significance of the expected economic benefits in case of relations which do not have a predetermined duration and, for relations from insurance products classified as investments, generally in decreasing portions corresponding to the duration of the contract in case of relations with predetermined expiry (residual lives of the policies);
– marketing-related intangibles represented by the measurement of the brand name which is also recorded at the time of business combinations. This asset is considered as having indefinite life since it is deemed to contribute for an indefinite period of time to the formation of income flows.

Lastly, intangible assets include goodwill.

With respect to business combinations, goodwill may be recorded when the positive difference between the fair value of shareholders' equity acquired and the purchase price of the equity investment is representative of the future income-generation potential of the equity investment.
If this difference is negative or if goodwill may not be attributed considering future income-generation potential of the equity investments, the same difference is directly recorded in the income statement.
Once a year (or every time that there is evidence of impairment losses), an impairment test is carried out for goodwill. This requires the identification of the Cash Generating Unit (or CGU) to which goodwill is allocated. The cash-generating units of the Intesa Sanpaolo Group correspond to the operating divisions presented in segment reporting. The business operations carried out directly by the Parent Company falls under the Cash-generating units corresponding to Banca dei Territori and Corporate and Investment Banking. Therefore, goodwill is allocated to such divisions. Any impairment losses are determined on the basis of the difference between the recognition value of goodwill and its recoverable amount, if lower. The recoverable amount is equal to the higher between the fair value of the cash-generating unit, less any cost to sell, and the relative value in use. The consequent adjustments are posted in the income statement.

With regard to the intangible asset represented by the brand name, if the reference CGU does not have any goodwill allocated, then an independent and specific valuation is made of the intangible on the basis of the fair value certified by the appraisal of an independent expert. If the fair value of the brand name is not higher than its carrying amount, the recoverable amount of the CGU is estimated, calculated based on future cash flows.

It is also noted that, where a CGU which is allocated both goodwill and a brand name has a value in use lower than the carrying amount, by an amount that exceeds the total value of the intangibles with indefinite life allocated, without prejudice to the full write-down of goodwill, an autonomous valuation of the brand name is carried out based on the fair value stated in the specific appraisal.

Derecognition criteria
Intangible assets are derecognised from the balance sheet on disposal and if no future economic benefits are expected.

8. Other assets

Other assets essentially consist of items awaiting classification and items not attributable to the other balance-sheet captions, including receivables arising from the supply of goods and non-financial services, sundry tax items other than those recognised in their own caption (e.g., connected to withholding agent activities), gold, silver and precious metal, the tax credits connected with the "Cura Italia" and "Rilancio" Decree Laws and accrued income other than that capitalised on the related financial assets, including the income resulting from contracts with customers in accordance with IFRS 15, paragraphs 116 and following. As required by paragraphs 91 and following of IFRS 15, the costs incurred for the acquisition and fulfilment of long-term contracts with customers are capitalised and amortised when they are incremental and are expected to be recovered.

9. Non-current assets held for sale and discontinued operations and Liabilities associated with non-current assets held for sale and discontinued operations

Non-current assets/liabilities for which a disposal process has commenced and for which disposal is deemed to be extremely probable are recorded in assets under Non-current assets held for sale and discontinued operations and in liabilities under Liabilities associated with non-current assets held for sale and discontinued operations. These assets/liabilities are measured at the lower of the carrying amount and fair value less cost to sell, except for some type of assets (e.g., financial assets within the scope of IFRS 9) for which IFRS 5 specifically establishes that the measurement principles of the applicable accounting

standard must be used. Assets that under IAS/IFRS are subject to the periodic depreciation/amortisation process cease to be depreciated/amortised when they are classified as assets (or groups of assets) held for sale.
Non-current assets held for sale and discontinued operations may include portfolios of assets for which there are no prices in an active market. In such case, where an agreement has been reached with the purchaser, they are measured at fair value by referring to the sale prices resulting from that agreement. Where there is no agreement, they are measured using specific valuation techniques based on the asset and, where necessary, by employing external fairness opinions.
The income and charges (net of tax effect) attributable to non-current assets held for sale and discontinued operations or recorded as such in the year are recognised in the income statement in a separate caption.

10. Current and deferred tax

Taxes on income[210], calculated according to domestic tax regulations, are accounted for as a cost on an accruals basis, in line with the method followed to include, in the financial statements, the costs and income that generated them. Therefore, they represent the balance of current and deferred income taxes[211] for the year. Current tax assets and liabilities include the balances of the Bank due to the relevant Italian and foreign tax authorities relating to direct taxation. More specifically, these captions include the net balance of tax liabilities from previous years and the current year, calculated on the basis of a prudent estimate of the tax charges due for the year, assessed according to the tax regulations currently in force, and the current tax assets represented by advances, by withholding taxes borne or other tax credits. The risk inherent in such proceedings and the risks inherent in proceedings where preliminary disbursements have not been requested are evaluated in applying the principles contained in IAS 37 regarding the best estimate of the economic resources required.
Considering the Group's adoption of the national fiscal consolidation provisions, tax positions which may be referred to the Bank and those originated by other Italian Group companies are managed separately from an administrative standpoint.
Deferred taxation is calculated according to the balance sheet liability method, taking into account the tax effect of the temporary differences between the book value of the assets and liabilities and their value for taxation purposes, which will determine taxable income or deductible amounts in the future. To this end, "taxable temporary differences" are differences which will give rise to taxable income in future years while "deductible temporary differences" are those which will give rise to deductible amounts in future years.
Deferred tax liabilities are calculated by applying the tax rates currently in force to taxable temporary differences that are likely to generate a tax burden, and to the deductible temporary differences for which it is likely that there will be future taxable amounts at the time when the related tax deductibility occurs (so-called probability test). Deferred tax assets and liabilities related to the same tax and due in the same period are offset.
If deferred tax assets and liabilities refer to items affecting the Income statement, the balancing entry is represented by taxes on income.
Where deferred tax assets and liabilities relate to transactions that have been recorded in shareholders' equity without affecting earnings (such as adjustments on IAS/IFRS first-time adoption, measurements of financial assets recognised at fair value through other comprehensive income or of cash flow hedge derivative contracts), the balancing entry is made in shareholders' equity, under specific reserves where so provided (e.g. valuation reserves).
No provision is made for reserves subject to latent taxation only in the event of distribution, since the size of the available reserves which have already been taxed leads to the belief that no transactions will be undertaken which may cause taxation of the untaxed reserves.
Deferred tax liabilities referred to Italian companies included in the fiscal consolidation are reported in their financial statements, in application of the accrual basis principle and in consideration of the fact that the effects of fiscal consolidation are limited to the settlement of current tax positions.

11. Allowances for risks and charges

Allowances for risks and charges for commitments and guarantees given
This sub-caption of the allowances for risks and charges contains the allowances for credit risk recognised for loan commitments and guarantees given that come under the scope of the IFRS 9 impairment rules. For these cases, in general, the methods described for financial assets measured at amortised cost or at fair value through other comprehensive income are adopted for the assignment to the three credit risk stages and the calculation of the expected credit loss.
This aggregate also includes allowances for risks and charges made to cover other types of commitments and guarantees given that, due to their specific characteristics, do not fall under the scope of impairment pursuant to IFRS 9.

Post-employment benefits
Company post-employment benefits are based on agreements and qualify as defined benefit plans. Liabilities related to such plans and the relative cost of current service are determined on the basis of actuarial assumptions based on the Projected Unit Credit Method. This method sets out that future obligations are forecast using past time-series analyses and the demographic curve and that such future cash flows are discounted based on a market interest rate. The provisions made in each year of service are considered separately and give rise to an additional unit of benefit entitlement for the purposes of the final obligation. The discounting rate is determined on the basis of market returns, surveyed as at the date of measurement, on high-quality corporate bonds, taking account of the residual average life of the liability. The present value of the liability at the reporting date is also adjusted by the fair value of any plan assets.

Actuarial profits and losses (namely the changes in the current value of the obligation resulting from changes in the actuarial assumptions and adjustments based on past experience) are recognised in the statement of comprehensive income.

[210] Pursuant to IAS 12, taxes on income also include those relating to the tax laws that implement the Global Minimum Tax.
[211] With respect to deferred taxation, it is noted that, under IAS 12, deferred tax assets and liabilities relating to taxes on income under the so-called Global Minimum Tax are not to be recognised or disclosed.

Other allowances

Other allowances for risks and charges record provisions related to legal obligations or connected to labour relationships or to litigations, also of a fiscal nature, originating from a past event for which a disbursement will probably arise to settle the obligations, provided that the amount of the disbursement may be estimated reliably.
Consequently, a provision is recognised when, and only when:

- there is a present obligation (legal or constructive) as a result of a past event;
- it is probable that an outflow of resources embodying economic benefits will be required to settle the obligation; and
- a reliable estimate can be made of the amount of the obligation.

The amount recognised as a provision is the best estimate of the expenditure required to settle the present obligation at the reporting date and takes into account the risks and uncertainties that inevitably surround many events and circumstances. Where time value is significant, provisions are discounted using current market rates. Provisions and increases due to time value are recorded in the income statement.

If it is no longer probable that an outflow of resources embodying economic benefits will be required to settle the obligation or when the obligation is settled, the provision should be reversed.

The caption also includes long-term benefits to employees, whose charges are determined with the same actuarial criteria described for post-employment benefits. Actuarial profits and losses are all immediately recognised in the income statement.

12. Financial liabilities measured at amortised cost

Classification criteria

Amounts Due to banks, Due to customers and Securities issued include various forms of funding on the interbank market and with customers, repurchase agreements with commitment to repurchase and funding via certificates of deposit, bonds issued and other funding instruments in circulation, net of any amounts repurchased.
It also includes the payables recorded by the Bank in the capacity of lessee in lease transactions.

Recognition criteria

Initial recognition of these financial liabilities occurs at the date of subscription of the contract, which usually coincides with the time of collection of the sums deposited or the issue of debt securities.
Initial recognition is based on the fair value of the liabilities, normally equal to the amount collected or the issue price, increased by any additional charges/revenues directly attributable to the single funding or issuing transaction. Internal administrative costs are excluded.
Lease payables are recognised at the present value of the future lease payments, discounted using the implicit interest rate of the transaction or, where it cannot be determined, the marginal financing rate.

Measurement criteria

After initial recognition, financial liabilities are measured at amortised cost with the effective interest method.
An exception is made for short-term liabilities, where time value is immaterial, which are stated at collected amount.
Lease payables are remeasured when there is a lease modification (e.g. a change in the contract which is not accounted for/considered as a separate contract); the effect of the remeasurement will be a corresponding adjustment to the right-of-use asset.

Derecognition criteria

Financial liabilities are derecognised from the balance sheet when they have expired or extinguished. Derecognition also occurs for repurchase of previously-issued bonds. The difference between book value of the liability and amount paid for repurchase is recorded in the income statement.
Placement of own securities, after their repurchase, is considered a new issue with recognition at the new placement price.

13. Financial liabilities held for trading

Recognition criteria

These financial instruments are recognised at the subscription or issue date at the fair value of the instrument, without taking into account directly attributable transaction costs or revenues.
This liability category includes, in particular, the negative fair value of trading derivatives, as well as embedded derivatives with a negative fair value separated from liabilities measured at amortised cost.
It also includes liabilities determined by short selling generated by trading of securities and certificates forming part of the trading business model.

Measurement criteria

All financial liabilities held for trading are measured at fair value through profit or loss.

Derecognition criteria

Financial liabilities held for trading are derecognised when the contractual rights to the related cash flows expire or when the financial liability is disposed of with the substantial transfer of all the risks and rewards connected to it.

14. Financial liabilities designated at fair value

Classification criteria
Financial liabilities designated at fair value are recorded under this caption, on the basis of the fair value option given to companies by IFRS 9 and in compliance with the cases contemplated in the reference regulations.

This category of liabilities also includes certificates included in the banking book business model.

Recognition criteria
These liabilities are recorded at fair value as at the date of issue, including the value of any embedded derivatives, net of placement fees paid.

Measurement criteria
These liabilities are measured at fair value according to the following rules established by IFRS 9:
- changes in fair value attributable to changes in own credit risk must be recognised in the statement of comprehensive income (shareholders' equity);
- the remaining changes in fair value must be recognised in the income statement.

The amounts recognised in the statement of comprehensive income are not subsequently recycled to the income statement. This method of accounting must not be applied when recognition of the effects of own credit risk on shareholders' equity results in or accentuates an accounting mismatch in the income statement. In this case, gains and losses associated with the liability, including those resulting from changes in own credit risk, must be recognised in the income statement.

Derecognition criteria
The financial liabilities designated at fair value are derecognised when the contractual rights to the related cash flows expire or when the financial liability is disposed with the substantial transfer of all the risks and rewards connected to it.

15. Foreign currency transactions

Definition
The foreign currency is a currency that is not the functional currency of the entity, which is in turn the currency of the primary economic environment in which the entity operates.

Initial recognition
Foreign currency transactions are recorded, on initial recognition, in the functional currency, by applying to the foreign currency amount the spot exchange rate at the date of the transaction.

Subsequent measurement
At every close of annual or interim financial statements, captions in foreign currency are measured as follows:
- foreign currency monetary items are translated using the closing rate;
- non-monetary items that are measured in terms of historical cost in a foreign currency are translated using the exchange rate at the date of the transaction;
- non-monetary items that are measured at fair value in a foreign currency are translated using the closing rates.

Exchange differences arising on the settlement of monetary items or on translating monetary items at rates different from those at which they were translated on initial recognition during the period or in previous financial statements are recognised through profit or loss in the period in which they arise.
When a gain or loss on a non-monetary item is recognised directly in equity, any exchange component of that gain or loss is recognised directly in equity. Conversely, when a gain or loss on a non-monetary item is recognised through profit or loss, any exchange component of that gain or loss is recognised through profit or loss.

16. Other information

Own shares
Any own shares held are directly deducted from equity. Similarly, their original cost and the profits or losses deriving from their subsequent sale are recorded in equity.

Accruals, prepayments and deferrals
Accruals, prepayments and deferrals for the year that include income and charges for the year, accrued on assets and liabilities, are shown in the financial statements as an increase or decrease of the assets and liabilities to which they are related.

Leasehold improvements
The costs sustained for restructuring property belonging to third parties are capitalised in consideration of the fact that for the duration of the rental contract the using company has control of the assets and may receive their future economic benefits. These costs, recorded in Other assets as provided for by the instructions of the Bank of Italy, are amortised over a period which must not exceed the duration of the rental contract.

Employee termination indemnities

Employee termination indemnities qualify as a "post-employment benefit" classified as:

- a "defined contribution plan" to the extent of the portions accruing from 1 January 2007 (the date the reform of the supplementary pension schemes came into force pursuant to Legislative Decree 252 of 5 December 2005) when the employee opted for the complementary pension scheme or decided to allocate such portions to the INPS (the Italian Social Security Institute) Treasury fund. Therefore, the amounts, recorded under personnel expenses, are determined on the basis of amounts due without the application of actuarial calculation;
- a "defined benefit plan" to the extent of the portions of employee termination indemnities accrued until 31 December 2006.
  These amounts are recognised at their actuarial value determined using the "Projected Unit Credit Method", without applying the pro-rata of the service rendered. Indeed, the current service cost of employee termination indemnities is almost entirely accrued and its revaluation in the years to come is not expected to generate significant benefits for employees.

For the purposes of discounting, the rate used is the market yield of high-quality corporate bonds taking into account the average remaining life of the liability, weighted based on the percentage amount paid and advanced, for each maturity, with respect to the total to be paid and advanced until the expiry of the entire obligation.
The plan's costs are recorded under personnel expenses, while actuarial profits and losses are recognised in the statement of comprehensive income.

Share-based payments

Share-based payments are recorded in the income statement, with a corresponding increase in shareholders' equity, on the basis of the fair value of financial instruments attributed at assignment date, dividing the charge over the period set forth by the plan.
In the case of options, the fair value is calculated using a model which considers, in addition to information such as strike price and expiry date of the option, spot price of the shares and their expected volatility, expected dividends and the risk-free interest rate, as well as the specific characteristics of the plan. The pricing model values the option and the probability of realisation of the condition on the basis of which the options have been assigned.
The combination of the two values supplies the fair value of the assigned instrument.
Any decrease in the number of financial instruments granted is accounted for as a cancellation of such instruments.

Employee benefits

Employee benefits are defined as all forms of consideration given by an entity in exchange for service rendered by employees. Employee benefits are divided into:

- short-term benefits (other than termination benefits or equity compensation benefits) that are expected to be paid in full within twelve months after the end of the period in which the employees render the related service and recognised in full through profit or loss when they become due (this category includes, for example, wages, salaries and "extraordinary" benefits);
- post-employment benefits payable after the conclusion of employment that require the entity to provide future benefits to employees. These include employee termination indemnities and pension funds, which are in turn divided into defined contribution plans and defined benefit plans or company pension funds;
- termination benefits, i.e. compensation that the company recognises to the staff members upon termination of the employment agreement, following the company's decision to terminate the employment relationship prior to the normal retirement date;
- long-term benefits, other than those above, that are not expected to be paid in full within twelve months after the end of the period in which the employee rendered their service.

Offsetting of financial instruments

According to IAS 32, paragraph 42, financial assets and financial liabilities are offset and the net amount presented in the financial statements when an entity:

- has a legal enforceable right of set off which is currently exercisable in all circumstances, both in the ordinary course of business or in the event of default, insolvency or bankruptcy of the parties;
- intends to settle the transactions on a net basis or on a gross settlement basis whose substantive effects are equivalent to a net settlement.

For derivative instruments covered by netting agreements that meet the above requirements, Bank of Italy Circular 262 also requires the offsetting to be performed between trading and hedging derivatives, with the mismatches to be presented on a net basis. The net balance is usually allocated to the trading book rather than to the hedging derivatives, based on the actual amount of the mismatch between trading and hedging derivatives.
In compliance with the requirements of IFRS 7, more detailed information is provided in the tables contained in Part B – Other information of these Notes to the financial statements, which present the following:

- the carrying amounts of assets and liabilities that meet the requirements of IAS 32, paragraph 42, before and after offsetting;
- the exposures subject to master netting agreements that have not been offset but have the potential to be offset following specific circumstances;
- the collateral associated with them.

Tax credits related to the "Cura Italia" and "Rilancio" Decree Laws acquired as a result of transfer by direct beneficiaries or previous purchasers (e.g. ecobonus)

Decree Laws no. 18/2020 ("Cura Italia" Decree) and no. 34/2020 ("Rilancio" Decree) introduced tax incentives related to both investment expenditure (e.g. ecobonus and seismicbonus) and current expenditure (e.g. rents for non-residential premises).The government once again intervened on the issue through Decree Law no. 50/2022 ("Decreto Aiuti"), mainly by

remodulating the base of potential re-assignees through Decree Law no. 11/2023 which prohibits, although with certain exceptions, the possibility of opting, instead of directly using the deduction, for the discount on invoices or transfer of credit and, finally, through Decree Law no. 39/2024 which mainly refers to qualified parties (financial intermediaries and insurance companies) and limits the possibility of netting social security against contribution liabilities.
These tax incentives apply to households or businesses, are linked to a percentage of the expenditure incurred (in some cases up to 110%) and are granted in the form of tax credits or tax deductions (with option for conversion into tax credits). The main features of these tax credits are: i) the possibility of using them for offsetting; ii) their transferability to third-party purchasers; and iii) their non-refundability by the Treasury.
The accounting for tax credits acquired from a third party (transferee of the tax credit) is not covered by a specific international accounting standard. IAS 8 requires, in cases where there is a circumstance not explicitly addressed by an IAS/IFRS accounting standard, that management develop an accounting policy to ensure relevant and reliable disclosure of such transactions.
To this end, Intesa Sanpaolo, in view of the guidance provided by the Authorities, in the document "Accounting treatment of tax credits connected with the 'Cura Italia' and 'Rilancio' Decree Laws acquired following the assignment by the direct beneficiaries or previous purchasers" published on 5 January 2021 by the Coordination Committee between the Bank of Italy, Consob and IVASS concerning the application of accounting standards IAS/IFRS has adopted an accounting policy that refers to the accounting rules established by IFRS 9, applying the provisions that are consistent with the characteristics of the transaction.
The Bank attributes:
- to a Hold to Collect business model the loans that are acquired within the limits of its tax capacity, with the objective of holding and using them for future offsetting. Those loans are recognised at amortised cost, representing the remuneration of net interest income over the time frame of recovery;
- to a Hold to Collect and Sell business model the loans that are acquired within the limits of its tax capacity, which may be further reassigned. Those credits are measured at fair value through other comprehensive income. Given the particular nature of these instruments, their fair value fluctuations are linked to the changes in interest rates. The profitability is recognised on a pro-rata basis under net interest income in the income statement;
- to an Other business model, the loans acquired for trading, e.g., in the event of purchases above its tax capacity and the signing of related reassignment agreements. Those loans are measured at fair value through profit or loss. Their fair value fluctuations are linked to the changes in interest rates. The profitability is recognised on a pro-rata basis under net interest income in the income statement.

In all the above cases, the initial recognition value matches the fair value at the date of purchase. Therefore, no day-one profit/loss is recognised.

The accounting framework set out in IFRS 9 for calculating expected credit losses is not deemed applicable to this specific case. The ECL (Expected Credit Loss) need not be calculated on these tax credits, as no refund is expected from the tax authorities, as the extinction of the instrument is linked to the offsetting of the bearer's tax payables. Moreover, in cases where reassignment is planned, the sale will be finalised by collecting the price of the instrument, without recognising a receivable due from the assignee.

Lastly, considering the operating methods implemented by the Bank, the risk of non-use of the tax credits, i.e. the risk that the Bank lacks the tax capacity to achieve the benefits associated with the asset, can be reasonably deemed as inexistent. Specifically:
- with regard to the Hold to Collect and Hold to Collect and Sell business models, the amounts acquired are consistent with the overall tax capacity, so that the Bank can offset its payables;
- with regard to the Other business model, for the loans acquired, reassignment agreements were gradually entered into for excess volumes, binding on the customer, with multiple counterparties, whose tax capacity is verified in advance.

As specified in the joint document from the Authorities, as mentioned above, given that the purchased tax credits do not qualify as tax assets, public subsidies, intangible assets or financial assets under the international accounting standards, the most appropriate classification, for their presentation in the financial statements, is the residual classification under Other Assets in the balance sheet.

Treatment of Irrevocable Payment Commitments (IPC) with the Single Resolution Fund (SRF)
Starting from 2016, the banks from all Eurozone countries joined the Single Resolution Mechanism (SRM) under which the Single Resolution Fund (SRF) was established with the aim of having adequate resources to be used in the event of banking crises. The relevant legislation establishes that the initial target level of the fund - to be achieved over 8 years (2016-2023) - is equal to at least 1% of the covered deposits of all credit institution authorised in the banking union. The contribution, which is determined annually by the Single Resolution Board (SRB) and communicated to the member banks, may be paid in cash and, in part, by entering into Irrevocable Payment Commitments (IPCs), not exceeding 30% of the total contribution and fully backed by collateral of low-risk assets. The use of irrevocable payment commitments is at the discretion of each bank. Intesa Sanpaolo decided to use IPCs - against which off-balance sheet commitments have been recognised - by paying, in this respect, cash collateral in the same amount as a deposit, which is remunerated on the basis of the applicable contractual conditions and consistently applied to all European banks that use the IPC mechanism.
The off-balance sheet commitment - which, for prudential purposes, is fully deducted from CET1 in accordance with the ECB provisions covering the SREP measure - is assessed at each reporting date and/or whenever there is evidence indicating that its enforcement is probable. In this respect, the Bank has activated a specific monitoring mechanism, with the support of a leading research company, in order to verify the absence of critical indicators in member banks that would deem SRF intervention probable and therefore the recall of the IPC. Based on the analyses performed, the risk that the IPCs be called as at 31 December 2024 is deemed remote.
Furthermore, since its establishment in 2016, the Single Resolution Fund has never called the IPCs entered into by the banks, as it did not take any action that involved the use of the funds raised.

Finally, in relation to the contributions requested in the 2016-2023 period, IPCs were entered into by the Parent Company for a total of 367 million euro, against which the Bank set up the cash collateral recognised under Financial assets measured at amortised cost. In 2024, having achieved the minimum capacity envisaged by Regulation (EU) 806/2014, the SRB did not request any further contributions.

Recognition of revenues and costs

Revenues are gross flows of economic benefits deriving from the performance of the company's ordinary business and are recognised when control of the goods or services is transferred to the customer, at an amount that represents the amount of consideration that the company considers it is entitled to. In particular, revenues are recognised by applying a model that must meet the following criteria:

- identification of the contract, defined as an agreement in which the parties are committed to perform their respective obligations;
- identification of the individual performance obligations contained in the contract;
- determination of the transaction price, i.e. the expected consideration for the transfer of the goods or services to the customer;
- allocation of the transaction price to each performance obligation, based on the sale prices of the individual obligation;
- recognition of revenues when (or as) the performance obligation is satisfied by transferring a promised good or service to a customer.

The transaction price is the amount to which an entity expects to be entitled in exchange for the transfer of goods and services promised. It may include fixed or variable amounts or both. Revenues from variable fees are recognised in the income statement if they can be reliably estimated and only if it is highly likely that all or a significant part of this fee will not need to be reversed from the income statement in future periods. Where there is a high level of uncertainty related to the nature of the consideration, it will be recognised only when this uncertainty is resolved.

Revenues may be recognised:

- at a specific point in time, when the entity satisfies a performance obligation by transferring a promised good or service to the customer, or
- over time, as the entity satisfies a performance obligation by transferring a promised good or service to the customer.

The good is transferred when, or in the period when, the customer acquires control of the good.

In particular:

- interest is recognised on accrual on the basis of the contractual interest rate or the effective interest rate in the case of application of amortised cost. Interest income (or interest expense) includes differentials and positive (or negative) margins accrued up to the reporting date, relating to financial derivatives:
  - hedging interest-generating assets and liabilities;
  - classified in the balance sheet in the trading book, though related to financial assets and/or liabilities designated at fair value through profit or loss (fair value option) in management terms;
  - related in management terms to assets and/or liabilities classified in the trading book and providing for the settlement of differentials or margins with different maturities;
- overdue interest, which may be provided for by the relevant contracts is recorded in the income statement solely at the time of collection;
- dividends are posted in the income statement when their distribution is approved, unless this date is not known or the information is not immediately available, in which case they may be recognised when they are collected;
- commission income from services is recorded, on the basis of the existence of contractual agreements, in the period in which the services have been rendered. Commission income included in the amortised cost for the purposes of determining the effective interest rate is recognised under interest;
- profits and losses from securities trading are recognised in the income statement at the date of sale, on the basis of the difference between the consideration paid or collected and the carrying value of such instruments;
- revenues deriving from the sale of non-financial assets are recorded at the date of sale, or when the performance obligation towards the customer is satisfied.

Costs are recognised in the income statement on an accruals basis. Costs relating to the receipt and performance of contracts with customers are recognised in the income statement in the periods when the related revenues are recognised.

Use of estimates and assumptions in preparing financial reports

The preparation of financial reports requires the use of estimates and assumptions that may have a significant effect on the amounts stated in the balance sheet and income statement, and on the contingent assets and liabilities reported in the financial statements. Estimates are based on available information and subjective evaluations, also founded on past experience, which are used to formulate reasonable assumptions in measuring operating events. Given their nature, the estimates and assumptions used may vary from year to year, and hence it cannot be excluded that current amounts carried in the financial statements may differ significantly in future financial years as a result of changes in the subjective evaluations made.

If there are greater uncertainties and/or the assets being measured are particularly material, the valuation is supported by specific fairness opinions from external appraisers/experts.

The main cases for which subjective evaluations are required to be made by corporate management include:

- the measurement of impairment losses on loans, investments, and, generally, other financial assets;
- the use of measurement models for determining the fair value of financial instruments not listed on active markets;
- the evaluation of the appropriateness of amounts stated for goodwill and other intangible assets;
- the fair value measurement of real estate and valuable art assets;
- the measurement of personnel funds and allowances for risks and charges;

– the estimates and assumptions on the collectability of deferred tax assets.

For some of the types listed above, the main factors subject to estimates by the Bank and which determine the carrying value of assets and liabilities in the financial statements can be identified. The following are noted, by way of example:

- to determine the fair value of financial instruments not listed on active markets, if the use of parameters that cannot be obtained from the market is necessary, the main estimates regard, on one hand, development of future cash flows (or even income flows, in the case of equities), possibly conditional on future events and, on the other, the level of specific input parameters not listed on active markets;
- the estimates for the assignment of loans and debt securities classified as Financial assets measured at amortised cost and Financial assets measured at fair value through other comprehensive income to the three credit risk stages required by IFRS 9 and to calculate the related expected credit losses involve:
  - the determination, where applicable, of the parameters for a significant increase in credit risk, essentially based on models for measuring the probability of default (PD) upon origination of the financial assets and at the reporting date;
  - the inclusion of forward-looking factors, including macroeconomic factors, for the determination of the PD and LGD (Loss Given Default);
  - the determination of the likelihood of sale of impaired financial assets, through the realisation of market positions;
- to determine the future cash flow estimates from non-performing loans, a number of items are considered: the expected recovery times, the presumed realisable value of guarantees and the costs to be sustained for the recovery of credit exposure;
- to determine the value in use of intangible assets with an indefinite life (brand name and goodwill) with regard to the Cash-Generating Units (CGU) comprising Intesa Sanpaolo, the future cash flows in the forecasting period of the analysis and the flows used to determine the terminal value, generated by the CGU, are subject to estimate, separately and appropriately discounted. Also the cost of capital is among the items subject to estimate;
- to determine the value in use of intangible assets with a finite life (asset management and insurance portfolios) with regard to the CGUs comprising Intesa Sanpaolo, the useful life is subject to estimate, on the one hand, as well as the future cash flows arising from the asset, on the other. The cost of capital is subject to estimate in the case of intangible assets with a finite life as well;
- the fair value measurement of real estate and valuable art assets is based on valuations prepared by qualified independent firms. Lease rentals, selling prices, discount rates and capitalisation rates are estimated in order to conduct the appraisals of the properties, while to conduct the appraisals on the valuable art assets, the estimate of the value is gathered from the performance of the exchanges of similar works (in terms of technique, size, subject) by the same author or regional movements and schools that are close with regard to style and technique;
- to measure post-employment benefits, the present value of the obligations is subject to estimate, taking into account the flows, appropriately discounted, arising from past time-series analyses and the demographic curve;
- to measure allowances for risks and charges, the amount of outflows necessary to fulfil the obligations is estimated, where possible, taking into account the effective probability of having to utilise resources;
- to determine the value of deferred tax items, the likelihood of an effective future tax burden is estimated (taxable temporary differences) and the level of reasonable certainty – if it exists – of future taxable amounts at the time when the tax deductibility occurs (deductible temporary differences and tax losses carried forward).

Considering that subjective evaluations are also used by management, inter alia, to estimate the useful life of property, equipment and intangible assets subject to the periodic amortisation process, such as owner-occupied properties and software subject to valuation by Intesa Sanpaolo, respectively, according to the revaluation model and at cost, the following should be noted in relation to these assets:

- −with respect to owner-occupied properties, in accordance with internal rules and the IAS/IFRS, the Bank periodically checks the adequacy of the useful life of these assets, also considering the close relationship between the useful life of an asset and the extent of the upgrading and modernisation work aimed at preserving quality and functional levels in line with market standards. The revaluation of the useful life of owner-occupied properties was carried out with the support of independent third-party appraisers and covered, in particular, clusters relating to entire buildings as well as branch buildings which showed suitable conditions for maintaining the original useful life. In consideration of the update of the useful life, a positive impact amounting to approximately 19 million euro due to lower depreciation was recognised in the 2024 income statement under “Net Adjustments to/Recoveries on property and equipment”;
- with respect to software, in the current digital environment, IT resources are becoming an increasingly strategic asset, including in the banking industry, to support corporate business development. Consequently, the investments in digital solutions and/or innovative and transformative information technology systems have become increasingly important in quantitative terms. Based on the above and in line with internal policies and the IAS/IFRS, the estimated useful life of the company's software applications was revised. As a result of the recent investments made in new functionalities and innovative technological developments, some software applications met the conditions for the revision of their useful life. This led to the recognition of a positive impact of approximately 68 million euro generated by lower amortisation on the 2024 income statement under “Net adjustments to/recoveries on intangible assets”.

The classification drivers for financial assets

The classification of the financial assets into the three categories established by the standard depends on two classification drivers: the business model used to manage the financial instruments and the contractual cash flow characteristics of the financial assets (or SPPI Test).

The classification of the financial assets derives from the combined effect of the two drivers mentioned above, as described below:

- Financial assets measured at amortised cost: assets that pass the SPPI test and come under the Hold to Collect (HTC) business model;

- Financial assets measured at fair value through other comprehensive income (FVOCI): assets that pass the SPPI test and come under the Hold to Collect and Sell (HTCS) business model;
- Financial assets measured at fair value through profit or loss (FVTPL): this is a residual category, which includes financial instruments that cannot be classified in the previous categories based on the results of the business model test or the test of the contractual cash flow characteristics (SPPI test not passed).

SPPI test

For a financial asset to be classified as at amortised cost or at FVOCI – in addition to the analysis of the business model – the contractual terms of the asset must also provide, on specified dates, for cash flows that are solely payments of principal and interest (SPPI). This analysis must be carried out for loans and debt securities in particular.
The SPPI test must be carried out on each individual financial instrument at the time of recognition in the balance sheet. After initial recognition, and as long as it is recognised in the balance sheet, the asset is no longer subject to new assessment for the purposes of the SPPI test. If a financial instrument is derecognised and a new financial asset is recognised, the SPPI test must be performed on the new asset.

For the application of the SPPI test, IFRS 9 provides the following definitions:
- Principal: this is the fair value of the financial asset at initial recognition. This value may change over the life of the financial instrument, for example as a result of repayments of part of the principal;
- Interest: this is the consideration for the time value of money and for the credit risk associated with the principal amount outstanding during a particular period of time. It can also include consideration for other basic lending risks and costs and a profit margin.

In assessing whether the contractual flows of a financial asset can be defined as SPPI, IFRS 9 refers to the general concept of a 'basic lending arrangement', which is independent of the legal form of the asset. When contract terms introduce exposure to risks or volatility in the contractual cash flows that is inconsistent with the definition of a basic lending arrangement, such as exposure to changes in share or commodity prices, the contractual cash flows do not meet the definition of SPPI. The application of the classification driver based on contractual cash flows sometimes requires a subjective judgement and, consequently, the establishment of internal application policies.

In cases of modified time value of money – for example, when the interest rate of the financial asset is recalculated periodically, but the frequency of the recalculation or the frequency of payment of the coupons does not reflect the nature of the interest rate (such as when the interest rate is recalculated monthly on the basis of a one-year rate) or when the interest rate is recalculated regularly on the basis of an average of particular short or medium-to-long term rates – an entity should assess, using both quantitative and qualitative information, whether the contractual cash flows still meet the definition of SPPI (benchmark cash flows test). If the test shows that the (undiscounted) contractual cash flows are "significantly different" from the (also undiscounted) cash flows of a benchmark instrument (i.e. without the modified time value element), the contractual cash flows cannot be considered to meet the definition of SPPI.
The standard requires specific analyses ("look through test") to be performed and these are therefore also conducted on multiple contractually linked instruments (CLIs) that create concentrations of credit risk for debt repayment and on non-recourse assets, for example in cases where the loan can only be enforced on specified assets of the debtor or on the cash flows from specified assets.

The presence of contractual clauses that may change the frequency or amount of the contractual cash flows must also be considered to determine whether those cash flows meet the requirements to be considered as SPPIs (e.g. prepayment options, the possibility of deferring contractually agreed cash flows, embedded derivative instruments, subordinated instruments, etc.).
However, as envisaged by IFRS 9, a contractual cash flow characteristic does not affect the classification of the financial asset if it could have only a de minimis effect on the contractual cash flows of the financial asset (in each year and cumulatively). Similarly, if a cash flow characteristic is not genuine, i.e. if it affects the instrument's contractual cash flows only on the occurrence of an event that is extremely rare, highly abnormal and very unlikely to occur, it does not affect the classification of the financial asset.

For operations in debt securities, Intesa Sanpaolo uses the services offered by well-known info-providers for the performance of the SPPI Tests. This choice, on one hand, provides front office staff who deal in securities with an immediate result for the performance of the test, enabling the streamlining of purchasing processes, and, on the other hand, provides access to market approaches shared by numerous operators and audit firms. Only in cases where the securities are not managed by info-providers, the test is carried out manually using a proprietary tool based on an internally developed methodology (decision-making trees).

A proprietary tool based on an internally developed methodology (decision-making trees) has also been developed for carrying out the SPPI test for the lending processes. In particular, given the significant differences in characteristics, the procedure differs between products related to a contractual standard (typically the retail loan portfolio) and tailor-made loans (typically the corporate loan portfolio).
For standard products, the SPPI test is carried out during the structuring of the contractual standard, through the "New Product Coordination" process, and the result of the test is applied to all the individual relationships related to the same catalogue product. For tailor-made products, on the other hand, the SPPI test is carried out for each new credit line/relationship submitted to the decision-making body through the use of the proprietary tool.

The decision-making trees – included in the proprietary tool – have been produced internally (both for debt securities and loans) and capture the possible non-SPPI compliant characteristics. They take account of the instructions provided by IFRS 9, as well as the interpretations of the standard made by Intesa Sanpaolo. The trees are used both for the implementation of the rules of the proprietary tool and for the verification and validation of the methodology adopted by the info-providers.

Business model

With regard to the business models, IFRS 9 identifies three cases relating to the way in which cash flows and sales of financial assets are managed:

- Hold to Collect (HTC): this is a business model whose objective is achieved by collecting the contractual cash flows of the financial assets included in the portfolios associated to it. The inclusion of the portfolio of financial assets in this business model does not necessarily result in the inability to sell the instruments, but the frequency, value and timing of sales in prior periods, the reasons for the sales, and the expectations about future sales, need to be considered;
- Hold to Collect and Sell (HTCS): this is a mixed business model whose objective is achieved by collecting the contractual cash flows of the financial assets in portfolio and (also) through the sale of the financial assets, which is an integral part of the strategy. Both activities (collection of contractual flows and sale) are indispensable for achieving the business model's objective. Accordingly, sales are more frequent and significant than for an HTC business model and are an integral part of the strategies pursued;
- Other/Trading: this is a residual category that includes both financial assets held for trading and financial assets managed with a business model that does not come under the previous categories (Hold to Collect and Hold to Collect and Sell). In general, this classification applies to a portfolio of financial assets whose management and performance are measured based on fair value.

The business model reflects the way in which financial assets are managed to generate cash flows for the benefit of the entity and is defined by top management with the appropriate involvement of the business structures. It is observed by considering the way in which financial assets are managed and, as a consequence, the extent to which the portfolio's cash flows derive from the collection of contractual flows, from the sale of the financial assets, or from both. This assessment is not performed on the basis of scenarios that the entity does not reasonably expect to occur, such as 'worst case' or 'stress case' scenarios. For example, if an entity expects that it will sell a particular portfolio of financial assets only in a stress case scenario, that scenario does not affect the entity's assessment of the business model for those assets if the entity reasonably expects that such a scenario will not occur.

The business model does not depend on management's intentions regarding an individual financial instrument, but refers to the way in which groups of financial assets are managed in order to achieve a specific business objective.

In summary, the business model:

- reflects the way in which financial assets are managed to generate cash flows;
- is defined by top management, with the appropriate involvement of the business structures;
- must be observable by considering the way the financial assets are managed.

In operational terms, the assessment of the business model is carried out in line with the company's organisation, the specialisation of the business functions, the risk cascading model, and the assignment of delegated powers (limits). All relevant factors available at the date of the assessment are used in the assessment of the business model. The above information includes the strategy, the risks and their management, the remuneration policies, the reporting, and the amount of the sales. In the analysis of the business model, the elements investigated must be consistent with each other and, in particular, must be consistent with the strategy pursued. Evidence of activities not in line with the strategy must be analysed and duly justified.
In this regard, and in relation to the business models under which the financial assets are held, a specific set of "Business Model Rules" (approved by the competent levels of governance) has been drafted for the Parent Company and Banking Group companies. It defines and sets out the components of the business model in relation to the financial assets included in the portfolios managed as part of the operations of Intesa Sanpaolo's business structures. In further detail, the mapping of the business model adopted by the various structures through which the Bank operates, with regard to both loans and receivables and debt securities, takes account of the structure of the division model and the Corporate Centre; this structure has been identified as the relevant level for formulating and representing the various business models applied by Intesa Sanpaolo's risk-taking centres.

Within the Chief Risk Officer Area, the Market & Financial Risk Management of the Bank provides high-level supervision of the procedure required for determining the business model within which a given set of assets is held and verifies the need for any updates (to be incorporated, at least annually, in the Business Model Rules document).

Monitoring of the business model

The monitoring of the reference business model of the various structures through which Intesa Sanpaolo operates is performed by the Market & Financial Risk Management structure, which uses indicators intended to verify the consistency of the declared strategy with that pursued within the business models; these indicators, differentiated for the various business models, have been developed in accordance with IFRS 9 and corporate rules and procedures.

For the Hold to Collect portfolios, Intesa Sanpaolo has set limits for frequent but not significant sales to be considered eligible (individually or in aggregate), or for infrequent sales even if their amount is significant, and the parameters have also been established for identifying sales as being consistent with that business model because they relate to an increase in credit risk or for securities nearing maturity.
More specifically, within an HTC business model, sales are allowed:

- in the event of an increase in credit risk, i.e., if the exposure deteriorates or moves to Stage 2 in accordance with the impairment rules under IFRS 9;

- for securities nearing maturity (i.e., according to the Group rules, in the 6 months preceding maturity), provided that the amount collected is close to the current value of the remaining contractual flows;
- when they are frequent but not significant in terms of value or occasional even if significant in terms of value, subject to authorisation assessment by the competent Control bodies. In order to determine these aspects, thresholds of frequency and significance have been set:
  - frequency is defined as the percentage ratio between the number of positions sold over the year and the number of portfolio positions at the beginning of the period considered;
  - significance is defined as the percentage ratio between the nominal value of the sales during the current year and the nominal value of the instruments held in the portfolio at the beginning of the period considered.

With regard to the determination of the "Risks" and the "Reporting" for the HTCS and Trading business models, the provisions of the RAF and Market Risk Charter and of internal policies in the area of market risk controls apply in principle, and measures are concurrently established for monitoring the consistency of the HTCS and Other/Trading business models.

With regard to the HTCS business model, IFRS 9 does not provide for the need for limits on the frequency or the value of the sales. However, Intesa Sanpaolo has established indicators for debt securities only in order to ensure that they are properly assigned to the chosen business model over time. These indicators are:
- The holding period, which measures the time for which a certain instrument has been held in portfolio;
- Turnover rate, which measures the speed with which positions in portfolio turn over during a predefined period of time.

Within the framework of the monitoring of the indicators set out above, limits and early-warning thresholds apply according to the overall strategies pursued by the HTCS portfolio.

Finally, with regard to debt or equity securities held for trading, a measure of the consistency of inclusion in the chosen business model applies, represented by the indicator of "expected average permanence" (so-called Vintage) which measures the observed holding period of all securities in portfolio.

The monitoring measures relating to the various business models are subject to regular reporting through technical committees.

Amortised cost measurement

The amortised cost of a financial asset or liability is the amount at which the financial asset or liability is measured at initial recognition net of any principal repayments, plus or minus cumulative amortisation, calculated using the effective interest rate method, of any difference between initial amount and amount at maturity and net of any reduction for impairment.

The effective interest rate is the rate that exactly discounts future cash payments or receipts through the expected life of the financial instrument or through the subsequent date for recalculation of the price to the present value of the financial asset or financial liability. In the calculation of the present value, the effective interest rate is applied to the flow of future cash receipts or payments through the entire useful life of the financial asset or liability or for a shorter period when certain conditions recur (for example review of market interest rates).

After initial recognition, amortised cost enables allocation of revenues and costs directly by decreasing or increasing the value of the instrument over its entire expected life via the amortisation process. The determination of amortised cost is different depending on the fact that financial assets/liabilities have fixed or floating rates and – in this last case – if the volatility of the rate is known or not beforehand. For instruments with fixed rate or fixed rate by time bands, future cash flows are quantified on the basis of the known interest rate (sole or floating) over the life of the loan. For financial assets/liabilities with a floating rate, for which the volatility is not known beforehand (for example because it is linked to an index), the determination of cash flows is carried out based on the last rate available. At every revision of the interest rate, the amortisation plan and the effective interest rate for the entire life of the investment, that is, until maturity, are recalculated. Any changes are recorded in the income statement as income or loss.

Measurement at amortised cost is applied for the financial assets measured at amortised cost and for the financial assets measured at fair value through other comprehensive income, as well as the financial liabilities measured at amortised cost.
Financial assets and liabilities traded at market conditions are initially recognised at fair value, which normally corresponds to the amount disbursed or paid including, for instruments measured at amortised cost, transaction costs and any directly attributable fees.
Transaction costs include internal or external marginal costs and income attributable to the issue, the acquisition or the disposal of a financial instrument which are not debited to the customer. These commissions, which must be directly attributable to the single financial asset or liability, modify the original effective return, thereby the effective interest rate associated to the transaction differs from contractual interest rate. Transaction costs do not include costs/income referred to more than one transaction and the components related to events which may occur during the life of the financial instrument, but which are not certain at the time of the initial agreement, such as for example: commissions for retrocession, for non-use, for advance termination. Furthermore, amortised cost does not include costs which would be sustained independently from the transaction (e.g. administrative and communication costs, stationery expenses), those, which though directly attributable to the transaction are part of standard practice for the management of the financing (e.g. activities related to the loan granting process), as well as commissions for services received following structured finance activities which would in any case have been received independently from the subsequent financing of the transaction (e.g. facility and arrangement fees).
With reference to loans, the following costs are considered directly attributable to the financial instrument: fees paid to distribution networks, fees paid for the origination and/or the participation in syndicated loans and lastly, up-front fees correlated to loans disbursed at rates exceeding market rates. Income considered in the calculation of amortised cost includes: up-front fees correlated to loans disbursed at rates below market rates, income for the participation in syndicated loans and brokerage commissions received.

For debt securities not measured at fair value through profit or loss, the following are considered transaction costs: commissions on contracts with brokers operating on the Italian stock exchange, commissions paid to dealers operating on the Italian and foreign stock and bond markets defined on the basis of the commission tables. Stamp duty is not considered in amortised cost since immaterial.
Regarding securities issued, amortised cost considers placement commissions on bond issues paid to third parties, amounts paid to Exchanges and remuneration paid to Independent auditors for the activities performed for each single issue, while amortised cost does not consider commissions paid to rating agencies, legal and advisory/review expenses for the annual update of prospectuses, the costs for the use of indexes and commissions which originate during the life of the bond issue.

Amortised cost is also applied for the measurement of loss incurred by the financial instruments listed above as well as for the measurement of instruments issued or purchased at a value other than fair value. The latter are measured at fair value, instead of the amount collected or paid, by discounting expected future cash flows at a rate equal to the effective rate of return of similar instruments (in terms of credit rating, contractual expiry, currency, etc.), with the simultaneous recognition in the income statement of a financial charge or income; after initial recognition, these are measured at amortised cost with the registration of higher or lower effective interest with respect to nominal interest. Lastly, structured liabilities that are not measured at fair value through profit or loss, for which the embedded derivative has been separated from the financial instrument, are also measured at amortised cost.

As specified by IFRS 9, in some cases, a financial asset is considered credit-impaired at initial recognition because the credit risk is very high, and in the case of a purchase it is purchased at a deep discount (with respect to the initial disbursement value). If these financial assets, based on the application of the classification drivers (SPPI Test and business model), are classified as assets measured at amortised cost or at fair value through other comprehensive income, they are classed as Purchased or Originated Credit Impaired (POCI) assets and are subject to special treatment for the impairment process. In addition, for the financial assets classed as POCI, the credit-adjusted effective interest rate is calculated, at the initial recognition date, which requires the inclusion of the initial expected credit losses in the cash flow estimates. This credit-adjusted effective interest rate is used for the application of the amortised cost and the consequent calculation of interest.
For non-performing loans arising from business combinations, the difference between the initial recognition amount (the fair value determined in the PPA) of the POCIs and the previous carrying amount at the acquired entity is split into two components: one related to the lower recoverable cash flows estimated at fair value, which therefore include the expected credit losses over their entire remaining life, and the other related to the discounting of those lower recoverable cash flows. Please note that the reversal of discounting (connected with the estimate of recoverable cash flows attributed to non-performing loans at the moment of the PPA) is recognised, on a pro-rata basis, among interest income so as to supplement the contractual interest rate with the higher return resulting from the lower value attributed to the recoverable cash flows, which, as mentioned above, take into account the expected losses over the entire remaining life of the POCI assets.

The amortised cost measurement criterion is not applied to hedged financial assets/liabilities for which fair value changes related to the risk hedged are recorded through profit or loss. The financial instrument is again measured at amortised cost in the case of hedge termination; from that moment the fair value changes recorded before are amortised, calculating a new effective interest rate which considers the value of the loan adjusted by the fair value of the hedged part, until the natural expiry of the hedge. Furthermore, as already mentioned in the paragraphs relating to financial assets and liabilities measured at amortised cost, measurement at amortised cost is not applied to short-term assets/liabilities for which the time value is deemed to be immaterial and to loans without a definite maturity or revocable loans.

Impairment of assets

Impairment of financial assets

At each reporting date, pursuant to IFRS 9, financial assets other than those measured at fair value through profit or loss are subject to an assessment aimed at verifying whether there is any evidence that the carrying value of the assets may not be fully recoverable. A similar analysis is also performed for loan commitments and for guarantees given that must be tested for impairment under IFRS 9.
In preparation for the determination of the impairment losses, at each reporting date the financial instruments must be assigned to the following categories (Stage Assignment or Staging):

- Stage 1: comprising financial instruments for which, from their initial recognition up to the reporting date, there is no evidence of a significant increase in credit risk;
- Stage 2: it comprises financial assets that have had a significant increase in credit risk since initial recognition;
- Stage 3: if there is evidence of impairment, these financial assets – in line with any other assets pertaining to the same counterparty – are considered impaired and are therefore included in Stage 3.
  The non-performing exposures consist of financial assets classified in the categories of bad loans, unlikely-to-pay (UTP) loans and exposures past due by more than ninety days, defined in Bank of Italy Circular 272/2008.

Impairment of performing financial assets

For financial assets for which there is no evidence of impairment (unimpaired financial instruments), it is necessary to check whether there are indicators that the credit risk of the individual transaction has increased significantly since initial recognition. This check, in terms of classification (or, more precisely, staging) and measurement, has the following consequences:

- where these indicators exist, the financial asset is included in Stage 2. In this case, in compliance with the IAS/IFRS and despite the absence of an actual impairment, the measurement consists of the recognition of impairment losses equal to the lifetime expected credit losses of the financial instrument. These adjustments are subject to revision at each subsequent reporting date, both to periodically check their consistency with the continuously updated loss estimates and to take account – if the indicators of "significantly increased" credit risk are no longer present – of the change in the forecast period for the calculation of the expected credit loss;

- where these indicators do not exist, the financial asset is included in Stage 1. In this case, in compliance with the IAS/IFRS and despite the absence of an actual impairment, the measurement consists of the recognition of the 12-month expected credit losses for the specific financial instrument. These adjustments are subject to revision at each subsequent reporting date both to periodically check their consistency with the continuously updated loss estimates and to take into account – if there are indicators that the credit risk has "significantly increased" – the change in the forecast period for the calculation of the expected loss.

With regard to the measurement of financial assets and, in particular, the identification of the "significant increase" in credit risk (a necessary and sufficient condition for the classification of the asset being measured as Stage 2), the following factors constitute the key elements to be taken into account, in accordance with the standard and its operational implementation by the Intesa Sanpaolo Group:

- the variation (beyond set thresholds) of the lifetime probabilities of default compared to the time of initial recognition of the financial instrument. This is therefore an assessment made on a "relative" basis, which constitutes the main driver;
- the presence of a past due position that – subject to the materiality thresholds identified by the regulations – has been in that status for at least 30 days. If these circumstances apply, the credit risk of the exposure is considered to have "significantly increased" and the exposure is therefore transferred to Stage 2 (when the exposure was previously included in Stage 1);
- the presence of forbearance measures, which – again on a presumption basis – result in the classification of the exposures under those whose credit risk has "significantly increased" since initial recognition. Activating a forbearance measure implies a minimum probation period of 24 months in Stage 2;
- some of the indicators from the credit monitoring systems are then considered for the purposes of the transfer between "stages". Specifically, reference is made to early warning systems. Where signals of high risk (traffic light results) are identified for at least three consecutive months by such systems, a perimeter of potentially riskier counterparties is defined, to be classified in Stage 2.

Finally, a staging allocation effect was identified in the in-model adjustment linked to the identification of extreme scenarios (described later in this section). This led to the Stage 2 classification of the counterparties deemed most vulnerable to the aforementioned extreme scenarios in relation to the rating assigned.

Focusing on the main trigger out of those referred to above (i.e. the change in the lifetime probability of default), the significant increase in credit risk ("SICR") is determined by comparing the relative change in the lifetime probability of default recorded between the initial recognition date of the relationship and the observation date (lifetime PD Change) with predetermined significance thresholds. The assignment of a lifetime PD to the individual relationships is carried out by allocating the ratings for each segment according to the masterscale at both the initial recognition date and the observation date. Ratings are determined based on internal models, where available, or on business models. If there are no ratings, the Benchmark PDs are assigned to the type of counterparty being assessed.
The significant deterioration is therefore based on the increase in the lifetime PD caused by downgrades of the position from its origination to the reporting (observation) date, as well as the change in the forecast of the future macroeconomic factors.

The above-mentioned "relative" change in lifetime PD is an indicator of the increase or decrease in credit risk during the reporting period. To establish whether, in accordance with IFRS 9, any increase in credit risk can be considered "significant" (and therefore entail a transition between stages), it is necessary to set specific thresholds. Increases in lifetime PD below these thresholds are not considered significant and, consequently, do not result in the transfer of individual credit lines/tranches of debt securities from Stage 1 to Stage 2. However, this transfer is required if there are relative increases in PD above these thresholds. The thresholds used have been estimated based on a process of simulations and optimisations of forecast performance, carried out using granular historical portfolio data. Specific thresholds are set for the Corporate, Retail, Large Corporate and Retail SME models and extended to the other models based on methodological affinity. The thresholds differ in terms of residual maturity, annual granularity and rating class.
The determination of the thresholds has been calibrated to find a suitable balance between the performance indicators relating to the ability of the thresholds to:

- detect Stage 2 positions before their transition to default;
- identify positions for which a return to Stage 1 is due to an actual improvement in credit rating.

To complement the above methodology, a "relative" threshold also exists (tripling of lifetime PD at the observation date compared to the lifetime PD at the initial recognition date), which acts on a residual basis compared to the main methodology. Therefore, if this threshold is exceeded, the position is automatically classified to Stage 2. In order to avoid the "sliding" into Stage 2 of particularly high credit quality positions, the threshold is only triggered for non-investment grade loans and securities.

Some specific considerations apply for the "staging" of the debt securities. Unlike loans, for this type of exposure, sales and purchases after initial recognition (made using the same ISIN) may form part of the ordinary management of the positions (with the consequent need to identify methods to be adopted for identifying the sales and repayments in order to determine the remaining quantities of the individual transactions that need to be allocated a credit quality/rating upon origination to be compared with that parameter at the reporting date). In this regard, the use of the "first-in-first-out" or "FIFO" method (for the recognition of the recorded ECL in the income statement, in the event of sales or repayments) was considered to help in providing a more transparent management of the portfolio, also for the front office operators, while also enabling the continued updating of the credit rating based on new purchases.

Once the allocation of the exposures to the various credit risk stages has been established, the expected credit losses (ECL) are determined at individual transaction or securities tranche level, using the IRB/Business models, based on the parameters

of Probability of Default (PD), Loss Given Default (LGD) and Exposure at Default (EAD), to which appropriate corrections are made to ensure compliance with the specific requirements of IFRS 9.
The following definitions apply for PD, LGD and EAD:
- PD (Probability of Default): likelihood of migrating from performing to non-performing status over the period of one year. In models consistent with supervisory provisions, the PD factor is typically quantified through the rating. In Intesa Sanpaolo, the PD values are derived from internal rating models where available, supplemented by external ratings or segment/portfolio average figures;
- LGD (Loss Given Default): percentage loss in the event of default. In the models consistent with supervisory provisions, it is quantified through the historical experience of discounted recoveries on exposures that have become non-performing;
- EAD (Exposure At Default) or credit equivalent: amount of the exposure at the time of default.

As mentioned above, in order to comply with IFRS 9, specific adjustments had to be made to these factors, including in particular:
- adoption of a Point in Time (PIT) PD compared to the Through the Cycle (TTC) PD used for Basel purposes;
- removal of some additional components from the TTC LGD, such as indirect costs (non-recurring costs) and an additional margin of conservatism specifically introduced for the regulatory models, as well as the component linked to the economic downturn;
- the introduction of specific treatment in relation to the regulatory provisions, in order to estimate the accounting LGD, to include in the modelling (in line with the indications of IFRS 9 on using entity-specific information) the estimates of internal recoveries exceeding the regulatory threshold of the Maximum Recovery Period, i.e., the maximum time limit beyond which the Supervisory Authority assumes that nothing will be recovered;
- the use of PDs and, where necessary, multi-period LGDs, to determine the lifetime expected loss of the financial instrument (Stages 2 and 3);
- the use of the effective interest rate of the individual transaction in the discounting of the expected future cash flows, unlike in the regulatory models, where the individual cash flows are discounted using the discounting rates determined in compliance with the prudential regulations.

In relation to the multi-period EAD, in line with IFRS 9 Intesa Sanpaolo refers to the plans at amortised cost for both loans and receivables and debt securities, regardless of the measurement method used (amortised cost or fair value through other comprehensive income). For loan commitments (margins), on the other hand, the EAD is assumed to be equal to the nominal amount weighted according to a specific Credit Conversion Factor (CCF).

The measurement of the financial assets also reflects the best estimate of the effects of current and future conditions and in particular the economic conditions that affect the forward-looking PDs and LGDs. IFRS 9, also based on the guidance from the international regulators, gives particular importance to information on future macroeconomic scenarios in which the Bank may find itself and which clearly influence the situation of the debtors, with regard both to the "risk" of migration of exposures to lower quality classes (and therefore concerning the staging) and to the recoverable amounts (and therefore concerning the determination of the expected loss on the exposures). In terms of method, various possible alternative approaches designed to take account of these elements have been analysed. Of the various alternatives considered, Intesa Sanpaolo has decided to adopt the "Most Likely scenario+Add-on" approach. According to this approach, the macroeconomic conditioning of PD and LGD is carried out through a baseline scenario ("Most Likely", in line with the approach used for other business purposes such as, for example, the budget and business plans) and then corrected with an Add-On to include any differences compared to downside and upside scenarios. If the overall impact of the Add-On on the risk parameters is positive, the decision has been made to neutralise the effect for both staging and ECL calculation purposes.

The macroeconomic scenario is determined by the Bank's Research structure using forecasting models that are disclosed to the market to determine the consensus. Alternative upside and downside scenarios are determined through stress tests of the input variables of the forecasting models.

In particular, the most likely scenario and alternative scenarios are determined using a set of analytical and stand-alone forecasting instruments that determine the forecast path for several blocks of variables, namely:
- national accounts and inflation of the main Eurozone countries, the United States, the United Kingdom and Japan;
- official rates (ECB, Fed, BoJ), EUR and USD swap rate curves, and several points of the government curves;
- exchange rates for EUR, USD, JPY and GBP;
- stock market indices (DJ Eurostoxx 50 and S&P 500);
- Brent price;
- some specific data for the Italian economy (industrial production, real estate prices, employment, public finance balances).

These forecasts are then processed using the Oxford Economics multi-country structural Global Economic Model, where they replace the forecast paths of the baseline scenario provided by the company with the periodic updating of the database. The model is then solved to derive a consistent global forecasting framework, including variables for which no specific models have been developed, and to obtain a simulation environment that can be used to generate alternative scenarios. This step may require some iterations, particularly if the forecasting framework generated internally is significantly different from the one provided by Oxford Economics. If this is the case, further fine-tuning may be needed for specific secondary variables that the analysts consider to be inconsistent with the forecast scenario or that have an unexplainable quarterly volatility.
The alternative paths are selected using external information. In particular:
- average annual GDP growth rates of several countries: this is the key driver for the simulation and the deviations are determined to replicate the dispersion of the growth estimates published by Consensus Economics in the most recent report available at the date of the simulation, considering the minimum and maximum forecasts (after applying a filter to identify and eliminate possible outliers). If there are outliers, these are discarded and the remaining maximum and minimum values are considered. Since consensus estimates are only available for the first two years of the simulation period, an extrapolation of the deviations identified for the first two years is used for the third year;

- stock market indices (DJ Eurostoxx 50, S&P 500) and US residential real estate prices: the minimum and maximum forecasts of the Thomson Reuters panel are used as a reference;
- Italian residential real estate prices: since no consensus estimates are currently available, the alternative paths are based on the distribution of the historical quarterly changes available from 1980 to the current quarter.

The percentile value identified is used, for the Most Likely scenario, to determine the variations corresponding to a probability gap, calculated through statistical analysis of the historical distribution of the observations. The two (positive and negative) changes with respect to the most likely scenario are then used to calculate the level of the individual identified indices, reconstructing the two alternative paths (one positive and one negative) for each of them that represent the input for the determination of the Add-On. The probability gap used is identified based on the variability characteristics of the series, to obtain a significant deviation from the most likely scenario.

In addition to defining the alternative paths, a map of possible additional factors is maintained, i.e., adverse idiosyncratic events or scenarios, not explicitly incorporated in the time series used for the construction of the most likely scenario or in the alternative paths, which can generate further significant effects on expected losses.

The following is assessed for these events/scenarios:
- the possible time frame;
- the degree of inclusion in the most likely scenario or the alternative paths;
- the potential impact, assessed in qualitative terms.

The map of additional factors also draws on the list of risk factors contained in the forecast reports of the IMF (World Economic Outlook) and the European Commission and may change over time.

Within the assessment of the time frame for the additional factors, note is made if the factor cannot be placed within a specific time period, which makes its incorporation into the Most Likely scenario or alternative paths unfeasible.

The assessments made take account of the fact that the consensus estimates may include forecasts that already incorporate the total or partial realisation of one or more risk factors in their estimates, which means that the alternative paths may already incorporate these additional factors to some extent.

Where there is considerable uncertainty in the national and international macroeconomic forecasts, as well as significant deviations in terms of best-case forecasts with respect to the TTC scenario, prudential factors may be introduced in relation to the deviations in the minimum and maximum values of the variables based on the above-mentioned consensus or historical figures.

The above macroeconomic scenarios (Most Likely and alternative scenarios) are used in internal models to determine the point-in-time (PIT) parameters.

Specifically, the time series of default rates acquired from the Bank of Italy are differentiated over the main economic macro-sectors (e.g. consumer households, family businesses, construction) and, for each of these, specific satellite models establish the relationships with the macroeconomic variables in order to obtain the forecast default rates. In turn, these impact the TTC transition matrices between rating classes and thus provide the PIT transition matrices for each scenario (most likely and alternative scenarios). These give rise to the lifetime conditional PD.

In particular, the TTC matrices are calculated using internal default rates for the Corporate, Retail SME and Retail segments, whereas the Bank of Italy system rates are used for the Low Default segments, because the internal time series data for those segments is less extensive. The forward-looking point-in-time matrices, on the other hand, are calculated using the system default rates for all the segments.

A similar process is used to determine the PIT LGD grids.

Taking account of the repayment plans of the individual loans, their conditional PD and LGD, residual maturity and staging, the impairment of performing financial assets is determined.

Finally, with reference to the estimation methodologies of impairment of performing financial assets, in certain circumstances, the need may arise to make adjustments (valuation increases) to the results of the models adopted. That need may indicatively arise as a result of external events that are unexpected, which the bank cannot control and have potential consequences, also on a large scale, on the measurement of the ECL of the portfolios as a result of elements that otherwise are not adequately captured within the IFRS 9 framework. It must be noted that the IFRS 9 estimation methodologies are founded on experience-based assumptions, and are strongly anchored to historical observations, which are considered over a congruous time horizon and in a sufficiently stable backdrop. Therefore, in order to fully understand the effects of particular conditions of volatility or of possible significant economic deviations from the expected macroeconomic scenarios, also in relation to "emerging risks", a specific reference framework was identified to take action - duly approved by the competent Management Bodies - to factor into ECL calculation further elements that are not yet and/or insufficiently covered by the models in use.

Specifically, the measurement of ECL in such situations is adjusted (increasing) via the following two elements:
- a first impact (in-model adjustment) on the performing positions as a whole, in the case of specific economic times characterised by risks of significant deviation from the expected scenarios, estimated through the forward-looking conditioning model, with an impact on the individual risk parameters (PD and LGD), by identifying "extreme" scenarios, characterised by a probability of occurrence considerably contained and typical only of extreme events (therefore outside the consensus ranges) with respect to the long-term macroeconomic scenario. The approach described also triggers a staging allocation effect with Stage 2 classification of the counterparties deemed most vulnerable to extreme scenarios in relation to the assigned rating;
- an additional impact (post-model adjustment) related to the effects - on "vulnerable" customers and at the same time belonging to subsectors of the loan portfolio, particularly exposed to the consequences of "emerging" risk factors - of the combination of evolving structural risks and new risks. This enhances the information from credit quality monitoring processes. This latter valuation burden is determined for vulnerable customers belonging to higher-risk subsectors, by increasing the ECL in relation to the estimated greater risk. The approach described also triggers a staging allocation effect with Stage 2 classification of the most vulnerable positions.

Impairment of non-performing financial assets

Non-performing loans are represented by bad loans, unlikely to pay and past due positions by more than 90 days.

Non-performing loans classified as bad loans are subject to the following measurement methods:

- analytical-statistical measurement, which is used for exposures of less than 2 million euro and is based on the use of specific LGD grids, plus an Add-On to take account of information linked to the evolution of the current conditions related to management variables highly correlated with the loss performance and forward-looking information relating to the impact of expected future macroeconomic scenarios (as described in the previous paragraphs);
- analytical-specific measurement, which is used for customers with exposures exceeding 2 million euro and is based on the impairment percentages allocated by the manager, following specific analysis and measurements, also based on the evolution of the current conditions, plus an Add-On to take account of forward-looking information, and in particular information relating to the impact of future macroeconomic scenarios (except for bad loans backed by mortgage collateral or relating to property leases for which the impact of future scenarios is included through the method used to determine the haircuts to the value of the properties pledged as collateral).

The measurement of unlikely-to-pay loans (UTPs) is also performed based on different approaches:

- analytical-statistical measurement, for exposures of less than 2 million euro, based on the use of specific LGD grids, plus an Add-On to take account of the already mentioned information linked to the current conditions and the impacts of future macroeconomic scenarios, as well as continuation in the risk status, in order to penalise positions with greater vintage or which have no movements and/or recoveries for a particular period of time;
- analytical-specific measurement, for on-balance sheet exposures of more than 2 million euro, based on the impairment percentages allocated by the manager, following specific analyses and assessments also based on the evolution of the current conditions, plus an Add-On to take account, also in this case, of the impacts of future macroeconomic scenarios and of continuation in the risk status.

Regardless of the division of these exposures between those subject to analytical-statistical measurement and those subject to analytical-specific measurement (as identified above), the add-ons envisaged include the sales scenarios for the disposable non-performing loans if the business plan and the NPL reduction plan envisage sales and those sales do not lead to a reclassification pursuant to IFRS 5. The valuation of the disposable non-performing loans therefore considers the possibility of also realising these loans through their sale.

Non-performing loans classified in the past-due loans category, on the other hand, are subject to analytical measurement based on statistics, regardless of the amount of the exposure. However, also in this case, the adjustment determined based on the LGD statistical grids is supplemented to take account of the Add-On attributable to the effect of the evolution of the current conditions and the future macroeconomic scenarios.

Credit exposures must continue to be carried as non-performing for at least three months after they cease to meet the requirements for being classified as such (the "probation period"). Until the conditions are met for reclassification out of the non-performing category, such exposures are retained in their respective risk classes and measured according to an analytical-statistical or an analytical-specific approach taking account of their lower risk level.

A brief description is provided below of the methods used for the analytical-specific and analytical-statistical measurement:

- the analytical-specific measurement of bad loans and unlikely-to-pay loans above 2 million euro is a measurement performed by the managers of the individual positions based on a qualitative and quantitative analysis of the borrower's financial position, the riskiness of the credit relationship, the targets and strategies for reduction of the non-performing loans, and any mitigating factors (collateral), taking into account the financial impact of the estimated recovery time.
  For bad loans in particular, a series of elements are relevant, which differ according to the characteristics of the positions, and must be thoroughly and prudently assessed, including the following, listed merely as examples:
  - nature of the credit, whether preferential or unsecured;
  - net asset value of the borrowers/third party collateral providers;
  - complexity of existing or potential litigation and/or the underlying legal issues;
  - exposure of the borrowers to the banking system and other creditors;
  - last available financial statements;
  - legal status of the borrowers and any pending insolvency and/or individual proceedings.

  In order to determine the estimated realisable value of loans secured by real estate, and to take into account both the time series of recoveries and the forward-looking information in accordance with IFRS 9, an approach is applied focused on the valuation of real estate based on the expected average auction price and the related reduction in the observed price, with the calculation of average haircuts that differ according to the type of real estate collateral (residential, commercial, industrial and land). Accordingly, to avoid duplications, a macroeconomic Add-On is not used in the analytical-specific measurement for bad mortgage loans, because the forward-looking component is already taken into account through the haircut.
  For real-estate bad loans arising from lease contracts, in view of the particular nature of the product (lack of auctions), the haircut is estimated as the depreciation of the asset with respect to the appraised value observed at the time of classification as non-performing and the actual price of sale.
  In addition, for unlikely-to-pay loans, the measurement is based on a qualitative and quantitative analysis of the borrower's financial position and on precise assessment of the risk situation.
  The calculation of the impairment loss involves the valuation of the future cash flows that the borrower is considered to be able to generate and that will also be used to service the financial debt. This estimate must be made based on two alternative approaches:
  - the going concern approach: the operating cash flows of the borrower (or the beneficial owner) continue to be generated and are used to repay the financial debts contracted. The going concern assumption does not rule out the realisation of collateral, but only to the extent that this can take place without affecting the borrower's ability to

generate future cash flows. The going concern approach is also used in cases where the recoverability of the exposure is based on the possible sale of assets by the borrower or on extraordinary transactions. Similarly to the case of bad loans, haircuts are also used in measuring real-estate collateral for unlikely-to-pay positions. For going-concern positions, these haircuts are determined on the basis of the haircuts applied in the liquidation process (gone-concern bad loan or UTP position), while applying a calibration factor equal to the probability of migration of the UTP positions to the bad loan category;

  - the gone concern approach: applicable in cases when it is believed that the borrower's cash flows will cease. This is a scenario that can apply to positions that are expected to be classified as bad loans. In this context, assuming that shareholders' interventions and/or extraordinary operations to restructure debt in turnaround situations are not reasonably feasible, recovery of the credit is essentially based on the value of the collateral that secures the Bank's credit claim, net of the application of a haircut (determined as for bad loans) and, alternatively, on the realisable value of the assets, taking into account the liabilities and possible pre-emptive claims;

– the analytical-statistical measurement, performed for bad loans and unlikely-to-pay loans of less than 2 million euro and for past-due loans has specific features according to the type of exposure involved.
  With regard to bad loans, the analytical-statistical measurement is based on the Bad Loan LGD grids, where the LGD Defaulted Asset model is mainly characterised by the differentiation of the loss rates that, in addition to the regulatory segment, is based on the continuation in the risk status ("vintage") and the possible activation of legal recovery proceedings. The grids are also differentiated for the other significant analysis axes used in the model estimation (e.g. product type, type of guarantee, geographical area, exposure band, etc.). The recovery time grids are mainly broken down by regulatory segment and by additional significant analysis axes used in the modelling (e.g. recovery procedures, exposure band, product type).
  For unlikely-to-pay loans, the measurement is performed using statistical LGD grids estimated specifically for positions classified as unlikely-to-pay loans, in line with the estimated LGD grids for bad loans. The estimation model for the LGD grid for unlikely-to-pay loans is similar to the one described above for bad loans and calculates the expected loss rate of the relationship being valued according to its characteristics. The LGD for unlikely-to-pay loans is obtained by recalibrating the bad loan LGD using the Danger Rate module. The Danger Rate is a multiplying correction factor to apply to the bad loan LGD, in order to take into account the loss rates that can be recorded in the various default statuses (Unlikely-to-Pay and/or past due). The Danger Rate is estimated using the probability of migration to bad loans for positions already in default, the loss rates observed in the pre-bad loans phase for positions migrating to bad loans, and the loss rates observed in the pre-bad loans phase for positions that return to performing status or are extinguished.
  In addition, for the two subclasses of the "Unlikely-to-Pay Loans" risk status ("Non-Forborne Unlikely-to-Pay Loans" and "Forborne Unlikely-to-Pay Loans"), differentiated grids are estimated to take into account the characteristics of the Forborne loans, which, in addition to having lower average loss levels due to the effect of the Forbearance Measures, are also affected by the regulatory constraints that prevent their return to performing loan status before 12 months from the date of the renegotiation.
  For past-due loans, the methods used to determine the grids are the same as those described for the unlikely-to-pay loans (Framework Danger Rate). In this case, the vintage factor is captured by the introduction of a differentiation based on the duration of the past-due period (Past Due at 90 days/180 days) which produces a significant variation in the loss rates of the grids, which are also differentiated according to regulatory segment and additional analysis axes (e.g. product type, type of guarantee, geographical area, exposure band, etc.) common to the other non-performing loan categories.
  Also in the LGD estimation models used in the analytical-statistical measurement of non-performing exposures, several additional components specifically included for regulatory models are removed, similar to that illustrated for performing exposures.

With regard to the inclusion of current and forward looking information, it should be noted that, for non-performing exposures, a statistically estimated component (Add-On from macroeconomic scenario) linked to the most likely and downside scenarios expected over the period of the next three years is also considered, according to the criteria already described.
In fact, as required by IFRS 9, the effects of the forward-looking scenario on LGD estimates must also be considered and the aforementioned component is aimed at capturing the non-linearity of the relationship between the macroeconomic variables and ECL measurement, by analysing the forecast uncertainty of the variables used for the preparation of the most likely scenario. It is based on the methodological framework that is used for performing loans, but ignores the upside scenario from a prudential perspective and only considers the average downside and most likely scenarios over the period of the next three years.
Furthermore, an additional factor is applied to the analytical/statistical measurement firmly based on internal management variables, in particular the level of past and prospective NPL ratio, which, on the basis of long-term observation, is statistically correlated with the loss performance. This factor makes the LGD estimate more sensitive to changes in the current and future economic/management context.
Also in terms of future scenarios, with regard to the unlikely to pay category, which includes positions that are still performing but show signs of difficulty, both for positions with analytical-specific measurement and those with analytical-statistical measurement, when there are no effective forbearance measures, an additional component shall be applied (in addition to the aforementioned add on from the macroeconomic scenario) to reduce the recoverable amount of the positions based on their vintage in the risk status and the absence of movements and/or recoveries in a specific period of time.

With regard to the alternative recovery scenarios, the Intesa Sanpaolo Group, in relation to the objectives of reducing the stock of outstanding non-performing loans, included in its business plans, and the commitments made to the Supervisory Authorities, with specific regard to the NPL Strategy, considers the sale of particular portfolios as the strategy that, in certain conditions, can maximise the cash flow recovery, also considering the recovery times.
Consequently, the "ordinary" scenario, which assumes a recovery strategy based on the collection of credit, typically through legal actions, mandates to credit recovery companies and the realisation of mortgage collateral, is also been accompanied - where applicable and as an alternative recovery strategy - by the scenario of the sale of the loan.

Where company plans and Bank strategies identify disposal objectives and, as a result, a portfolio of non-performing loans that may be disposed of, until the disposal objectives are reached, the loans and receivables included in that portfolio shall be measured taking account of both the amount recoverable through operating activities and market valuations (based on external appraisals) and/or sales prices, if already defined.
In particular, where a larger loan portfolio that may be sold represented by Group loans that are disposable (thus, for example, positions that are not involved in disputes, as per precise indication by the management structures and which are not subject to synthetic securitisation), in relation to the sales objectives is identified, the book value of said portfolio is determined by weighting the recoverable amount through operating activities with the amount recoverable through sale.
More specifically, the recoverable amount of disposable non-performing loans is quantified as the average between (i) the value in the event of sale (fair value) and (ii) the collection amount, weighted on the basis of the percentage of the loans eligible for sale - determined as the ratio between the target volume of loans to be sold and the respective non bankruptcy-remote portfolios having the same profile, i.e. as a percentage that reflects the probability of sale of the portfolios whose disposal is considered highly probable. The "collection amount" was determined according to the ordinary methods adopted by Intesa Sanpaolo for the impairment of non-performing loans, i.e. based on the individual measurement of the exposures exceeding a defined threshold and based on an analytical-statistical measurement for the others. The measurement of the value in the event of sale is carried out by an external expert, based on market valuations.
However, where the positions to be sold are specifically identified, those positions shall be measured exclusively taking account of the market values established by external experts, based on a specific fairness opinion or, if already defined through a binding agreement with the buyer, the sales price. Those loans are also reclassified as assets held for sale.

As already mentioned, the purchased or originated credit-impaired (POCI) financial assets have specific features in terms of impairment. As a result, value adjustments equal to the lifetime ECL must be recognised on these instruments from their initial recognition date and for their entire lifetime. At each subsequent reporting date, the amount of the lifetime ECL must therefore be adjusted, with the recognition through profit or loss of the amount of any change in lifetime expected credit losses as a gain or an impairment loss. In view of the above, POCI financial assets are initially recognised in Stage 3, subject to the possibility of being subsequently transferred to the performing loans stage, even if an expected loss equal to the lifetime ECL will continue to be recognised.

Lastly, with regard to non-performing loans, it is highlighted that Intesa Sanpaolo uses the – full or partial – write-off/derecognition of unrecoverable accounting positions and, in the following cases, the consequent allocation to loss of the remainder that has not yet been adjusted:
- uncollectability of the debt, as a result of definite and precise elements (such as, for example, untraceability and indigence of the debtor, lack of recovery from realisation of securities and real estate, negative foreclosures, bankruptcy proceedings closed with no full compensation for the Bank, if there are no further guarantees that can be enforced etc.);
- waiver of the credit claim, due to the unilateral cancellation of the debt or residual amount as a result of settlement agreements;
- no waiver of the credit claim. With regard to the full or partial write-offs without waiver of the credit claim, in order to avoid maintaining loans on the balance sheet that have a very low possibility of recovery, despite continuing to be managed by the recovery structures, they are fully or partially written off due to uncollectability even if the legal proceedings have not been closed. The write-off can only involve the portion of the loan covered by provisions and, therefore, each loan can only be written off up to the amount of its net book value. Therefore, on a periodic basis, the Group identifies the bad loan portfolios to be subject to total or partial write-offs with the following macro-characteristics:
  - percentage cover of 100% and a vintage (understood as the period of time in "bad loan" status) of >1 year;
  - percentage cover of >95% and a vintage (understood as the period of time in "bad loan" status) of >5 years or >8 years, respectively, for non-mortgage and mortgage loans.

  Portfolios to be written off can also be identified that have similar characteristics that are different from those indicated above, but that relate to exposures that have a marginal possibility of recovering the amount of the provision, where the minimum amount of the provision (calculated taking into account the accumulated write-offs on the position, according to the same rule established at prudential level by the calendar provisioning framework) is at least equal to the amount needed to bring the value of the exposures up to their fair value estimated based on the prices recorded in the latest sales of bad loans made by the Group.

Impairment of equity investments
At each reporting date the equity investments are subjected to an impairment test to assess whether there is objective evidence to consider that the carrying value of such assets is not fully recoverable.
The process of detection of any impairment involves the verification of the presence of impairment indicators and the determination of any write-down. The impairment indicators are essentially divided into two categories: qualitative and quantitative indicators.
Qualitative indicators include:
- the generation of negative economic results or in any case a significant variance with respect to the targets budgeted or established in the multi-year plans disclosed to the market;
- the announcement/initiation of insolvency proceedings or restructuring plans;
- the downgrading by more than two rating classes;
- failure to discharge payment obligations for debt securities issued fully and in a timely manner;
- use of industrial policy tools aimed at responding to a serious crisis or allowing companies to face restructuring/reorganisation processes.

Quantitative indicators include:
- a reduction in fair value of over 30% below the carrying value or for a period of over 24 months;
- a market capitalisation lower than the company's net book value, in the case of securities listed on active markets, a carrying value of the investment in the Parent Company's financial statements higher than the carrying value in the

consolidated financial statements of the investee's net assets and goodwill, or distribution by the investee of a dividend that is higher than its total income.

The presence of impairment indicators results in the recognition of a write-down to the extent that the recoverable amount is lower than the recognition value.
The recoverable amount consists of the higher of the fair value and the value in use, less costs to sell.
For an illustration of the valuation techniques used to determine fair value, see the specific Section A.4 – Information on fair value.
Value in use is the present value of expected future cash flows from the asset; it reflects estimated expected future cash flows from the asset, the estimate of possible changes in the amount and/or timing of cash flows, time value of money, the price able to repay the risk of the asset and other factors, which may affect the appreciation by market participants of expected future cash flows from the asset.
Value in use is determined by discounting future cash flows.

For controlling investments in subsidiaries, the single equity investments are not individually significant for the purposes of the impairment test in the Parent Company's financial statements, instead they are included in the impairment test of the Cash-Generating Units (CGU) conducted at consolidated level. The CGUs identified are represented in some cases (Banca dei Territori and IMI Corporate & Investment Banking) by operations conducted directly by the Parent Company and some subsidiaries, in other cases (International Banks) by combinations of subsidiaries, and in other cases (Private Banking and Asset Management) they correspond to the associated legal entity. When an equity investment does not produce cash flows that are largely independent of the cash flows from other assets the impairment tests are conducted at CGU level, rather than at the individual investment level. Consequently, when the assets attributable to a subsidiary are included in a CGU that is broader than the equity investment itself, as described in more detail in the following chapter, the impairment test can only be conducted at this level and not at the level of individual subsidiary for which the accurate estimation of a value in use is not possible.

Impairment of non-financial assets
Property, equipment and intangible assets with definite useful life are subject to impairment testing if there is the indication that the book value of the asset may no longer be recovered. The recoverable amount is determined with reference to the fair value of the property and equipment or intangible assets less costs to sell or the value in use, if determinable and if it is higher than fair value.
For property and equipment other than real estate and valuable art assets and intangible assets (other than those recognised following business combinations) it is assumed that the carrying amount normally corresponds to the value in use, since it is determined by a depreciation or amortisation process estimated on the basis of the effective contribution of the asset to the production process and since the determination of fair value is extremely subjective. The two values diverge and lead to impairment in case of damages, exit from the production process or other similar non-recurring circumstances.
As clarified in the discussion of "Property and equipment and intangible assets", Intesa Sanpaolo measures owner-occupied properties and valuable art assets according to the revaluation model; in this case, any impairment loss on a revalued asset must be treated as a decrease in the revaluation up to the relevant amount, after which any difference is taken to the income statement.
As described in the Information on fair value - Fair value of real estate and valuable art assets, for owner-occupied properties each year a scenario analysis is conducted on trends in the real-estate market to assess whether there are any significant deviations in the value of the assets. If significant changes are identified (+ or - 10%), an updated appraisal is prepared to adjust the fair value of the asset to the valuations of the real estate market. If there are no significant differences, the value is redetermined through a new expert appraisal every two years for "trophy assets" (i.e. particularly prestigious properties used by management functions located in the main cities where the bank is based or properties of particular historical and artistic interest because they are listed by the Ministry of Culture) and every three years for other owner-occupied properties.
For the valuable art assets, the revaluation is carried out by means of a new expert appraisal every three years. However, a scenario analysis is carried out annually to identify any appreciable changes in value in order to bring forward the valuation. If the annual monitoring identifies a possible positive or negative value deviation of more than 15% for individual works of artists in the bank's collections and comparable on the basis of objective criteria (size, technique, period of production, etc.), new appraisals are commissioned.
Intangible assets recognised following a business combination and in application of IFRS 3 are subjected to an impairment test at each reporting date to assess whether there is objective evidence that the asset may have been impaired.
Intangible assets with a finite life, represented by the value of the asset management portfolio and the value of the insurance portfolio, in the presence of impairment indicators are subjected to a new valuation process to assess the recoverability of the book values. The recoverable amount is determined on the basis of the value in use, namely the present value estimated using a rate representing the time value of money and the asset's specific risks, of the income margins generated by the existing relations as at the valuation date over a period which expresses their expected residual life.
Intangible assets with an indefinite life, represented by the valuation of the brand name and goodwill, do not have independent cash flows and therefore annually undergo an assessment of the adequacy of the value recorded under the assets with reference to the Cash-Generating Unit (CGU) to which the values are attributed at the time of the business combinations. As CGU identification requires an analysis of the management characteristics and reporting methods used by management, and as the logic for strategic decision-making by management of the Parent Company is that of the Group as a whole and not only that of the Parent Company as an individual entity, the CGUs are identified in the consolidated financial statements.
The CGUs identified are represented in some cases (Banca dei Territori and IMI Corporate & Investment Banking) by operations conducted directly by the Parent Company and some subsidiaries, in other cases (International Banks) by combinations of subsidiaries, and in other cases (Private Banking and Asset Management) they correspond to the associated legal entity. As stated, as these are the same CGUs identified at consolidated level, the assessment of the retention of goodwill and other assets with an indefinite life recorded in the Intesa Sanpaolo Group's financial statements is also valid with

reference to the values recorded in the Parent Company's financial statements. Therefore, the assessment conducted at consolidated level with reference to the individual CGUs is used, after comparing the book value of the assets in the Parent Company's financial statements, without conducting, if the result is positive, a new test in the Parent Company's financial statements.
If, at consolidated financial statement level, an impairment loss needs to be recognised for a particular CGU, this write-down must be assigned to the assets that make up the CGU starting with goodwill. If the need to record an adjustment is found relating to a CGU that does not coincide with the associated legal entity, the write-down is assigned to the banking subsidiaries, after the elimination of the goodwill pertaining to the CGU recorded in the Parent Company's financial statements under a specific caption, on the basis of the respective fair values.
For a description of the criteria for the determination of the recoverable amount of the CGUs see the contents of Part A - Accounting policies, of the consolidated financial statements.
With regard to the intangible asset represented by the brand name, if the reference CGU does not have any goodwill allocated and, as a result, it is not possible to test the recoverable amount of the specific intangible as part of the impairment test of the goodwill based on total cash flows at the level of the CGU, then an independent and specific valuation is made on the basis of the fair value certified by the appraisal of an independent expert.

Business combinations

Business combinations are governed by IFRS 3.
The transfer of control over a company (or over a group of assets managed together as a single business) is considered a business combination.
To this end, control is deemed to have transferred when the investor is exposed to, or has rights to, variable returns from its involvement with the investee and has the ability to affect those returns by exercising its power over the investee.
IFRS 3 requires that an acquirer be identified in any business combination. The acquirer is identified as the combining entity that obtains control of the other combining entities or businesses. If a controlling entity cannot be identified, following the definition of control described above, as for example in the case of exchange of equity investments, the identification of the acquirer must occur considering other factors such as: the entity which has a significantly higher fair value, the entity which pays a cash consideration, the entity which issues new shares.
The acquisition, and therefore the initial consolidation of the acquired entity, must be recognised in the books on the date in which the acquirer effectively obtains control over the acquired company or businesses. When the combination occurs via an exchange of voting ordinary equity instruments, the date of the exchange usually coincides with the date of the acquisition. However, it is always necessary to verify that there are no agreements which may lead to transfer of control prior to the date of the exchange.
The consideration transferred as part of a business combination is equal to the sum of the fair value, at the exchange date, of the transferred assets, the liabilities incurred or assumed and the equity instruments issued by the acquirer in return for control.
In transactions which entail cash consideration (or when payment occurs via cash-equivalent financial instruments), the purchase price is the agreed consideration. When settlement does not occur in the short-term, the fair value of any deferred component is calculated by discounting the amounts payable to their present value; when payment occurs via an instrument other than cash, therefore via the issue of financial instruments, the price is equal to the fair value of such instruments net of the costs directly attributable to their issue. For the determination of fair value of financial instruments, see Section A.4 – Information on fair value and note that, in the case of shares quoted on active markets, fair value is represented by Stock Exchange price at acquisition date or, should that not be available, the last price available.
Purchase price at acquisition date includes any adjustments to the cost contingent on future events, if provided for by the combination agreement and only if the adjustment is probable, can be measured reliably and realised within the twelve months subsequent to the date of acquisition of control. Instead, any restoration related to any loss in the value of the assets used as consideration is not included in purchase price since it is already considered either in the fair value of equity instruments or as a reduction in the premium or an increase in the discount on the initial issue of debt instruments.
Acquisition costs refer to the charges incurred by the acquirer to carry out the business combination, including, for example, professional fees paid to independent auditors, experts, legal advisors, costs for legal opinions and audit of accounts, preparation of information documents required by the law, as well as advisory fees sustained to identify potential acquisition targets if the contract provides for the payment of success fees as well as debt securities' or equities' registration and issue costs.
Acquisition costs must be recognised as charges when incurred and when the related services are provided, except for the costs relating to the issue of debt securities or equities which must be recognised in accordance with IAS 32.
Business combinations must be accounted for using the "acquisition method" whereby identifiable assets acquired (including any intangible assets which had not been previously recognised by the acquired company) or liabilities assumed (including contingent liabilities) are recognised at their fair value at acquisition date.
Moreover, as specifically required by IFRS 3, for each business combination, any minority interest in the acquired company can be recognised at fair value (therefore increasing the consideration transferred) or in proportion to the minority investment in the net identifiable assets of the acquired companies.
If control is achieved in stages, the acquirer recalculates its previous interest in the acquired company at the acquisition date fair value. Any difference with respect to the previous carrying value is taken to income statement.
Excess between the consideration transferred (being the fair value of transferred assets, liabilities incurred and equity instruments issued by the acquirer), increased, where present, by minority interests (determined as above) as well as the fair value of the stakes already held by the acquirer, and the fair value of acquired assets and liabilities should be recognised as goodwill. Conversely, such difference is taken to the income statement when the latter exceed the sum of the consideration, minority interests and the fair value of the stakes already held.
The accounting for business combination can be determined provisionally by the end of the year in which the combination is realised and must be completed within twelve months of the acquisition date.
The following transactions are outside the scope of business combinations: transactions aimed at acquiring control over one or more entities which are not part of the company's business; transactions aimed at acquiring transitory control; transactions

conducted for organisational purposes, therefore between two or more companies or businesses which are already part of the Intesa Sanpaolo Group, and which do not entail changes in control, independently of the extent of minority interests in each of the combining entities before and after the business combinations (business combinations involving entities under common control). These transactions are considered immaterial. Therefore, since there are no specific provisions in IAS/IFRS and in compliance with IAS 8 which requires – in the absence of a specific standard – that the reporting entity must use its judgement in applying an accounting policy that results in information that is relevant, reliable, prudent and that reflects the economic substance of the transaction, these are accounted for safeguarding the continuing values in the financial statements of the acquirer.
Mergers are examples of combinations between companies and represent the most complete business combinations, since they imply the legal and economic unification of the merged entities.

Mergers which entail the establishment of a new legal entity and mergers by incorporation (which entail that an entity is absorbed by another existing entity) are treated according to the criteria illustrated above, that is:
- if the transaction leads to the transfer of control of a company, it is accounted for as a business combination as provided for by IFRS 3;
- if the transaction does not lead to the transfer of control, it is accounted for by privileging the continuity of the values.

A.3 – INFORMATION ON TRANSFERS BETWEEN FINANCIAL ASSET PORTFOLIOS

Following the adoption of IFRS 9, the Intesa Sanpaolo Group did not make changes to its business model for managing its financial assets and, therefore, no transfers occurred between portfolios of financial assets.
According to the general rules established by IFRS 9 on the reclassification of financial assets (except for equity instruments, for which no reclassification is permitted), reclassifications to other categories of financial assets are not permitted unless the entity changes its business model for those financial assets. Such changes are expected to be extremely rare and must be decided by the management following significant external or internal changes that can be demonstrated to external parties.

A.3.1 Reclassified financial assets: change in business model, book value and interest income
No disclosure is required since there are no reclassified financial assets recognised under balance sheet assets.

A.3.2 Reclassified financial assets: change in business model, fair value and effects on comprehensive income
No disclosure is required since no transfers were carried out between portfolios of financial assets in 2024.

A.3.3 Reclassified financial assets: change in business model and effective interest rate
No disclosure is required since there are no reclassified financial assets recognised under balance sheet assets.

A.4 – INFORMATION ON FAIR VALUE

FAIR VALUE MEASUREMENT OF FINANCIAL ASSETS AND LIABILITIES, INDEPENDENT PRICE VERIFICATION AND PRUDENT VALUATION

FAIR VALUE, INDEPENDENT PRICE VERIFICATION AND PRUDENT VALUE OF FINANCIAL INSTRUMENTS

The framework of financial measurement at fair value is based on three pillars: fair value measurement according to the IAS/IFRS, independent price verification (IPV) and prudent value measurement. The latter two are established by the Capital Requirements Regulation (CRR). The paragraphs below describe the methods applied by the Bank to implement and use those elements.

General fair value principles

The Bank governs and defines the fair value measurement of financial instruments through the Group Guidelines and Rules for Valuation of Financial Instruments at Fair Value, drawn up by the Market & Financial Risk Management structure.

The "Guidelines for Valuation of Financial Instruments at Fair Value", once a favourable opinion has been given by the Group Financial Risks Committee, are revised and approved at least on an annual basis by the Board of Directors, with the support of the Risks and Sustainability Committee. The "Rules for Valuation of Financial Instruments at Fair Value" are reviewed, revised and approved at least on an annual basis by the Group Financial Risks Committee, which is specifically delegated to do so by the Management Bodies, and which also reviews material changes and updates proposed by Market & Financial Risk Management.

The "Rules for the measurement of unlisted equity investments", drawn up by Group Shareholdings and approved by the Group Financial Risks Committee, govern the fair value measurement of unlisted equities and financial instruments with unlisted equities as their underlying.

IFRS 13, which harmonises the measurement rules and the related disclosure, defines fair value as the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants (i.e. not as part of the compulsory liquidation or a below-cost sale) as at the measurement date. Fair value is a market measurement criterion, not specifically referring to a single Bank. Underlying the definition of fair value is the assumption that the Bank is carrying out normal operations, without any intention of liquidating its assets, significantly reducing the level of operations or carrying out transactions at unfavourable conditions.
The Bank measures the fair value of an asset or liability by adopting the assumptions that would be used by market participants when pricing an asset or liability, presuming that they act with a view to satisfying their own economic interest in the best way possible. Measurement at fair value presumes that the asset is sold or the liability transferred:
– in the principal active market for the asset or liability;
– in the absence of a major market, in the most advantageous active market for the asset or liability.

The Bank is not required to conduct an exhaustive study of all possible markets to identify the major market or, in the absence of the major market, the most advantageous market, but must take into account all the reasonably available information. If there is no evidence to the contrary, the market that the entity normally operates in to sell the asset or transfer the liability is assumed to be the major market or the most advantageous market, if there is no major market. The Bank considers the principal market of a financial asset or liability to be the market in which the Bank generally operates.

In accordance with IFRS 13, the Bank considers an active market to be a market where transactions in an asset or liability occur with sufficient frequency and volume to provide useful information for determining price on an ongoing basis. More specifically, a financial instrument is regarded as quoted in an active market if quoted prices are readily and regularly available from an exchange, dealer, broker, industry group, pricing service or regulatory agency, and those prices represent actual and regularly occurring market transactions on an arm's length basis.

In specific cases, governed by the Guidelines and Rules for Valuation of Financial Instruments at Fair Value, and despite being quoted on regulated markets, relevant research is carried out to verify the significance of the official market values. In the event of a significant reduction in the volume or level of operations compared to normal operations for the asset or liability (or for similar assets or liabilities) highlighted by a number of indicators (number of transactions, limited significance of market prices, significant increase in implicit premiums for liquidity risk, widening or increase of the bid-ask spread, reduction or total lack of market for new issuances, limited publicly-available information), analyses of the transactions or of the quoted prices must be carried out. A reduction in the volume or the level of activity alone may not indicate that the price of a transaction or the quoted price does not represent fair value or that the transaction in that market is not ordinary. If an entity determines that a transaction price or quoted price does not represent fair value (e.g., non-ordinary transactions) an adjustment to the transaction prices or listed prices is required if the entity uses those prices as the basis for fair value measurement and that adjustment may be significant with respect to the fair value as a whole.

The fair value of financial instruments

The presence of quoted prices in an active market represents the best evidence of fair value and these prices are therefore the quoted prices to be used on a priority basis for the measurement of financial assets and liabilities. If there is no active market, the fair value is determined using valuation techniques aimed, ultimately, at establishing the price the product would have had, at the measurement date, in an arm's length exchange motivated by normal business considerations.
The choice of the above measurement methods is not optional, because they must be applied in hierarchical order: the availability of a price stated in an active market prevents the use of one of the other measurement approaches.

Inputs of the valuation techniques

The inputs are defined as the assumptions that market participants would have used to determine the price of the asset or the liability, including assumptions regarding risk, such as, for example, the risk relating to a particular valuation technique used to measure fair value or the risk relating to the inputs of the valuation technique. The inputs may be observable or unobservable.
Observable inputs are those produced using market data, such as publicly available information on operations or actual events, which reflect the assumptions that market participants would use in determining the price of the asset or the liability.
Unobservable inputs are those for which no market information is available and that are produced using the best available information regarding the assumptions that market participants would use to determine the price of the asset or the liability.

Fair value hierarchy

IFRS 13 establishes a fair value hierarchy in which inputs to fair value measurement techniques are divided into three levels. That hierarchy assigns top priority to (unadjusted) quoted prices on active markets for identical assets or liabilities (level 1 data) and the lowest priority to unobservable inputs (level 3 data). Specifically:

- fair value level 1 applies when an instrument is measured directly on the basis of (unadjusted) quoted prices on active markets for identical assets or liabilities to which the entity has access on the measurement date;
- fair value level 2 applies when a price has not been found on an active market and the instrument is measured according to valuation techniques, on the basis of observable market parameters, or of the use of parameters that are not observable but are supported and confirmed by market evidence, such as prices, spreads or other inputs (the comparable approach);
- fair value level 3 applies when fair value is measured using various inputs, not all of which are directly drawn from observable market parameters, and which thus entail estimates and assumptions by the valuator.

If various inputs are used to measure the fair value of an asset or liability, classification in the hierarchy is determined on the basis of the lowest-level input used in measurement. When assigning a level in the fair value hierarchy, priority is given to the inputs of the valuation techniques rather than the valuation techniques themselves.
The attachment "Fair Value Hierarchy Rules" to the "Rules for Valuation of Financial Instruments at Fair Value" defines, with regard to the respective financial instrument valuation models/inputs, the basic rules that market inputs must comply with in order to be classified as Level 2, and the significance thresholds which, when overrun, result in the assignment of Level 3.

For level 1 financial instruments, the current bid price is used for financial assets and the current ask price for financial liabilities, struck on the principal active market at the end of the reference period.
For financial instruments with a scarcely significant bid-ask spread or for financial assets and liabilities with offsetting market risks, mid-market prices are used (again referred to the last day of the reference period) instead of the bid or ask price.
The following are considered level 1 financial instruments: contributed bonds (i.e. bonds for which the Composite Bloomberg Bond Trader is available from the Information Provider Bloomberg, or, alternatively, a price on the EuroMTS circuit, or at least three prices available from the Information Provider Bloomberg), contributed equities (i.e., quoted on the official market of reference), contributed UCITS funds (covered by EU directives), spot exchange rates, and derivatives for which prices are available on an active market (for example, exchange traded futures and options) and UCITS hedge funds.
Conversely, all other financial instruments that do not belong to the above-described categories or that do not have the contribution level defined by the Guidelines and Rules for Valuation of Financial Instruments at Fair Value are not considered level 1 instruments.

When no listing on an active market exists or the market is not functioning regularly, that is when the market does not have a sufficient and continuous number of trades, and bid-ask spreads and volatility that are not sufficiently contained, the fair value of the financial instruments is mainly determined through the use of valuation techniques whose objective is the establishment of the price at which, in an orderly transaction, the asset is sold or the liability transferred between market participants, as at the measurement date, under current market conditions.
In the case of instruments classified as level 2, the valuation is based on prices or credit spreads presumed from the official listing of instruments which are similar in terms of risk factors, using a given calculation methodology (valuation model). The use of this approach requires the identification of transactions on active markets in relation to instruments that, in terms of risk factors, are comparable with the instrument to be measured. Level 2 calculation methodologies reproduce prices of financial instruments quoted on active markets (model calibration) and do not contain discretional parameters – parameters for which values may not be inferred from quotations of financial instruments present on active markets or fixed at levels capable of reproducing quotations on active markets – that significantly influence the final measurement.

The following are measured using level 2 input models:
- bonds without official quotations expressed by an active market and whose fair value is determined through the use of an appropriate credit spread which is estimated starting from contributed and liquid financial instruments with similar characteristics;
- loans whose fair value is determined through the use of an appropriate credit spread which is estimated starting from market data of financial instruments with similar characteristics;
- derivatives measured through specific models, fed by input parameters (such as yield, foreign exchange and volatility curves) observed on the market;
- structured credit products (including, among others, ABSs – Asset Backet Securities, CLOs HY - Collateralized Loan Obligations High Yield, CDOs - Collateralized Debt Obligations) for which significant prices are not available and whose fair value is measured using valuation techniques that consider parameters that can be gathered from the market;
- non-contributed equity instruments measured based on direct transactions, that is significant transactions on the stock registered in a time frame considered to be sufficiently short with respect to measurement date and in constant market conditions, or using the "relative" valuation models based on multipliers;
- non-UCITS hedge funds, provided the Level 3 instruments do not exceed a set threshold.

In case of instruments classified as level 3, the calculation of the fair value is based on valuation models which consider input parameters not directly observable on the market, therefore implying estimates and assumptions on the part of the valuator. In particular, the valuation of the financial instrument uses a calculation methodology which is based on specific assumptions of:
- the development of future cash flows, which may be affected by future events that may be attributed probabilities presumed from past experience or on the basis of the assumed behaviour;
- the level of specific input parameters not quoted on active markets, for which information acquired from prices and spreads observed on the market is in any case preferred. Where this is not available, past data on the specific risk of the underlying asset or specialised reports are used (e.g. reports prepared by Rating agencies or primary market players).

The following are measured using this method:
- some transactions in derivatives, bonds, or complex structured credit instruments measured using level 3 inputs;
- hedge funds in which the level 3 assets are above a set limit;
- private equity funds, private debt funds, real estate funds and closed-end funds resulting from sales of non-performing loans valued at NAV (Net Asset Value), with possible discounts;
- shareholdings and other equities measured using models based on discounted cash flows or using equity methods;
- loans whose fair value is determined through the use of a credit spread that does not meet the criteria to be considered level 2;
- loans with underlying equity risk, whose fair value is calculated based on the discounting of expected contractual flows.

The transfer of fair value levels of financial assets and financial liabilities measured at fair value on a recurring basis occurs, as established by IFRS 13, as follows: the transfer between levels 2 and 3 occurs upon a change in the observability or significance of an input to the measurements; and the transfer between levels 1 and 2 or 3 occurs upon a change in the availability of prices in an active market.

For OTC derivatives, the initial choice of the level of fair value hierarchy depends on the degree of observability and significance of the parameters used to determine the risk-free component. The calculation of the counterparty/issuer default risk component may result in a transfer to level 3 when the current exposure is positive for the bank and the counterparty is in non-performing loan status, or when the determination of default risk requires unobservable inputs and the bilateral credit value adjustment (bCVA) component is significant when compared to the overall fair value of the netting set, or when the counterparty's sensitivity to downgrading is significant when compared to the overall fair value of the netting set.

For non-contributed equity instruments, the change of the level occurs:
- when inputs observable on the market (e.g., prices defined based on comparable transactions on the same instrument between independent and informed counterparties) have become available during the period. In this case, Intesa Sanpaolo reclassifies from level 3 to level 2;
- when the directly or indirectly observable elements used as the basis for the valuation cease to exist, or when they are no longer up to date (e.g., comparable transactions that are no longer recent or multiples that are no longer applicable). In this case, Intesa Sanpaolo uses valuation techniques that use unobservable inputs.

Valuation of financial instruments

The valuation of financial instruments entails the following phases:
- identification of the sources for valuation: for each asset class, the Guidelines and Rules for Valuation of Financial Instruments at Fair Value establish the processes that are necessary to identify market parameters and the manner according to which such data must be extracted and used;
- validation and processing of input data for periodic valuation: this stage consists of the accurate verification, at each accounting measurement date, of the market parameters used (verifying the integrity of data contained on the proprietary platform with respect to the source of contribution), reliability tests (consistency of each single figure with similar or comparable figures) and verification of concrete application means;
- certification of the measurement methods: this phase is aimed at verifying the consistency and the adherence of the various measurement techniques used with current market practice, at highlighting any critical aspects in the measurement models used and at determining any adjustments necessary for measurement;
- monitoring and revision of the measurement methods: the monitoring consists of the ongoing checking of the adherence to the market of the valuation model and enables the timely discovery of any gaps, in order to initiate the necessary checks and measures.

Identification, certification and processing of the input data for the measurements

The fair value calculation process and the need to distinguish between products which may be measured on the basis of effective market quotes rather than through the application of measurement techniques, highlight the need to establish univocal principles in the determination of market parameters. To this end, the Guidelines and Rules for Valuation of Financial Instruments at Fair Value establish the processes needed to identify the market parameters, the contribution sources considered appropriate and how the data must be received (cut-offs) and used for the measurement of financial instruments held for any purpose in the proprietary portfolios of the Parent Company and its subsidiaries. The same sources are used in measurements carried out for third parties under Service Level Agreements, entered into in advance. The adequacy of the input data for the measurements is guaranteed by the respect of reference requirements, which are based on comparability, availability and transparency of the data, or the possibility of extracting the figure from one or more info providing systems, measuring the contribution bid-ask, and lastly, for OTC products, verifying the comparability of the contribution sources.
The use of all market parameters in Intesa Sanpaolo is subordinated to their certification by Market & Financial Risk Management, in terms of specific controls (verifying the integrity of data contained on the proprietary platform with respect to the source of contribution), reliability tests (consistency of each single figure with similar or comparable figures) and verification of concrete application means.

Certification of measurement methods

The measurement methods used by the Intesa Sanpaolo Group are certified by IMI CIB Risk Management, with the involvement of all relevant structures. The purpose of the certification is to verify the consistency of the methods with current market practice, to highlight any problems or limitations, and to determine any fair value adjustments, in accordance with the applicable regulations. The certification process considers all aspects of the measurement method (basic assumptions, mathematical derivation, any approximations, numerical algorithms used, inputs and outputs) but also all contextual elements that are relevant to the management, including the characteristics of the associated products (payoffs, early termination clauses, etc.), any ancillary agreements (e.g. netting or collateral agreements), the market where the products are traded, and how they are used by end users (e.g. precision vs. performance, calculation of risk measures, etc.). These aspects are subject to qualitative and quantitative analysis and are duly reported in the internal documentation.
The possibility of independent validation issued by high standing financial service companies is also envisaged in highly-complex cases and/or in presence of market turbulence (market dislocation).
At the end of the certification process, the measurement method is recorded in the Rules for Valuation of Financial Instruments at Fair Value.

Monitoring and review of measurement methods

As required by the applicable regulations, the measurement methods used are subject to ongoing monitoring of their performance with respect to the evolution of financial instruments, markets and methodological innovations developed by the scientific community, in order to ensure their continuous alignment to the market, promptly highlight any inadequacies and initiate the necessary checks and actions. The Rules for Valuation of Financial Instruments at Fair Value detail all elements considered for the periodic monitoring and revision of the measurement methods. The functions involved in the monitoring process are the same as those involved in the process of certification of the measurement methods mentioned above and in the IPV process governed by the Guidelines and Rules on Independent Price Verification.

Valuation risk: fair value adjustments

The Bank defines valuation risk as the risk of losses arising from the valuation uncertainty for the fair value exit price of financial instruments, due to any limitations of the measurement techniques used or particular market conditions.
The main measure of the valuation risk associated with a financial instrument are the fair value adjustments, which are designed to take into account the valuation uncertainty or the difficulty in the disposal of specific financial positions, and may relate to a single financial instrument or to the net position for a particular risk factor. The adjustments may be calculated as add-ons to the valuation or included directly in the valuation. They are regularly reviewed, also considering market trends, or the introduction of new liquid instruments, different calculation methodologies and, in general, methodological advances which may also lead to significant changes in measurement methods chosen and their implementation.
In particular, the Bank envisages fair value adjustments for the following categories of valuation uncertainty:

- uncertainty of input data: any valuation uncertainty related to the input data for the valuation (whether mid, bid or ask) is measured with respect to temporary or structural conditions on the markets or in relation to the size of the values held (in the case of concentration), and where necessary a fair value adjustment is made, quantifying the consequent impact on the valuations;
- illiquidity of the underlying positions or risk factors: similarly to the case above, the market bid-ask spread is measured and, where necessary, a fair value adjustment is made, quantifying the consequent impact on the valuations;
- model risk: this is based on the identification and use of variants of the same model or alternative models, with which to carry out comparison analyses aimed at quantifying the variability of the valuations (in particular any directionality of the price when the model changes) and the behaviour of the model in various market scenarios (stress tests). The quantification of the fair value adjustment is based, where possible, on easily comprehensible and measurable financial variables (e.g. vega, delta, correlation shift). This category includes transactions involving ESG contractual clauses that condition cash flows on the achievement of environmental, social or governance objectives by the counterparty. If these clauses are favourable to the counterparty, a prudential fair value adjustment is made by considering the most unfavourable scenario for the Bank;
- counterparty and funding risk: counterparty and funding risks, collectively referred to as XVA, include Bilateral Credit Value Adjustment (bCVA) and Funding Value Adjustment (FVA). The bCVA takes account of the counterparty risk premium associated with the possibility that the counterparties may not honour their mutual commitments (for example in the event of bankruptcy). This component derives, in turn, from two components: the Credit Value Adjustment (CVA, negative) and the Debt Value Adjustment (DVA, positive), which consider, respectively, the scenarios where the Counterparty goes bankrupt before the Bank (and the Bank has a positive exposure towards the Counterparty), and vice versa the scenarios where the Bank goes bankrupt before the Counterparty (and the Bank has a negative exposure

towards the Counterparty). The Funding Value Adjustment (FVA, negative), on the other hand, takes into consideration the funding risk premium, connected to the costs of funding the cash flows (coupons, dividends, collateral, etc.) generated by the Bank's overall OTC derivatives portfolio. The calculation of the XVAs depends on the overall exposure between the two counterparties, calculated using techniques for simulating the underlying risk factors of the transactions considered, taking into account any counterparty risk mitigation arrangements (in particular netting and collateralisation agreements), as well as any contractual clauses. The calculation of the XVAs also depends on the Loss Given Defaults (LGDs) based on the estimated value of the expected recovery in the event of counterparty default, and the probability of counterparty default (PD). LGDs and PDs are obtained from credit default swap market quotes or are based on internal estimates by sector/rating used for credit risk. In addition, the FVA calculation is based on a funding curve representative of the best market counterparties that the Bank could renegotiate transactions with, in accordance with the most IFRS 13 advantageous market principle, as there is currently no real main market for these transactions.

The management process for fair value adjustments is formalised in the Guidelines and Rules for Valuation of Financial Instruments at Fair Value and the Rules for the Valuation of Unlisted Equity Investments with appropriate calculation methodologies on the basis of the different configurations of the points set out above, and is carried out in the most objective, consistent and systematic manner possible by IMI CIB Risk Management and Group Shareholdings. The introduction and release of the fair value adjustments depend on the factors described above. Such processes are a combination of quantitative elements that are rigidly specified and qualitative elements, valued based on the different configuration over time of the risk factors which generated the adjustments. Thus, the estimates subsequent to initial recognition are always guided by the mitigation or elimination of said risks.

For new products, the decision to apply the adjustments is taken during the new product approval process, upon proposal by IMI CIB Risk Management.

The application of the adjustments is subject to an authorisation procedure that, above a certain warning threshold defined for specific cases, involves both the area of the Chief Risk Officer and the Manager responsible for preparing the Company's financial reports.

A.4.1 Fair value levels 2 and 3: valuation techniques and inputs used

The sections below provide a summary of the information, by type of financial instrument (securities, derivatives, structured products, hedge funds, and loans), on the valuation models used.

I. Valuation of non-contributed debt securities

The fair value of non-contributed debt securities is measured using the income approach, i.e. by calculating the present value of expected future cash flows using an appropriate risk premium represented by the credit spread, identified on the basis of contributed and liquid financial instruments with similar characteristics. The sources used for this measurement are the following:

- contributed and liquid debt securities of the same issuer;
- credit default swaps on the same reference entity;
- contributed and liquid securities of an issuer with the same rating and belonging to the same sector.

In any case, the different seniority of the security to be priced is considered with regard to the issuer's debt structure.

In the case of Italian public issuers, a rating/maturity matrix is defined on the basis of the spread levels on government issues, to which the spreads among the various rating/maturity classes with respect to public issues (regions, provinces, municipalities, government entities) are applied.

When applying the spread for the pricing of the non-contributed instrument, if the estimated 'fair' credit curve does not respect the same characteristics of the instrument, correction factors are considered.

Also, for bonds that are not quoted on active markets, an extra spread, estimated based on the bid/ask spread recorded on the market, is added to the "fair" credit spread component, to take account of the higher premium demanded by the market compared to similar contributed securities.

Finally, if the instrument includes an optional component, a further adjustment is made to the spread by adding a component designed to capture the hedging costs of the structure and any illiquidity of the underlying assets. This component is calculated based on the type of option, using the corresponding valuation models for derivatives mentioned below.

Similarly, Intesa Sanpaolo's credit spread for the Bank's financial liabilities designated at fair value is determined and measured based on the bonds issued by the Parent Company, with regular, periodic coupons, maturity beyond one year and quoted on an active market in compliance with IAS/IFRS. The implicit credit rating is determined on the basis of market prices and subsequently adjusted through interpolation models which generate credit spread curves by type of coupon, maturity and subordination level. Similarly, the issued certificates are measured at fair value by breaking them down into the following two components: an issued bond, measured as described above, and an option component, measured using the corresponding derivative pricing models described below.

II. Valuation of loans

Loans are measured at fair value through contributions from info providers when available or by calculating the present value of expected future cash flows using an appropriate credit spread, identified starting from the following sources:

- contributed loans on the market;
- sector/rating-specific loan market curves;
- contributed securities of the same issuer;
- credit default swaps on the same reference entity.

In any case, the different seniority of the instrument to be priced is considered with regard to the issuer's debt structure.

When applying the spread for the pricing of the loan, if the estimated 'fair' credit curve does not respect the same characteristics of the instrument, correction factors are considered.

Moreover, where, in determining the credit spread of the loans, reference is made to the curves created through bonds,

a Bond – Loan basis must be applied, to capture the different structure of the market, if any, and the different type of loan.
In order to consider the premium required by the market for illiquid and/or structured instruments, several adjustments are applied to the credit spread.
Loans with an underlying unlisted equity risk (which include financial instruments that, pursuant to IAS 32, cannot be classed as equity, e.g. loans convertible into shares) are usually measured by discounting the cash flows provided for by the contract. Since these are debt securities, the cash flows are normally discounted using a rate consisting of the sum of: a risk free rate, a spread deriving from the CDS or measured on listed securities or similar disbursements, and any additional risk premium.
In the case of non-performing loans, the fair value is determined based on the recoverable amount of the position. This estimate is made taking into account the contractual elements that characterise the loan and may involve, for example, the valuation of the cash flows from the sale of the real estate pledged as collateral or the valuation of any capital instruments that may be acquired following the introduction of an equity conversion clause for the position.

III. Valuation of OTC derivatives

Derivatives, if not traded on regulated markets, are Over The Counter (OTC) instruments, which are bilaterally exchanged with market counterparties and are measured through specific measurement methods and input parameters (such as, for example, interest rate, foreign exchange and volatility curves) observed on the market and subject to the certification and monitoring illustrated above.
The fair value of an OTC derivative is calculated considering the risk premium related to the various underlying risk factors. Specifically, there are two relevant cases, according to whether or not the instrument is subject to collateralisation agreements (CSAs) aimed at mitigating the counterparty and funding risk:

- for CSA transactions with characteristics that reduce counterparty and funding risk to a negligible level, the fair value is calculated according to the non-arbitrage principle, by including the market risk premium related to the risk factors underlying the contract (e.g. interest rates, volatility, etc.), and, in the most significant cases, using the rate of remuneration for the collateral as the discount rate for the future cash flows;
- for transactions without CSAs, or with CSAs with characteristics that do not reduce the counterparty and funding risk to a negligible level (e.g., One Way CSAs, or with non-negligible limits or minimum transfer amounts), the fair value of the instrument may be stated, under appropriate circumstances, as the sum of the reference (or base) value, equal to the price of the corresponding collateralised instrument, and several additional valuation components related to the counterparty and funding risk premium, referred to jointly as XVA (see "Valuation risk: fair value adjustments").

In view of the number and complexity of the OTC derivatives, a systematic reference framework has been developed which represents the common elements (calculation algorithms, processing models, market data used, basic assumptions of the model) that are used for their measurement.

The table below illustrates the main methods used to measure OTC derivatives based on the category of underlying asset.

Underlying class	Valuation models	Market data and input parameters
Interest rate	Net Present Value, Shifted-Black, Shifted-SABR, Libor Market Model, Hull-White, Bivariate log-normal, Hagan exact formula for CMS	Interest rate curves (deposits, FRA, Futures, OIS, swap, basis swap, CMS), cap/floor/swaption option volatility, correlation between interest rates
Foreign exchange rate	Net present Value FX, Garman-Kohlhagen, Mixture, Stochastic Local Volatility, Local Volatility	Interest rate curves, spot and forward FX curves, FX volatility, "quanto" volatility and correlations
Equity	Accrual, Net present Value Equity, Generalised Black-Scholes, Heston, Local Volatility, Jump Diffusion	Interest rate curves, underlying asset spot rate, expected dividends, underlying asset volatility and correlation between underlying assets, "quanto" volatility and correlations
Inflation	Inflation NPV, Inflation SABR, Inflation Jarrow-Yildirim	Nominal and inflation interest rate curves, interest and inflation rate volatility, seasonality ratios of consumer price index, correlation between inflation rates
Commodity	Net present Value Commodity, Black-Scholes Commodity, Independent Forward, Local Volatility, 2-Factors Jump Diffusion	Interest rate curves, spot rate, forwards and futures of underlying assets, underlying asset volatility and correlation between underlying assets, "quanto" volatility and correlations
Loans	Net present Value, CDS Option (or log-normal model), Contingent CDS	Probability of default, Recovery rate, credit index volatility.

As envisaged by IFRS 13, in determining fair value, the Bank also takes into account the effect of non-performance risk. This risk includes changes in the counterparty credit rating and changes in the issuer's own credit risk.

IV. Valuation model for structured credit products

With regard to asset-backed securities (ABSs), if significant prices are not available, valuation techniques are used that take into account parameters that can be gathered from an active market (level 2 inputs) or, where parameters cannot be observed, estimated parameters (level 2 or 3 inputs, where immaterial or material).

In this case, the cash flows are obtained from infoproviders or specialised platforms, where available, or are taken from the business plan of the transaction, supplemented with periodic reporting, such as the case of Non-Performing Loans (NPLs) and Unlikely to Pay (UTP); the spreads are gathered from prices available on the market/market info provider, further strengthened by a qualitative analysis relative to the performance of the underlying assets presumed from periodic investor reports and aimed at highlighting structural aspects that are not (or not fully) encompassed by the analyses described above, relating to the actual future ability to pay the expected cash flows and analyses of relative value with respect to other similar structures.

In the case of securitised high-yield loans to European corporate borrowers (HY CLO), valuation techniques call for calculation of the net present value of the expected cash flows, determined through specialised platforms, discounted using market spreads. When modelling expected future flows, account is taken of all contractual aspects of the HY CLOs that may influence the waterfall, i.e. the distribution of cash flows from the collateral on the notes.

After this valuation, credit analyses on underlying assets are fine-tuned to incorporate further valuation elements not included in the quantitative models. In particular, a Qualitative Credit Review is provided for and entails an accurate analysis of credit aspects referred to the specific structure of the HY CLO and to the collateral present. This is to identify any present or future weaknesses which emerge from the characteristics of the underlying assets, which could have been missed by rating agencies and as such not fully considered in the valuations described in the previous point.

V. Valuation of non-contributed equities

Level 2 equities include:

- equities measured based on direct transactions, that is significant transactions on the stock registered in a time frame considered to be sufficiently short with respect to measurement date and in constant market conditions;
- equities measured using relative methods, based on multipliers: implied multiples in transactions in comparable listed or unlisted companies, within a time frame deemed sufficiently short with respect to the time of measurement and under constant market conditions (M&A multiples) or implicit multiples in the stock market prices of a sample of comparable companies (stock market multiples).

Level 3 equities for which the "relative" models described above are not applicable in significant terms, and, therefore, "absolute" valuation models are used, include:

- equities for which analytical models based on flows are used, which determine the value through estimates of the cash or income flows that the company is expected to generate over time, discounted using an appropriate rate based on the level of risk of the instrument;
- equities measured based on net worth criteria such as NAV or Adjusted Net Asset Value (ANAV), which estimates the fair value of the various components of the assets of the investee.

Any values deemed representative of the fair value of the equity instrument deriving from contractual clauses (for example, options) are classified in level 2 or 3 of the fair value hierarchy, according to the observability of the inputs used in the valuation. Specifically, if the negotiation of the clause resulted in strike prices or pre-defined algorithms and multiples, the instrument is classified in level 2.

The cost criterion as estimate of fair value is used to a lesser extent, where none of the previous methods are applicable due to lack of sufficient information, and in the cases where there is a wide range of possible fair value measurements and it is not possible to identify the most appropriate value among these.

This case also includes Equity Instruments which, in accordance with IAS 32, have the characteristics to be considered as equities.

VI. The valuation of hedge funds

The fair value of a hedge fund corresponds to the Net Asset Value (NAV) provided by the fund administrator, to which an adjustment can be applied, deriving from a measurement process aimed at capturing the main risk factors that the management of the funds is subject to, which consist of the following two types:

- counterparty (broker) risk, i.e. the risk that the assets of the fund are exposed to when a single service provider is entrusted with prime brokerage or custodian activities, subject to the risk of default;
- illiquidity risk, i.e. the risk that the assets of the fund are illiquid due to the limited prices available or due to a lack of information on the assessment policies used by the fund.

These risks are assessed on the basis of the information contained in the documentation received periodically from the fund managers or administrators.

The fair value hierarchy level is Level 2, provided the Level 3 instruments do not exceed a set threshold.

VII. The valuation of private debt funds

For Private Debt Funds, the investment authorisation process involves an initial due diligence to verify the consistency between each fund's asset valuation policy and the Guidelines and Rules for Valuation of Financial Instruments at Fair Value. The fund is subsequently valued at NAV. The fair value hierarchy level is Level 3.

VIII. Valuation of closed-end private equity funds, real estate funds and closed-end funds resulting from sales of non-performing loans

Closed-end private equity funds are usually valued using the latest Net Asset Value approved by the asset management company (published half yearly or quarterly), adjusted solely to take into account events that have not yet occurred at the reference date of the NAV, such as:

- a material transaction on a portfolio company;
- the bankruptcy or liquidation of a portfolio company;
- the alignment of any listed assets to current prices;
- draw downs and distributions by the fund.

Closed-end real estate funds are valued using the last available Net Asset Value, adjusted for any subsequent call ups or distributions and, where considered necessary, applying a discount calculated using an internal model, with the aid of an independent expert. Specifically, this model enables the calculation of a discount on the Net Asset Value based on five different factors: (i) the size of the asset management company that manages the fund; (ii) the number of subscribers; (iii) the fund's historical return; (iv) the fund's return for the period; and (v) the level of debt. These factors are calibrated differently based on the business model and the fund's resulting risk profile, distinguishing between core, value added and opportunistic funds.

With regard to closed-end funds resulting from sales of non-performing loans, where an information set is available that makes it possible to conduct an analysis of the business plan of the positions held by the fund, individually or by uniform cluster, to determine the fair value of the units of the fund, in general the Bank uses the support of an independent expert, who, among other duties, carries out a comparison of performance of the business plans of the underlying exposures, and states in its report, that the fair value determined by the expert complies with the indications from the main regulators[212].

Where it is not possible to apply the approach mentioned above, for each fund a comparison is made between the expected return of the fund and a benchmark rate, defined using a model that factors in various elements, such as: i) the fund's valuation policies, verifying whether they are compliant with criteria consistent with the definition of fair value pursuant to IFRS 13, ii) verification that there is an updated business plan and of the performance of the fund compared to the available business plan, iii) the characteristics of the fund's assets, iv) the level of the cost of funding on the market for issuing liquid instruments, v) the completeness and extensiveness of the information provided by the fund, and vi) the fund management methods. Where the expected return of the fund is higher than the defined benchmark rate, the NAV communicated by the asset management company is used as the fair value measure. Where, instead, the benchmark rate is higher than the expected return of the fund, the fair value is determined based on the NAV minus a discount, which takes account of the spread between the benchmark rate and the expected return of the fund and the average residual life of the fund (Weighted Average Life or WAL).

Valuation of financial assets and liabilities not measured at fair value on a recurring basis

Finally, for asset and liability financial instruments measured at amortised cost, whose fair value is determined solely for the purposes of disclosure in the notes to the financial statements, the following is noted:

- the fair value of the bonds is calculated using the methods described above;
- the fair value measurement of the other medium- and long-term asset and liability financial instruments is performed by discounting future cash flows using the discount rate adjustment approach, which requires credit risk factors to be taken into account in the discount rate for future cash flows;
- for short-term assets and liabilities, the book value is assumed to be a reasonable approximation of fair value.

For more information see paragraph A.4.5.4.

[212] See Bank of Italy/Consob/Ivass Document no. 8 "Treatment in the financial statements of sales without recourse of unlikely-to-pay loans in exchange for units of investment funds", published in April 2020.

As required by IFRS 13, the table below highlights, for financial assets and liabilities measured at level 3 fair value, quantitative information on the significant, unobservable inputs used in the fair value measurement.

(thousands of euro)

Financial assets/ liabilities	Valuation technique	Main non-observable input	Minimum value of range of changes	Maximum value of range of changes	Unit	Favourable changes in FV	Unfavourable changes in FV
Securities and loans	Discounting Cash Flows	Credit Spread	-2	2	%	994	-1,205
Structured securities and loans	JD model	JD parameters	-46	14	%	281	-611
Structured securities and loans	Two-factor model	Correlation	-77	35	%	85	-21
ABSs	Discounting Cash Flows	Credit Spread	-2	2	%	468	-516
CLOs Cash	Discounting Cash Flows	Credit Spread	-6	6	%	240	-250
OTC derivatives subject to FV adjustment for CVA/DVA	CVA	Loss Given Default Rate (LGD)	0	100	%	433	-1,338
OTC derivatives subject to FV adjustment for CVA/DVA	CVA	Probability of default (PD) based on counterparty's internal rating	CCC	A	Internal rating	775	-690
OTC Derivatives - Equity basket option	Black - Scholes model	Equity basket correlation	92	99	%	12	-9
OTC Derivatives - Equity Option	Black - Scholes model	Historical volatility	8	37	%	544	-1,732
OTC Derivatives - Equity Option	Marshall Olkin Model	Historical correlation	4	67	%	63	-44
Fondi hedge	Discounting Cash Flows	Net Asset Value	-1	2	%	70	-48
Uncontributed Equity Securities	Net present value	Cost of Equity	-100	100	bp	6,245	-5,027
Uncontributed Equity Securities	Various	Carrying Amount/Net Asset Value	-0.89	0.89	%	4,540	-4,540
UCI units deriving from sales of non-performing loans and similar assets	Adjusted NAV on IRR Basis/Net Present Value	IRR benchmark / Cost of Equity	-100	100	bp	40,388	-42,375
UCI units not deriving from sales of non-performing loans and similar assets	Net Asset Value	Net Asset Value	-1	1	%	15,593	-15,593

A.4.2 Valuation processes and sensitivity

For a description of the valuation processes used by the Group for instruments measured at level 3 in a recurring and non-recurring manner, see paragraphs A.4.1 and A.4.5 respectively.

As required by IFRS 13, for the financial assets and liabilities measured at level 3 fair value, the following table lists the effects of a change in one or more significant non-observable parameters used in the valuation techniques adopted to determine the fair value. Note that only the total material effects at the end of the year are shown in the table.

Financial assets/liabilities	Non-observable parameters	Sensitivity (thousands of euro)	Change in non-observable parameter
FVTPL and FVTOCI securities and loans	Credit spread	-60	1 bp
FVTPL and FVTOCI securities and loans	JD parameters	-23	1%
FVTPL and FVTOCI securities and loans	Correlation	-281	1%
OTC Derivatives - Equity	Correlation between underlying equity baskets	-32	10%
OTC Derivatives - Equity	Historical volatility	825	10%
OTC Derivatives - Equity CPPI	Historical correlation	-17	10%
Fondi Hedge	Net Asset Value	42	1%

For tax credits held under the Hold to Collect and Sell and Other/Trading business models, which are initially recognised and subsequently measured at fair value, note that the fluctuations in fair value are mainly due to the trends in risk-free rates. Specifically, an increase (decrease) in interest rates of 1 basis point is estimated to correspond to a negative (positive) fluctuation of:

- 1,304 thousand euro for tax credits classified under the Other/Trading business model;
- 546 thousand euro for tax credits classified under the Hold to Collect and Sell business model.

A.4.3 Fair value hierarchy (transfers between the different levels)

A description of the policy for determining when transfers occur between the different levels of fair value hierarchy (see IFRS 13, par. 95) is provided above (see "Fair value hierarchy").

A.4.4 Other information

In calculating the bCVA, the Bank considers the net positions in derivatives of each counterparty (see paragraph A.4.1 above for further details on the measurement of derivatives). For other cases, the Bank does not make use of the option provided in paragraph 48 of IFRS 13, which permits an entity "to measure the fair value of a group of financial assets and financial liabilities on the basis of the price that would be received to sell a net long position (i.e. an asset) for a particular risk exposure or paid to transfer a net short position (i.e. a liability) for a particular risk exposure in an orderly transaction between market participants at the measurement date under current market conditions".

General Independent Price Verification principles

The Bank governs and defines the independent price verification process through the Group Guidelines and Rules on Independent Price Verification, documents that are coordinated by Market & Financial Risk Management and applied by the Parent Company and all consolidated subsidiaries of the Banking Group.

The "Guidelines on Independent Price Verification", once a favourable opinion has been given by the Group Financial Risk Committee, are revised and approved at least on an annual basis by the Board of Directors, with the support of the Risks and Sustainability Committee. The level I and II "Rules on Independent Price Verification" are revised and approved at least on an annual basis by the Group Financial Risks Committee, which is specifically delegated to do so by the Management Bodies, and which also reviews material changes and updates proposed by Market & Financial Risk Management.

According to the provisions of Regulation (EU) 575/2013 (Capital Requirement Regulation – CRR), Article 4, par. 1.70 and Article 105, par. 8, the Bank governs the Independent Price Verification (IPV) process, which consists of the regular verification of the accuracy and independence of market prices or the data input in pricing models, carried out by an organisational unit independent from the business functions, at a frequency commensurate with the trading carried out and the nature of the market.

The Bank has set up an IPV process with 3 levels of control in line with the provisions of Bank of Italy Circular 285/2013 (Supervisory regulations for banks), incorporated into the Integrated Internal Control System, which requires the risk management processes to be incorporated in the processes and methods for valuing the company activities, also for accounting purposes.

Within the IPV, the level I, II and III control functions have the following main responsibilities:

- the level I control function participates in the definition of the related methodological framework and carries out the level I implementations and controls, reporting the results to the business function and the level II control functions;
- the level II control function defines the methodological and control framework, ensures alignment with current regulations and consistency between the IPV controls, accounting valuations and additional valuation adjustments (AVA) (carried out, respectively, on the basis of the Guidelines and Rules for Valuation of Financial Instruments at Fair Value and the Guidelines and Rules for Prudent Valuation of Financial Instruments at Fair Value) and supervises the level I controls and performs the level II controls;
- the level III control function carries out internal audit controls to identify breaches of procedures and regulations, as well as to periodically assess the completeness, adequacy, functionality (in terms of efficiency and effectiveness) and reliability of the organisational structure of the other components of the internal control system and the IT system at Bank level, at scheduled deadlines in relation to the nature and intensity of the risks.

The level I and II IPV controls are qualitative and quantitative controls and are distinguished according to the type of instruments subject to control. They are applied consistently to both the input data underlying the valuations and the valuations themselves, and ensure consistency between the management valuations and the accounting valuations carried out in the various systems. They are characterised by completeness and suitability of application, absence of overlaps, sequentiality and complementarity in execution. The IPV control instruments use, as far as possible, specific applications or IT procedures, which enable extensive data analysis on a daily basis. In particular:

- the level I controls are aimed at ensuring the validation of the market data entered into the systems and are based on an in-depth analysis of the data obtained from external providers. If the level I controls detect that certain thresholds have been exceeded for the data contained in the systems, or the data is not considered correct by the level I control functions, a comparison process (challenge) is activated with the involvement of the business function and the level II control functions, in line with the degree of complexity of the report;
- the level II controls are characterized by sequentiality and complementarity in execution with the level I controls and are designed to ensure alignment between management and accounting valuations, based on an in-depth analysis of consensus or counterparty data and, where these are not available, through the application of pricing models associated with the respective instruments.

The results of the IPV process are analysed, assessed and coordinated by the Financial Measurements Working Group, a technical body set up specifically for this purpose, with the aim of facilitating integration and comparison between the business functions and the control functions.

General prudent value principles

The framework of financial measurements is completed with the prudent valuation of financial instruments measured at fair value, which involves the calculation of additional valuation adjustments for prudential purposes, without impacts on the fair value calculated for accounting purposes in accordance with the IFRS.
The Bank governs and defines the prudent value measurement of financial instruments through the Group Guidelines and Rules for Prudent Valuation of Financial Instruments at Fair Value, prepared by Market & Financial Risk Management and applied by the Parent Company and all the consolidated subsidiaries of the Banking Group.
The "Guidelines on Prudent Valuation of Financial Instruments", once a favourable opinion has been given by the Group Financial Risks Committee, are revised and approved at least on an annual basis by the Board of Directors, with the support of the Risks and Sustainability Committee. The "Rules for Prudent Valuation of Financial Instruments" are revised and approved at least on an annual basis by the Group Financial Risks Committee, which is specifically delegated to do so by the Management Bodies, and which also reviews material changes and updates proposed by Market & Financial Risk Management.
In accordance with the provisions of Regulation (EU) 575/2013 (Capital Requirements Regulation – CRR), prudent valuation entails the calculation of specific additional valuation adjustments (AVAs) for the financial instruments measured at fair value, aimed at capturing different sources of valuation uncertainty and ensuring the achievement of a suitable level of certainty in the measurement of the positions. The total value of the AVAs is deducted from the Common Equity Tier 1 capital, without impacts on accounting fair values.
The Bank, in line with the criteria indicated in Delegated Regulation (EU) 101/2016, is subject to the application of the core approach for the determination of AVAs both at individual and at consolidated level for all the positions measured at fair value. In particular the following AVAs are considered:

- market price uncertainty: this reflects the uncertainty of the market prices, calculated at valuation exposure level;
- close-out costs: it reflects the uncertainty of the exit price calculated at valuation exposure level;
- model risks: it considers the valuation model risk which arises due to the potential existence of a range of different models or model calibrations, which are used by market participants, and the lack of a firm exit price for the specific product being valued;
- unearned credit spreads: it reflects the valuation uncertainty in the adjustment necessary according to the applicable accounting framework to include the current value of expected losses due to counterparty default on derivative positions;
- investment and funding costs: it represents the valuation uncertainty in the funding costs used when assessing the exit price according to the applicable accounting framework;
- concentrated positions: it reflects the uncertainty relating to the exit price of the positions defined as concentrated;
- future administrative costs: it considers administrative costs and future hedging costs over the expected life of the valuation exposures for which a direct exit price is not applied for the close-out costs AVAs for concentrated positions;
- early termination: it considers the potential losses arising from non-contractual early terminations of customer trades;
- operational risks: it considers the potential losses which may be incurred consequently to the operational risks connected to the valuation processes.

The prudent value corresponds to the exit price from the position with a level of certainty equal to 90%. Where possible, this value is determined on the basis of a distribution of exit prices observed on the market. In all the other cases, an expert-based approach is used, referring to the qualitative and quantitative information available.
The AVA value associated to the single position and to the single source of uncertainty in valuation thus corresponds to the difference between the prudent value and the fair value. The total AVA is obtained by aggregating the single AVAs, taking into account the corresponding weighting ratios.
The "Rules for Prudent Valuation of Financial Instruments" outline, for each AVA, the definition and interpretation, the scope of application, the input data and the detailed calculation method for each class of financial instrument.

FAIR VALUE OF REAL ESTATE AND VALUABLE ART ASSETS

Fair value of real estate assets

As extensively illustrated in the first part regarding the accounting policies, the Group has adopted the revaluation model as the basis of measurement for the owner-occupied properties accounted for according to IAS 16 and fair value for the investment properties accounted for according to IAS 40.

Measurement of real estate assets

The revaluation model applied to owner-occupied properties envisages that property and equipment, whose fair value can be reliably determined, is recorded at a revalued amount, equal to its fair value at the date of the revaluation, net of depreciation and any accumulated impairment losses.
For the properties held for investment, the Intesa Sanpaolo Group has chosen the fair value method, according to which, after initial recognition, all investment properties are measured at fair value.

Valuation approach

IFRS 13 defines fair value as "the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date".
The valuation approach has been defined on the basis of the business relevance and plan for the use of the properties, which consists of three main groups:

- "trophy assets", i.e. particularly prestigious properties used by management functions located in the main cities where the Bank is based or properties of particular historical and artistic interest because they are listed by the Ministry for Culture;
- "owner-occupied properties";
- "investment properties".

The properties are valued individually asset-by-asset without considering any discount, or premium, that may be agreed during commercial negotiations if all or part of the portfolio is sold in bulk or in lots.
The Intesa Sanpaolo Group has chosen to assign the valuation activity to professionally qualified external companies with an international structure, able to provide property valuations based on the RICS Valuation standards[213] which guarantee:

- determination of the value consistent with the fair value configuration indicated in the IAS/IFRS;
- compliance with the professional, ethical and independence requirements for experts, in line with the provisions of international and European standards.

To determine the value of the assets, the following valuation methods are used based on the characteristics of the asset and the conditions of the market of reference; the valuer determines the most suitable method for each individual property:

- The Discounted Cash Flow Method: the discounted cash flow method is based on the discounting (for a variable period based on the rental/occupational situation of the property and its subsequent optimisation) of the future net proceeds from the rental or sale of the property. At the end of this period, the value of the property is assumed to be the sale price obtained by capitalising the income of the last year at a market rate for investments similar to the object of the estimate or through a split sale. This method is used for the valuation of all the owner-occupied properties or real estate leased to third parties, located in Italy.
- Comparative or Market Method: the comparative or market method is based on the comparison between the assets examined and similar assets recently sold/purchased or offered on the same market or in competitive environments. This criterion is based on a comparison with properties that have recently been sold or offered on the open market and, if possible, have the same characteristics. In the absence of observations directly related to the property examined, cases are used that are as similar as possible to the property examined, making the necessary adjustments. This method, which also represents the basis for other valuation methods, can be adopted in particular for non-owner-occupied assets and/or, in any case, for unrestricted and available assets in Italy and abroad.
- Direct capitalisation income approach: the income approach is based on the current value of the potential market income of a property, obtained by capitalising the income at a market rate. This approach is applied mainly to owner-occupied properties abroad, where a prolonged stay within the building is envisaged.
- Investment Value (Worth): the Investment Value (Worth) is defined by the International Valuation Standard as: "the value of an asset to a particular owner or prospective owner for individual investment or operational objectives". This definition is consistent with the provisions of the latest edition of the "RICS Valuation - Global Standards" of the Royal Institution of Chartered Surveyors of the United Kingdom, where the Investment Value is defined as "the value of an asset to the owner or a prospective owner for individual investment or operational objectives".
  The Investment Value is applicable to properties built by the entity or properties with a strong business relevance subject to significant investments for technological, construction and functional adaptation.
  The Investment Value of these properties is determined on the basis of a 12+6 year plan for business use without break options, whose annual rent is determined by applying an appropriate gross rate of return to the amount of direct and indirect costs capitalised by the owner, including the costs of purchasing the land.

For the purposes of the valuation, where applicable and relevant, the assumptions include considerations relating to specific legislation (for example on safety, accessibility, and the removal of architectural barriers) as well as sustainability considerations connected to climate change factors and energy efficiency. In conclusion, based on the assessments conducted by the independent expert, it can be confirmed that at present the climate variables have not led to any significant impacts on the 2024 Financial Statements.

[213] Standards set out in the Royal Institution of Chartered Surveyors of the United Kingdom document "RICS Valuation – Global Standard" (also known as the "Red Book"): the version in force as at 31 December 2024 was issued in November 2021 and took effect on 31 January 2022.

Frequency of valuation

Revaluations must be made with sufficient regularity to ensure that the carrying amount does not differ materially from that which would be determined using fair value at the reporting date.

The frequency of revaluations depends upon the changes in fair values of the property and equipment being revalued. When the fair value of a revalued asset differs materially from its carrying amount, a further revaluation is required.

Specifically, based on the market trends, different valuation frequencies have been identified that, according to the characteristics of the assets and their location, are considered capable of capturing the significant changes in the value of the assets.

The following distinction is made for owner-occupied properties:

– for trophy assets, the revaluation is carried out by verifying the value through a scenario analysis (market trend analysis) every year and with a new appraisal every two years;
– for the other owner-occupied properties, the revaluation is carried out through scenario analysis (market trend analysis) every year and through a new appraisal every three years.

If the scenario analysis identifies significant changes (+/- 10%), specific and updated appraisals must be carried out to adjust the fair value of the asset to the valuations of the real estate market.

For investment properties, the value is determined on the basis of new appraisals each year.

Based on the rules mentioned above, in 2024, the investment properties and the owner-occupied properties, for which the scenario analysis identified changes with respect to the threshold set, were subject to periodic valuation.

Scenario analysis

As part of the annual update of the fair value of the owner-occupied properties, in the years when a revaluation of the property is not envisaged, a scenario analysis (market trend analysis) is carried out using the best information sources available for the various countries in which the properties are located, in order to identify deviations, using databases, in the market values between the analysis period and the previous period.

In particular, for real estate located in Italy, the changes are defined using at least 3 different sources. The main source is that provided by the Italian Revenue Agency, based on the specific OMI (Real Estate Market Monitor) zones. The second publication source is Nomisma for which, for the related zoning, the same queries are conducted as those for the OMI (main database).

Lastly, the third source is based on the analyses of the changes during the year surveyed in terms of the offers present on the real estate market.

Accordingly, the experts identify the annual deviations in rents and/or prices by related asset class for each property.

Real estate located abroad is grouped, for each country, into different clusters based on location and asset class. Specific market analyses are conducted based on local and national knowledge of the particular target real estate market.

The market study also takes account of the following macroeconomic drivers:

– analysis of economic data (unemployment rate, GDP per capita, inflation and consumer price index); these macroeconomic factors constitute the first economic analysis, supporting the real estate market forecasts;
– movement in average yield;
– movement in market rents;
– range of movement in unit values.

The above-mentioned market survey, together with a qualitative weighting of the macroeconomic key drivers is used to determine a range of percentage deviation from the last assessment carried out, which is compared with the target threshold set, identifying a synthetic percentage factor for each individual property, included in a single worksheet.

This activity is carried out close to the end of the year in order to produce a range of deviations within a reference threshold and to enable the timely planning of the updating of the specific appraisals for the properties whose deviation exceeds the threshold.

The permitted variation threshold is +/-10%.

If the deviations identified exceed this threshold, a new valuation will be carried out before the end of the year.

Sensitivity of valuations

Just as for financial instruments, level 3 non-financial assets and liabilities measured at fair value for which, due to the valuation model used to determine the fair value, execution is possible, and whose results are significant, are subject to sensitivity analysis. The analysis essentially concerned the properties of the Parent Company Intesa Sanpaolo, which represent the Core perimeter of the Group's real estate assets.

It is noted that the sensitivity analysis was conducted by identifying the most important variables in the valuation model used to value the various classes of real estate, represented by the discounted cash flow method. Specifically, taking account of the trend recorded in the various asset classes of the real estate market and the parameters featuring greater volatility/variability, for owner-occupied properties, reference was made to the net capitalisation rate (yield) and the average medium/long-term inflation rate, while for investment properties, to the exit value. In compliance with the estimate assumptions applied to real estate assets, for the purpose of the analysis, variation ranges were used that were consistent with the potential trends in the market at the reporting date. For owner-occupied properties, a change of +/- 25 bps for the net capitalisation rate and a concurrent change of -/+20% for the inflation rate were assumed, in relation to which average deviations of fair value of +4.4% and -3.8% were recorded. For investment properties, a change of +/- 5% in the exit value was assumed, in relation to which there were average deviations of fair value of +4.5% and -4.4%.

Fair value of valuable art assets

The Bank's valuable art assets are also valued using the revaluation model, which envisages that property and equipment, whose fair value can be reliably determined, is recorded at a revalued amount, equal to its fair value at the date of the revaluation.

Works of art included in the asset class "valuable art assets" are works of particular importance, recognised for their historic and artistic value by experts and in line with the ministerial guidelines, and particularly those set out in Ministerial Decree 537 of 6 December 2017 on the exportation of works of art, such as: the state of preservation, the historical importance of the artist, the importance of the work in terms of art criticism/history, illustrious origin, certain quality and attribution and the declaration of interest by the Italian government.

Valuation approach

The valuation is carried out by determining the value through external appraisals, entrusted to qualified independent experts.
These values are obtained from online databases such as Artnet and Artprice, which list over 100 million works of art and monitor the results of leading Italian and international auction houses. These are objective parameters that are compared with the market as a whole, in an analysis that also involves monitoring galleries and art fairs.
In particular, the factors considered for the fair value measurement include objective factors relating to the historical-critical-artistic value of the author, state of preservation, execution technique, size and quality of the artwork, importance of the artwork in the production by the artist, publication of the artwork in specialist catalogues, period of execution of the artwork, international exposure of the artworks by the artist, distinguished provenance, certainty of attribution, guarantee of authenticity of an artwork, as well as other factors (which may change over time, depending on the evolution and tastes of the market), such as the reputation of the museum hosting the artwork by the artist, the prestige of fairs/exhibitions/galleries/auction houses that handle the artwork, the reputation of its critics and collectors, and the quality of the communications concerning the artist's work.
Once these factors have been identified, the fair value is determined comparing them firstly with artworks similar to those examined (in terms of period of production/year, technique, size, type of subject and state of preservation), by the same artist and from the same period, if available (this is more feasible for modern and contemporary works) and, secondly, with works by artists or schools and areas that are close in style, philosophy and importance in the same historical period. Where several similar artworks are available, average values are used to take account of price volatility.
In addition to considering the trends in auction trading, starting from the most recent trading and also including unsold items in the analysis, which are a possible indicator of the loss of market value for the artwork/artist, the valuation also considers the current market interest in an artwork or an artist, measured by the number and quality of temporary exhibitions held in internationally important museum spaces and accompanied by specific publications.
The valuations also take into account any declarations of historical-artistic interest formally expressed by the Italian Ministry for Culture (commonly referred to as "notifications"), which tie part of the artworks in the collection to Italy's heritage and restrict their circulation to the country's territory, reducing the price obtainable on the international market.
The pricing is also influenced by the importance of the buyers/sellers (e.g. prices paid by famous collectors or known investors may be more significant).
The valuation approach is based on the monitoring of the objective market values of the artworks included in the category examined, which follows three methodological approaches:

- prudent basis, analysing the average values of a variety of different information sources, based on robust, updated and statistically representative databases: in a market of "unique" artworks, often without transactions for decades, this approach ensures the periodic identification of any outlier values and avoids following speculative trends;
- comparison, monitoring the transactions that have taken place at a global level in a variety of distribution channels, in order to avoid considering only certain forms of transaction and the related financial values: in a global market with global demand, this approach enables verification of the presence of any geographical arbitrage or specific appreciation/depreciation phenomena with potential impacts;
- recurrence, since it updates and monitors price trends over the shortest period of time that the specific features of the market allow, i.e. the half year: in a market in which there are no public trades monitored daily, the shortness of the measurement period ensures maximum attention and timeliness of any changes.

This approach is applied to all the "valuable art assets".

Frequency of valuation

For valuable art assets, the revaluation is carried out by means of an expert appraisal every three years. However, a scenario analysis is carried out annually to identify any appreciable changes in value in order to bring forward the valuation.
Based on the rules mentioned above, in 2024, the artworks, for which the scenario analysis identified changes with respect to the threshold set, were subject to valuation.

Scenario analysis

In order to identify and determine the changes in the market of the artworks being valued, market trends are monitored to detect signs of significant change that require appraisals to be made in advance with respect to the frequency established.
This monitoring is carried out on a two-fold basis:

- Monitoring of the market prices of the top artworks in terms of value held in Intesa Sanpaolo's collections, which represent 75% of the total value of the artworks included in the "valuable art assets" class, by verifying both the results of the main international auctions (which are based on a calendar of precise seasonal deadlines) and the reports of the two main world databases (Artprice and Artnet), whose analytics provide useful tools for monitoring prices;
- Monitoring the performance of the art market in general, to identify trends and changes with respect to Intesa Sanpaolo's "valuable art assets", verifying both the results of the main international auctions (which are based on a calendar of precise seasonal deadlines), and the reports of the two main world databases (Artprice and Artnet); since the works of many artists in the Intesa Sanpaolo's collection very rarely go up for auction due to the limited number of items left in the market, it is important to monitor the trend of similar artists or works; accordingly, the monitoring is not just limited to the works held and their artists, but also extends to the authors and artworks related to the same area, to take into account trend data.

If the annual monitoring identifies a potential, positive or negative, value deviation of more than 15% for individual artworks/collections of artists in Intesa Sanpaolo's collections and comparable on the basis of objective criteria (such as period of production/year, size, technique, period of production, etc.), the appraisals are commissioned according to the usual internal procedures in order to align the carrying amount.

Quantitative information

A.4.5 Fair value hierarchy

A.4.5.1 Assets and liabilities measured at fair value on a recurring basis: fair value by level

(millions of euro)

Assets / liabilities at fair value	31.12.2024			31.12.2023		
	Level 1	Level 2	Level 3	Level 1	Level 2	Level 3

Total	**8,371**	**63,015**	**86**	**7,916**	**62,729**	**81**

Pursuant to IFRS 13, par. 93(c), during 2024 transfers were carried out from level 1 to level 2 of assets for 74 million euro and of liabilities for 76 million euro, in addition to transfers from level 2 to level 1 of assets for 102 million euro, and of liabilities for 1,494 million euro. In particular:

- from level 1 to level 2
  - Financial assets held for trading under debt securities of 56 million euro;
  - Financial assets measured at fair value through other comprehensive income under debt securities of 18 million euro;
  - Financial liabilities designated at fair value under debt securities of 76 million euro;
- from level 2 to level 1
  - Financial assets held for trading under debt securities of 101 million euro, and under financial derivatives of 1 million euro;
  - Financial liabilities held for trading under financial derivatives of 6 million euro;
  - Financial liabilities designated at fair value under debt securities of 1,488 million euro;

The transfers between fair value levels are determined by the trends in the observability of prices or market data used to measure the financial instruments and by the materiality of the unobservable inputs.
The transition from level 1 to level 2 is a consequence of the disappearance of an active market, assessed by analysing the reliability and the reciprocal consistency of the available prices according to the provisions of the Rules for Valuation of Financial Instruments at Fair Value. Conversely, financial instruments for which a mark-to-model measurement is performed using inputs that can be observed on the market – classified, therefore, as level 2 – are transferred to level 1 when the existence of an active market is identified.

As at 31 December 2024, the impact of non-performance risk (Credit Value Adjustment and Debt Value Adjustment) in the determination of the fair value of derivative contracts amounted to a reduction of 101 million euro in positive fair value and a reduction of 2 million euro in negative fair value.
The impact of the Funding Value Adjustment in reducing the fair value amounted to 43 million euro, equal to the cost of funding the cash flows generated by the Bank's overall portfolio of OTC derivatives.
Determining the quantity of those adjustments is irrespective of the effects of the correlated operational hedging strategies, where present.

With regard to assets, level 3 instruments, which allow for more discretion in fair value measurement, account for a limited portion of the portfolio, with an impact of 8.6% on total assets (9.2% as at 31 December 2023). The level 3 financial assets mainly relate to quotas of UCIs, of which, under Financial assets mandatorily measured at fair value, 196 million euro is represented by units of the Atlante Fund and the Italian Recovery Fund put in place as part of the regulations to support the banking system.
Property and equipment measured at level 3 fair value includes real estate assets and valuable art assets, which represent 56.5% of the balance sheet assets at level 3 fair value.

Lastly, the caption "Other assets", not directly included in the table above, comprised tax credits recognised and measured at fair value for 11.2 billion euro as at 31 December 2024, of which 3.3 billion euro held under the Hold to Collect and Sell business model and 7.9 billion euro held under the Other/Trading business model. The fair value of those credits was determined with reference to the changes in interest rates. Given the specific characteristics of the credits in question, they have been assigned to level 3, also in line with the considerations set out in the clarification note issued by the Bank of Italy on 24 July 2023 ("Clarification Note on credit risk").

3.4. Transfers from other levels	-7	-6	-	-1	-10	-	-	-
3.5 Other decreases	-141	-	-	-141	-169	-	-672	-
4. Final amount	**3,847**	**152**	**-**	**3,695**	**727**	**-**	**5,458**	**-**

The captions of transfers between levels of Financial assets measured at fair value through profit or loss refer to transfers from level 3, decreasing by 7 million euro and to level 3, increasing by 13 million euro.
The former are transfers of Financial assets held for trading from level 3 to level 2 involving debt securities for 4 million euro and financial derivatives for 2 million euro, in addition to transfers of Financial assets mandatorily measured at fair value from level 3 to level 2 involving loans for 1 million euro.
The latter are transfers of Financial assets held for trading from level 2 to level 3 involving loans for 9 million euro and financial derivatives for 2 million euro, in addition to transfers of Financial assets mandatorily measured at fair value from level 2 to level 3 involving debt securities and loans for 1 million euro each.

For Financial assets measured at fair value through other comprehensive income, we note decreasing transfers from level 3 to level 2 of equity instruments for 10 million euro, against increasing transfers from level 2 to level 3 of equity instruments for 371 million euro, mainly attributable to stakes in the capital of the Bank of Italy.
Transfers between levels of debt securities from level 3 to level 2 occurred as a result of the use in the fair value measurement as at 31 December 2024 of parameters observable on the market, without including discretionary parameters in compliance with the Guidelines and Rules for Valuation of Financial Instruments at Fair Value.

The increasing transfers between levels of equities to level 3 refer to the stake in the Bank of Italy, measured – as there are no direct transactions on the stakes – using a method based on discounting future flows of dividends deriving from the investment (DDM - Dividend Discounted Model). Transfers from level 3 to level 2 refer to non-contributed equity instruments measured based on direct transactions or using relative methods based on multipliers.
The level transfers of loans are attributable to the change in observability or the materiality of the input for the valuations. Level 2 fair value was determined using an appropriate credit spread identified starting with market evidence of financial instruments with similar characteristics, while fair value was assigned level 3 if input parameters were used that are not directly observable on the market or if the counterparties are impaired.
Transfers of derivative contracts from level 3 are due to the changes in counterparty risk, considering that derivatives with non-performing counterparties are classified in level 3 of the fair value hierarchy.
Transfers between fair value levels were carried out in accordance with the guidelines described in paragraph A.4.3 - Fair value hierarchy.

During the year, the value of investment properties measures at fair value was also updated. Moreover, based on the results of the scenario analysis, owner-occupied properties and valuable art assets were subject to appraisal, valued using the revaluation criterion. That adjustment resulted in the recognition of gains and losses, both through profit and loss and equity, posted under sub-captions 2.2 and 3.3, respectively. Caption 3.3 also includes amortisation and depreciation.

Other increases and Other decreases of Financial assets mandatorily measured at fair value and Financial assets at fair value through other comprehensive income comprise payments made and the reimbursements received by the Bank, with no change in the quotas of UCIs held.
With regard to Property and equipment, the captions mainly include transfers of these assets from investment to operations and vice versa and the reclassification to Non-current assets held for sale.

A.4.5.3 Annual changes in financial liabilities measured at fair value on a recurring basis (level 3)

(millions of euro)

	Financial liabilities held for trading	Financial liabilities designated at fair value	Hedging derivatives
1. Initial amount	**50**	**31**	**-**
2. Increases	**4**	**53**	**-**
2.1 Issues	1	51	-
2.2 Losses recognised in:	-	2	-
2.2.1. Income statement	-	2	-
- of which capital losses	*-*	*2*	-
2.2.2 Shareholders' equity	X	-	-
2.3 Transfers from other levels	3	-	-
2.4 Other increases	-	-	-
3. Decreases	**-45**	**-7**	**-**
3.1 Reimbursements	-	-	-
3.2. Repurchases	-	-7	-
3.3 Gains recognised in:	-1	-	-
3.3.1. Income statement	-1	-	-
- of which capital gains	*-1*	-	-
3.3.2 Shareholders' equity	X	-	-
3.4. Trasferts to other levels	-44	-	-
3.5 Other decreases	-	-	-
4. Final amount	**9**	**77**	**-**

The Final amount of Level 3 Financial liabilities held for trading refer entirely to derivative contracts with a negative fair value. Transfers from level 3 totalling 44 million euro, refer certificates, with characteristics similar to derivative instruments, for 42 million euro and to financial derivatives for 2 million euro, while transfers to level 3, per 3 million euro, fully refer to financial derivatives.
The Final amount of Financial liabilities designated at fair value level 3 refers to certificates which provide for partial or full redemption of the premiums paid on maturity, pursuant to Bank of Italy Communication of 21 October 2014 (certificates with guaranteed or protected capital), classified in that accounting category if issued after 1 January 2020.

Financial assets and liabilities

For financial assets and liabilities not measured at fair value (loans and loans represented by securities, amounts due to customers and securities issued), the Bank measures fair value by calculating the present value of future cash flows at a rate that incorporates the estimate of the main risks and uncertainties associated with the financial instrument to be measured (discount rate adjustment approach).

In particular, the interest rate used to discount the future cash flows is determined by taking into account the following risk factors:

– interest rate risk, which represents the rate offered by the market for each unit of capital provided to risk-free counterparties;
– credit risk, which is the premium for having provided capital to counterparties with insolvency risk.

For fixed-rate instruments, the cash flows are those envisaged by the contracts. For floating-rate instruments, the future cash flows are determined based on forward rates, implicit in the zero-coupon interest rate curves observed at the various fixing dates and differentiated by indexation type.

The value of the risk premium (credit spread) is determined per individual position, through acquisition of the risk class (LGD) and rating (PD). These amounts, together with the average residual financial life, constitute the guideline for acquisition of the credit spread. For securities issued by Intesa Sanpaolo, the construction of the spread curve follows the rules set out in the Rules for Valuation of Financial Instruments at Fair Value.

The following assumptions were used in determining the fair values indicated in table A.4.5.4:

– for loans represented by securities, the same rules envisaged for the fair value measurement of other categories of securities are used;
– for securities issued, the rules used are the same as those applied to securities under assets;
– the book value is calculated as the reasonable approximation of fair value for:
  - demand financial items (assets and liabilities) or financial items with an original maturity equal to or shorter than 12 months and residual maturity equal to or shorter than 12 months: in the table, the column corresponding to level 2 of the fair value hierarchy presents the short-term financial items and cash collateral for financial operations, while the column corresponding to level 3 of the fair value hierarchy presents demand loans;
  - non-performing assets which in the table are included in the column corresponding to level 3 of the fair value hierarchy.

A.5 – INFORMATION ON "DAY ONE PROFIT/LOSS"

Under IFRS 9, financial instruments shall be initially recognised at fair value. The fair value of a financial instrument at initial recognition is normally the "transaction price", i.e. the fair value of the consideration given or received in relation to, respectively, financial assets and liabilities. The fact that, upon initial recognition, the fair value of a financial instrument normally coincides with the transaction price is usually intuitively verifiable in the case of transactions falling under level 1 of the fair value hierarchy. Any differences between the price and the fair value are usually attributable to the so-called commercial margins, which are considered as not falling within the scope of Day One Profit (DOP). Therefore, commercial margins are taken to the income statement on the first subsequent measurement of the financial instrument. Also in the case of level 2, which is based on quotes that can be derived indirectly from the market (Comparable Approach), the fair value and the price often coincide upon initial recognition. Any residual differences, as in the previous case, are usually attributable to the commercial margins. With respect to level 3 instruments, no definite reference benchmark is available to compare the transaction price with, since there is more discretion in fair value measurement. For the same reason, the calculation of any commercial margin to be taken to the income statement is also difficult. In this event, the instrument is always initially recognised at the transaction cost, irrespective of whether it is possible to identify commercial margins. Subsequent measurement shall not include the difference between cost and fair value identified upon initial recognition (also defined as DOP). This difference shall be recognised in the income statement only when it arises from changes to the factors over which market participants base their valuations when fixing prices (including the time effect). Where unobservable inputs used to estimate the fair value become observable, the residual deferred DOPs are recognised in the income statement. Similarly, in the event of "on the book" transactions falling under the investment division's activities, the DOPs earned on transactions – included in the above on the book management – are taken to the income statement when transactions are carried out which substantially eliminate the risks linked to unobservable parameters of the instrument which generated the DOP.
At the end of 2024, the amount of the DOPs deferred in the balance sheet had been fully released to the income statement, following the closing of the associated transactions.

Part B – Information on the Parent Company's balance sheet

ASSETS

SECTION 1 - CASH AND CASH EQUIVALENTS - CAPTION 10

1.1 Cash and cash equivalents: breakdown

(millions of euro)

	31.12.2024	31.12.2023
a) Cash	2,416	2,184
b) Current accounts and on demand deposits with Central Banks	22,277	69,260
c) Current accounts and on demand deposits with banks	1,508	1,385
Total	**26,201**	**72,829**

Sub-caption b) Current accounts and on-demand deposits with Central Banks mainly refers to (overnight) on-demand deposits for an amount of 17,507 million euro, down on the amount of 64,021 million euro as at 31 December 2023. That change mainly reflects the decrease in "Financial liabilities measured at amortised cost" due to the repayment of TLTRO III operations during the year.

SECTION 2 - FINANCIAL ASSETS MEASURED AT FAIR VALUE THROUGH PROFIT OR LOSS – CAPTION 20

2.1 Financial assets held for trading: breakdown

(millions of euro)

Captions	31.12.2024			31.12.2023

Total (A+B)	**14,622**	**27,755**	**152**	**11,379**	**27,998**	**129**

Structured securities as at 31 December 2024 consist of 19 million euro of debt securities convertible into shares and 16 million euro of fixed-rate debt securities indexed to inflation, as an additional component.

Other debt securities are made up of the securities connected with securitisation transactions for a total amount of 1,017 million euro (962 million euro Level 2 and 55 million euro Level 3), of which 832 million euro is senior, 177 million euro is mezzanine and 8 million euro is junior.

Equity instruments as at 31 December 2024 include investments correlated with financial trading derivatives on equity instruments and stock indices.

As the gross positive fair value of the derivative instruments implemented with the legal clearing agent LCH Ltd. meets the requirements set out for offsetting between gross positive and negative balances pursuant to IAS 32, paragraph 42, it was subject to offsetting, with recognition of the net fair value under Financial liabilities held for trading and Financial assets held for trading, respectively.

2.2 Financial assets held for trading: borrower/issuer/counterparty breakdown

Total	**4,764**	**4,278**

Quotas of UCI refer to real estate funds for 1,129 million euro, private equity funds for 1,049 million euro, private debt funds for 776 million euro, infrastructure funds for 219 million euro, hedge funds for 204 million euro, venture capital funds for 105 million euro and other equity funds for 4 million euro. The caption also includes 196 million euro in interests held by the bank in the Atlante Fund and in the Italian Recovery Fund (formerly Atlante Fund II), as alternative investment funds to support Italian banks in their recapitalisation transactions and in the management of the bad loans in the sector.

Loans include credit exposures classified among financial assets mandatorily measured at fair value as they failed the test on the contractual characteristics of cash flows (SPPI Test) required by IFRS 9.

SECTION 3 - FINANCIAL ASSETS MEASURED AT FAIR VALUE THROUGH OTHER COMPREHENSIVE INCOME - CAPTION 30

3.1 Financial assets measured at fair value through other comprehensive income: breakdown

(millions of euro)

Captions	31.12.2024			31.12.2023		
	Level 1	Level 2	Level 3	Level 1	Level 2	Level 3
1. Debt securities	**53,625**	**2,787**	**8**	**47,229**	**2,657**	**10**
1.1 Structured securities	964	-	-	654	-	-
1.2 Other debt securities	52,661	2,787	8	46,575	2,657	10
2. Equities	**542**	**99**	**637**	**455**	**474**	**339**
3. Loans	**-**	**832**	**82**	**-**	**805**	**97**
Total	**54,167**	**3,718**	**727**	**47,684**	**3,936**	**446**

Loans, as illustrated in Part A – Accounting policies, refer to portions of syndicated loans underwritten and destined to be subsequently sold.

Structured securities as at 31 December 2024 consist entirely of fixed-rate debt securities indexed to inflation, as an additional component.
Other debt securities include the securities connected with securitisations for a total amount of 2,203 million euro (entirely Level 2), of which 2,152 million euro is senior and 51 million euro is mezzanine.

Financial assets measured at fair value through other comprehensive income (caption 2. Equities) include the stakes in the capital of the Bank of Italy for an amount of 368 million euro, amounting to 4.91% of the share capital and lower than the 5% limit, beyond which there is a limitation on the receipt of dividends in compliance with Article 3, paragraph 4 of the Articles of Association of the Bank of Italy. In this regard, lacking recent direct transactions on the stakes, the method based on the discounting of future dividends deriving from the investment (DDM – "Dividend Discount Model") was used to value the stake as at 31 December 2024, with classification at Level 3 of the fair value hierarchy, instead of to Level 2 as in the 2023 Financial Statements.

Equity instruments deriving from the recovery of impaired financial assets amounted to 11 million euro.

3.2 Financial assets measured at fair value through other comprehensive income: borrower/issuer breakdown

Other loans include loans disbursed on public funds under administration for which the Bank holds the risk in the amount of 49 million euro.

Other debt securities include the securities connected with securitisations for a total amount of 7,720 million euro, of which 7,704 million euro is senior and 16 million euro is mezzanine.

They also include debt securities of 5,180 million euro, connected with the securitisation of the vehicle Romulus Funding Corporation, included in the Group's scope of consolidation.

The amount of Debt securities - Structured securities, under sub-caption 2.1, consists entirely of fixed-rate debt securities indexed to inflation, as an additional component.

The sub-caption Other loans includes operating loans, i.e. loans for operations connected to the provision of activities and financial services, with no credit facilities, for an amount of 731 million euro (562 million euro as at 31 December 2023). Value adjustments of 3 million euro were recorded on those exposures, mainly classified as Stage 1.

4.3 Financial assets measured at amortised cost: breakdown by borrower/issuer of loans to customers

(millions of euro)

Transaction type/Amount	31.12.2024			31.12.2023

For the approach used to represent the gross value and the total adjustments to impaired financial assets, see the illustration provided in Part A – Accounting policies.

On 16 December 2022, the EBA repealed the Guidelines on reporting and disclosure of exposures subject to measures applied in response to the COVID-19 crisis, contained in EBA/GL/2020/07, with effect from 1 January 2023, following the change in the scenario related to the pandemic. However, the Bank of Italy, in the communication dated 14 March 2023, requested that certain financial statement disclosures be maintained on loans subject to public guarantees, in free format at the bottom of this table.

In this regard, it should be noted that the gross value of the loans subject to public guarantees issued in response to the COVID-19 situation as at 31 December 2024 amounted to 15,038 million euro, of which 12,120 million euro in Stage 1, 1,954 million euro in Stage 2, and 964 million euro in Stage 3.
The total adjustments amounted to 402 million euro, of which 12 million euro related to Stage 1, 28 million euro to Stage 2, and 362 million euro to Stage 3.

SECTION 5 - HEDGING DERIVATIVES – CAPTION 50

Concerning the objectives and the strategies underlying hedging transactions see the information provided in Part E – Information on risks and relative hedging policies, Section 2 – Market risks.

5.1 Hedging derivatives: breakdown by type of hedge and level

(millions of euro)

	Fair value 31.12.2024			Notional amount	Fair value 31.12.2023			Notional amount
	Level 1	Level 2	Level 3	31.12.2024	Level 1	Level 2	Level 3	31.12.2023
A. Financial derivatives								
1. Fair Value	-	5,686	-	282,730	-	6,185	-	199,530
2. Cash flows	-	96	-	16,860	-	40	-	1,086
3. Foreign investments	-	-	-	-	-	-	-	-
B. Credit derivatives								
1. Fair Value	-	-	-	-	-	-	-	-
2. Cash flows	-	-	-	-	-	-	-	-
Total	**-**	**5,782**	**-**	**299,590**	**-**	**6,225**	**-**	**200,616**

As the gross positive fair value of Hedging derivatives implemented with the legal clearing agent LCH Ltd. meets the requirements set out for offsetting between gross positive and negative balances pursuant to IAS 32, paragraph 42, it was subject to offsetting, with recognition of the net fair value under Hedging derivatives.
The total positive fair value of hedging derivatives gross of on-balance sheet offsetting would amount to 11,798 million euro (of which 11,675 million euro hedging fair value and 123 million euro hedging cash flows).

5.2 Hedging derivatives: breakdown by hedged portfolio and type of hedge

(millions of euro)

Transactions / Type of hedge	Fair Value							Cash-flow hedges		Foreign investm
	Specific						Generic	Specific	Generic	
	debt securities and interest rates	equities and stock indices	foreign exchange rates and gold	credit risk	commodities	other				
1. Financial assets measured at fair value through other comprehensive income	476	-	162	-	X	X	X	-	X	X
2. Financial assets measured at amortised cost	1,233	X	1	-	X	X	X	-	X	X
3. Portfolio	X	X	X	X	X	X	2,031	X	87	X
4. Other transactions	-	-	-	-	-	-	X	-	X	-
Total assets	**1,709**	**-**	**163**	**-**	**-**	**-**	**2,031**	**-**	**87**	**-**
1. Financial liabilities	449	X	92	-	-	-	X	9	X	X
2. Portfolio	X	X	X	X	X	X	1,242	X	-	X
Total liabilities	**449**	**-**	**92**	**-**	**-**	**-**	**1,242**	**9**	**-**	**-**
1. Forecast transactions	X	X	X	X	X	X	X	-	X	X
2. Financial assets and liabilities portfolio	X	X	X	X	X	X	-	X	-	-

The table indicates positive fair values of hedging derivatives, broken down in relation to asset or liability hedged and type of hedge.
Considering the values gross of netting in the financial statements, these continued to refer mainly to macro fair value hedges of loans disbursed and liabilities represented by core deposits, as well as micro fair value hedges of debt securities under assets.

SECTION 6 – FAIR VALUE CHANGE OF FINANCIAL ASSETS IN HEDGED PORTFOLIOS – CAPTION 60

6.1 Fair value change of hedged assets: breakdown by hedged portfolios

(millions of euro)

Fair value change of hedged assets / Amount	31.12.2024	31.12.2023
1. Positive fair value change	**1,284**	**-**
1.1 of specific portfolios:	1,284	-
a) financial assets measured at amortised cost	*1,284*	-
b) financial assets measured at fair value through other comprehensive income	-	-
1.2 overall	-	-
2. Negative fair value change	**-4,856**	**-5,573**
2.1 of specific portfolios:	-4,856	-5,573
a) financial assets measured at amortised cost	*-4,856*	*-5,573*
b) financial assets measured at fair value through other comprehensive income	-	-
2.2 overall	-	-
Total	**-3,572**	**-5,573**

The balance of the changes in value of assets subject to macrohedging against interest rate risk is recorded in this caption. For the application the Bank took advantage of the option envisaged by IFRS 9 to continue to apply the provisions permitted by the IAS 39 carve out.

The lower negative balance compared to 31 December 2023 of the fair value change of financial assets in hedged portfolios from interest rate risk was due to the reduction in interest rates in 2024.

SECTION 7 – EQUITY INVESTMENTS – CAPTION 70

(a) Where different from the % portion of the equity investment, the actual availability of votes in the Ordinary Shareholders' Meeting is indicated, distinguishing between the effective and potential voting rights, where applicable: (*) Effective voting rights (**) Potential voting rights.

(b) minority shareholders are subject to a legal commitment to purchase 0.7% of share capital.

(c) Companies included under significant equity investments as, on the whole, the Group holds a controlling interest or the conditions set out in IFRS 10 are met.

in the event of liquidation of the equity investment, the minority shareholder has the right to sell, and Intesa Sanpaolo is required to purchase, the entire minority investment.

(f) Vehicles used for covered bond issues.

(f) A closed-end alternative real estate investment fund managed by COIMA SGR S.p.A.

(g) Company not subject to the management and coordination activities pursuant to Article 2497 and following of the Italian Civil Code.

(h) Intesa Sanpaolo S.p.A. also holds 100% of the equity instruments issued by the investee.

(i) The member structure totals 7 members with identical per capita voting rights, pursuant to Article 6 of the Articles of Association (Compagnia di Sanpaolo, Intesa Sanpaolo S.p.A., Bank of Alexandria S.A.E., Intesa Sanpaolo Rent Foryou S.p.A., Intesa Sanpaolo Innovation Center S.p.A., Privredna Banka Zagreb D.D. and Intesa Sanpaolo Bank Albania SH.A.)

(j) These are vehicles used for securitisation transactions within the Group. The put&call options are exercisable in the half year following the closing date of the securitisation.

(k) the different value between the actual share and the number of votes in the Shareholders' Meeting is linked to the presence of various categories of shares (A and B). Only category A shares (also held by Intesa Sanpaolo) grant rights to vote in the Shareholders' Meeting.

(l) the different value between the actual share and the number of votes in the Shareholders' Meeting is linked to the presence of various categories of shares (A, B, D, MO, M). Category M shares (held by managers) do not attribute the right to vote in the Shareholders' Meeting, but only in the Special Meeting (pursuant to Art. 2766 of the Italian Civil Code).

(m) the interest is included under Companies subject to significant influence because, even though it represents a more complex situation than that typical of an ordinary non-controlling interest, the absence has been confirmed of the conditions for exercise of control envisaged by IFRS 10 on the basis of the corporate governance provisions in the articles of association/regulations.

(n) EIB Funds: the economic effects of the investments in equity and loans underlying the fund's operations will be borne in full by the EIB.

(o) the different value between the actual share and the number of votes in the Shareholders' Meeting is linked to the presence of a category of shares (B) lacking the right to vote in the Shareholders' Meeting.

The illustration of the criteria and the methods for the definition of the scope of consolidation and the reasons which determine that a company is subject to joint control or significant influence is contained in Part A – Accounting policies, to which reference should be made.

The fair value as at 31 December 2024 of the only listed equity investment, Risanamento S.p.A., amounted to 26 million euro.

7.2 Individually material equity investments: book value, fair value and dividends received

E. Total revaluations	**-**	**-**
F. Total impairment losses	**-7,607**	**-7,504**

Sub-caption B.1 Purchases primarily relates to the following transactions:

- increase in the value of the equity investment in the Efesto fund for 194 million euro following the contribution of a portfolio of non-performing loans in exchange for units of the fund;
- purchase of an investment of 99.98% in First Bank S.A. for 144 million euro;
- purchase of an investment in the UTP Restructuring Corporate fund for 137 million euro, following the contribution of a non-performing loan portfolio in exchange for units of the fund;
- purchase of an investment in the Retail & Leisure Fund for 126 million euro, following the contribution of a non-performing loan portfolio in exchange for units of the fund;
- increase in the value of the equity investment in the UTP Italia Fund - Loans Sub-Fund for 82 million euro following the contribution of a portfolio of non-performing loans in exchange for units of the fund;
- subscription of a share capital increase in favour of Pravex Bank Joint-Stock Company for 26 million euro;

Sub-caption B.2 Recoveries refers to the equity investments in UTP Italia Fund Loans Sub-Fund for 18 million euro, FI.NAV. Sub-Fund A – Loans for 8 million euro, and other minor equity investments for 8 million euro.

Sub-caption B.4 Other changes essentially refers to:

- the capitalisation of 1,000 million euro in favour of Fideuram – Intesa Sanpaolo Private Banking S.p.A.;
- the reclassification of the IDEA CCR (Corporate Credit Recovery) II Fund – Loans Sub-Fund for 235 million euro, from the Financial assets mandatorily measured at fair value portfolio;
- the income of Bancomat S.p.A. for 18 million euro;
- the capitalisation of Intesa Sanpaolo Innovation Center S.p.A. for 16 million euro;

The sub-caption C.1 Sales mainly relates to the sale of 10% of Porta Nuova Gioia for 23 million euro and the repayment of units of Porta Nuova Gioia for 10 million euro.

Sub-caption C.2 “Impairment losses” refers to the impairment losses on the equity investments in: Lendlease MSG Heartbeat for 80 million euro, Intrum Italy S.p.A. for 42 million euro, Pravex Bank Joint-Stock Company for 26 million euro, Risanamento S.p.A. for 24 million euro, Back2Bonis for 17 million euro, Qingdao Yicai Fund Distribution Co. Ltd. for 10 million euro, IDEA CCR (Corporate Credit Recovery) II Comparto Crediti for 9 million euro and other minor investments for 12 million euro.

Sub-caption C.4 Other changes essentially includes:

- the reimbursement of the funds: FI.NAV Sub-Fund A - Loans for 101 million euro, Efesto for 27 million euro, UTP Italia Fund - Loans Sub-Fund for 25 million euro and RSCT Fund - Loans Sub-Fund for 7 million euro;
- the reclassification of Bancomat S.p.A. for 32 million euro to the Financial assets mandatorily measured at fair value portfolio.

7.6 Commitments referred to investments in companies subject to joint control

For the information relating to this paragraph, reference should be made to the relevant section of the Notes to the consolidated financial statements.

7.7 Commitments referred to investments in companies subject to significant influence

For the information relating to this paragraph, reference should be made to the relevant section of the Notes to the consolidated financial statements.

7.8 Significant restrictions

For the information relating to this paragraph, reference should be made to the relevant section of the Notes to the consolidated financial statements.

7.9 Other information

For the information relating to this paragraph, reference should be made to the relevant section of the Notes to the consolidated financial statements.

Impairment tests of equity investments

As required under IAS/IFRS, equity investments are subjected to impairment testing to assess whether there is objective evidence to consider that the carrying value of the assets is not fully recoverable. With reference to equity investments, the process of detection of any impairment involves verification of the presence of impairment indicators and the determination of any write-down. The impairment indicators are essentially divided into two categories: qualitative indicators, such as the generation of negative economic results or in any case a significant variance with respect to the targets budgeted or established in the multi-year plans disclosed to the market, the announcement/start-up of insolvency proceedings or restructuring plans, and the downgrading by more than two classes of the rating; quantitative indicators, represented by a reduction in fair value of over 30% below the carrying value or for a period of over 24 months, by market capitalisation lower than the company's net book value, in the case of securities listed on active markets or by a carrying value of the investment in the Parent Company's financial statements higher than the carrying value in the consolidated financial statements of the investee's net assets and goodwill or by distribution by the latter of a dividend that is higher than its total income. If impairment indicators are detected, the recoverable amount, represented by the higher of the fair value less costs to sell and the value in use, is calculated and if it proves lower than the carrying value, impairment is recognised. If, subsequently, the recoverable amount is higher than the new carrying amount and the reasons for the impairment no longer apply following an event subsequent to the recognition of the impairment, write-backs are recognised, through profit or loss, up to the amount of the adjustment previously recognised.

In particular, where impairment indicators were recorded with respect to investments in associates or companies subject to joint control, analyses were carried out based, as a priority, on market methodologies (direct or comparable transactions and market multiples) or alternatively on "fundamental" analyses mainly based on an estimate of the expected discounted cash flows or on the adjusted net asset value (ANAV). The results of these assessments led to the need to recognise adjustments, mainly referring to the equity investments in Lendlease MSG Heartbeat (80 million euro), Intrum Italy S.p.A. (42 million euro), Back2Bonis (17 million euro), IDEA CCR (Corporate Credit Recovery) II Comparto Crediti (9 million euro), Efesto (5 million euro) and other minor investments for 7 million euro. The valuation of investments in associates or companies subject to joint control also led to the recognition of a write-backs of the equity investments in UTP Italia Fund Loans Sub-Fund (18 million euro), FI.NAV. Sub-Fund A - Loans (8 million euro) and other minor investments for 8 million euro.

Individual investments in subsidiaries, while material as individual assets from an accounting standpoint, do not present independent cash flow generation and governance capacity, given the organisational model, which calls for CGUs larger than the individual legal entities. Accordingly, investments in subsidiaries are not individually material for the purposes of conducting impairment tests in the financial statements of the Parent Company, but rather are aggregated (along with the operating activities conducted directly by the Parent Company) into CGUs consistent with those identified at the level of the consolidated financial statements. This approach is tied to the organisational model applied by the Group. According to that model, individual investments belonging to a given CGU are not capable of generating cash flows independently from the other investments. Therefore, their recoverable amounts cannot be calculated individually, as required by IAS 36.

In view of the consistency that must be preserved between the impairment tests conducted in the consolidated financial statements and the Parent Company's financial statements, in addition to the homogeneity of the composition of CGUs, the correlation between the items tested in the two sets of financial statements must be carefully considered: the goodwill attributed to the various CGUs in the consolidated financial statements and the Parent Company's financial statements partly reflects the goodwill associated solely with the Parent Company and partly the carrying amounts of investments in subsidiaries. The goodwill associated with the latter is implicit in the carrying amounts of the equity investments in the financial statements of the Parent Company and emerges in the consolidated financial statements following the consolidation process on the basis of the values determined during the purchase process pursuant to IFRS 3.

If a need to recognise an impairment loss on goodwill attributable to a given CGU is identified at the level of the consolidated financial statements, in the Parent Company's financial statements that impairment loss is attributed to the assets pertaining to the same CGU not subject to testing individually, namely goodwill, the brand name and investments in subsidiaries. As described in Part B – Information on the consolidated balance sheet - Assets, impairment tests on Cash Generating Units did not lead to the need to recognise in the consolidated financial statements impairment of goodwill. Accordingly, no impairment losses were recognised in relation to investments in subsidiaries.

Investments in subsidiaries that did not present goodwill values in the consolidated financial statements but that closed 2024 with a loss were treated differently. For such companies, it was prudentially verified that the latter result was due to contingent or structural factors; from this analysis the need emerged to make some adjustments, aligning the carrying amount of the

investment to the proportional share of equity of the subsidiaries. The impairment refers to the equity investments held in Pravex Bank Joint-Stock Company for 26 million euro, Risanamento S.p.A. for 24 million euro and Qingdao Yicai Fund Distribution Co. Ltd. for 10 million euro. The write-down in the interest in Pravex Bank Joint-Stock Company offset the increase in the equity investment of the same amount, deriving from the payment of 26 million euro made in the second half of 2024 as a capital increase of the subsidiary.
Moreover, following the outbreak of the Russia-Ukraine conflict, in 2022 the value of the investments in the capital of the subsidiaries in Russia (Joint-Stock Company Banca Intesa) and Ukraine (Pravex Bank) was written off during the year for 68 million euro and 48 million euro, respectively. In addition to that impairment, a provision was recognised for 71 million euro, required to cover indirect risks regarding the controlling investment held in Pravex Bank in relation to the ongoing conflict. That provision, of which 44 million euro was partially released in 2023 to align the values with the contribution of the subsidiary to the Consolidated financial statements, was fully released in 2024 (the remaining 27 million euro).

As explained in Part A – Fair value of real estate and valuable art assets, in accordance with the rules on valuation frequencies, the properties classified as owner-occupied assets and the valuable art assets were valued during the scenario analyses, through external appraisals, entrusted to qualified and independent experts.
Sub-captions B.4 and C.4 respectively report the positive and negative changes in fair value relating to owner-occupied real estate (land and buildings) and valuable art assets, for which the Bank applies the revaluation model. The Other changes, both increases and decreases, refer mainly to renegotiations and early terminations during the year of leases (IFRS 16) and, only regarding decreases, to amortisation and depreciation recorded during the year on assets deriving from the acquisition of business lines of the former Venetian banks, covered using the allowance for risks and charges specifically allocated at the time.
Sub-caption E. Measurement at cost only contains property and equipment measured according to the revaluation model.

8.9 Commitments to purchase property and equipment

Commitments to purchase property and equipment in existence as at 31 December 2024 amounted to approximately 2 million euro, mainly relating to efficiency improvement measures implemented on the systems installations in the head office buildings.

SECTION 9 - INTANGIBLE ASSETS - CAPTION 90

9.1 Intangible assets: breakdown by type of asset

(millions of euro)

Activities/Values	31.12.2024		31.12.2023	
	Finite useful life	Indefinite useful life	Finite useful life	Indefinite useful life
A.1 Goodwill	**X**	**67**	**X**	**67**
A.2 Other intangible assets	**3,220**	**1,507**	**2,932**	**1,507**
of which: Software	*2,957*	*-*	*2,649*	*-*
A.2.1 Assets measured at cost	3,220	1,507	2,932	1,507
a) internally generated intangible assets	2,143	-	2,096	-
b) other assets	1,077	1,507	836	1,507
A.2.2 Assets measured at fair value	-	-	-	-
a) internally generated intangible assets	-	-	-	-
b) other assets	-	-	-	-
Total	**3,220**	**1,574**	**2,932**	**1,574**

Other intangible assets and Goodwill with an indefinite useful life essentially reflect components from the purchase price allocation process, as per IFRS 3, as part of the merger by incorporation of Sanpaolo IMI into Banca Intesa finalised on 1 January 2007 and the subsequent business combinations under common control.

The sub-caption A.2.1 a) "internally-generated intangible assets" with a finite useful life refers to software developed internally. Sub-caption A.2.1 b) other assets, on the other hand, comprises the software licenses purchased from external suppliers, in addition to the intangible assets identified under the purchase price allocation of the price paid for business combinations. IFRS 3 requires that an acquisition that is part of a business combination must be recognised using the purchase method and that the price paid must be allocated to the assets acquired and the liabilities assumed, measured at their respective fair values. The intangibles identified, which express the value of the relationships acquired, are amortised over the estimated duration of their benefit.

9.2 Intangible assets: annual changes

(millions of euro)

	Goodwill	Other intangible assets: internally generated		Other intangible assets: other		Total

9.3 Intangible assets: other information

As at 31 December 2024, the commitments relating to investments in intangible assets, essentially software, amounted to around 73 million euro.

Information on intangible assets and goodwill

Intangible assets and goodwill recognised into the Intesa Sanpaolo financial statements derive mainly from the merger between Banca Intesa and Sanpaolo IMI completed on 1 January 2007, and subsequent mergers of the network banks and the merger by incorporation of UBI Banca, completed in 2021.

Reference should be made to Part B – Information on the consolidated balance sheet – Assets of the consolidated financial statements for further details of the various components and measurement criteria.
The following table summarises the recorded values of intangible assets, with their changes recorded in the Parent Company's Financial Statements during 2024.

(millions of euro)

	2023 financial statements	Amortisation	2024 financial statements
BANCA DEI TERRITORI DIVISION	**1,790**	**-21**	**1,769**
- Asset management intangible assets - distribution	173	-15	158
- Insurance intangible assets - distribution	97	-5	92
- Intangible under administration - distribution	13	-1	12
- Brand name intangible	1,507	-	1,507
IMI CORPORATE & INVESTMENT BANKING DIVISION	**67**	**-**	**67**
- Intangible brand name	-	-	**-**
- Goodwill	67	-	67
CGU TOTAL	**1,857**	**-21**	**1,836**
- Asset management intangible assets - distribution	173	-15	158
- Insurance intangible assets - distribution	97	-5	92
- Intangible under administration - distribution	13	-1	12
- Brand name intangible	1,507	-	1,507
- Goodwill	67	-	67

The intangible assets with finite useful lives shown in the table above refer to assets linked to customer relationships and are represented by the insurance portfolio and asset management accounts for the value components attributable to distribution activities.
For the intangible assets with a finite useful life, the amortisation for the year was recognised to the income statement (under "190. Net adjustments to/recoveries on intangible assets") for a total of 21 million euro.

The brand name, an intangible asset linked to marketing, was also measured. This asset is considered to have an indefinite life since it is expected to contribute for an indefinite period of time to the formation of income flows.

Based on IAS 36, both intangible assets with an indefinite useful life and goodwill are submitted to impairment testing on an annual basis to verify recoverability of their value. For intangible assets with a finite useful life, impairment must be calculated each time there is evidence of impairment indicators. The recoverable amount consists of the higher of the fair value and the value in use, less costs to sell.

With regard to the intangible assets with finite useful lives, specific impairment tests were conducted, which did not identify any problems. Moreover, consideration should be given to the amortisation process that had reduced their carrying amounts compared to their initial book values and in addition to the fact that the standard requires that the recoverable amount be determined by referring to the contractual relationships of the entire CGU at the reporting date and not only to the residual assets for which the initial value of the intangible asset was determined. In that regard, it should be mentioned that IAS 36, for the purpose of calculating the value in use of intangibles subject to impairment testing, states that reference must be made to cash flows for the intangible asset in its current condition (as at the impairment test date), with no distinction between cash flows arising from the asset initially recognised according to IFRS 3 and those deriving from later changes, improvements or developments since its acquisition. This because it would be difficult, especially with regard to extraordinary transactions between businesses or changes in the asset following significant turnover in volumes, customers or contracts, to separate flows relating to the original asset from others.
This concept can also be applied in impairment testing of goodwill to calculate the Value in use of the CGUs, for which the cash flows have to be considered with regard to all assets and liabilities of that CGU and not only the assets and liabilities for which goodwill was recognised on application of IFRS 3.

Pursuant to IAS 36, the recoverable amount consists of the higher of the fair value and the value in use, less costs to sell. As previously implemented in prior financial statements, to calculate the recoverable amount, the Value in Use that represents the present value of net future cash flows from the asset (or business) being valued was used also in the impairment tests for the 2024 Financial Statements.
As previously specified in relation to the consolidated situation, there were no critical issues in terms of impairment of either the goodwill allocated to the Corporate & Investment Banking CGU or the brand name allocated to the Banca dei Territori CGU, whose recoverable amount, in terms of fair value, was confirmed by a specific valuation drawn up by an independent expert.
Furthermore, the methods and assumptions of the impairment test procedures for intangible assets and goodwill defined by management were approved by the Board of Directors prior to approval of the draft financial statements for 2024.

Impairment testing of intangibles

Insurance portfolio

As previously specified, as part of the merger by incorporation of UBI Banca into Intesa Sanpaolo, finalised in April 2021, the intangible assets referring to the component of the insurance business linked to the distribution activities were valued. The value of that intangible asset is represented by the capacity of contracts with customers (insurance policies) in force at the time of acquisition to generate revenues over the useful life of acquired relationships. For the 2024 financial statements the amortisation of the asset for the year, calculated on a variable basis corresponding to the residual life of the policies, amounting to 5 million euro gross of the tax effect, was recognised to the income statement.
The analyses conducted during the year on the main impairment indicators were updated and extended for this type of intangible. However, a thorough recalculation of value of the intangible asset was not performed since the trend of the insurance business did not present any particular critical issues in 2024 to place into doubt the accuracy of the carrying amount.

Portfolio of assets under management and under administration

As part of the acquisition of certain assets and liabilities of Banca Popolare di Vicenza in compulsory administrative liquidation and Veneto Banca in compulsory administrative liquidation, in 2017 the intangible assets linked to assets under administration and management (AUM) deriving from the acquired Aggregate Set were calculated, represented by the capacity of the relationships existing at the acquisition date to generate cash flows over the residual useful life of those relationships. That type of intangible asset increased during 2019 due to the incorporation of Banca Apulia, and during 2021 due to the merger by incorporation of UBI Banca into Intesa Sanpaolo. Both transactions were recorded maintaining consistency with the values of the merged companies deriving from the Group's consolidated financial statements.
For the purpose of the impairment test as at 31 December 2024, no problems arose in relation to the strength of the value recorded, considering the performance of assets during the year and taking account of the fact, also specified above, that possible valuation for the purpose of impairment testing should not be limited only to the cash flows deriving from the asset acquired, but should also take account of all the cash flows linked to the assets of the specific CGU.
For more details, reference is made to Part B - Information on the Consolidated balance sheet – Assets.

Brand name

IFRS 3 considers the "brand name" a potential, marketing-related intangible asset, which may be recorded in the purchase price allocation process for business combinations.
For this purpose, please note that the term "brand" is used in accounting standards with an extensive meaning and not as a synonym of "logo" or "name". It is considered a general marketing term which defines a set of complementary intangible assets (in addition to the name and the logo, also the competencies, consumer trust, service quality, etc.) which concur to form brand equity.
The value recorded in the Intesa Sanpaolo financial statements refers to the Sanpaolo IMI brand recognised at the time of the Banca Intesa-Sanpaolo IMI merger, and is allocated to the Banca dei Territori CGU.
In general, the brand name is considered an intangible asset that has no independent cash flows and, thus, to be subject to impairment testing as part of the verification of the retention of goodwill for the various CGUs. For the purposes of this impairment test, it was considered that the Banca dei Territori CGU did not have any goodwill allocated and, in line with that carried out for the previous financial statements, it was decided to conduct a specific, autonomous valuation of the specific intangible based on the fair value resulting from the dedicated appraisal commissioned from a third party expert.
For more details, reference is made to Part B - Information on the Consolidated balance sheet – Assets.

Impairment testing of CGUs and goodwill

For impairment testing purposes, the estimation of the value in use relating to intangible assets with an indefinite life (including goodwill) that do not generate cash flows unless jointly with other business, as per IAS 36, requires the preliminary assignment of such intangible assets to relatively independent business units, able to generate cash flows strongly independent of those produced in other business areas, but interdependent within the business unit generating them. In IAS/IFRS terminology, such business units are known as Cash Generating Units (CGUs).
Specifically, the allocation of goodwill as at the date of the business combination takes into account the benefits produced by the synergies expected from the combination.
As CGU identification requires an analysis of the management characteristics and reporting methods used by management, and as the logic for strategic decision-making by management of the Parent Company is that of the Group as a whole and not only that of the Parent Company as an individual entity, the CGUs are identified in the consolidated financial statements. At the Intesa Sanpaolo Group level, the following CGUs have been identified:

- Banca dei Territori;
- IMI Corporate & Investment Banking;
- Insurance;
- Asset Management;
- Private Banking;
- International Banks;
- Bank of Alexandria;
- Pravex Bank.

For a description of the criteria relating to the definition of the Group's CGUs reference is made to Part B - Information on the Consolidated balance sheet – Assets. More specifically, goodwill recognised to the Intesa Sanpaolo financial statements has been allocated to the IMI Corporate & Investment Banking CGU.
Furthermore, as illustrated in the Accounting Policies, investments in subsidiaries are not treated, for impairment test purposes, as single assets to be individually subjected to testing. Considering the organisational model adopted by Intesa Sanpaolo, CGUs are defined without regard to the structure of legal entities, inasmuch as investments are aggregated, along

with the operating activities performed directly by the Parent Company, into CGUs of greater size or different structure. Accordingly, the impairment test performed at the consolidated level is also relevant at the Parent Company's financial statements level.
For an illustration of impairment tests for this caption, reference should be made to Part B - Information on the consolidated balance sheet - Assets.
If a need to recognise an impairment loss on goodwill attributable to a given CGU is identified at the level of the consolidated financial statements, in the Parent Company's financial statements that impairment loss is attributed to the assets pertaining to the same CGU not subject to testing individually, namely goodwill and investments in subsidiaries. As described in Part B – Information on the consolidated balance sheet – Assets, no value adjustments were identified at the CGU level in the consolidated financial statements. Therefore, on the basis of the results of the impairment test conducted at the level of the consolidated financial statements, there was no need for adjustments to the goodwill recognised in the Parent Company's financial statements.

SECTION 10 – TAX ASSETS AND LIABILITIES – CAPTION 100 OF ASSETS AND CAPTION 60 OF LIABILITIES

b) other	*-163*	*-172*
3.4 Business combinations	-	-
4. Final amount	**9,014**	**10,771**

Among Increases, sub-caption a) relating to previous years comprises 336 million euro referring to the recognition of deferred tax assets on tax losses carried forward pertaining to the merged company UBI Banca, as well as on tax losses and Aid for Economic Growth (ACE) surpluses of the merged company Intesa Sanpaolo Provis.
Again, among Increases, sub-caption d) other refers mainly to the recognition of convertible deferred tax assets on the portion of the tax loss that is attributable to the reversal of accumulated adjustments to loans and goodwill (60 million euro) and the deductible temporary differences arising during the year, connected to provisions for risks and charges (348 million euro).
Other increases refers to the reversal of netting against deferred tax liabilities, applied as at 31 December 2023, amounting to 128 million euro, of which 95 million euro against deferred tax liabilities through profit and loss and 33 million euro against deferred tax liabilities recorded in equity.
Among Decreases, sub-caption a) reversals mainly refer to the elimination of deferred tax assets pursuant to Law no. 214/2011 (1,488 million euro) and deferred tax assets previously recorded in relation to provisions for risks and charges, as a result of their use during the year (342 million euro).
Among Other decreases, sub-caption a) changes into tax credits pursuant to Law no. 214/2011 refers to the information set out in Part C, table 19.1.
Again among Other decreases, sub-caption b) other includes 150 million euro relating to the netting with deferred tax liabilities for the year, of which 110 million euro against deferred tax liabilities through profit and loss and 40 million euro against deferred tax liabilities recorded in equity.

3. Decreases	**-282**	**-440**
3.1 Deferred tax assets eliminated in the period	-188	-357
a) reversals	*-188*	*-357*
b) write-offs	-	-
c) due to changes in accounting criteria	-	-
d) other	-	-
3.2 Tax rate reductions	-	-
3.3 Other decreases:	-94	-83
3.4 Business combinations	-	-
4. Final amount	**1,131**	**983**

Among Increases, sub-caption c) other mainly refers to deductible temporary differences arising during the year, connected with the results of financial assets measured at fair value through other comprehensive income (329 million euro) and cash flow hedging derivatives (16 million euro).
Other increases comprise 83 million euro for the write-off of netting against deferred tax liabilities recorded in equity, applied as at 31 December 2023.
Among Decreases, sub-caption a) reversals mainly refers to the elimination of deferred tax assets previously recorded in relation to the fair value measurement of cash flow hedging derivatives (60 million euro) and financial assets measured at fair value through other comprehensive income (121 million euro) following the adjustment of the valuation effects or the related realisation during the year.
Other decreases comprise 81 million euro relating to the netting against deferred tax liabilities recorded in equity.

10.6 Changes in deferred tax liabilities (recorded in equity)

(millions of euro)

	31.12.2024	31.12.2023
1. Initial amount	**192**	**159**
2. Increases	**275**	**269**
2.1 Deferred tax liabilities recognised in the period	146	148
a) related to previous years	-	-
b) due to changes in accounting criteria	-	-
c) other	*146*	*148*
2.2 New taxes or tax rate increases	-	-
2.3 Other increases	129	121
2.4 Business combinations	-	-
3. Decreases	**-269**	**-236**
3.1 Deferred tax liabilities eliminated in the period	-136	-120
a) reversals	*-136*	*-120*
b) due to changes in accounting criteria	-	-
c) other	-	-
3.2 Tax rate reductions	-	-
3.3 Other decreases:	-133	-116
3.4 Business combinations	-	-
4. Final amount	**198**	**192**

Increases c) other refers to taxable temporary differences arising during the year connected with the measurement of financial assets measured at fair value through other comprehensive income (94 million euro) as well as the fair value measurement of property and equipment (12 million euro) and cash flow hedging derivatives (38 million euro).
Other increases consist of the write-off of netting against deferred tax assets as at 31 December 2023 for 116 million euro, of which 83 million euro refers to deferred tax assets recorded in equity and 33 million euro to deferred tax assets through profit or loss.
Decreases a) reversals refer to the discharge of deferred tax liabilities previously recorded in relation to the valuation of financial assets measured at fair value through other comprehensive income (110 million euro) as well as the fair value measurement of property and equipment (14 million euro) and cash flow hedging derivatives (12 million euro).
Other decreases comprise the netting against deferred tax assets recorded during the year, of which 81 million euro against deferred tax assets recorded in equity and 40 million euro against deferred tax assets through profit or loss.
As indicated in the accounting policies, with regard to current and deferred taxation, no provision is made in the financial statements for reserves subject to latent taxation only in the event of distribution, since the size of the available reserves which have already been taxed leads to the belief that the Bank will not undertake any transactions which may cause taxation of those untaxed reserves.

Probability test on deferred taxation

For information concerning the probability test on deferred taxation, refer to the contents of Part B – Assets of the Notes to the consolidated financial statements.
The test performed at Group and Parent Company levels showed a taxable base that was sufficient and adequate to allow recovery of the deferred taxes carried in the financial statements as at 31 December 2024.

10.7 Other information

There is no other information to be provided in addition to that already contained in this Section.

SECTION 11 - NON-CURRENT ASSETS HELD FOR SALE AND DISCONTINUED OPERATIONS AND RELATED LIABILITIES - CAPTION 110 OF ASSETS AND 70 OF LIABILITIES

The table above contains assets and related liabilities which no longer refer to continuing operations as they are being disposed of.

Caption A.1 Financial assets, amounting to 42 million euro net, in addition to 3 million euro in caption C.3 Other liabilities, consists of non-performing loans (329 million euro gross) which will be disposed of as part of operations planned for 2025.

A.3 Property and equipment comprise properties to be sold to the Coima Funds for 506 million euro, as part of a wider agreement finalised between the Bank and Coima, as well as of single properties held for sale for 29 million euro.

Liabilities associated with assets held for sale are entirely comprised of liabilities associated with the sale of the loans mentioned above.

11.2 Other information

There is no other significant information to note as at 31 December 2024.

SECTION 12 – OTHER ASSETS – CAPTION 120

12.1 Other assets: breakdown

(millions of euro)

Captions		
Amounts to tax authorities		24,446
Amounts to be credited and items under processing		901
Invoices to be issued		694
Bank cheques drawn on third parties to be settled		268
Accruals, prepayments and deferrals to be allocated		178
Cheques and other instruments held		126
Leasehold improvements		88
Due from Group companies on fiscal consolidation		79
Balance illiquid in portfolio		-
Other		925
TOTAL	**31.12.2024**	**27,705**
TOTAL	**31.12.2023**	**25,980**

The sub-caption Amounts due from tax authorities includes 22.5 billion euro in tax credits acquired from customers, of which 11.3 billion euro under the Hold to Collect business model, 3.3 billion euro under the Hold to Collect and Sell business model and 7.9 billion euro under the Other business model.

As required by paragraph 116 et. seq. of IFRS 15, assets arising from contracts with customers, which are included under the sub-caption "Other" and "Invoices to be issued" amounted to 340 million euro (323 million euro at the end of 2023).

LIABILITIES

SECTION 1 – FINANCIAL LIABILITIES MEASURED AT AMORTISED COST – CAPTION 10

1.1 Financial liabilities measured at amortised cost: breakdown of amounts due to banks

(millions of euro)

Transaction type/Amount	31.12.2024				31.12.2023			
	Book value	Fair Value			Book value	Fair value		
		Level 1	Level 2	Level 3		Level 1	Level 2	Level 3

1.4 Details of subordinated debts/securities
There were no subordinated debts with banks and customers as at 31 December 2024.
At the reporting date, Intesa Sanpaolo has subordinated securities issued for 11,800 million euro.

1.5 Details of structured debts
At the reporting date, Intesa Sanpaolo has structured debts with banks totalling 82 million euro.

1.6 Lease payables
As at 31 December 2024, Intesa Sanpaolo has lease payables of 955 million euro, of which 168 million euro maturing within one year, 460 million euro maturing within 1 to 5 years and 327 million euro maturing in over 5 years.
Lease payables comprise 950 million euro referring to customer counterparties and 5 million euro to bank counterparties.

SECTION 2 – FINANCIAL LIABILITIES HELD FOR TRADING – CAPTION 20

(*) Fair value calculated excluding changes in creditworthiness of the issuer after issue date.

Amounts due to banks and customers consist entirely of short selling of securities.
Sub-caption 3.2.1 Other structured securities under Debt securities entirely consist of certificates which provide for partial or full redemption of the premiums paid on maturity, pursuant to Bank of Italy Communication of 21 October 2014.
Derivative instruments include 7,650 million euro in certificates with characteristics similar to financial derivative instruments due to the prevalence of market risk in relation to the return of the premiums paid.

The changes in fair value recorded during the year due to the change in its own credit rating were negative overall by 5 million euro and related to Derivatives and Debt securities - Other.

The values of derivative instruments as at 31 December 2024 include the results of the offsetting of accounts between positive and negative gross balances of trading derivatives undertaken with the legal clearing agent LCH Ltd. as they meet the requirements set out in IAS 32, paragraph 42.

2.2 Breakdown of "Financial liabilities held for trading": subordinated liabilities
The aggregate Financial liabilities held for trading includes subordinated liabilities represented by Due to banks for 383 million euro and Due to customers for 46 million euro.

2.3 Breakdown of "Financial liabilities held for trading": structured debts
As at 31 December 2024, structured debts classified under Financial liabilities held for trading amounted to 9 million euro due to banks and 1 million euro due to customers, attributable to 4 million euro of short selling of fixed-rate bonds indexed to inflation, as an additional component, and 6 million euro of short-selling of convertible bonds.

SECTION 3 – FINANCIAL LIABILITIES DESIGNATED AT FAIR VALUE – CAPTION 30

3.1 Financial liabilities designated at fair value: breakdown

(*) Fair value calculated excluding changes in creditworthiness of the issuer after issue date

The Bank has classified the LECOIP 3.0 for the employment agreements, terminated early, of employees of Group companies and life policies connected to social initiatives, managed by the Bank based on fair value, under Amounts due to customers.

Sub-caption 3.1 Debt securities – Structured comprised certificates which provide for partial or full redemption of the premiums paid on maturity, pursuant to Bank of Italy Communication of 21 October 2014 (certificates with guaranteed or protected capital). As they were issued after 1 January 2020, these are classified under Financial liabilities designated at fair value (Fair Value Option), as a result of the Bank's implementation of a business model based on a banking book approach, with the goal of generating stable inflows.
Certificates representing Financial liabilities designated at fair value record the related changes in fair value attributable to changes in own credit risk in the statement of comprehensive income (shareholders' equity). Changes in fair value attributable to the change in the Bank's own credit rating during the year were negative by 98 million euro.

3.2 Breakdown of "Financial liabilities designated at fair value": subordinated liabilities
Intesa Sanpaolo has no subordinated liabilities classified under Financial liabilities designated at fair value.

SECTION 4 – HEDGING DERIVATIVES – CAPTION 40

4.1 Hedging derivatives: breakdown by type of hedge and level

(millions of euro)

	31.12.2024				31.12.2023			
	Fair value			Notional value	Fair value			Notional value
	Level 1	Level 2	Level 3	31.12.2024	Level 1	Level 2	Level 3	31.12.2023
A. Financial derivatives	**-**	**3,741**	**-**	**199,503**	**-**	**4,336**	**-**	**214,932**
1) Fair value	-	3,549	-	188,988	-	4,140	-	201,528
2) Cash flows	-	192	-	10,515	-	196	-	13,404
3) Foreign investments	-	-	-	-	-	-	-	-
B. Credit derivatives	**-**	**-**	**-**	**-**	**-**	**-**	**-**	**-**
1) Fair value	-	-	-	-	-	-	-	-
2) Cash flows	-	-	-	-	-	-	-	-
Total	**-**	**3,741**	**-**	**199,503**	**-**	**4,336**	**-**	**214,932**

The values of Financial Derivatives as at 31 December 2024 include the results of the offsetting of accounts between positive and negative gross balances of hedging derivatives undertaken with the legal clearing agent LCH Ltd. as they meet the requirements set out in IAS 32, paragraph 42.
The total negative fair value of hedging derivatives gross of on-balance sheet offsetting would amount to 9,757 million euro (of which 9,112 million euro hedging fair value and 645 million euro hedging cash flows).

4.2 Hedging derivatives: breakdown by hedged portfolio and type of hedge

(millions of euro)

Transactions/Type of hedge	Fair Value							Cash flow		Foreign invest.

2. Financial assets and liabilities portfolio	X	X	X	X	X	X	-	X	-	-

The table indicates negative fair values of hedging derivatives, broken down in relation to asset or liability hedged and type of hedge.
Considering the values gross of netting in the financial statements, these continue to refer mainly to macro fair value hedges of core deposits as well as micro-hedges of debt securities under assets and liabilities issued. Cash flow hedges relate to floating-rate loans and funding, with the latter including the macro hedges of cash flows on securities issued to the extent they fund fixed-rate loans.

SECTION 5 – FAIR VALUE CHANGE OF FINANCIAL LIABILITIES IN HEDGED PORTFOLIOS – CAPTION 50

5.1 Fair value change of hedged liabilities: breakdown by hedged portfolios

(millions of euro)

Fair value change of hedged liabilities/Group members	31.12.2024	31.12.2023
1. Positive fair value change of financial liabilities	1,591	-
2. Negative fair value change of financial liabilities	-3,394	-3,907
Total	**-1,803**	**-3,907**

The balance of the changes in value of liabilities subject to macrohedging against interest rate risk is recorded in this caption. For the application the Bank took advantage of the option envisaged by IFRS 9 to continue to apply the provisions permitted by the IAS 39 carve out.
The lower negative balance compared to 31 December 2023 of the fair value change of financial liabilities in macro-hedged portfolios from interest rate risk was due to the reduction in interest rates in 2024.

SECTION 6 – TAX LIABILITIES – CAPTION 60

For information on this section, see Section 10 of Assets.

SECTION 7 – LIABILITIES ASSOCIATED WITH NON-CURRENT ASSETS HELD FOR SALE AND DISCONTINUED OPERATIONS – CAPTION 70

For information on this section, see Section 11 of Assets.

SECTION 8 – OTHER LIABILITIES – CAPTION 80

8.1 Other liabilities: breakdown

10.4 Allowances on other commitments and other guarantees given

As at 31 December 2024, there were no allowances on other commitments and guarantees given.

10.5 Post-employment defined benefit plans

1. Illustration of the characteristics of the funds and related risks

As already illustrated in Part A – Accounting policies, for defined benefit plans, the liability of the Bank, according to IAS 19 "Employee Benefits", is determined via the "projected unit credit method" by an independent actuary. The liability is recognised net of any plan assets of each Pension Fund and the actuarial gains and losses calculated in the valuation process for the plans are recognised in the statement of comprehensive income and, therefore, in shareholders' equity.
The defined benefit plans, in which Intesa Sanpaolo S.p.A. is jointly responsible, can be distinguished in:
– internal funds;
– external funds.

Internal funds include:
– Three defined benefit plans in force for the London branch, relating to the former Cariplo, Banca Commerciale Italiana and Banco Ambrosiano Veneto branches. The private pension funds have been set up by the UK employers to integrate the levels of the local state pension, which has always been very low. The London branches of Cariplo, Banca Commerciale Italiana and Banco Ambrosiano Veneto set up defined benefit plans for their employees at the time of their opening, under the form of Trusts incorporated under English law and managed by Boards of Trustees, appointed partly by the employers and partly by beneficiaries. Such funds are operational for employees hired until the end of 1999 for Banco Ambrosiano Veneto and Cariplo and until the end of 2000 for Banca Commerciale Italiana. In general, all funds guarantee a pension payable when the beneficiary turns 65 and the benefit is determined, with different rules for the various funds, on the basis of the annual gross wage received in the last year of service.

External funds include:
- the Intesa Sanpaolo Group Defined-Benefit Fund "Fondo Pensione a Prestazione definita del Gruppo Intesa Sanpaolo", the name given to the former Supplementary Pension Fund for the Employees of Banco di Napoli "Fondo Pensione Complementare per il Personale del Banco di Napoli – Sezione A", identified as a collector of other "defined benefit" forms under the reorganisation and rationalisation of the existing pension schemes within the Intesa Sanpaolo Group, with protection of the rights of the (active and retired) subscribers. To this end, the "Fund" – in the virtually separated sections – has been assigned the asset captions contained in the financial statements of the pre-existing pension schemes, in order to ensure full coverage of the supplementary benefits. For that reason, with regard to this Pension Fund, liabilities to be recorded in the financial statements (net of the plan assets) are calculated section by section, considering the specific characteristics of each base. The Fund, which is a legal entity with independently managed assets, includes the following: employees enrolled in the plan and other beneficiaries from former Banco di Napoli; retired employees receiving Supplementary Pension Cheques, formerly the Sanpaolo IMI internal fund; retired employees from the former Banca Nazionale delle Comunicazioni; current and retired employees of Cassa di Risparmio in Bologna, formerly enrolled in the Complementary pension fund for the employees of said bank, transferred to the Fund in question in 2004; retired employees of the Complementary pension fund of the former Fin.Opi, transferred to the Fund in question on 1 June 2005; current and retired employees of the former Banca Popolare dell'Adriatico, formerly enrolled in the Pension fund for the employees of Banca Popolare dell'Adriatico, transferred to the Fund in question on 30 June 2006; retired employees of Cassa di Risparmio di Udine e Pordenone, formerly enrolled in the Complementary pension fund for the employees of said bank, transferred to the Fund in question in 2006; retired employees of Cassa di Risparmio di Forlì, formerly enrolled in the Complementary pension fund for the employees of said bank, transferred to the Fund in question on 1 January 2007; retired employees of the former Carive internal Fund, transferred to the Fund in question on 1 January 2008; retired employees of the former CR Firenze FIP internal fund, transferred to the Fund in question on 1 January 2010; retired employees of Cassa di Risparmio di Pistoia e Pescia internal fund, transferred to the Fund in question on 1 September 2012; retired tax-collection personnel of the Supplementary pension fund for tax-collection personnel formerly employed by Cariplo, transferred to the Fund in question on 1 January 2015; retired employees formerly enrolled in the Supplementary pension fund for employees of Mediocredito Lombardo S.p.A., transferred to the Fund in question on 1 January 2015; retired employees formerly enrolled in the Pension Fund for key Managers, former Key Managers and entitled parties of former Comit, transferred to the Fund in question on 1 January 2015; retired employees formerly enrolled in the "Casse del Centro" Pension Funds, in particular those enrolled in the Supplementary INPS benefits fund for the compulsory insurance for invalidity, old-age and survivors for personnel of Cassa di Risparmio di Città di Castello, Supplementary INPS benefits fund for the compulsory insurance for invalidity, old-age and survivors for personnel of Cassa di Risparmio di Foligno, Company supplementary pension AGO fund for employees of Cassa di Risparmio di Spoleto, Supplementary/complementary pension fund for the mandatory pension for employees of Cassa di Risparmio di Rieti, Pension fund for the Employees of Cassa di Risparmio della Provincia di Viterbo and Company supplementary pension fund for employees of Cassa di Risparmio di Ascoli Piceno, transferred to the Fund in question on 1 January 2015; retired employees formerly enrolled in the Company supplementary pension fund of INPS benefits for employees of Cassa di Risparmio di Civitavecchia, transferred to the Fund in question on 1 January 2015; retired employees formerly enrolled in the supplementary fund of SIL – Società Italiana Leasing S.p.A., transferred to the Fund in question on 1 January 2015; retired employees formerly enrolled in the Supplementary Pension Fund for the personnel of Banca Monte Parma, transferred to the Fund in question on 1 January 2016; employees and retired employees formerly enrolled in the Pension Fund for the personnel of the former Crediop hired before 30 September 1989, transferred to the Fund in question on 1 January 2016; retired employees formerly enrolled in the Supplementary Pension Fund for the personnel of Cassa di Risparmio di Mirandola, transferred to the Fund in question on 1 April 2016; retired employees formerly enrolled in the Pension Fund for the Personnel of the former Cassa di Risparmio di Prato transferred to the Fund in question on 1 May 2018; retired employees formerly enrolled in the Defined Benefit Plan of the former Cassa di Risparmio di Fabriano e Cupramontana transferred to the Fund in question on 1 May 2018; current and retired employees of the Supplementary pension fund for the personnel of Istituto Bancario Sanpaolo di Torino, transferred to the Fund in question on 1 January 2019; retired employees of the Supplementary pension fund for the

personnel of Cassa di Risparmio di Padova e Rovigo, transferred to the Fund in question on 1 July 2019; employees and retired employees formerly enrolled in the former UBI Banca internal Funds - which include the Funds relating to the former Centrobanca (former Supplementary Pension Fund for employees of Centrobanca - former Banca Centrale di Credito Popolare S.p.A.), former Banca Regionale Europea (former Fund for the personnel of Banca Regionale Europea from the former Banca del Monte di Lombardia and the former Cassa di Risparmio di Cuneo), former Carime (former Fund of the former Cassa di Risparmio di Calabria e Lucania, Fund of the former Cassa di Risparmio di Puglia, Fund of the former Cassa di Risparmio Salernitana) and former Banca Adriatica (former Retirement Fund for the personnel of the loans business line of the former Cassa di Risparmio di Macerata S.p.A., Retirement Fund for the personnel of the former Banca Ca.Ri.Ma. transferred to Se.Ri.Ma - now Equitalia Servizi di Riscossione S.p.A., Retirement Fund for the personnel of the former Mediocredito Fondiario Centro Italia S.p.A., Retirement Fund for personnel in the tax-collection segment of the former Cassa di Risparmio di Pesaro, Retirement Fund for the personnel of the former Cassa di Risparmio di Jesi, Retirement Fund for personnel in the tax-collection segment of the former Cassa di Risparmio di Pesaro S.p.A. transferred to the former SE.RI.T. S.p.A.) - transferred to the Fund in question on 1 July 2022; retired employees formerly enrolled in the Pension Fund of the former UBI Banca Group of the former Banca Popolare di Bergamo and its subsidiaries, transferred to the Fund in question on 1 September 2022; and retired employees formerly enrolled in the Pension Fund for the Personnel of the former Banca Popolare di Ancona and its subsidiaries, transferred to the fund in question on 1 September 2022; employees and retired employees formerly enrolled in the former Retirement Fund of the Cassa di Risparmio di Firenze, transferred to the Fund in question on 1 January 2023.
It should be clarified that the Articles of Association of the Defined-Benefit Fund of the Intesa Sanpaolo Group provide for the immediate settlement by the co-obligated Banks, if sections of the Fund present a technical imbalance determined according to the statutory methodology (without prejudice to provisions to the contrary in trade union agreements). Any outlays to settle the technical imbalance to be made in the next year will be determined at the time the financial statements of the Fund are approved, which is scheduled for June;

- Pension fund for the employees of Cariplo, a fund with legal status and full economic independence, whose aim is to guarantee supplementary pension treatment in addition to AGO cheques to former Cariplo employees already retired on 30 June 1998;
- a defined benefit plan at the New York branch: the fund was established in 1977 by the branch of Banca Commerciale Italiana and guarantees a pension treatment to all the employees resident in the United States who have been in service at the Bank for at least 5 years. The benefit is considered to be accrued even if the employment relationship ceases in advance. The benefit is calculated based on the highest average wage considering three consecutive years out of the last 10 years of service, or, if the employment relationship ceases before, based on the average wage in the last three years of service. The fund is fully managed by Prudential.

On 5 December 2017, Intesa Sanpaolo S.p.A., also in its capacity as Parent Company, signed an agreement with the Trade Unions, as Fund Founders, for the integration of the Supplementary Pension Fund for the Personnel of Istituto Bancario San Paolo di Torino into the former Supplementary Pension Fund for the Personnel of Banco di Napoli (now, as previously indicated, the "Fondo pensione a prestazione definita del Gruppo Intesa Sanpaolo"). This agreement also provided for the formulation of an individual capitalisation offer for the supplementary benefits to be made to the participants, which was carried out in the second half of 2018. The subscriptions received over time led to a decrease in the obligation, which, in the current year, amounted to around 2 million euro, partly covered by the Fund's assets and partly through the use of Funds set up specifically for this purpose by the Bank, under the guarantee given.

With regard to the investment and integrated risk management policies, the Funds verify the level of coverage and the possible outcomes under various scenarios. For this purpose, various investment configurations and portfolio mixes and allocations are defined, in order to satisfy the pension and profitability objectives as adequately as possible.

2. Changes in the year of net liabilities (assets) with defined benefits and redemption rights

(millions of euro)

Pension plan liabilities defined benefit obligations	31.12.2024			31.12.2023		
	Employee termination indemnities	Internal plans	External plans	Employee termination indemnities	Internal plans	External plans
Initial amount	**717**	**94**	**925**	**797**	**103**	**1.004**
Current service costs	3	1	2	3	2	1
Recognised past service costs	-	-	-	-	-	-
Interest expense	22	5	29	25	5	32
Actuarial losses due to changes in financial assumptions	9	-	11	-	-	-
Actuarial losses due to changes in demographic assumptions	1	-	-	-	-	21

Benefits paid	-80	-3	-97	-94	-3	-100
Decreases - business combinations	-	-	-	-	-	-
Curtailments of the fund	X	-	-	X	-	-
Settlements of the fund	X	-	-	X	-	-
Other increases	20	-	2	33	-	1
Other decreases	-34	-	-	-22	-	-
Final amount	**652**	**116**	**838**	**717**	**94**	**925**

Pension plan liabilities defined benefit obligations	31.12.2024			31.12.2023		
	Employee termination indemnities	Internal plans	External plans	Employee termination indemnities	Internal plans	External plans
Unfunded plans	652	-	-	717	-	-
Partly funded plans	-	-	-	-	-	-
Wholly funded plans	-	116	838	-	94	925

The actuarial gains recognised due to changes in demographic assumptions mainly depend on the updating of mortality rates of the general population of Italy. Actuarial losses recognised due to changes in financial assumptions are mainly due to the decrease in the discount rate.
On the basis of actuarial calculations, the present value of the defined benefit obligations, excluding Employee termination indemnities, was as follows.

Internal plans
– as said before, the final amount refers to defined benefit plans at the London branch, entirely contributed by Intesa Sanpaolo S.p.A.

External plans
– 487 million euro referred to the Intesa Sanpaolo Group Defined-Benefit Fund (of which 482 million euro pertaining to Intesa Sanpaolo S.p.A.);
– 328 million euro referred to the Pension fund for employees of Cariplo, entirely contributed by Intesa Sanpaolo S.p.A.;
– 23 million euro referred to defined benefit plans at the New York branch, entirely contributed by Intesa Sanpaolo S.p.A.

3. Information on the fair value of plan assets

The following tables show the changes in plan assets for certain defined benefit plans and their composition.

(millions of euro)

Plan assets	31.12.2024		31.12.2023	
	Internal plans	External plans	Internal plans	External plans
Initial amount	**124**	**928**	**137**	**927**

TOTAL ASSETS	**132**	**100.0**	**913**	**100.0**	**124**	**100.0**	**928**	**100.0**

The difference between net defined benefit liabilities (see the previous disclosure, Table 10.5, point 2) and the plan assets (see the previous disclosure, Table 10.5, point 3) is recognised, based on the criteria illustrated in paragraph 10.5, point 1) above, under the company post-employment plans.
The internal plans are subject to the effect of the limitation of the asset ceiling determined pursuant to IFRIC 14, amounting to 16 million euro as at 31 December 2024 (30 million euro as at 31 December 2023).

4. Description of the main actuarial assumptions

The table below indicates the actuarial assumptions and interest rates used by the various funds.

Actuarial assumptions	31.12.2024				31.12.2023			
	Discount rate	Expected rate of return	Expected rate of wage rises (a)	Annual inflation rate	Discount rate	Expected rate of return	Expected rate of wage rises (a)	Annual inflation rate
EMPLOYEE TERMINATION INDEMNITIES	2.9%	X	2.6%	1.9%	3.2%	X	2.8%	2.1%
INTERNAL PLANS	5.3%	0.0%	2.9%	2.9%	5.3%	0.0%	2.9%	2.9%
EXTERNAL PLANS	3.7%	4.7%	2.7%	2.0%	3.8%	5.1%	3.2%	2.4%

(a) Net of career developments.

The discount rate of external plans for 2024 was 5% for the New York branch (5% also for 2023) and varies from 2.9% to 3.1% for Italian Funds (the range was 3.1% to 3.4% in 2023).

The Intesa Sanpaolo Group primarily uses the Eur Composite AA rate as its discounting rate, weighted by the ratio of payments and advances referring to each maturity, on the one hand, and the total amount of payments and advances to be made for the final fulfilment of the entire obligation, on the other. In the case of defined-benefit plans in particular, the rate used is the average rate that reflects the market parameters covered by the plan. The Eur Composite AA curve is obtained daily from the Bloomberg's information provider and refers to a basket of securities issued by investment-grade corporate issuers included in the AA rating class, residing in the Eurozone and belonging to various sectors.

Likewise, the Intesa Sanpaolo Group mainly uses the European Zero-Coupon Inflation-Indexed Swap rate curve, weighted on the basis of the ratio of the amount paid for each maturity and the total amount to be paid until the obligation is finally discharged in full, as the inflation rate.

5. Information on amount, timing and uncertainty of cash flows

Discount rate	611	697	101	133	778	907
Rate of wage rises	652	652	126	107	845	831
Inflation rate	680	626	120	111	887	792

The sensitivity analysis is not conducted on the expected rate of return as it has no effect on the calculation of the liabilities.

The sensitivity analysis was carried out on the net defined benefit liabilities pursuant to the previous disclosure, 10.5, point 2.
The absolute values of the data presented indicate the possible amount of net defined benefit liabilities in the event of a change in rate of +/-100 basis points.
The average duration of the defined benefit obligation is 9.20 years for pension funds and 6.80 years for employee termination indemnities.

6. Multi-employer plans

The Bank has the following defined benefit plans regarding more than one employer:

- Pension Fund for the employees of the former Crediop hired before 30 September 1989, which on 1 January 2016 was transferred to the former Supplementary Pension Fund for the Employees of Banco di Napoli (now the Intesa Sanpaolo Group Defined-Benefit Fund "Fondo Pensione a Prestazione Definita del Gruppo Intesa Sanpaolo"). The commitments of Crediop S.p.A. (now Dexia-Crediop) and the former Sanpaolo IMI (now Intesa Sanpaolo S.p.A.) with regard to the Fund are governed by the agreement entered into between the parties on 28 May 1999. Its transfer into the Intesa Sanpaolo Group Defined-Benefit Fund "Fondo Pensione a Prestazione Definita del Gruppo Intesa Sanpaolo" did not modify the guarantees and commitments undertaken by the parties in the past;
- Retirement Fund for former employees of Banca Ca.Ri.Ma., transferred to Se.Ri.Ma. (now Equitalia Servizi di Riscossione S.p.A.), whose tax collection services were transferred on 1 January 1990 to the former Equitalia Marche S.p.A. (currently Agenzia delle Entrate - Riscossione) which was transferred to the Intesa Sanpaolo Group Defined-Benefit Fund on 1 July 2022. The trade union agreement and agreements between subscribers of the operation sanctioned that the then-parent company Ca.Ri.Ma. (then former Banca Marche S.p.A., then former Nuova Banca Marche S.p.A. and subsequently former Banca Adriatica S.p.A., then merged into former UBI Banca, in turn merged into Intesa Sanpaolo S.p.A.) would continue to allocate in its financial statements the mathematical reserves pertaining to personnel hired before the operation was finalised;
- Pension Fund for the Personnel of the former Banca Popolare di Ancona and its subsidiaries, transferred on 1 September 2022 to the Intesa Sanpaolo Group Defined-Benefit Fund, which provides a guarantee of settlement of the respective shares of the subscribers by Intesa Sanpaolo S.p.A. (former UBI Banca) and Credito Valtellinese.

7. Defined benefit plans that share risks among entities under joint control

The Intesa Sanpaolo Group Defined-Benefit Fund is a defined-benefit plan that shares the risks amongst the various Group companies. These companies issue a joint guarantee for their registered employees and pensioners with respect to the subject pension entities.
The liabilities of each jointly responsible Company are determined by an Independent Actuary through the "projected unit credit method" and are recorded in the financial statements net of the plan assets. Similarly, the current service cost, which represents the average present value at the measurement date of the benefits accrued by workers in service during the year, is calculated for each Company by said Actuary.
Each jointly responsible Company reports in this section, for each table, the total liabilities/assets of the Funds for which it is jointly responsible, highlighting at the bottom of said tables the liability/asset amount under their responsibility.

10.6 Allowances for risks and charges – Other allowances

(millions of euro)

Captions/Components	31.12.2024	31.12.2023
Other allowances		
1. legal and tax disputes	595	663
2. personnel charges	1,867	1,772
incentive-driven exit plans	*999*	*905*
employee seniority bonuses	*21*	*87*
other personnel expenses	*847*	*780*
3. other risks and charges	271	362
Total	**2,733**	**2,797**

Other allowances refers to:

– Legal and tax disputes: the allowance was set up mainly to cover expected outlay for litigation, revocatory action and tax disputes;
– Personnel charges: the allowance includes charges for incentive-driven exit plans, employee seniority bonuses (calculated on the basis of actuarial assumptions) and provisions for bonuses and other charges relating to employees; the charges for exit incentives during 2024 included those relating to the agreement signed with the trade unions on 23 October 2024;
– Other risks and charges: these mainly refer to charges connected with the sale of portfolios of NPLs and other charges relating to sundry obligations.

SECTION 11 – REDEEMABLE SHARES – CAPTION 120

11.1 Redeemable shares: breakdown

These are not present in Intesa Sanpaolo.

SECTION 12 – PARENT COMPANY'S SHAREHOLDERS' EQUITY – CAPTIONS 110, 130, 140, 145, 150, 160, 170 AND 180

12.1 Share capital and Treasury shares: breakdown

As at 31 December 2024, the Bank's portfolio amounted to 25,629,058 treasury shares fully paid in. The treasury shares have no par value and represent 0.14% of the share capital.
For information on this section, see point 12.3 below.

In 2024, capital was affected by the annulment of 479,128,488 ordinary shares following the purchase of own shares in the period from 3 June to 18 October 2024 in execution of the buyback plan announced to the market on 27 May 2024. During that period, a total of 479,128,488 shares with no par value were purchased, equal to around 2.62% of the pre-annulment share capital, at an average purchase price per share of 3.5481 euro, for a total value of 1,699,999,992.53 euro. The shares were annulled on 23 October. As a result of the annulments, the share capital changed its composition, due to the reduction in the number of shares constituting it, while its amount remained unchanged at 10,368,870,930.08 euro.

The caption "Purchase of own shares" includes purchases to service the free assignment plans for personnel. The programme was launched on 9 September 2024 and ended on 11 September 2024, resulting in the purchase of 10,301,330 ordinary shares of the Bank at an average purchase price per share of 3.7146 euro for a total amount of 38,265,555.39 euro. The purchase transactions were executed in compliance with the provisions included in Articles 2357 and following and 2359-bis and following of the Italian Civil Code and within the limits determined in the resolutions passed by the Shareholders' Meeting of Intesa Sanpaolo of 24 April 2024.

12.3 Share capital: other information

The share capital of the Bank as at 31 December 2024 amounted to 10,369 million euro, divided into 17,803,670,501 ordinary shares, with no par value. Each ordinary share gives the right to one vote in the Shareholders' Meeting. The share capital is fully paid-in.
There are no liens or pledges on the Bank's shares and, as regards the constraints on the distribution of dividends and the redemption of capital, please refer to the statement containing a summary of shareholders' equity captions broken down by origin and with an indication of the possibility of use and distributability pursuant to Article 2427, paragraph 1, no.7-bis of the Italian Civil Code set out in point 12.4.
Entries made in accordance with IFRS 3 regarding the merger between Banca Intesa and Sanpaolo IMI, finalised on 1 January 2007, generated a reserve of 23,734 million euro as at 31 December 2024, equal to the difference between the acquisition cost of the Sanpaolo IMI Group and the nominal value of the shares issued to service the exchange. In the 2007 financial statements, it was reported under share premium reserve, based on the opinions expressed by legal experts. This reserve will be reported differently should the Law or Supervisory Authorities indicate a different solution.
For completeness, please note that during the year there was positive change in the share premium reserve of 4,136,160 euro related to the sale and assignment of treasury shares.

12.4 Reserves from retained earnings: other information

Reserves amounted to 5,024 million euro and included legal reserve, extraordinary reserve, concentration reserves (Law 218 of 30 July 1990, Art. 7, par. 3, and Law 218 of 30 July 1990, Art. 7) and other reserves.
The legal reserve, set up as provided for by law, must be at least one fifth of share capital; in the past it was set up by allocating each year at least one twentieth of net income for the year. Should the reserve decrease, it must be reintegrated through mandatory allocation of at least one twentieth of net income for the year.
Concentration reserves under Law 218 of 30 July 1990 were set up at the time of reorganisations or concentrations carried out pursuant to the aforementioned law.
Other reserves included reserves pertaining to international branches and other reserves set up in the past following specific legal provisions. They also include the reserve established pursuant to Article 26, paragraph 5-bis of Decree Law no. 104 of 10 August 2023, converted with amendments by Law no. 136 of 9 October 2023.

Valuation reserves amounted to 26 million euro and included reserves of financial assets measured at fair value through other comprehensive income, reserves for cash flow hedging derivatives, financial liabilities designated at fair value through profit or loss (changes in the Bank's own credit rating) and revaluations of net defined benefit liabilities (assets), as well as legally-required revaluation reserves and revaluation reserves of properties and valuable art assets.

In 2024, the reserves underwent the following changes:

- allocation of the 1,991,446,276 euro to the reserve established pursuant to Article 26, paragraph 5-bis of Decree Law No. 104 of 10 August 2023, converted with amendments by Law No. 136 of 9 October 2023 and allocation of the remaining 2023 net income of 838,999 euro to the extraordinary reserve, as per the resolution of the ordinary Shareholders' Meeting of 24 April 2024; on the same date, through reversal from the extraordinary reserve, the share of the 2023 net income corresponding to the capital gains recognised in the income statement of 275,743,258 euro was recognised in an unavailable reserve pursuant to Article 6, paragraph 1, letter a), of Legislative Decree No. 38/2005;
- reduction of the extraordinary reserve of 1,699,999,993 euro resulting from the annulment of the own shares under the buyback programme;
- allocation to other reserves of the total net negative amount of 400,819,796 euro for the coupons paid to subscribers of the Additional Tier 1 instruments, net of the related taxes;
- adjustment of the reserves for the Equity Settled Share Based Payment plans (named "LECOIP 3.0" and targeted to all employees), the Performance Share Plan (known as the PSP and aimed at all of the Group's Management, including the Managing Director and CEO, the remaining Top Risk Takers and the Other Risk Takers of the Group, both in Italy and abroad), for a total positive amount of 156,369,896 euro;
- allocation to other reserves of the total net negative amount of 79,222,140 euro for the realisation component of certificates measured under the fair value option;
- recognition in other reserves of the valuation reserves for the gains/losses realised on financial assets measured at fair value through other comprehensive income, for a total net negative amount of 40,167,517 euro;
- recognition in other reserves pursuant to IFRS 2 of the fair value of the shares to be granted to Top Management under the equity settled plans reserved for them for a total net positive amount of 19,265,028 euro;
- allocation to other reserves of the total net negative amount of 5,305,045 euro for repurchases of own Additional Tier 1 instruments;
- transfer to other reserves of the valuation reserves for the gains/losses realised on property and equipment measured at fair value, for a total net positive amount of 5,078,188 euro;
- transfer on 31 December 2024 from unavailable reserve, pursuant to Article 6, paragraph 3, of Legislative Decree No. 38/2005, to extraordinary reserve of 306,523,455 euro, attributable to the realisation of capital gains or the recognition of capital losses for the year;
- other effects, for a total net positive amount of 5,729,149 euro.

Non-distributable portion (e)	9,946	-	-	-	-	-

(a) A = capital increase; B = loss coverage; C = distribution to shareholders.

(b) This reserve includes 23,734 million euro originating from the merger between Banca Intesa and Sanpaolo IMI, as a result of the application of IFRS 3 concerning business combinations.
Pending the issue of legal measures concerning the classification of the reserve recognised in application of that accounting standard, this reserve is considered unavailable up to the amount of goodwill and intangible assets recognised in the financial statements. It should be noted that, solely for the amount classified as suspended tax, if the reserve is used to cover losses, net income cannot be distributed unless the reserve is replenished or reduced by the corresponding amount. In addition, if the suspended tax amount is distributed to shareholders, it contributes to the formation of the company income. The portion of profits subject to tax suspension, equal to 3,669 million euro, includes 1,685 million euro relating to the realignment of the tax values to the higher carrying amounts of several real estate assets in accordance with Article 1, paragraph 948, of Law 145/2018 and 1,473 million euro relating to the realignment of the tax values of the brand name and other intangible assets to the higher carrying amounts pursuant to Article 110, paragraphs 8 and 8 bis of Decree Law 104/2020.

(c) This reserve originates from the resolution approving the 2023 Financial Statements which provided for the allocation of around 1,991 million euro to the non-distributable reserve (corresponding to 2.5 times the one-off tax), in accordance with Article 26 paragraph 5-bis of Decree Law no. 104 of 10 August 2023, converted with amendments by Law no. 136 of 9 October 2023.

(d) The non-distributable portion mainly relates to the revaluation reserves, the valuation reserves established as a direct offsetting entry to the fair value measurement of property and equipment, the reserve established under the long-term incentive plans, a portion of the share premium reserve, the other suspended tax reserves, the share of net income corresponding to the capital gains recognised in the income statement of the previous year, net of the related tax expense, arising from the application of the fair value measurement, pursuant to Article 6, paragraph 1, letter a) of Legislative Decree 38/2005, the amount of the legal reserve corresponding to one-fifth of the share capital pursuant to Article 2430 of the Italian Civil Code, as well as the reserve established pursuant to Article 26 paragraph 5-bis of Decree Law no. 104 of 10 August 2023, converted with amendments by Law no. 136 of 9 October 2023.

(1) May be used to increase capital (A) and for distribution to shareholders (C) for the portion exceeding one fifth of the share capital.

(2) If the reserve is used to cover losses, net income cannot be distributed unless the reserve is replenished or reduced by the corresponding amount.

(3) If this reserve is not recorded under shareholders' equity it may only be reduced in accordance with the provisions of paragraphs 2 and 3 of Article 2445 of the Italian Civil Code. If it is distributed to shareholders, it contributes to forming the taxable income of the company.

(4) The use of the reserve for share capital increase without payment and subsequent repayment of the share capital to the shareholders, for any reason, including for a minimum amount, triggers the payment of the entire one-off tax, plus interest in the amount provided for by Decree Law no. 104 of 10 August 2023.

(5) If this reserve is used to cover losses, and there are other available reserves, the non-distributability constraint will be transferred to the other available earnings and/or capital reserves, for the amount of the reserve used, and, in any event, up to the extent of those available reserves; no distribution of net income may be made until the reserve is replenished.

(6) This reserve is unavailable pursuant to Article 6 of Legislative Decree 38/2005.

(7) Pursuant to Article 47, paragraph 1 of the Combined Tax Regulations, the portion of net income includes retained earnings reserves of 4,208 million euro classified as capital reserves for tax purposes.

The valuation reserves have been included under retained earnings reserves because these are either reserves destined to be reversed to the income statement at the time of sale or discharge of the corresponding assets or liabilities, or they are reserves substantially equivalent to retained earnings reserves.

12.5 Equity instruments: breakdowns and annual changes

This caption consists entirely of Additional Tier 1 bond issuance placed between 2015 and 2024, net of related issuance costs, totalling 8,688 million euro.
In 2024, the early repurchase was completed for 247 million euro of a perpetual bond issued in 2017 (the bond had an original total nominal value of 750 million euro and had already been partially bought back during 2023 for 503 million euro), and a new issuance was placed with a nominal value of 1 billion euro.
For more details, see the relevant section of the Notes to the consolidated financial statements.

12.6 Other information

Pursuant to Art. 2433-bis, paragraph 4, of the Italian Civil Code, Intesa Sanpaolo distributed an interim dividend for 2024 to each of the 17,803,670,501 ordinary shares comprising the share capital. The total amount disbursed was 3,022,396,312.63 euro[214], corresponding to a unit dividend of 17.00 euro cents per ordinary share. The dividend was paid out on 20 November 2024 (with coupon presentation on 18 November and record date on 19 November).

See the specific chapter of these Financial Statements for information regarding the allocation of the net income for the year.

---

[214] It does not include the interim dividend on the 24,868,662 own shares held at the record date, equal to 4,227,672.54 euro.

IFRS 7, amended in 2013, requires specific disclosure for financial instruments that have been offset in the Balance Sheet pursuant to IAS 32 or that may be potentially offset, upon occurrence of specific conditions, but are recognised in the Balance Sheet without any netting since they are regulated by "master netting arrangements or similar agreements" that do not respect all of the criteria set forth by IAS 32, paragraph 42.
In this respect, Intesa Sanpaolo has netting arrangements in force that meet the requirements envisaged by IAS 32, paragraph 42, for netting in the financial statements.
In terms of instruments that may be potentially offset upon occurrence of such events and to be presented in Tables 5 and 6, it is noted that Intesa Sanpaolo uses bilateral netting arrangements that allow, in the event of counterparty default, the netting of claims and obligations in relation to financial and credit derivatives, as well as securities financing transactions (SFTs). In particular, there are ISDA agreements (for transactions in derivatives), GMRAs (for repurchase agreements) and GMSLAs (for securities lending).

With regard to securities lending transactions, only those transactions that require the payment of a cash guarantee fully available to the lender must be reported in tables 5 and 6, as this is the only type of transaction recognised in the Balance Sheet. Intesa Sanpaolo did not have any such transactions as at 31 December 2024.

For the purposes of preparing the tables and in compliance with the provisions of IFRS 7 and the provisions that govern the financial statements of banks, the following are noted:
- the effects of the potential offsetting of the balance sheet values of financial assets and liabilities are indicated under column (d) "Financial instruments", together with the fair value of financial collateral consisting of securities;
- the effects of the potential offsetting of the exposure with the relative cash collateral are included under column (e) Cash deposits pledged as collateral;
- repurchase agreement transactions are recognised in the tables based on the amortised cost measurement criterion, while the relative collateral is measured at fair value;
- derivatives transactions are recognised at fair value.

These effects are calculated for each individual counterparty included in a master netting arrangement, to the extent of the exposure indicated in column (c).

Based on the preparation methods indicated above, the netting arrangements between financial instruments and the relative collateral permit a significant reduction in credit/debt exposure to the counterparty, as indicated under column (f) Net amount.

7. Securities lending transactions

The securities lending accessory banking service, offered by Intesa Sanpaolo to its customers (natural persons, legal entities and commercial entities), is worth mentioning. The contract envisages transfer of the ownership exclusively of government bonds and equity instruments, with the obligation for Intesa Sanpaolo to return them, paying a consideration amount as remuneration for their availability. The transaction has no speculative purposes.
As at 31 December 2024, the collateral of transactions amounted to 13 million euro.

8. Disclosure on joint-control assets

The Bank is not required to provide information on joint-control assets. For the information relating to this paragraph, reference should be made to the relevant section of the Notes to the consolidated financial statements.

Part C – Information on the Parent Company's income statement

SECTION 1 – INTEREST – CAPTIONS 10 AND 20

1.1 Interest and similar income: breakdown

(millions of euro)

Captions/Types	Debt securities	Loans	Other transactions	2024	2023

of which: interest income on financial lease	*X*	*368*	*X*	*368*	*387*

Interest income also includes interest on debt securities used in repurchase agreements.
Interest income on impaired financial assets relate almost entirely to loans to customers and also include interest due to the passing of time, equal to 165 million euro (time value).
The caption Financial assets measured at amortised cost, sub-caption Due from banks, includes interest on "on demand" loans due from banks and central banks classified in the balance sheet to the caption Cash and cash equivalents.
The caption Hedging derivatives includes the differentials on hedging transactions, which adjust interest income recognised on hedged financial instruments.
"Financial liabilities" include residual interest on funding transactions with negative rates.

1.2 Interest and similar income: other information

1.2.1 Interest income on foreign currency financial assets

As at 31 December 2024, interest income on foreign currency financial assets amounted to 3,399 million euro.

1.3 Interest and similar expense: breakdown

(millions of euro)

Captions/Types	Debts	Securities	Other transactions	2024	2023
1. Financial liabilities measured at amortised cost	**7,145**	**4,382**	**X**	**11,527**	**10,897**
1.1 Due to Central Banks	647	X	X	647	2,042

l) Commitments to disburse funds	**-**	**-**
m) Financial guarantees given	**462**	**438**
of which: credit derivatives	-	-
n) Financing transactions	**825**	**710**
of which: for factoring transactions	*75*	*76*
o) Currency dealing	**10**	**8**
p) Commodities	**-**	**-**
q) Other fee and commission income	**124**	**125**
of which: for management of multilateral trading facilities	-	-
of which: for management of organised trading facilities	-	-
Total	**6,700**	**6,180**

As required by IFRS 15, paragraph 116 b), it is noted that fee and commission income includes the revenues recognised during the year included in the opening balance of liabilities deriving from contracts with customers. In line with paragraph 116 c) of IFRS 15, revenues deriving from performance obligations satisfied in the previous years are included, amounting to 2 million euro.

2.2 Fee and commission income: distribution channels of products and services

(millions of euro)

Channels/Amounts	2024	2023
a) Group branches	**2,199**	**1,920**
1. portfolio management	-	-
2. placement of securities	1,231	1,000
3. third party services and products	968	920
b) "Out-of-Branch" offer	**86**	**69**
1. portfolio management	-	-
2. placement of securities	44	29
3. third party services and products	42	40
c) Other distribution channels	**2**	**4**
1. portfolio management	-	-
2. placement of securities	2	4
3. third party services and products	-	-

2.3 Fee and commission expense: breakdown

(millions of euro)

	2024	2023
a) Financial instruments	**92**	**92**
of which: trading in financial instruments	*30*	*33*
of which: placement of financial instruments	*62*	*59*
of which: individual portfolio management	-	-
- Own portfolio	-	-
- Third-party portfolio	-	-
b) Clearing and settlement	**33**	**34**
c) Custody and administration	**71**	**56**
d) Collection and payment services	**405**	**391**
of which: credit cards, debit cards and other payment cards	*308*	*293*
e) Servicing related to securitisations	**-**	**-**
f) Commitments to receive funds	**-**	**-**
g) Financial guarantees received	**333**	**340**
of which: credit derivatives	*20*	*21*
h) "Out-of-branch" offer of financial instruments, products and services	**42**	**31**
i) Currency dealing	**5**	**5**
j) Other fee and commission expense	**152**	**157**
Total	**1,133**	**1,106**

As required by IFRS 15, paragraph 116 b), it is noted that fee and commission income includes the revenues recognised during the year included in the opening balance of liabilities deriving from contracts with customers in the amount of 62 million euro.
In line with paragraph 116 c) of IFRS 15, revenues deriving from performance obligations satisfied in the previous years are included, amounting to 8 million euro.

SECTION 3 – DIVIDEND AND SIMILAR INCOME - CAPTION 70

3.1 Dividend and similar income: breakdown

(millions of euro)

Captions/Income	2024		2023	
	Dividends	Similar income	Dividends	Similar income
A. Financial assets held for trading	69	3	32	-
B. Other financial assets mandatorily measured at fair value	8	141	6	100
C. Financial assets measured at fair value through other comprehensive income	57	3	62	-
D. Equity investments	1,822	4	4,069	-
Total	**1,956**	**151**	**4,169**	**100**

Sub-caption B. Other financial assets mandatorily measured at fair value includes 8 million euro of dividends on equities and 141 million euro of income on quotas of UCIs.

Sub-caption D. Equity investments includes the dividends and income distributed by the subsidiaries and associates:
– Intesa Sanpaolo Assicurazioni S.p.A. for 550 million euro;
– Intesa Sanpaolo Holding International S.A. for 500 million euro;
– Eurizon Capital SGR S.p.A. for 464 million euro;
– Intesa Sanpaolo Bank Ireland Plc for 107 million euro;
– CIB Bank Ltd for 79 million euro;
– Intesa Sanpaolo Bank Albania Sh.A. for 44 million euro;
– other equity investments for 82 million euro.

SECTION 4 – PROFITS (LOSSES) ON TRADING - CAPTION 80

4.1 Profits (Losses) on trading: breakdown

(millions of euro)

Transactions/Income components	Revaluations	Profits on trading	Write-downs	Losses on trading	Net result
1. Financial trading assets	**439**	**612**	**-300**	**-561**	**190**
1.1 Debt securities	67	321	-43	-372	-27
1.2 Equities	229	241	-229	-186	55
1.3 Quotas of UCI	43	48	-1	-3	87
1.4 Loans	-	2	-2	-	-
1.5 Other	100	-	-25	-	75
2. Financial liabilities held for trading	**68**	**8**	**-114**	**-38**	**-76**
2.1 Debt securities	-	-	-	-	-
2.2 Payables	53	-	-45	-	8
2.3 Other	15	8	-69	-38	-84
3. Financial assets and liabilities: foreign exchange differences	**X**	**X**	**X**	**X**	**500**
4. Derivatives	**27,798**	**60,599**	**-30,952**	**-57,477**	**-425**
4.1 Financial derivatives:	25,119	58,215	-28,321	-55,347	-727
- on debt securities and interest rates	*24,268*	*48,162*	*-24,583*	*-48,155*	*-308*
- on equities and stock indexes	*414*	*8,941*	*-3,401*	*-6,001*	*-47*
- on currencies and gold	*X*	*X*	*X*	*X*	*-393*
- other	*437*	*1,112*	*-337*	*-1,191*	*21*
4.2 Credit derivatives	2,679	2,384	-2,631	-2,130	302
of which: natural hedging associated with the fair value option	*X*	*X*	*X*	*X*	*-*
Total	**28,305**	**61,219**	**-31,366**	**-58,076**	**189**

Profits and losses on Financial assets held for trading include the results of both long and short positions.
"Net result" includes profits, losses, revaluations and write-downs on currency transactions and currency and gold derivatives.

The net result of the exchange differences on Financial assets and liabilities, reported in sub-caption 3, is connected to the result of sub-caption 4.1 relating to Derivatives - Financial derivatives on currencies and gold, which includes the results of the related operational hedges taken out by the Bank on foreign exchange risk using financial trading derivatives. Similarly, the result in Financial derivatives on debt securities and interest rates should be viewed in conjunction with the results of the Financial assets held for trading in Debt securities and Financial liabilities held for trading in Payables (short selling of securities) respectively, as these transactions are operationally linked to each other.

SECTION 5 – FAIR VALUE ADJUSTMENTS IN HEDGE ACCOUNTING - CAPTION 90

5.1 Fair value adjustments in hedge accounting: breakdown

(millions of euro)

Income component/Amount	2024	2023
A. Income from:		
A.1 fair value hedge derivatives	4,057	6,819
A.2 financial assets hedged (fair value)	2,639	6,572
A.3 financial liabilities hedged (fair value)	205	-
A.4 cash flow hedge: derivatives	-	-
A.5 currency assets and liabilities	-	-
Total income from hedging (A)	**6,901**	**13,391**
B. Expenses for		
B.1 fair value hedge derivatives	-3,627	-7,219
B.2 financial assets hedged (fair value)	-765	-21
B.3 financial liabilities hedged (fair value)	-2,499	-6,208
B.4 cash flow hedge: derivatives	-	-
B.5 currency assets and liabilities	-1	-
Total expense from hedging (B)	**-6,892**	**-13,448**
C. Fair value adjustments in hedge accounting (A - B)	**9**	**-57**
of which: fair value adjustments in hedge accounting on net positions	-	-

Intesa Sanpaolo has exercised the option, provided for on the introduction of IFRS 9, of continuing to fully apply the provisions of IAS 39 on hedge accounting (in the carved-out version endorsed by the European Commission) for each type of hedge (both for micro hedges and macro hedges). For this reason, table 5.1 Fair value adjustments in hedge accounting: breakdown, contains no amounts in the row "of which: profits (losses) on hedges of net positions" envisaged for parties that apply IFRS 9 also to hedges.

SECTION 6 – PROFITS (LOSSES) ON DISPOSAL OR REPURCHASE - CAPTION 100

6.1 Profits (Losses) on disposal or repurchase: breakdown

(millions of euro)

Captions/Income components	2024			2023		
	Profits	Losses	Net result	Profits	Losses	Net result
A. Financial assets						
1. Financial assets measured at amortised cost	172	-129	43	183	-259	-76
1.1 Due from banks	*7*	*-16*	*-9*	*3*	*-*	*3*
1.2 Loans to customers	*165*	*-113*	*52*	*180*	*-259*	*-79*
2. Financial assets measured at fair value through other comprehensive income	297	-68	229	289	-105	184
2.1 Debt securities	*297*	*-66*	*231*	*289*	*-69*	*220*
2.2 Loans	*-*	*-2*	*-2*	*-*	*-36*	*-36*
Total assets	**469**	**-197**	**272**	**472**	**-364**	**108**
B. Financial liabilities measured at amortised cost						
1. Due to banks	26	-25	1	1	-1	-
2. Due to customers	-	-7	-7	-	-	-
3. Securities issued	87	-84	3	50	-14	36
Total liabilities	**113**	**-116**	**-3**	**51**	**-15**	**36**

The Net result on Financial assets measured at amortised cost in sub-caption 1.2 Loans to customers - Profits mainly relates to the sale on the market of government debt securities. Sub-caption 1.2 Loans to customers - Losses relates almost entirely to loans.

The Net result on Financial assets measured at fair value through other comprehensive income in sub-caption 2.1 Debt securities relates to profits and losses mainly deriving from the sale of government debt securities.

SECTION 7 – PROFITS (LOSSES) ON OTHER FINANCIAL ASSETS AND LIABILITIES MEASURED AT FAIR VALUE THROUGH PROFIT OR LOSS - CAPTION 110

7.1 Net change in the value of other financial assets and liabilities measured at fair value through profit or loss: breakdown of financial assets and liabilities designated at fair value

(millions of euro)

Transactions/Income components	Revaluations	Gains on disposal	Write-downs	Losses on trading	Net result
1. Financial assets	**-**	**-**	**-**	**-**	**-**
1.1 Debt securities	-	-	-	-	-

2. Financial liabilities	**161**	**2**	**-427**	**-718**	**-982**
2.1 Securities issued	161	2	-427	-718	-982
2.2 Due to banks	-	-	-	-	-
2.3 Due to customers	-	-	-	-	-
3. Foreign currency financial assets and liabilities: foreign exchange differences	**X**	**X**	**X**	**X**	**-28**
Total	**161**	**2**	**-427**	**-718**	**-1,010**

Sub-caption 2.1 Financial liabilities - Securities issued, reports the net result of the certificates which provide for partial or full redemption of the premiums paid on maturity, pursuant to Bank of Italy Communication of 21 October 2014 (certificates with guaranteed or protected capital), issued after 1 January 2020. The revaluations and write-downs shown in the table refer to the fair value measurement of these financial instruments, calculated excluding the changes in value due to the change in own credit rating recognised in the Statement of comprehensive income (Shareholders' equity). For information on the methods used to measure counterparty risk, reference should be made to Part A.4 - Information on fair value of the Notes to the financial statements.
The Realised gains and losses relate to disbursement made to the holders of certificates where contractually provided for, as well as repurchases of certificates made by the issuer as market maker.

7.2 Net change in the value of other financial assets and liabilities measured at fair value through profit or loss: breakdown of other financial assets mandatorily measured at fair value

(millions of euro)

Transactions/Income components	Revaluations	Gains on disposal	Write-downs	Losses on trading	Net result

B. Loans	**-7**	**-4**	**-**	**-4**	**-**	**-**	**6**	**10**	**-**	**-**	**1**	**13**
- to customers	-7	-4	-	-4	-	-	6	10	-	-	1	13
- to banks	-	-	-	-	-	-	-	-	-	-	-	-
Total	**-12**	**-12**	**-**	**-4**	**-**	**-**	**10**	**11**	**-**	**-**	**-7**	**-15**

SECTION 9 – PROFITS/LOSSES FROM CHANGES IN CONTRACTS WITHOUT DERECOGNITION – CAPTION 140

9.1 Profits (Losses) from changes in contracts: breakdown

Within profits (losses) from changes in contracts without derecognition, losses of 8 million euro were recognised (gains of 24 million euro as at 31 December 2023).

SECTION 10 - ADMINISTRATIVE EXPENSES - CAPTION 160

10.1 Personnel expenses: breakdown

(millions of euro)

Type of expense	2024	2023
1) Employees	**6,137**	**5,646**
a) wages and salaries	3,876	3,849
b) social security charges	1,038	1,034
c) termination indemnities	31	43
d) supplementary benefits	-	-
e) provisions for termination indemnities	25	28
f) provisions for post employment benefits	5	8
- defined contribution plans	-	-
- defined benefit plans	*5*	*8*
g) payments to external pension funds	371	339
- defined contribution plans	*371*	*339*
- defined benefit plans	-	-
h) costs from share based payments	142	149
i) other benefits in favour of employees	649	196
2) Other non-retired personnel	**9**	**9**
3) Directors and statutory auditors	**7**	**7**
4) Early retirement costs	**-**	**-**
5) Recovery of expenses for employees seconded to other companies	**-78**	**-74**
6) Reimbursement of expenses for third party employees seconded to the company	**11**	**11**
Total	**6,086**	**5,599**

Provisions to employee termination indemnities - sub-caption 1) Employees e) - determined on the basis of Article 2120 of the Italian Civil Code amounted to 17 million euro.

10.2 Average number of employees by categories

	2024	2023
Personnel employed	**59,223**	**59,972**
a) managers	1,038	1,012
b) total officers	25,945	26,095
c) other employees	32,240	32,865
Other personnel	**31**	**26**
TOTAL	**59,254**	**59,998**

10.3 Post-employment defined benefit plans: costs and revenues

(millions of euro)

	2024			2023		
	Employee Termination Indemnities	**Internal plans**	**External plans**	**Employee Termination Indemnities**	**Internal plans**	**External plans**
Current service cost	-3	-1	-2	-3	-2	-1
Interest expense	-22	-5	-29	-25	-5	-32
Interest income	-	5	27	-	4	28
Reimbursement from third parties	-	-	-	-	-	-
Past service cost	-	-	-	-	-	-
Curtailment of the fund	X	-	-	X	-	-
Settlement of the fund	X	-	-	X	-	-

This table illustrates the economic components referred to Employee termination indemnities – caption 90 of Balance sheet liabilities and Allowances for risks and charges - post employment benefits – caption 100b of Balance sheet liabilities.

10.4 Other benefits in favour of employees

The other benefits in favour of employees as at 31 December 2024 amounted to 649 million euro and mainly related to charges for exit incentives for personnel including those relating to the agreement signed with the trade unions on 23 October 2024. The caption also includes healthcare contributions, the canteen contributions including meal vouchers, as well as the adjustment of seniority bonuses.

10.5 Other administrative expenses: breakdown

(millions of euro)

Type of expense/Amount	2024	2023
Expenses for maintenance of information technology and electronic equipment	576	617
Telephonic, teletransmission and transmission expenses	41	40
Information technology expenses	**617**	**657**
Rentals and service charges - real estate	27	33
Security services	28	24
Cleaning of premises	33	35
Expenses for maintenance of real estate assets furniture and equipment	63	61
Energy costs	110	148
Property costs	5	6
Management of real estate assets expenses	**266**	**307**
Printing, stationery and consumables expenses	11	11
Transport and related services expenses (including counting of valuables)	73	70
Information expenses	200	189
Postal and telegraphic expenses	32	32
General structure costs	**316**	**302**
Expenses for consultancy fees	119	88
Legal and judiciary expenses	83	98
Insurance premiums - banks and customers	50	50
Professional and legal expenses	**252**	**236**
Advertising and promotional expenses	**160**	**153**
Services rendered by third parties	**302**	**294**
Indirect personnel costs	**141**	**139**
Other costs	**29**	**30**
Other costs	**85**	**85**
Contributions to resolution funds and guarantee schemes	**325**	**612**
Taxes and duties	**806**	**759**
Recovery of other expenses	**-21**	**-19**
Total	**3,278**	**3,555**

The amount of the sub-caption Rentals and service charges - real estate relates to contracts with a total lease term of 12 months or less and to contracts with a value of the underlying asset, when new, of 5,000 euro or less ("low value"). In such cases, as allowed by IFRS 16, the lease payments for these leases are recognised as an expense on a straight-line basis for the contract term.

The sub-caption "Contributions to resolution funds and guarantee schemes" includes around 10 million euro of contributions to the formation of the Insurance Guarantee Fund for life insurance policies in line with Law no. 213 of 30 December 2023, accounted for according to IFRIC 21 "Levies" as per the guidance provided by IVASS in the letter to the market dated 18 December 2024. As at 31 December 2023, the amount included 287 million euro in charges related to the European Resolution Fund. This fund for the banking union EU countries is currently in funded status.

SECTION 11 - NET PROVISIONS FOR RISKS AND CHARGES - CAPTION 170

11.1 Net provisions for credit risk associated with loan commitments and financial guarantees given: breakdown

(millions of euro)

	Provision	Reallocations	Net provision
Stage1	-15	26	11
Stage2	-33	54	21
Stage3	-100	48	-52
Total	**-148**	**128**	**-20**

11.2 Net provisions associated with other commitments and other guarantees given: breakdown

This case was not present.

11.3 Net provisions for other risks and charges: breakdown

(millions of euro)

	Provisions	Reallocations	Net provision
Net provisions for legal and tax disputes	-129	48	-81
Net provisions for other personnel charges	-	-	-
Net provisions for risks and charges	-63	58	-5
Total	**-192**	**106**	**-86**

"Net provisions for risks and charges", which amounted to a negative 86 million euro, recorded the provisions attributable to the year relating to legal and tax disputes and other risks and charges, net of reallocations.

In particular, the sub-caption Net provisions for legal disputes includes provisions for legal disputes, including bankruptcy claw-back actions and other disputes, net of releases for the year.

The sub-caption Other net provisions for risks and charges mainly includes, among provisions, charges relating to prize competitions of 17 million euro, and, among reallocations, the partial release, amounting to 27 million euro, of the provision for indirect risks associated with the equity investment in Pravex Bank Joint-Stock Company in relation to the ongoing conflict, in order to align the values to the investee's contribution to the consolidated financial statements.

SECTION 12 – NET ADJUSTMENTS TO/RECOVERIES ON PROPERTY AND EQUIPMENT - CAPTION 180

12.1 Net adjustments to property and equipment: breakdown

(millions of euro)

Assets/Income components	Depreciation	Impairment losses	Recoveries	Net result
A. Property and equipment				
A.1 Used in operations	-444	-1	-	-445
- Owned	*-276*	*-1*	-	*-277*
- Licenses acquired through lease	*-168*	-	-	*-168*
A.2 Investment property	-	-	-	-
- Owned	-	-	-	-
- Licenses acquired through lease	-	-	-	-
A.3 Inventories	X	-4	-	-4
B. Non-current assets held for sale	X	-	-	-
Total	**-444**	**-5**	**-**	**-449**

Depreciation of rights of use acquired under leases is associated with application of the accounting standard IFRS 16, which entered into effect on 1 January 2019. As at 31 December 2024 the analysis of factors internal and external to the Company did not indicate any impairment of rights of use (RoUs). See the description provided in Part A – Accounting policies of the Notes to the financial statements in paragraph "17. Other information - Use of estimates and assumptions in preparing financial reports".

SECTION 13 – NET ADJUSTMENTS TO/RECOVERIES ON INTANGIBLE ASSETS - CAPTION 190

13.1 Net adjustments to intangible assets: breakdown

(millions of euro)

Assets/Income components	Amortisation	Impairment losses	Recoveries	Net result
A. Intangible assets				
of which: software	*-888*	*-19*	-	*-907*
A.1 Owned	-908	-19	-	-927
- Internally generated	-692	-16	-	-708
- Others	-216	-3	-	-219
A.2 Rights of use acquired through the lease	-	-	-	-
B. Non-current assets held for sale	**X**	**-**	**-**	**-**
Total	**-908**	**-19**	**-**	**-927**

With regard to the method of the impairment testing for intangible assets and related impairment recognised to the income statement, see Part B – Section 9 – Intangible Assets in these Notes to the financial statements.

With regard to the revision of the useful life of intangible assets, see the description provided in Part A – Accounting policies of the Notes to the financial statements in paragraph "17. Other information - Use of estimates and assumptions in preparing financial reports".

SECTION 14 – OTHER OPERATING EXPENSES (INCOME) - CAPTION 200

14.1 Other operating expenses: breakdown

(millions of euro)

Type of expense/Amount	
Amortisation of leasehold improvements	29
Other expenses for consumer credit and leasing transactions	14
Settlements for legal disputes	6
Other	324
Total 2024	**373**
Total 2023	**262**

The sub-caption Other expenses includes around 53 million euro of losses arising from the trading of precious metals and gold and the results of their valuation, in addition to the amount paid to the National Resolution Fund recorded as Profit Sharing under the settlement agreement entered into by Intesa Sanpaolo S.p.A. (as the incorporating entity of UBI Banca S.p.A.) and the Bank of Italy of 130 million euro.

14.2 Other operating income: breakdown

(millions of euro)

Type of expense/Amount	
Recovery of taxes and duties	656
Recovery of services rendered to third parties	258
Rentals and recovery of expenses on real estate	64
Income related to consumer credit and leasing	29
Recovery of other expenses	18
Recovery of insurance costs	5
Other	323
Total 2024	**1,353**
Total 2023	**1,051**

The sub-caption Other income includes the gains from the trading of precious metals and gold and the results of their valuation of approximately 73 million euro, as well as income relating to commercial agreements signed by the Bank.

As required by paragraph 116 c) of IFRS 15, revenues deriving from performance obligations satisfied in the previous years are included, amounting to 19 million euro.

SECTION 15 – PROFITS (LOSSES) ON EQUITY INVESTMENTS - CAPTION 220

15.1 Profits (Losses) on equity investments: breakdown

(millions of euro)

Income component/Amount	2024	2023
A. Revenues	**59**	**260**
1. Revaluations	-	-
2. Profits on disposal	25	234
3. Recoveries	34	26
4. Other	-	-
B. Charges	**-220**	**-140**
1. Write-downs	-	-
2. Impairment losses	-220	-140
3. Losses on disposal	-	-
4. Other	-	-
Net result	**-161**	**120**

Sub-caption A.2. Profits on disposal refers to Bancomat S.p.A. for 18 million euro and other minor equity investments for 7 million euro. As at 31 December 2023, this mainly related to the profit on disposal of Zhong Ou Asset Management Company Ltd.

Sub-caption A.3. Recoveries refers to the equity investments in UTP Italia Fund Loans Sub-Fund for 18 million euro, FI.NAV. Sub-Fund A – Loans for 8 million euro, and other minor equity investments for 8 million euro.

Sub-caption B.2 Impairment losses mainly relates to the impairment losses on the following interests in:
- Lendlease MSG Heartbeat for 80 million euro;
- Intrum Italy S.p.A. for 42 million euro;
- Pravex Bank Joint-Stock Company for 26 million euro;
- Risanamento S.p.A. per 24 million euro;
- Back2bonis for 17 million euro;
- Qingdao Yicai Fund Distribution Co. Ltd for 10 million euro;
- IDEA CCR (Corporate Credit Recovery) II Loans Sub-Fund for 9 million euro.

SECTION 16 - VALUATION DIFFERENCES ON PROPERTY, EQUIPMENT AND INTANGIBLE ASSETS MEASURED AT FAIR VALUE – CAPTION 230

16.1 Valuation differences on property, equipment and intangible assets measured at fair value or estimated realisable value: breakdown

(millions of euro)

Assets/Income component	Revalutations	Write-downs	Foreign exchange differences		Net result
			Positive	Negative	
A. Property and equipment	**6**	**-29**	**-**	**-**	**-23**
A.1 Used in operations:	-	-6	-	-	-6
- Owned	-	*-6*	-	-	*-6*
- Licenses acquired through lease	-	-	-	-	-
A.2 Investment:	6	-23	-	-	-17
- Owned	*6*	*-23*	-	-	*-17*
- Licenses acquired through lease	-	-	-	-	-
A.3 Inventories	-	-	-	-	-
B. Intangible assets	**-**	**-**	**-**	**-**	**-**
B.1 Owned:	-	-	-	-	-
B.1.1 Internally generated	-	-	-	-	-
B.1.2 Other	-	-	-	-	-
B.2 Licenses acquired through lease	-	-	-	-	-
Total	**6**	**-29**	**-**	**-**	**-23**

SECTION 17 – GOODWILL IMPAIRMENT - CAPTION 240

17.1 Goodwill impairment: breakdown

During the year, no impairment of goodwill was recognised. For a description of the impairment testing methods for goodwill, reference should be made to Part B - Assets - Section 9 - Intangible Assets.

SECTION 18 – PROFITS (LOSSES) ON DISPOSAL OF INVESTMENTS - CAPTION 250

18.1 Profits (Losses) on disposal of investments: breakdown

(millions of euro)

Income component/Amount	2024	2023
A. Real estate assets	**-3**	**-1**
- profits on disposal	-	1
- losses on disposal	-3	-2
B. Other assets	**-**	**-**
- profits on disposal	-	-
- losses on disposal	-	-
Net result	**-3**	**-1**

SECTION 19 - TAXES ON INCOME FROM CONTINUING OPERATIONS - CAPTION 270

19.1 Taxes on income from continuing operations: breakdown

(millions of euro)

Income component/Amount	2024	2023
1. Current taxes (-)	-518	-489
2. Changes in current taxes of previous years (+/-)	65	87
3. Reduction in current taxes of the year (+)	4	-
3. bis Reduction in current taxes of the year for tax credits pursuant to Law no. 214/2011 (+)	470	391
4. Changes in deferred tax assets (+/-)	-1,722	-1,306
5. Changes in deferred tax liabilities (+/-)	-42	-34
6. Taxes on income for the year (-) (-1+/-2+3+3bis+/-4+/-5)	**-1,743**	**-1,351**

The current taxes for the year include 3 million euro pertaining to the Top-up Tax payable by ISP as Ultimate Parent Entity under the Global Minimum Tax rules established by Directive (EU) 2022/2523 and transposed by Legislative Decree 209/2023.
The reduction in current taxes for the year, measured at 470 million euro, as required by the "Roneata" Letter from the Bank of Italy of 7 August 2012, shows the transformation into tax credits of the deferred tax assets pursuant to Law 214/2011 due to the tax loss of Intesa Sanpaolo S.p.A. in relation to 2024. This effect is entirely offset by the corresponding decrease in the caption Changes in deferred tax assets with the ensuing nil impact on the income statement.

Sub-caption 4. Changes in deferred tax assets, as at 31 December 2024, included an increase of 206 million euro, which took place in the fourth quarter, relating to losses carried forward pertaining to the merged UBI Banca and Provis (there were similar losses totalling 352 million euro pertaining to UBI Banca, UBI Leasing, and UBI Factor as at 31 December 2023). This caption also includes additional deferred tax assets of 130 million euro, recognised in June 2024, connected to the payment (non-tax deductible) of the same amount to the National Resolution Fund, recognised under Other operating expenses.

19.2 Reconciliation of theoretical tax charge to total income tax expense for the period

(millions of euro)

	2024	2023
Income (Loss) before tax from continuing operations	7,347	8,643
Income (Loss) before tax from discontinued operations	-	-
Theoretical taxable income	**7,347**	**8,643**

	Taxes (a)	Impact (%) on theoretical taxable income
Income taxes - theoretical tax expense (income) (b)	**2,429**	**33.1**
Increases of taxes	**184**	**2.5**
Non-deductible cost	70	1.0
Loss on investments	26	0.3
Other	88	1.2
Decreases of taxes	**-870**	**-11.9**
Lower IRAP taxable income	-7	-0.1
Non-taxed capital gains on equity investments	-25	-0.4
Tax-exempt portion of dividends	-485	-6.6
Other	-353	-4.8
Total change in taxes	**-686**	**-9.4**
Total tax expense (income) for the period	**1,743**	**23.7**
of which: - effective tax expense (income) from continuing operations	**1,743**	**23.7**
- effective tax expense (income) from discontinued operations	**-**	**-**

(a) Tax expenses are indicated with a positive sign and tax income with a negative sign.

(b) Includes IRES ordinary tax 24%, IRES additional rate 3.5% and IRAP weighted average rate 5.56%.

SECTION 20 – INCOME (LOSS) AFTER TAX FROM DISCONTINUED OPERATIONS - CAPTION 290

This case was not present for the Bank.

SECTION 21 – OTHER INFORMATION

There is no information further to that already provided in the previous sections.

SECTION 22 – EARNINGS PER SHARE

For details, reference should be made to the relevant section of the Notes to the consolidated financial statements.

Part D – Comprehensive income

(millions of euro)

	Statement of comprehensive income	2024	2023
10	**Net income (loss)**	**5,604**	**7,292**
	Other comprehensive income that may not be reclassified to the income statement	**161**	**-159**

Part E – Information on risks and relative hedging policies

INTRODUCTION

This part of the Notes to the Parent Company's financial statements provides the quantitative information on risks relative to the Parent Company, Intesa Sanpaolo. For qualitative information regarding the methods whereby risks are managed and monitored, the organisation of the Bank's risk governance, the associated processes and key functions, the culture of risk-awareness at the Bank and the methods whereby it is ensured that this culture is spread, the main risks associated with the Bank's business model, the risk appetite and the methods whereby such risks are managed and the use of stress tests within risk governance strategies, refer to Part E of the Notes to the consolidated financial statements.
The qualitative and quantitative disclosure is presented according to the order established by Bank of Italy Circular 262, which specifically regulates not only the format of the tables but also the sequence of the various topics, except for the section relating to market risks in relation to the application of internal models.

SECTION 1 – CREDIT RISK

QUALITATIVE INFORMATION

Qualitative information on Intesa Sanpaolo's credit quality is contained in Part E of the Notes to the consolidated financial statements.

QUANTITATIVE INFORMATION

A. CREDIT QUALITY

For the purposes of quantitative information about credit quality, the term "credit exposures" is understood to exclude equities and quotas of UCI.
The term "on-balance sheet credit exposures" refers to all the on-balance sheet financial assets due from banks or customers, irrespective of the accounting portfolio they are allocated to (measured at fair value through profit or loss, measured at fair value through other comprehensive income, measured at amortised cost, or discontinued financial assets). Although on demand receivables due from banks and central banks come under the definition of on-balance sheet exposures, by convention they are not included in the tables in Section 1, except in cases specifically identified by Bank of Italy Circular 262, where they must be considered.
The term "off-balance sheet exposures" refers to all the financial transactions that are not on the balance sheet (guarantees given, revocable and irrevocable commitments, derivatives, etc.) but entail the assumption of credit risk, regardless of the purpose of those transactions (trading, hedging, etc.). The off-balance sheet credit exposures also include the counterparty risk associated with any securities lending transactions. Where necessary, the counterparty risk associated with exposures relating to repurchase agreements, transactions involving the granting or assumption of goods on loan, and loans with margins falling within the notion of securities financing transactions defined by the prudential regulations, is also reported.
Non-performing credit exposures (on-balance sheet and off-balance sheet) do not include financial assets held for trading and hedging derivatives, which are therefore normally recognised as performing credit exposures.

A.1 Performing and non-performing credit exposures: amounts, adjustments, changes, and economic breakdown

A.1.1 Breakdown of financial assets by portfolio classification and credit quality (book values)

(millions of euro)

Portfolios/quality		Bad loans	Unlikely to pay	Non-performing past due exposures	Performing past due exposures	Other performing exposures	TOTAL
1. Financial assets measured at amortised cost		948	3,091	278	2,160	440,128	446,605
2. Financial assets measured at fair value through other comprehensive income		-	7	-	-	57,327	57,334
3. Financial assets designated at fair value		-	-	-	-	2	2
4. Other financial assets mandatorily measured at fair value		3	26	-	18	555	602
5. Non-current financial assets held for sale		34	8	-	-	-	42
Total	**31.12.2024**	**985**	**3,132**	**278**	**2,178**	**498,012**	**504,585**
Total	**31.12.2023**	**774**	**3,388**	**369**	**2,613**	**496,201**	**503,345**

A.1.2 Breakdown of financial assets by portfolio classification and credit quality (gross and net values)

(millions of euro)

Portfolios/quality		NON-PERFORMING ASSETS				PERFORMING ASSETS			TOTAL (net exposure)
		Gross exposure	Total adjustments	Net exposure	Overall partial write-off	Gross exposure	Total adjustments	Net exposure	
1. Financial assets valued to amortized cos		8,300	-3,983	4,317	1,477	443,844	-1,556	442,288	446,605
2. Financial assets valued to fair value with impact on overall profitability		47	-40	7	-	57,354	-27	57,327	57,334
3. Financial assets designated to fair value		-	-	-	-	X	X	2	2
4. Other financial assets mandatorily valuated to fair value		65	-36	29	-	X	X	573	602
5. Financial assets as held for sale		330	-288	42	-	-	-	-	42
Total	**31.12.2024**	**8,742**	**-4,347**	**4,395**	**1,477**	**501,198**	**-1,583**	**500,190**	**504,585**

On 16 December 2022, the EBA repealed the Guidelines on reporting and disclosure of exposures subject to measures applied in response to the COVID-19 crisis, contained in EBA/GL/2020/07, with effect from 1 January 2023, following the change in the scenario related to the pandemic. However, the Bank of Italy, in the communication dated 14 March 2023, requested that certain financial statement disclosures be maintained, in free format, on transfers between the various credit risk stages which involved the loans subject to public guarantees issued in response to the COVID-19 situation.
In that regard, it is noted that the loans subject to COVID-19 public guarantees measured at amortised cost that were transferred from Stage 1 to Stage 2 in 2024 amounted to 1,204 million euro, while those transferred from Stage 2 to Stage 1 amounted to 464 million euro. Transfers from Stage 2 to Stage 3 amounted to 157 million euro, from Stage 3 to Stage 2 amounted to 12 million euro, from Stage 1 to Stage 3 amounted to 317 million euro and, lastly, from Stage 3 to Stage 1 amounted to 3 million euro.

A.1.6 On- and off-balance sheet credit exposures to banks: gross and net values

(millions of euro)

Purchased or originated credit-impaired financial assets mainly include financial assets purchased "through business combinations".
The exposures also include financial assets allocated to the assets held for sale accounting portfolio.

The On- and off-balance sheet credit exposures to customers classified as Stage 2 mainly include the positions for which a change (behind specific thresholds) was found in the lifetime probability of default compared to the time of initial recognition of the financial instrument in the financial statements. For the purpose of classification in Stage 2 – without prejudice to the materiality thresholds identified by the regulations – exposures that are past due by at 30 days or subject to forbearance measures are important. Activating a forbearance measure implies a minimum probation period of 24 months in Stage 2. Moreover, some of the indicators from the credit monitoring systems are now considered for the purposes of the transfer between stages (early warning systems). Where signals of high risk (traffic light results) are identified for at least three consecutive months by such systems, a perimeter of potentially riskier counterparties is defined, to be classified in Stage 2.

To complement the above methodology, a "relative" threshold has also been established (tripling of lifetime PD at the observation date compared to the lifetime PD at the initial recognition date), which acts on a residual basis compared to the main methodology, i.e. the change in the lifetime probability of default. Therefore, if this threshold is exceeded, the position is automatically classified to Stage 2. In order to avoid the "sliding" into Stage 2 of particularly high credit quality positions, the threshold is only triggered for non-investment grade loans and securities, identified considering the definitions within the Group.

Finally, a staging allocation effect was identified in the in-model adjustment linked to the identification of extreme scenarios. This led to the Stage 2 classification of the counterparties deemed most vulnerable to the aforementioned extreme scenarios in relation to the rating assigned.

The gross amount of loans subject to COVID-19 public guarantees as at 31 December 2024 came to 15,082 million euro. The aggregate comprised performing exposures of 14,074 million euro gross, with 41 million euro in adjustments and non-performing exposures of 1,008 million euro gross, with 395 million euro in adjustments.
Performing exposures are broken down into (i) performing past due loans for 140 million euro gross, with 3 million euro in adjustments and (ii) performing loans not past due for 13,934 million euro gross, with 38 million euro in adjustments.

A.1.8 On-balance sheet credit exposures to banks: changes in gross non-performing exposures

(millions of euro)

Reasons/Categories	Bad loans	Unlikely to pay	Non-performing past due exposures
A. Initial gross exposure	**4**	**33**	**-**

- of which: exposures sold not derecognised	-	-

A.1.9 On-balance sheet credit exposures to customers: changes in gross non-performing exposures

(millions of euro)

Reasons/Categories	Bad loans	Unlikely to pay	Non-performing past due exposures
A. Initial gross exposure	**2,664**	**5,508**	**478**
- of which: exposures sold not derecognised	*87*	*530*	*230*
B. Increases	**1,620**	**3,152**	**396**
B.1 inflows from performing exposures	253	2,557	379
B.2 inflows from purchased or originated credit-impaired financial assets	-	-	-
B.3 transfers from other non-performing exposures categories	1,178	302	2
B.4 changes in contracts without derecognition	-	9	-
B.5 other increases	189	284	15
C. Decreases	**-1,092**	**-3,493**	**-511**
C.1 outflows to performing exposures	-1	-314	-53
C.2 write-offs	-399	-151	-1
C.3 collections	-480	-921	-58
C.4 profits on disposal	-21	-735	-12
C.5 losses on disposal	-1	-13	-
C.6 transfers to other non-performing exposure categories	-4	-1,096	-382
C.7 changes in contracts without derecognition	-	-23	-
C.8 other decreases	-186	-240	-5
D. Final gross exposure	**3,192**	**5,167**	**363**
- of which: exposures sold not derecognised	*21*	*285*	*148*

The other increases mainly include the increases in the amounts for charges and the increase in the amounts in foreign currency due to changes in the exchange rate.
The other decreases mainly include the portfolio of loans classified as "bad loans" and "unlikely to pay" sold during the year.

A.1.9 Bis On-balance sheet credit exposures to customers: changes in gross forborne exposures broken down by credit quality

(millions of euro)

Reasons/Quality	Forborne exposures: non-performing	Forborne exposures: performing
A. Opening balance (gross amount)	**2,999**	**4,645**
- Sold but not derecognised	*196*	*862*
B. Increases	**1,287**	**1,945**

- Sold but not derecognised	*14*	*2*	*103*	*20*	*35*	*5*

The other increases mainly include the collections of loans already derecognised in full (through "recoveries on repayments") and increases in the balances of allowances in foreign currency due to changes in the exchange rate.
The other decreases mainly include the portfolio of loans classified as "bad loans" and "unlikely to pay" sold during the year. This caption also includes the collections of overdue interest applied in previous years, losses on disposal not covered by the allowance, the decrease in allowances in foreign currency due to changes in the exchange rate and the reduction in the allowances for adjustment due to the passing of time.

A.2 Classification of financial assets, commitments to disburse funds and financial guarantees given based on internal and external rating

A.2.1 Breakdown of financial assets, commitments to disburse funds and financial guarantees given by external rating classes (gross amounts)

Intesa Sanpaolo uses the ratings supplied by the following external rating agencies for portfolios subject to supervisory reporting: S&P Global Ratings, Moody's, Fitch Ratings and Morningstar DBRS.
In compliance with the regulations, if there are two ratings for the same customer, the most prudential of the two is used, when three ratings are available, the middle rating is adopted, and when all ratings are available, the second-best is taken.
For the mapping of the risk classes and agency ratings employed, see the corresponding section of the Notes to the consolidated financial statements.

A.2.2 Breakdown of financial assets, commitments to disburse funds and financial guarantees given by internal rating classes (gross amounts)

The breakdown of exposures by internal rating classes shown in the following table is based on all ratings available in the credit risk management and control system, in addition to ratings for validated models. These ratings include credit ratings assigned by external agencies for counterparties in customer segments for which an internal model is not available.

Total 31.12.2023	**724**	**727**	**-275**	**452**	**113**

As at 31 December 2024, there were financial assets and non-financial assets resulting from the enforcement of guarantees.

The Property and equipment related to assets acquired upon closure of non-performing credit exposures on finance lease contracts, connected to seized assets consisting of: 2 million euro for a property used in operations; 57 million euro for investment properties (43 million euro in buildings and 14 million euro in land); and 129 million euro for real estate stock (essentially buildings).

The equities and debt securities, with a carrying amount of 145 million euro (1 million euro as Equity investments, 109 million euro as Financial assets mandatorily measured at fair value and 35 million euro as Financial assets measured at fair value through other comprehensive income) represent financial assets not previously provided by the borrower as security for pre-existing loans, but acquired under bilateral agreements with the borrower, following which the Bank derecognised the related credit exposure.

B.4 Large exposures

Large exposures	
a) Book value (millions of euro)	322,942
b) Weighted value (millions of euro)	24,334
c) Number	12

Based on regulatory provisions, the number of "Large exposures" presented in the table was determined by the reference to unweighted "exposures" in excess of 10% of Tier 1 Capital as defined by the new Regulation (EU) 876/2019 (CRR2). The "exposures" are defined as the sum of on-balance sheet assets at risk and off-balance sheet transactions (excluding those deducted from Tier 1 Capital) with a customer or a group of connected customers, without applying risk weighting factors.
These presentation criteria result in the inclusion among "Large exposures" of entities that – even with a weighting of 0% – present an unweighted exposure in excess of 10% of Tier 1 Capital of the entity. In that regard, it is noted that the table above includes exposures to Intesa Sanpaolo Group companies, whose book value amounted to 118,754 million euro which, in line with prudential regulations, have a weighted value of zero.

Lastly, it should be noted that in accordance with the provisions of the EBA document "Guidelines on connected clients under Article 4(1)(39) of Regulation (EU) 575/2013", the supervisory reports have standard methods of presentation of groups of connected clients that (in the case of silos) require exposures to the central governments to be repeated within each corresponding economic group directly controlled by a central government or connected to it by economic dependence. However, the amounts shown in points a) and b) and the number shown in point c) in the table above include the exposure to the various central governments, to which the Intesa Sanpaolo Group is exposed, only once.

C. SECURITISATIONS

This section does not include securitisations where the originator is the Bank and all the liabilities (e.g. ABS securities, loans at the warehousing stage) issued by the vehicle companies are subscribed at the time of issue by the Bank. For a description of these types of transactions, see the section on liquidity risk in Part E of the Notes to the Parent Company's financial statements.

Qualitative information

The qualitative information is contained in Part E of the Notes to the consolidated financial statements.

Quantitative information

C.1 Breakdown of exposures deriving from the main "originated" securitisations by type of securitised asset and by type of exposure

On-balance sheet

(millions of euro)

Type of securitised asset/ Exposure	ON-BALANCE SHEET EXPOSURES					
	Senior		Mezzanine		Junior	
	Book value	Adjust./ recoveries	Book value	Adjust./ recoveries	Book value	Adjust./ recoveries
A. Fully derecognised	**4,649**	**-18**	**33**	**-2**	**18**	**-**
- Loans to businesses (including SMEs) (a)	2,155	-19	23	-1	6	1
- Leases (b)	2,134	3	10	-	12	-1
- Residential mortgage loans (a)	360	-2	-	-1	-	-
B. Partly derecognised	**-**	**-**	**-**	**-**	**-**	**-**
C. Not derecognised	**34,187**	**-15**	**48**	**-28**	**798**	**-**
- Loans to businesses (including SMEs) (c) (d)	26,813	-13	42	-28	675	-
- Residential mortgage loans (d)	3,075	-	-	-	68	-
- Leases (d)	2,232	-1	-	-	30	-
- Commercial mortgage loans (d)	2,067	-1	6	-	25	-
TOTAL	**38,836**	**-33**	**81**	**-30**	**816**	**-**

(a) The entire amount relates to non-performing financial assets.
The Loans to businesses (including SMEs) relate to the Savoy, Kerma, Yoda and Sirio, Grogu and Kerdos, Organa and Anakin securitisations (see the 2018, 2019, 2020, 2021, 2022 and 2023 Consolidated Financial Statements, respectively, for details about the transactions). Residential mortgage loans relate to the Maior and Iseo securitisations.

(b) The amounts refer to the Portland securitisation relating to non-performing financial assets for amounts of 3 million euro – senior and 4 million euro – mezzanine, respectively (see the 2021 Consolidated Financial Statements for details of the transaction) and the Teseo transaction relating to performing financial assets (see the 2022 Consolidated Financial Statements for details of the transaction).

(c) The exposures include non-performing financial assets amounting to 18 million euro mezzanine (net of adjustments). The performing exposures include the Chewbecca securitisation (see the 2023 Consolidated Financial Statements for details of the transaction).

(d) The captions also include performing amounts associated with the synthetic securitisations originated by the Bank.

Off-balance sheet

This type of exposure did not exist as at 31 December 2024.

C.2 Breakdown of exposures deriving from main "third-party" securitisations by type of securitised asset and by type of exposure

On-balance sheet

(millions of euro)

Type of underlying assets/Exposures	ON-BALANCE SHEET EXPOSURES					
	Senior		Mezzanine		Junior	
	Book value	Adjust./ recoveries	Book value	Adjust./ recoveries	Book value	Adjust./ recoveries
Loans to businesses (including SMEs)	2,956	11	147	2	1	-
Consumer credit	1,553	-3	9	-	-	-
Residential mortgage loans	576	3	41	-	-	-
Leases	541	-	-	-	-	-
Trade receivables	327	-	2	-	7	-
Commercial mortgage loans	134	3	16	-	-	-
Covered bonds	68	-	21	-	-	-
Securitisations	65	-	-	-	-	-
Other assets (a)	7,943	19	1	-	-	-
TOTAL	**14,163**	**33**	**237**	**2**	**8**	**-**

(a) The amount also includes the Romulus securities for 5,180 million euro, held by the Bank, shown under third-party securitisations, as well as loans to the vehicle Duomo Funding Plc for 2,495 million euro as a result of the use of credit lines. For more information regarding the type of underlying assets, see Section 4 – Risks of other companies, of Part E of the Notes to the consolidated financial statements.

Off-balance sheet

(millions of euro)

Type of underlying assets/Exposures	GUARANTEES GIVEN						CREDIT LINES					
	Senior		Mezzanine		Junior		Senior		Mezzanine		Junior	
	Net exposure	Adjust./ recoveries	Net exposure	Adjust./ recoveries	Net exposure	Adjust./ recoveries	Net exposure	Adjust./ recoveries	Net exposure	Adjust./ recoveries	Net exposure	Adjust./ recoveries
Duomo ABCP Conduit transactions (a)	-	-	-	-	-	-	(a)	(a)	-	-	-	-
Loans to businesses including SMEs	-	-	-	-	-	-	191	-	-	-	-	-
Total	**-**	**-**	**-**	**-**	**-**	**-**	**191**	**-**	**-**	**-**	**-**	**-**

(a) With regard to the transactions carried out through Duomo Funding Plc and funded by ABCP, the Bank has granted liquidity facilities (amounting to 5,944 million euro in terms of net exposures and 1 million euro of recoveries) to secure the assets included under Other assets in Table C.2 on-balance sheet exposures.

C.3 Securitisation vehicles

(millions of euro)

-	REGISTERED OFFICE	CONSOLIDATION (a)	ASSETS (b)			LIABILITIES (b)		
			Loans	Debt securities	Other	Senior	Mezzanine	Junior
Augusto S.r.l. (d)	Milan	(e)	-	-	2	13	-	-
Brera Sec S.r.l. (c)	Conegliano Veneto (TV)	(e)	10,868	-	349	9,404	-	1,585
Clara Sec S.r.l. (c)	Conegliano Veneto (TV)	(e)	6,260	-	2,347	6,350	-	824
Diocleziano S.r.l. (d)	Milan	(e)	2	-	1	48	-	-

UBI Finance S.r.l. (f)	Milan	(e)	6,426	-	680	-	7,061	-

(a) Consolidation method relating to the "prudential" scope applied in the Group's financial statements.

(b) The amounts shown under assets and liabilities refer to the total values reported in the financial statements of the special purpose vehicles.

(c) Self-securitisation vehicle described in paragraph 2 of the quantitative information in Section 4 - Liquidity Risk of these Notes to the financial statements.

(d) The amounts shown under assets and liabilities relate to the latest financial statement data available (31 December 2023).

(e) Vehicle consolidated using the equity method.

(f) Vehicle used for covered bond issues. For more information, see Section E.4. Covered bond transactions in Part E of these Notes to the financial statements.

The securitisations structured by Intesa Sanpaolo on its own assets include those named Towers, K-Equity, Savoy, Kerma, Yoda, Maior, Iseo, Sirio, Kerdos, Grogu, Portland, Organa, Andor, Teseo and Chewbecca, for which special purpose vehicles were used that are third-party and independent entities with respect to the Bank, and in which the Bank does not hold any investments. For that reason, these vehicles are not shown in the table above.

C.4 Unconsolidated securitisation vehicles

The information set out in this section is not provided by the banks that draw up consolidated financial statements pursuant to Bank of Italy Circular 262.

C.5 Servicer activities – originated securitisations: collection of securitised loans and repayment of securities issued by the securitisation vehicle

SPECIAL PURPOSE VEHICLE	SECURITISED ASSETS (end-of-period figure) (millions of euro)		COLLECTIONS OF LOANS IN THE YEAR (millions of euro)		PERCENTAGE OF REIMBURSED SECURITIES (period-end figure)					
					Senior		Mezzanine		Junior	
	Non-performing	Performing	Non-performing	Performing	Non-performing	Performing	Non-performing	Performing	Non-performing	Performing
Teseo SPV S.r.l. (a)	51	2,427	4	708	0%	34%	0%	34%	0%	16%
Total	**51**	**2,427**	**4**	**708**						

(a) Vehicle used for the traditional securitisation of performing lease receivables described in the 2022 Consolidated Financial Statements.

D. INFORMATION ON STRUCTURED ENTITIES NOT CONSOLIDATED IN THE ACCOUNTS (OTHER THAN SECURITISATION VEHICLES)

The qualitative and quantitative information set out in this section is not provided by the banks that draw up consolidated financial statements pursuant to Bank of Italy Circular 262.

E. SALES

A. Financial assets sold not fully derecognised

Qualitative information

For a description of the operations shown in tables E.1, E.2 and E.3, reference is made to the information shown below the relevant tables.
For operations in debt securities against medium/long-term repurchase agreements, reference is made to the information in Part B of the Notes to the consolidated financial statements.

Quantitative information

E.1 Financial assets sold fully recognised and related financial liabilities: book values

(millions of euro)

The table above does not include covered bond transactions in which the Bank is both the originator and lender for the vehicle issuing the debt securities.

B. Financial assets sold fully derecognised with recognition of continuing involvement

These are not present in Intesa Sanpaolo.

C. Financial assets sold and fully derecognised

Qualitative information

The disclosure is provided below regarding the multi-originator sale transactions involving loan portfolios – classified as unlikely to pay in particular – attributable to the sale of loans to a mutual investment fund with the assignment of the units in the fund to the selling intermediaries.

Back2Bonis Fund

In implementation of the derisking envisaged in the previous 2018-2021 Business Plan and the current 2022-2025 Business Plan, in the third quarter of 2020 the Intesa Sanpaolo Group begun the deconsolidation of a portfolio of credit exposures (including real estate assets and contracts) classified as unlikely to pay with real estate underlying held by the Bank, accompanied by their conversion into units of the securities fund called Back2Bonis. The transaction, the closing of which took place at the end of 2020, took the form for the Bank (including the transactions undertaken in 2019 and 2020 by UBI Banca, merged in 2021) of the sale of a portfolio of loans, short-term legal relationships and legal relationships and assets from lease receivables for a total gross amount of 351 million euro and net exposure of 164 million euro, accompanied by the subscription of the units of the Back2Bonis fund for an amount of 164 million euro, substantially in line with the net value of the loans and receivables sold. The transaction was completed through: (i) the sale to the securitisation vehicle Ampre S.r.l. of the bank receivables and the lease receivables; (ii) the sale to Ampre LeaseCo S.r.l. of the legal relationships and assets arising from the leases; (iii) the sale of the short-term revolving contracts and the related legal relationships and receivables of

Intesa Sanpaolo, together with the medium/long-term contracts with residual disbursements and the related legal relationships, other than the lease relationships and assets through the fronting bank provided by Banca Finanziaria Internazionale S.p.A.; (iv) the subscription by the Back2Bonis Fund of all the securities issued by the securitisation vehicle; and (v) the acquisition by Intesa Sanpaolo of the units of the Fund in exchange for the loans and receivables sold. In 2022, additional loans were sold, for a gross amount of 1 billion euro and net exposure of 216 million euro, accompanied by the subscription of units of the Back2Bonis fund, for an amount of 216 million euro, with the sale price offset against the subscription price of the Fund's units, without significant effects on the income statement for 2022.
The Back2Bonis fund, established in the form of a closed-end mutual fund whose units can only be subscribed by professional investors, is a multi-originator platform for the management of Real Estate Small & Medium Size loans classified as UTP, deriving from loans and credit lines granted to companies operating in the real estate sector or to real estate funds (including those not fully disbursed/drawn down at the time of sale). Following the completion of the transfer of the loans and receivables to the platform, Intesa Sanpaolo had deconsolidated the loans and receivables and recognised the Fund's units in place of those loans and receivables. The breakdown of the assigned debtors by economic sector was mainly concentrated in the following sectors:

- "Production companies" at 79.9%;
- "Construction companies" at 12.9%;
- "Real estate business" at 3.5%;
- "Financial and insurance business" at 2.6%;
- and a residual amount in other business sectors (Services, Transport and Manufacturing Activities).

The assets of the assigned debtors were broken down as follows by geographical area:

- 92.2% North-West;
- 3.5% North-East;
- 3.2% South and Islands;
- 1.1% Centre.

At 31 December 2024, the Bank held a 42.47% stake (with voting rights limited to 35%) in the Back2Bonis Fund, classified among investments subject to significant influence, for a book value of 344 million euro. The measurement of the Back2Bonis Fund yielded an overall negative effect for the year of 16 million euro.

FI.NAV. Fund SUB-FUND A - LOANS

In pursuit of the de-risking activities provided for in the previous 2018-2021 Business Plan and the current 2022-2025 Business Plan, in the fourth quarter of 2018 the Intesa Sanpaolo Group had launched the contribution to the FI.NAV. fund (a closed-end Italian securities umbrella fund) of a portfolio of non-performing secured and unsecured loans attributable to the shipping sector. The Fund, reserved for institutional investors, is managed by the asset management company IQ EQ Fund Management (Ireland) Limited, not a member of the Intesa Sanpaolo Group, based in Ireland, and is divided into two autonomous sub-funds: FI.NAV. Sub-Fund A – Loans, dedicated to including the loans contributed by the Intesa Sanpaolo Group and Unicredit, and FI.NAV. Sub-fund B - New Finance, dedicated to including the capital of third-party investors to relaunch the repossessed ships. The transaction, formulated in 2018, was closed in 2019 through a sale of receivables without recourse for total gross consideration of 155 million euro and a net exposure of 102 million euro, equal to the sale price, set off against the price of subscription of the Fund units and, therefore, without any effects on the income statement for 2019. In the first quarter of 2020, a further tranche was sold without recourse for a gross amount of 37 million euro and a net value of 34 million euro, in line with the sale price and, therefore, with no impact on the income statement for 2020. Pursuant to IFRS 9, for the Intesa Sanpaolo Group the transaction entailed the derecognition of the loans sold since the Fund has become solely responsible for managing them following the sale; the Intesa Sanpaolo Group had therefore derecognised the loans concerned, while recognising the corresponding fair value of the units of the Fund assigned. The Group companies involved in the transaction were the Parent Company Intesa Sanpaolo and some of its subsidiaries merged in 2019 and 2020 (Cassa di Risparmio in Bologna and Mediocredito, both merged in 2019, and Banca IMI, merged in 2020). In December 2022 the sale of a loan portfolio was finalised for a gross amount of 74 million euro and net exposure of 37 million euro, accompanied by the subscription of the units of the fund for an amount essentially in line with the value of the exposure sold, without significant effects on the income statement for 2022. The economic sector of the assigned debtors was mainly concentrated in Transport. The transferred financial assets are primarily in the South and Islands area.
In 2024, two distributions were made by the Fund for an overall total of 200 million euro. Intesa Sanpaolo's *pro rata* share was 101 million euro.
As at 31 December 2024, the Bank held a 50.54% stake in the FI.NAV. fund, classified among investments subject to significant influence[215], for a book value of 48 million euro. The measurement of the FI.NAV fund yielded a positive effect for the year of 8 million euro.

[215] The interest is included under Companies subject to significant influence because, even though it represents a more complex situation than that typical of an ordinary non-controlling interest, the absence has been confirmed of the conditions for exercise of control envisaged by IFRS 10 on the basis of the corporate governance provisions in the articles of association/regulations.

RSCT Fund – Loans Sub-Fund

As part of the derisking envisaged in the previous 2018-2021 Business Plan and the current 2022-2025 Business Plan, the Intesa Sanpaolo Group had identified the opportunity to transfer assets (loans and securities) relating to non-performing positions to the closed-end RSCT Fund, in exchange for units of the fund. The project was managed by Pillarstone, which had selected a portfolio of industrial and commercial companies with the objective of helping each of them to identify a strategy for maximising the potential for debt recovery, also through injections of new finance. The transaction took place in May 2020 with the transfer of a portfolio of loans with 18 companies originated by the Group (Intesa Sanpaolo and Banca IMI, subsequently merged into Intesa Sanpaolo on 20 July 2020), Unicredit, BPER Banca and Crédit Agricole to the newly established closed-end alternative investment RSCT Fund, managed by IQ EQ Fund Management (Ireland) Limited, an alternative fund manager authorised by the Central Bank of Ireland. The RSCT Fund is made up of two separate sub-funds: sub-fund A for the management of loans acquired from the selling banks and sub-fund B for the management of the new finance. The May 2020 sale involved a portfolio of loans, Sirti notes and PS Reti equity instruments for a gross amount of 339 million euro (Intesa Sanpaolo and Banca IMI) at a net value of 255 million euro, substantially in line with the sale price. In July 2020, a further sale was completed of a loan position for a gross amount of 6.3 million euro at a value of 4.5 million euro, with the sale price offset against the subscription price of the Fund's units. In February 2021, a sale was completed of a loan position for a gross amount of 21.3 million euro at a value of 13.9 million euro, with the sale price offset against the subscription price of the Fund's units. In March 2021, a sale was completed of a loan position deriving from the absorption of UBI Banca for a gross amount of 3.1 million euro and a net exposure of 1.2 million euro, with the concurrent subscription of units of the RSCT Fund for 1.3 million euro, essentially aligned with the net value of the transferred loans. In June 2021, a further sale was completed of a loan position for a gross amount of 0.4 million euro at a value of 0.1 million euro, with the sale price offset against the subscription price of the Fund's units. By economic sector, the assigned debtors are 72% concentrated in "Companies that install electrical equipment", 18% in "Amusement and theme parks" and 10% in "Retail sale of footwear and accessories".
In 2024, a distribution was made by the Fund for a total of 10 million euro with a *pro rata* share in favour of Intesa Sanpaolo of 7 million euro.
The transferred financial assets are primarily in the North-west area.
As at 31 December 2024, the Bank held a 70.07%[216] stake in the RSCT fund, classified among investments subject to significant influence, for a book value of 257 million euro. The measurement of the RSCT fund yielded an overall positive effect for the year of 3 million euro.

IDEA CCR Corporate Credit Recovery II Fund - Loans Sub-fund

In 2018, the Intesa Sanpaolo Group (specifically Intesa Sanpaolo and the banks subsequently merged into Intesa Sanpaolo: Cassa di Risparmio del Veneto, Cassa di Risparmio di Firenze, Cassa di Risparmio del Friuli-Venezia Giulia, Cassa di Risparmio in Bologna, and Mediocredito) participated in the closed-end Italian fund IDEA CCR Corporate Credit Recovery II - Loans Sub-Fund, managed by Dea Capital Alternative Funds S.G.R. S.p.A. and dedicated to the recovery of mid-size Italian companies in situations of financial tension but with solid industrial fundamentals. The transaction, which was completed in 2018, was undertaken by contributing non-performing loans with a nominal value of 59 million euro and a net exposure to the sale price of 39.2 million euro, with the price of sale offset against the subscription price, of equal amount, of the units of the IDEA CCR Corporate Credit Recovery II fund - Loans Sub-Fund. In 2021, the Bank's investment in the IDEA CCR fund increased further, due to the merger of UBI Banca, which had sold loan positions to the IDEA CCR Corporate Credit Recovery II fund, Loans Sub-fund, managed by Dea Capital Alternative Funds SGR, in 2020, 2019, 2018 and 2017 for a total gross amount of 231 million euro and a net exposure of 144 million euro, with concurrent subscription of the units of the IDEA CCR fund for an amount of 148 million euro, with the price of sale offset against the price of subscription of the Fund units.
In 2022, the investment of the Bank in the IDEA CCR fund changed due to: i) the inclusion of the stake held by UBI Leasing S.p.A., merged into Intesa Sanpaolo in May 2022, which had sold loan positions to the IDEA CCR Corporate Credit Recovery II Fund - Loans Sub-Fund in 2019 for a total gross amount of 5 million euro and a net exposure of 3 million euro, with the sale price offset against the subscription price, in the same amount, of the Fund units, and ii) the sale of A1 units held by Intesa Sanpaolo in the Fund to Banca Nazionale del Lavoro S.p.A. The receivable held by Intesa Sanpaolo in relation to the sale was settled by offsetting with the purchase of units of Back2Bonis. In the second half of 2024, Intesa Sanpaolo transferred a loan portfolio for a total gross amount of 232 million euro, with payment of the price through the subscription of fund units recognised at an initial recognition amount of 201 million euro, with no significant impact on the 2024 income statement.
The breakdown of the assigned debtors by economic sector was mainly concentrated in the following sectors:
– "Production Companies" at 70.7%;
– "Other collective investments undertakings" at 10.3%;
– "Non-financial companies of non-EU countries" at 10.1%;
– and, to a residual extent, other business sectors.

The assets of the assigned debtors were broken down as follows by geographical area:
– 33.3% Centre;
– 19.3% North-East;
– 18.1% South and Islands;
– 16.7% North-West;
– 12.6% Outside Italy.

Following this transaction, Intesa Sanpaolo increased its holding in the Fund and reclassified the interest from financial assets mandatorily measured at fair value to interests subject to significant influence. As at 31 December 2024, the Bank held a 35.23% stake in the IDEA CCR Corporate Credit Recovery II fund, Loans Sub-Fund, classified among interests subject to significant influence, for a book value of 226 million euro. The measurement of the IDEA CCR Corporate Credit Recovery II fund - Loans Sub-Fund yielded a negative effect of 9 million euro during the year.

[216] The interest is included under Companies subject to significant influence because, even though it represents a more complex situation than that typical of an ordinary non-controlling interest, the absence has been confirmed of the conditions for exercise of control envisaged by IFRS 10 on the basis of the corporate governance provisions in the articles of association/regulations.

UTP Italia Fund – Loans Sub-Fund

The UTP Italia fund is an alternative closed-end Italian securities umbrella fund (AIF) in charge of managing loans classified as unlikely-to-pay (UTP) and whose target is credit exposures to small and medium-sized enterprises and individuals. In November 2022, the Bank finalised the sale of a loan portfolio (mainly UTP) to the UTP Italia fund managed by Sagitta S.G.R., with Intrum Italy S.p.A. as special servicer. Specifically, the transaction entailed: i) the sale of loans owed to the Bank for a gross amount at the cut-off date of 42 million euro and net exposure of 25 million euro, to Finn SPV S.r.l. (SPV 130), without significant effects on the income statement for 2022; ii) the recognition of the receivable of 25 million euro from the SPV 130; iii) the contribution to the UTP Italia fund of the receivable from the SPV 130 in exchange for units of the fund by way of price; and iv) issue of Asset-Backed Securities (ABS) by the vehicle, subscribed by the Fund, derecognising the receivable from the SPV 130. Effective 20 March 2023, Intesa Sanpaolo finalised the sale of a loan portfolio with gross exposure of 366 million euro and net exposure of 147 million euro to the securitisation vehicle Finn SPV S.r.l., with the sale price netting the subscription price of the fund units. Following this transaction, Intesa Sanpaolo had increased its holding in the Fund and had reclassified the interest from financial assets mandatorily measured at fair value to interests subject to significant influence.

In the second half of 2024, Intesa Sanpaolo transferred a loan portfolio for a total gross amount of 180 million euro, with payment of the price through the subscription of Fund units recognised at an amount of 82 million euro, with no significant impact on the 2024 income statement.

Two distributions were made during the year for an overall total of 50 million euro. Intesa Sanpaolo's share was 25 million euro.

The breakdown of the assigned debtors by economic sector was mainly concentrated in the following sectors:

– "Consumer Households" at 67.2%;
– "Production Companies" at 12.7%;
– and, to a residual extent, other business sectors.

The assets of the assigned debtors were broken down as follows by geographical area:

– 34.8% South and Islands;
– 29.4% North-West;
– 21.7% Centre;
– 14.1% North-East.

As at 31 December 2024, the Bank held a 55.02% stake (with voting rights limited to 35%) in the UTP Italia fund for a book value of 229 million euro. The measurement of the UTP Italia fund yielded a positive effect for the year of 18 million euro.

Efesto

Efesto is an alternative closed-end Italian securities fund (AIF). In July 2022, the sale of loans was finalised for a gross amount of 17 million euro and net exposure of 9 million euro, accompanied by the subscription of the units of the fund for an amount of 7 million euro, without significant effects on the income statement for 2022.

Effective 20 March 2023, Intesa Sanpaolo finalised the sale of a loan portfolio with gross exposure of 320 million euro and net exposure of 181 million euro to the securitisation vehicle Esino SPV S.r.l., with the sale price netting the price of subscription of the Fund units. Following this transaction, Intesa Sanpaolo had increased its holding in the fund and had reclassified the interest from financial assets mandatorily measured at fair value to interests subject to significant influence.

In the second half of 2024, Intesa Sanpaolo transferred a loan portfolio for a total gross amount of 223 million euro, with payment of the price through the subscription of fund units recognised at an amount of 194 million euro, with no significant impact on the 2024 income statement.

Four distributions were made during 2024 for an overall total of 80 million euro. Intesa Sanpaolo's share was 27 million euro.

The breakdown of the assigned debtors by economic sector was mainly concentrated in the following sectors:

– "Consumer Households" at 51.9%;
– "Production Companies" at 38.4%;
– and, to a residual extent, other business sectors.

The assets of the assigned debtors were broken down as follows by geographical area:

– 31.7% North-West;
– 30.5% South and Islands;
– 27.8% Centre;
– 10% North-East.

As at 31 December 2024, the Bank held a 43.19% stake in the Efesto fund for a book value of 336 million euro. The measurement of the Efesto Fund yielded an overall negative effect for the year of 4 million euro.

Lendlease MSG Heartbeat

In 2022, a complex operation regarding the Risanamento Group was launched, as part of the "Starfighter Project", to: i) develop the real estate project in the Milano Santa Giulia area; ii) enable the company to cover the commitments assumed with public and private parties, and iii) deconsolidate the on-balance sheet exposure due to the banks involved from Risanamento.

The Board of Directors of Intesa Sanpaolo approved the transaction on 2 February 2023, which was completed on 30 June 2023 following the fulfilment of the conditions precedent attached to the Term Sheet General Framework Agreement.

The complex transaction aimed at the financial and corporate restructuring of the Risanamento Group included:

– the establishment of a closed-end Alternative Real Estate Investment Fund;
– the commitment by Intesa Sanpaolo and the other banks involved, and by the other stakeholders involved in the transaction, to subscribe to the units of the Fund;
– the deconsolidation of Intesa Sanpaolo's credit exposure and shareholders' loan with the Risanamento Group through the discharge by the Fund and simultaneous offsetting of the related loans, due to Intesa Sanpaolo and the other banks, with the commitments made by the banks towards the Fund against the subscription of units;
– the disbursement of new performing loans to the Fund;
– the maintenance of Risanamento's business operations.

The economic sector of the assigned debtors was mainly concentrated in "Non-financial companies". The transferred financial assets are primarily in the North-West area.
The Bank's credit exposure to the Risanamento Group was offset against the latter's commitments made in exchange for the subscription of class A1 and B2 units of the Lendlease MSG Heartbeat fund. Therefore, at the closing completed on 30 June 2023, Intesa Sanpaolo derecognised the loans due from Risanamento, including the shareholders' loan, recognising respectively the B2 and A1 units of the fund received at fair value, at a value substantially aligned with the net value of the loans sold.
As at 31 December 2024, the Bank held a 56.80% stake (with voting rights limited to 40%) in the Lendlease MSG Heartbeat Fund, classified among investments subject to significant influence, for a book value of 132 million euro. The measurement of the Lendlease MSG Heartbeat Fund yielded a negative effect for the year of 80 million euro.

Retail & Leisure fund

As part of the de-risking, in 2024 Intesa Sanpaolo sold a loan portfolio for a total gross amount of 165 million euro with underlying real estate assets, owed by seven counterparties operating in the mall & hospitality sector with unsatisfactory performance, lack of available equity to support the relaunch plan, and consequent situation of substantial stalemate and difficulty in formulating sustainable financial measures. The "Retail & Leisure" fund is an Alternative Investment Fund, focused on acquiring and managing high-risk and non-performing credit exposures, primarily backed by real estate, and owed by companies in temporary financial distress operating in the mall & hospitality segments (shopping centres). The Fund is managed by IQ-EQ Fund Management with the support of the advisor Pillarstone, which is tasked managing the positions and the underlying assets. Upon the initial subscription, in exchange for the sale, Intesa Sanpaolo received shares representing 68% of the Fund, which, based on the economic and governance rights, were classified under interests subject to significant influence for a total of 126 million euro.
The breakdown of the assigned debtors by economic sector was mainly concentrated in the following sectors:
– "Production Companies" at 51%;
– "Other collective investments undertakings" at 44%;
– and, to a residual extent, other business sectors.
The assets of the assigned debtors were broken down as follows by geographical area:
– 67% North-West;
– 33% Centre.
As at 31 December 2024, the Bank held a 68.30%[217] stake in the Retail & Leisure fund, classified among investments subject to significant influence, for a book value of 124 million euro. The measurement of the Retail & Leisure fund yielded a negative effect for the year of 2 million euro.

UTP Restructuring Corporate

As part of the de-risking, in 2024, Intesa Sanpaolo sold a loan portfolio for a total gross amount of 160 million euro to the newly established fund managed by Arrow (UTP Restructuring Corporate), with payment of the price through the subscription of fund units recognised at an amount of 137 million euro, with no significant impact on the 2024 income statement. The Fund is an Alternative closed-end Italian securities Fund (AIF), reserved for professional investors. The purpose of the Fund is to carry out professional management aimed at maximising the value of the assets forming part of the Fund's portfolio. This involves actively participating in turnaround procedures and/or restructuring agreements and/or debtor balance plans; managing and exercising of rights related to equity investments and holding other financial instruments issued by the debtors, also through M&A or refinancing transactions; repossessions; and credit collection.
The breakdown of the assigned debtors by economic sector was concentrated in the following sector:
– "Production Companies" at 100%;
The assets of the assigned debtors were broken down as follows by geographical area:
– 55% North-East;
– 45% North-West.
As at 31 December 2024, the Bank held a 58.07% stake (with voting rights limited to 35%) in the UTP Restructuring Corporate Fund, classified among investments subject to significant influence, for a book value of 136 million euro. The measurement of the UTP Restructuring Corporate Fund yielded a negative effect for the year of 1 million euro.

Clessidra Restructuring Fund

Clessidra Restructuring Fund (CRF Fund) is a closed-ended Alternative Investment Fund reserved for institutional investors, dedicated to investing in loans classified as unlikely to pay to previously identified industrial companies. In September 2019, UBI Banca, which during 2021 was merged into Intesa Sanpaolo, had sold loans to five borrowers with a total gross amount of 17 million euro and a net exposure of 11 million euro, with concurrent subscription of the units of the CRF Fund for an amount essentially in line with the net value of the transferred loans. The economic sector of the assigned debtors was mainly concentrated in "Manufacture of wooden doors and manufacture of furniture". The transferred financial assets are primarily in the North-West area.
As at 31 December 2024, the Bank held a 4.34% stake in the CRF fund, classified among Financial assets mandatorily measured at fair value, for a book value of 8 million euro. The fair value measurement of the Clessidra Restructuring Fund yielded an immaterial positive effect during the year.

[217] The interest is included under Companies subject to significant influence because, even though it represents a more complex situation than that typical of an ordinary non-controlling interest, the absence has been confirmed of the conditions for exercise of control envisaged by IFRS 10 on the basis of the corporate governance provisions in the articles of association/regulations.

IDEA CCR Corporate Credit Recovery II Fund - Shipping Sub-fund

The Shipping Loans Sub-Fund refers to single-name, unlikely-to-pay non-performing loans with a sector focus on shipping companies. The Fund consists of three sub-funds: loans, new finance and shipping. Following the incorporation of UBI Banca in 2021, Intesa Sanpaolo also has a holding in the Shipping Sub-Fund against the sale of UBI loans with a total gross amount of 45 million euro and a net exposure of 31 million euro. As at 31 December 2024, the Bank held a 20.37% stake in the IDEA CCR II fund - Shipping Sub-Fund, classified among Financial assets mandatorily measured at fair value, with an immaterial book value.

Other information

For completeness, it should be noted that during the second half of 2023 Intesa Sanpaolo completed a transaction for the sale of performing on-balance sheet exposures (amounting to around 800 million euro in terms of Gross Book Value) to the Italian Commercial Real Estate sector, with a substantially neutral effect on the income statement. In summary, the transaction involved i) the transfer of part of the credit exposure to two Real Estate Funds, in exchange for units of the transferee funds, and ii) the conversion of the remaining exposure into newly issued Equity Instruments.
Lastly, in the first half of 2024 Intesa Sanpaolo completed a transaction for the sale of performing on-balance sheet exposures (amounting to around 80 million euro in terms of Gross Book Value) and Equity Instruments, with a substantially neutral effect on the income statement, by means of transfer of the Instruments to a Real Estate Fund in exchange for units of that fund.

E.4 Covered bond transactions

Covered bond transactions where the selling bank and the lending bank are the same must be reported under this section. Intesa Sanpaolo uses covered bonds mainly as a type of funding through securities guaranteed by assets originated by Intesa Sanpaolo or by other companies of the Group.
Intesa Sanpaolo has three programmes for the issuance of Covered Bonds (CB).

The first Programme, launched in 2009, had a maximum amount of 20 billion euro (the original maximum amount was 10 billion euro) and was closed in 2024. The guarantor of the Covered Bonds is the vehicle ISP CB Pubblico, to which a portfolio of performing loans and securities to the public sector, originated by the former subsidiary Banca Infrastrutture Innovazione e Sviluppo, now Intesa Sanpaolo, was transferred. The Bank gradually sold the vehicle assets with a total original nominal value of 13.2 billion euro (net of retrocessions of assets of 1.7 billion euro). The last sale (amounting to 1 billion euro) took place in April 2013.
At the end of November 2023, Intesa Sanpaolo had repurchased the entire portfolio of bonds segregated in the vehicle for an amount of 1.1 billion euro, while the remaining loan portfolio still segregated in the vehicle was repurchased in March 2024 for a total amount of 1.85 billion euro. The programme was closed on 2 April, at the final payment date.
Against these sales of the assets to the vehicle, Intesa Sanpaolo carried out issuances of Covered Bonds, over time, for a total nominal value of 25.2 billion euro (of which 21.7 billion euro relating to issues acquired in full by the Bank and subject to early redemption or matured and 3.5 billion euro relating to an exchange offer to investors during 2012, of which 2 billion euro that matured in the second quarter of 2017 and the remaining 1.5 billion euro in January 2021).
As at 31 December 2023, a total residual nominal amount of 1.85 billion euro of issues made as part of the Covered Bond programme of the vehicle ISP CB Pubblico was outstanding, fully subscribed by the Bank.
In January 2024, the 13th and 14th series (both retained) were subject to total early redemption for an overall nominal amount of 1.85 billion euro, thereby eliminating all the Covered Bonds issued under the programme.

In the second Programme, launched in 2010, amounting to a maximum of 35 billion euro (the original maximum amount was 20 billion euro), the guarantor of the Covered Bonds is the vehicle ISP CB Ipotecario, to which Italian residential mortgage loans and, initially bonds issued by Adriano Finance S.r.l., originated by Intesa Sanpaolo, were transferred.
The Bank gradually sold the vehicle mortgage loans with an original total nominal value of 56.8 billion euro (net of retrocessions).
In 2024, the following transactions were completed:
- in February, sale for an amount of 5.8 billion euro;
- in May, sales for an amount of 4.2 billion euro;
- in September, buyback of non-performing loans for 48.6 million euro.

As at 31 December 2024, the loans sold to the vehicle had a book value of 30 billion euro.
Over time, against the sale of assets to the vehicle, Intesa Sanpaolo has carried out issues of Covered Bonds for a total nominal value of 48 billion euro (of which a total of 25.1 billion euro subject to early redemption or matured at 31 December 2024).
As at 31 December 2023, a total nominal amount of 18.9 billion euro of issues made as part of the covered bond programme of the vehicle ISP CB Ipotecario was outstanding, of which 8.4 billion euro placed with third party investors and 10.5 billion euro subscribed by Intesa Sanpaolo. Part of the latter was used in repurchase agreements for an amount of 5.8 billion euro.
In March 2024, the 25th series matured for an amount of 1 billion euro, and in May the 21st retained series was redeemed early for an amount of 1.2 billion euro. In addition, five issuances of covered bonds were made for a total amount of 6.3 billion euro:
- in March the 34th retained series was issued for 1 billion euro, with a floating rate and a 5-year maturity;
- three retained series were issued in May:
  - the 36th for 1.4 billion euro, with a floating rate and a 4-year maturity;
  - the 37th for 1.7 billion euro, with a floating rate and a 9-year maturity;
  - the 38th for 1.7 billion euro, with a floating rate and an 11-year maturity;
- in June, the 35th series was issued, consisting of a private placement for 500 million euro, with a floating rate and a 6-year maturity.

Accordingly, as at 31 December 2024, a total nominal amount of 23 billion euro of issues made as part of the covered bond programme of the vehicle ISP CB Ipotecario was outstanding, of which 7.9 billion euro placed with third party investors and 15.1 billion euro subscribed by Intesa Sanpaolo. Part of the latter is being used in repurchase agreements for an amount of 12.9 billion euro.
All the securities issued under the programme are listed on the Luxembourg Stock Exchange and have a Moody's Aa3 rating.

The third multi-originator Covered Bond issue Programme, launched in 2012, has the vehicle ISP OBG S.r.l. as the guarantor of its securities. This programme is secured by mortgages for a maximum amount of 55 billion euro (the original maximum amount was 30 billion euro) and is aimed at realising the retained issues.
The portfolio used to collateralise the issues of Covered Bonds is composed of mortgages originated by Intesa Sanpaolo, Banco di Napoli, Cassa di Risparmio del Veneto, Cassa di Risparmio in Bologna and Banca CR Firenze (merged by incorporation into Intesa Sanpaolo between July 2018 and February 2019).
Over time, the Bank has sold mortgages to the vehicle for an original total nominal value of 89.2 billion euro (net of retrocessions).
In 2024, Intesa Sanpaolo did not sell any mortgage loans to the vehicle, while the following were repurchased:
– in January, non-performing loans for 22.6 million euro;
– in September, non-performing loans for 171.4 million euro.
As at 31 December 2024, the loans sold to the vehicle by Intesa Sanpaolo had a book value of 38.7 billion euro.
Over time, against the sale of these assets, Intesa Sanpaolo has carried out issues of Covered Bonds for a total nominal value of approximately 86.3 billion euro (of which 48.93 billion euro subject to early redemption or matured at 31 December 2024).
As at 31 December 2023, there were issuances made under the programme guaranteed by the vehicle ISP OBG for a total nominal amount of 41.8 billion euro, fully subscribed by Intesa Sanpaolo, a part of which was subsequently used in repurchase agreements for an amount of 5.8 billion euro.
In February 2024, the 32nd retained series matured for an amount of 1.65 billion euro. In June, the 21st retained series was partially redeemed for 500 million euro and subsequently matured in August for the remaining amount of 1.25 billion euro, and the 25th retained series was partially redeemed in June for 50 million euro and in December for an additional 1.2 billion euro.
Therefore, as at 31 December 2024, there were issuances made under the programme guaranteed by the vehicle ISP OBG for a total nominal amount of 37.15 billion euro, fully subscribed by Intesa Sanpaolo, part of which is being used in repurchase agreements for an amount of 5.8 billion euro.
All the securities issued as part of the programme are listed on the Luxembourg Stock Exchange and have a Morningstar DBRS A rating.

The fourth programme was launched by the former UBI Banca Group in 2008.
UBI Banca, merged into Intesa Sanpaolo S.p.A. during 2021, included two covered bond programmes, run by two special purpose vehicles named UBI Finance S.r.l. and UBI Finance CB2 S.r.l., respectively. The latter was closed in January 2021.
The programme still provides Intesa Sanpaolo with the right to issue securities, targeted to institutional investors, for a maximum amount of 15 billion euro. The Programme includes residential mortgage loans assigned by the former UBI Group's network banks. These banks participated in the programme as Originator Banks and Lending Banks.
Following the incorporation of UBI Banca, Intesa Sanpaolo sold mortgage loans to the vehicle for an original total nominal value of 628 million euro (net of retrocessions).
In 2024, Intesa Sanpaolo did not sell any mortgage loans to the vehicle, while the following were repurchased:
– in January, non-performing loans for 22.7 million euro;
– in September, non-performing loans for 42.8 million euro.
As at 31 December 2024, the loans sold to the vehicle had a book value of 6.4 billion euro.
As at 31 December 2023 a total nominal amount of 6.45 billion euro of issues made as part of the covered bond programme of the vehicle UBI Finance was outstanding, of which 6.25 billion euro placed with third party investors and 0.2 billion euro retained.
In 2024, the 14th series matured in February for an amount of 1 billion euro and the 24th series matured in July for an amount of 750 million euro.
As at 31 December 2024 a total nominal amount of 4.7 billion euro of issues made as part of the covered bond programme of the vehicle UBI Finance was outstanding, of which 4.5 billion euro placed with third party investors and 0.2 billion euro retained.
As at 31 December 2024, the bonds under the programme were assigned an Aa3 rating from Moody's and AA (Low) from Morningstar DBRS.

(1) This caption includes the subordinated loan granted by Intesa Sanpaolo to the vehicles to finance the purchase of the portfolio used to collateralise the covered bonds. This loan is subject to derecognition in the separate IAS-compliant financial statements. The amount of the loan relates to the issuance already made under an issuance programme of a higher maximum amount.

(2) The nominal amount and carrying amount are net of the repurchased securities.

The additional information required by IFRS 12 is not provided by banks that draw up consolidated financial statements pursuant to Bank of Italy Circular 262.

F. MODELS FOR THE MEASUREMENT OF CREDIT RISK

As of 31 December 2024, the expected loss on performing loans to customers (which takes into account cash and unsecured loans) was 0.28%, down from 0.31% in 2023. The decrease was attributable to the improvement in the quality of the loan portfolio.

For the companies included in the roll out plan, the internal rating (PD), LGD and EAD models are subject to a second level control process carried out by the Validation function on the adequacy of the existing methodological framework, on an annual basis in accordance with the rules established by the Supervisory Authority, and a level three control by the Internal Audit Function. The control functions produce annual reports for the Supervisory Authority on the compliance of the models with the supervisory regulations, which also includes a verification on the deviations between estimates made and the actual figures, and they issue a compliance opinion when material model changes are made to the models. These reports, approved by the Board of Directors of Intesa Sanpaolo, confirm the compliance to the regulatory requirements.

SECTION 2 – MARKET RISKS

REGULATORY TRADING BOOK

2.1 INTEREST RATE RISK AND PRICE RISK

Qualitative information

Qualitative information on the measurement of financial risks of Intesa Sanpaolo's regulatory trading book is contained in Part E of the Notes to the consolidated financial statements.

Quantitative information

Operational quantitative information on Intesa Sanpaolo's market risks is contained in Part E of the Notes to the consolidated financial statements.

BANKING BOOK

2.2 INTEREST RATE RISK AND PRICE RISK

Qualitative information

Qualitative information on the measurement of financial risks in Intesa Sanpaolo's banking book is contained in Part E of the Notes to the consolidated financial statements.

Quantitative information

Banking book - internal models and other sensitivity analysis methodologies

The sensitivity of net interest income – assuming a +50, -50 and +100 basis point change in interest rates – amounted to -93 million euro, +77 million euro and -228 million euro, respectively, at the end of 2024.

The latter figure was down (-552 million euro) on the amount at the end of 2023, reflecting the implementation of the strategy to protect the net interest income against falling interest rates, mainly achieved through hedging derivatives on demand deposits. The repricing of floating rate assets also contributed to the change in the measure. In all the scenarios reported, the changes in net interest income are very small, thanks to the already mentioned net interest income stabilisation strategies implemented by the Bank. The lack of symmetry between the upward and downward rate shocks is due to the presence of contractual floors on demand deposits, reflected in the use of estimation parameters (betas) that predict an increase in reactivity as rates rise, and consequently in the cost of funding.

Interest rate risk, generated by Intesa Sanpaolo's banking book, measured through the value sensitivity (sensitivity of portfolio value to a parallel and uniform shift in the yield curve of +100 basis points), recorded an average of -1,843 million euro during 2024 and amounted to -2,198 million euro at year-end. The increase in sensitivity recorded in December 2024 compared to December 2023 (-1,320 million euro), reflected the phenomena already described in relation to the sensitivity of the net interest income, namely the implementation of a strategy to protect the net interest income from expected interest rate declines and the repricing of the floating-rate assets, as well as the increase in the exposure of the HTCS portfolio, which mainly occurred during the first half of 2024.

Interest rate risk, measured in terms of VaR (99% confidence level, 10-day holding period), amounted to an average of 527 million euro during 2024, with a maximum value of 663 million euro and a minimum value of 301 million euro. In December 2024 VaR was 488 million euro, up by 239 million euro compared to the figure at the end of December 2023. This change was due to the increase in the exposure recorded in 2024.

Price risk generated by minority stakes in listed companies, mostly held in the portfolios of Assets at fair value through other comprehensive income (FVOCI) and measured in terms of VaR, recorded an average level during 2024 of 52 million euro, with minimum and maximum values of 34 million euro and 77 million euro, respectively, with the latter coinciding with the value at the end of 2024 (39 million euro at the end of 2023). This change was mainly due to the increase in the price volatility of the equity portfolio.

Lastly, the table below shows a sensitivity analysis of the banking book to price risk, measuring the impact on Shareholders' Equity of a price shock for the above-mentioned quoted assets.

Price risk: impact on Shareholders' Equity

(millions of euro)

		Impact on shareholders' equity at 31.12.2024	Impact on shareholders' equity at 30.09.2024	Impact on shareholders' equity at 30.06.2024	Impact on shareholders' equity at 31.03.2024	Impact on shareholders' equity at 31.12.2023
Price shock	10%	74	75	70	57	52
Price shock	-10%	-74	-75	-70	-57	-52

2.3 FOREIGN EXCHANGE RISK

Qualitative information

Qualitative information, including hedging activities of foreign exchange risk, is contained in Part E of the Notes to the consolidated financial statements.

As of 31 December 2022, the presentation of the "Breakdown by currency of assets and liabilities and of derivatives" has been aligned with the prudential approach in compliance with the new methodological framework introduced by the EBA Guidelines on the treatment of structural FX under Article 352(2) of Regulation (EU) No 575/2013 (CRR).

2. Internal models and other sensitivity analysis methodologies

As already noted, the management of Transaction Foreign Exchange Risk relating to trading activities is included in the operating procedures and in the estimation methodologies of the managerial VaR.
Foreign exchange risk expressed by equity investments in foreign currency (banking book) originated a VaR (99% confidence level, 10-day holding period) amounting to 84 million euro as at 31 December 2024. This potential impact would only be reflected in the Shareholders' Equity.

SECTION 3 – DERIVATIVES AND HEDGING POLICIES

The Bank is authorised to use EPE (Expected Positive Exposure) internal models to determine the capital requirement for counterparty risk. These models are used for almost the entire derivatives portfolio (as shown in the table below, as at 31 December 2024 approximately 97% of the total EAD of financial and credit derivatives is measured using EPE models).
Derivatives whose counterparty risk is measured using approaches other than internal models represent a residual portion of the portfolio (as at 31 December 2024 accounting for approximately 3% of overall EAD) and refer to types not included in the calculation model, in compliance with the immateriality thresholds set by the EBA.
As a result of the entry into force of the Basel 3 rules, the scope of counterparty risk also includes Exchange Traded Derivatives (ETD) and contracts with central counterparties (CCP).
The table below shows the overall EAD of exposures in financial and credit derivatives, broken down by measurement approach.

(millions of euro)

Transaction categories	Exposure at default (EAD)			
	31.12.2024		31.12.2023	
	Standardised models	Internal Method (EPE)	Standardised models	Internal Method (EPE)
Derivative contracts	311	10,924	212	10,364

Using the EPE internal model, it is possible to consider the collateral collected to mitigate credit exposure and any excess collateral paid in the simulation. The value of the guarantees received and included in the calculation of the EAD amounts to approximately 16.3 billion euro for Intesa Sanpaolo, while the collateral provided to counterparties amounts to around 16.4 billion euro (these amounts include the initial margins posted in connection with transactions with central counterparties and those received from bilateral counterparties and clearing service customers).

This table shows the fair value of all the unmargined contracts, both on regulated markets and with central counterparties.

The amounts shown in the column "Over the counter" with central counterparties relate to the gross fair value of the over-the-counter (OTC) derivatives settled through legal clearing, including LCH Ltd.

The fair value of the over-the-counter (OTC) trading derivatives held with the legal clearing agent LCH Ltd., considered to have met the requirements of IAS 32, paragraph 42, was offset in the financial statements (Part B of the Notes to financial statements) with a total negative difference for financial derivatives held for trading of 4,525 million euro (positive fair value of 50,975 million euro and negative fair value of 55,500 million euro). The difference relates to transactions originated by customers and Group companies for a positive clearing amount of 523 million euro (positive fair value of 2,373 million euro and negative fair value of 1,850 million euro), shown under financial assets held for trading, and to transactions on own account for a negative clearing amount of 5,048 million euro (positive fair value of 48,602 million euro and negative fair value of 53,650 million euro), shown under financial liabilities held for trading.

A.3 Over the counter financial trading derivatives: notional amounts, gross positive and negative fair value by counterparty

(millions of euro)

Underlying asset	Central Counterparties	Banks	Other financial companies	Other counterparties
Contracts not included under netting agreements				
1) Debt securities and interest rates

Total 31.12.2023	**14,330**	**65,392**	**1,164**	**80,886**

B.5 Credit derivatives associated with the fair value option: annual changes

Intesa Sanpaolo does not hold credit derivatives associated with the fair value option.

3.2 Accounting hedges

Qualitative information

On first-time adoption of IFRS 9, the Intesa Sanpaolo Group exercised its option under the standard to continue to fully apply the rules of IAS 39 for all types of hedges (micro and macro hedges). As a result, the provisions of IFRS 9 on hedging do not apply.

A. Fair value hedging

The hedging carried out by the Bank is aimed at protecting the banking book from variations in the fair value of loans and deposits due to movements in the interest rate curve (interest rate risk).

The Bank uses both micro fair value hedges and macro fair value hedges.
The micro fair value hedges mainly hedge bonds issued, debt securities under assets and loans to customers.
The macro fair value hedges are used for:

- core deposits, based on the applicable standards in the carved-out version of IAS 39;
- the already fixed portion of floating-rate loans, in which the macro fair value hedge is used to hedge the interest rate risk inherent in the floating-rate coupons of the loans granted, when the coupon rate is set;
- a portion of fixed-rate loans; for this type, in line with the carved-out version of IAS 39, an open-portfolio macrohedging model has been adopted according to a bottom-layer approach that, in accordance with the interest rate risk measurement method involving modelling of the prepayment phenomenon, is more closely correlated with risk management activity and asset dynamics.

The main types of derivative contracts used are plain and structured interest rate swaps (IRS), overnight index swaps (OIS), cross-currency swaps (CCS), forward sales and options on interest rates stipulated with market counterparties.
The derivatives are not listed on regulated markets but are traded in OTC (over the counter) circuits. The OTC contracts also include contracts entered into through clearing houses, which account for the majority of derivatives.

B. Cash flow hedging

The hedging carried out by the Bank is aimed at protecting it from the exposure to changes in future cash flows attributable to movements in the interest rate curve, associated with a particular asset/liability, such as variable future interest payments on a debt/loan or a highly probable expected future transaction.

The Bank uses both micro cash flow hedges and macro cash flow hedges. The micro cash flow hedges mainly hedge bonds issued.
The macro cash flow hedges are used for:

- floating-rate funding when it is used to finance fixed-rate loans;
- floating-rate loans hedging fixed-rate funding.

The derivatives used are interest rate swaps (IRS) with market counterparties.
The derivatives are not listed on regulated markets but are traded in OTC (over the counter) circuits. The OTC contracts also include contracts entered into through clearing houses, which account for the majority of derivatives.

C. Hedging of foreign investments

The Bank takes out foreign exchange hedges against the foreign exchange risk on the cost of funding in foreign currency and on foreign currency gains generated by the Parent Company's international branches. These are operational hedges, which are therefore not recognised as accounting hedges covered by this section.

D. Hedging instruments

The main causes of ineffectiveness of the model adopted by the Bank for verifying the effectiveness of the hedges are attributable to the following:

- misalignment between the notional value of the derivative and the hedged underlying recognised at the time of initial designation or generated subsequently, such as in the case of partial repayments of loans or the repurchase of bonds;
- application of different curves respectively on the hedging derivative and hedged item for the effectiveness test on fair value hedges. In the derivatives, normally collateralised or entered into through clearing houses, the cash flows are discounted on the overnight curves, while the hedged items are discounted on the indexing curve of the cash flows of the hedging instrument;
- inclusion in the effectiveness test of the value of the floating-rate cash flows of the hedging derivative, for fair value hedges.

The ineffectiveness of the hedge is promptly determined for the purposes of:

- the determination of the impact to be recognised in the income statement;
- the assessment of the possibility of continuing to apply the hedge accounting rules.

The Bank does not use dynamic hedges, as defined in IFRS 7, paragraph 23C.

E. Hedged items

The main types of hedged items are:

- debt securities under assets;
- debt securities issued and non-securities funding;
- fixed-rate loans;
- floating-rate loans;
- optional embedded component of floating-rate mortgages;
- already set coupon of floating-rate loans;
- modelled on demand deposits.

E.1 Debt securities under assets

The debt securities under assets are hedged by micro fair value hedges, involving the use of IRS (interest rate swaps), OIS (overnight index swaps) and CCS (cross-currency swaps) as hedging instruments.
The interest rate risk is usually hedged for the entire portfolio holding period of the debt instrument.
The Dollar Offset Method is used to verify the hedge effectiveness. This method is based on the ratio between the cumulative changes (from the inception of the hedge) in the fair value of the hedging instrument, attributable to the hedged risk, and cumulative changes in the fair value of the hedged item (fair value change), net of the accrual component of the earned interest.
Micro fair value hedges also include forward sales on debt securities held under Financial assets at fair value through other comprehensive income (HTCS), carried out to hedge risks of fair value changes connected to movements in credit spreads and interest rates. With regard to the forward sale contract, which is a derivative because it is a non-regular way transaction, the spot component is separated from the interest component by designating only the spot component as the hedging instrument in a fair value hedging relationship.

E.2 Debt securities issued and non-securities funding

The Bank establishes micro fair value hedges in place on fixed-rate funding and micro cash flow hedges or macro cash flow hedges on floating-rate funding, using IRS (interest rate swaps), OIS (overnight index swaps) and CCS (cross-currency swaps) as hedging instruments.
The interest rate risk is usually hedged throughout the life of the bond.
For the micro hedges, the hedge effectiveness is verified using the Dollar Offset Method. This method is based on the ratio between the cumulative changes (from the inception of the hedge) in the fair value or the cash flows of the hedging instrument, attributable to the hedged risk, and cumulative changes in the fair value or the cash flows of the hedged item (fair value change), net of the accrual component of the earned interest.
For the macro hedges, the hedge effectiveness is verified by means of a capacity test. This test involves a comparison of the consistency between the hedged items, referring to existing or expected floating-rate funding (highly probable future transactions), and the hedging instruments, and must be performed throughout the life of the hedging relationship and for each time band. In this case, the hedged item is represented by the expected cash flows from funding that will arise over the life of the funding. The estimate of the expected upcoming and highly probable funding is subject to annual approval by the Group Financial Risks Committee.

E.3 Fixed-interest loans

The Bank establishes micro fair value hedges for fixed-rate loans and macro fair value hedges for mortgage loans disbursed to retail counterparties of the Bank, mainly using IRS (interest rate swaps) as hedging instruments.
The interest rate risk is usually hedged throughout the life of the underlying.
For the micro hedges, the hedge effectiveness is verified using the Dollar Offset Method.
For the macro hedges, the loan portfolio hedged is open, i.e. it is dynamically composed of fixed-loans hedged, at aggregate

level, through hedging derivatives entered into over time.
The effectiveness of the macro hedges on fixed-rate loans is periodically verified through specific prospective and retrospective tests aimed at demonstrating that the hedged portfolio contains an amount of assets whose sensitivity profile and changes in fair value due to interest rate risk reflect those of the derivatives used for the hedge.

E.4 Floating-rate loans

The Bank establishes macro cash flow hedges on floating-rate loans, mainly using interest rates swaps (IRSs) as hedging instruments.
The hedge effectiveness is verified by means of a capacity test. This test, which involves a comparison of the consistency between the hedged items, referring to the floating-rate loans outstanding, and the hedging instruments, must be performed throughout the life of the hedging relationship and for each time band. In this case, the hedged item is represented by the expected cash flows originating from the loans that will arise over the life of the assets.

E.5 Optional embedded component of floating-rate mortgages

The Bank hedges the optional embedded components (interest rate options) of floating-rate mortgages through micro fair value hedges, using options (cap, floor, collar) as hedging instruments.
The underlying assets may be partially or totally hedged, over time and in terms of amount.
The hedge effectiveness is verified using the Dollar Offset Method.

E.6 Already set coupon of floating-rate loans

The Bank establishes macro fair value hedges on coupons already set for floating-rate loans using OIS (overnight index swaps) as hedging instruments.
The purpose of this type of hedge is to neutralise the interest rate risk generated by the coupons already fixed.
The Dollar Offset Method is used to verify the hedge effectiveness, while the actual consistency of the hedged items is verified through a capacity test.

E.7 Modelled on demand deposits

Modelled on demand deposits are hedged by macro fair value hedges, as required by the "carve out" of IAS 39, using IRS (interest rate swaps) and OIS (overnight index swaps) as hedging instruments.
The purpose of the hedge is to protect net interest income from possible falls in interest rates that reduce the spread generated by the Bank's core deposits.
The model is subject to continuous monitoring and verification by Market & Financial Risk Management, in order to promptly incorporate changes in the main characteristics of the model (volumes, stability, reactivity) and make the necessary adjustments where appropriate.
The hedge effectiveness is verified using the Dollar Offset Method.

E.8 Equity investments

The Bank establishes micro fair value hedges on equity interests in foreign currency measured at cost using foreign exchange outright derivatives as hedges.
The purpose of the hedging is to neutralise the exchange rate fluctuations in equity investments.
The Dollar Offset Method is used to verify the hedge effectiveness assuming that the changes in fair value relate exclusively to foreign exchange risk.

B.2 Credit hedging derivatives: gross positive and negative fair value - breakdown by product

B.3 Over the counter credit hedging derivatives: notional amounts, gross positive and negative fair values by counterparty

B.4 Residual maturity of over the counter credit hedging derivatives: notional amounts
Intesa Sanpaolo does not hold credit derivatives classified as hedges in its portfolio.

C. Non-derivative hedging instruments

C.1 Non-derivative hedging instruments: breakdown by accounting portfolio and type of hedge
Intesa Sanpaolo has exercised the option, provided for on the introduction of IFRS 9, of continuing to fully apply the provisions of IAS 39 on hedge accounting (in the carved-out version endorsed by the European Commission) for each type of hedge (both for micro hedges and macro hedges). For this reason, the Bank does not hold financial instruments to be shown in table "C.1 Non-derivative hedging instruments: breakdown by accounting portfolio and type of hedge".

D. Hedged items

Intesa Sanpaolo has exercised the option, provided for on the introduction of IFRS 9, of continuing to fully apply the provisions of IAS 39 on hedge accounting (in the carved-out version endorsed by the European Commission) for each type of hedge (both for micro hedges and macro hedges).

D.1 Fair value hedges

(millions of euro)

	Micro-hedges: book value	**Micro-hedges – net positions: book value of assets and liabilities (prior to netting)**	**Micro-hedges**			**Macro-hedges: book value**
			Cumulative fair value changes (hedged instrument)	Termination of hedging: residual cumulative fair value changes	Changes in value used to assess hedge ineffectiveness	
A. Assets						
1. Financial assets designated at fair value through other comprehensive income – hedging of:	**45,280**	**-**	**-372**	**-321**	**-285**	**-**
1.1 Debt securities and interest rates	41,554	-	-343	-316	-257	x

1.3 Foreign exchange rates and gold	-	-	-	-	-	x
1.4 Loans	-	-	-	-	-	x
1.5 Other	3,726	-	-29	-5	-28	x
2. Financial assets measured at amortised cost - hedging of:	**47,056**	**-**	**-608**	**-466**	**-311**	**116,017**
1.1 Debt securities and interest rates	46,617	-	-788	-466	-522	x
1.2 Equities and stock indices	-	-	-	-	-	x
1.3 Foreign exchange rates and gold	-	-	-	-	-	x
1.4 Loans	-	-	-	-	-	x
1.5 Other	439	-	180	-	211	x
Total 31.12.2024	**92,336**	**-**	**-980**	**-787**	**-596**	**116,017**
Total 31.12.2023	**85,178**	**-**	**-1,680**	**-3,043**	**-1,398**	**105,307**
B. Liabilities						
1. Financial liabilities measured at amortised cost - hedging of:	**58,548**	**-**	**-1,242**	**-**	**-1,227**	**202,412**
1.1 Debt securities and interest rates	52,982	-	-693	-	-744	x
1.2 Foreign exchange rates and gold	-	-	-	-	-	x
1.3 Other	5,566	-	-549	-	-483	x
Total 31.12.2024	**58,548**	**-**	**-1,242**	**-**	**-1,227**	**202,412**
Total 31.12.2023	**62,306**	**-**	**-1,528**	**-41**	**-1,518**	**144,651**

D.2 Cash flow hedges and hedges of foreign investments

(millions of euro)

		Change in value used to assess hedge ineffectiveness	Hedging reserves	Termination of hedging: residual cumulative value of the hedging reserves
A. Cash flow hedge				
1. Assets		**156**	**-35**	**-**
1.1 Debt securities and interest rates		156	-35	-
1.2 Equities and stock indices		-	-	-
1.3 Foreign exchange rates and gold		-	-	-
1.4 Loans		-	-	-
1.5 Other		-	-	-
2. Liabilities		**21**	**-141**	**-**
1.1 Debt securities and interest rates		21	-141	-
1.2 Foreign exchange rates and gold		-	-	-
1.3 Other		-	-	-
Total (A)	**31.12.2024**	**177**	**-176**	**-**
Total (A)	**31.12.2023**	**299**	**-318**	**-**
B. Hedges of foreign investments		X	-	-
Total (A+B)	**31.12.2024**	**177**	**-176**	**-**
Total (A+B)	**31.12.2023**	**299**	**-318**	**-**

E. Effects of hedging on shareholders' equity

E.1 Reconciliation of components of shareholders' equity

(millions of euro)

	Cash flow hedging reserve					Reserve for hedging of foreign investments				
	Debt securities and interest rates	Equities and stock indices	Foreign exchange rates and gold	Loans	Other	Debt securities and interest rates	Equities and stock indices	Foreign exchange rates and gold	Loans	Other
Initial amount	**-318**	**-**	**-**	**-**	**-**	**-**	**-**	**-**	**-**	**-**
Fair value changes (effective portion)	142	-	-	-	-	-	-	-	-	-
Reclassification to the income statement	-	-	-	-	-	-	-	-	-	-
of which: future transactions no longer expected	-	-	-	-	-	*X*	*X*	*X*	*X*	*X*
Other changes	-	-	-	-	-	-	-	-	-	-
of which: transfer to the initial book value of the hedged instruments	-	-	-	-	-	*X*	*X*	*X*	*X*	*X*
Final amount	**-176**	**-**	**-**	**-**	**-**	**-**	**-**	**-**	**-**	**-**

The category "Hedging instruments (non-designated items)" is not present, because Intesa Sanpaolo has exercised the option, provided for on the introduction of IFRS 9, of continuing to fully apply the provisions of IAS 39 on hedge accounting (in the carved-out version endorsed by the European Commission) for each type of hedge (both for micro hedges and macro hedges).

3.3 Other information on derivative instruments (trading and hedging)

A. Credit and financial derivatives

A.1 Over the counter credit and financial derivatives: net fair values by counterparty

(millions of euro)

	Central counterparties	Banks	Other financial companies	Other counterparties
A. Financial derivatives				
1) Debt securities and interest rates				
- notional amount	2,518,720	-	-	-
- positive net fair value	-	-	-	-
- negative net fair value	-4,536	-	-	-
2) Equities and stock indices				
- notional amount	-	-	-	-
- positive net fair value	-	-	-	-
- negative net fair value	-	-	-	-
3) Foreign exchange rates and gold				
- notional amount	-	-	-	-
- positive net fair value	-	-	-	-
- negative net fair value	-	-	-	-
4) Commodities				
- notional amount	-	-	-	-
- positive net fair value	-	-	-	-
- negative net fair value	-	-	-	-
5) Other				
- notional amount	-	-	-	-
- positive net fair value	-	-	-	-
- negative net fair value	-	-	-	-
B. Credit derivatives				
1) Protection purchases				
- notional amount	-	-	-	-
- positive net fair value	-	-	-	-
- negative net fair value	-	-	-	-
2) Protection sales				
- notional amount	-	-	-	-
- positive net fair value	-	-	-	-
- negative net fair value	-	-	-	-

The table shows the values resulting from the offsetting in the balance sheet for the derivatives whose netting agreements meet the criteria set out in IAS 32 paragraph 42.
In particular, the above refers to over-the-counter (OTC) trading and hedging financial and credit in place with the legal clearing agent LCH Ltd., for which the fair values attributable to transactions on own account and transactions on behalf of customers and Group companies have been offset separately in the financial statements.
The clearing amount, which had a total net negative value of 4,536 million euro (positive fair value of 56,991 million euro and negative fair value of 61,527 million euro), attributable to a negative result of 4,525 million euro from trading derivatives and a negative result of 11 million euro from hedging derivatives, is presented in Part B of the Notes to the financial statements for operations on behalf of customers and Group Companies (trading derivatives) under financial assets held for trading for 523 million euro, for operations on own account under financial liabilities held for trading for 5,048 million euro and in liabilities under financial hedging derivatives for 11 million euro.

SECTION 4 - LIQUIDITY RISK

QUALITATIVE INFORMATION

The qualitative information is contained in Part E of the Notes to the consolidated financial statements.

QUANTITATIVE INFORMATION

1. Breakdown by contractual residual maturity of financial assets and liabilities

The breakdown by maturity of financial assets and liabilities is shown in the tables below according to the rules set forth in the financial statement regulations (Bank of Italy Circular 262 and related clarifications issued by the Supervisory Authority), using accounting information organised by contractual residual maturity.

Therefore, no operational data was used that would require, for example, the modelling of core deposits and the representation of on-balance sheet items according to their level of liquidability.

Currency of denomination: Euro

(millions of euro)

2. Self-securitisations

A brief illustration of the securitisations originated by Intesa Sanpaolo outstanding as at 31 December 2024 is shown below, in which the Bank subscribed all the securities issued by the related vehicle (self-securitisations), and which need not be shown in the tables of Part E, section C "Securitisations" of the Notes to the financial statements.

Brera Sec S.r.l. (SEC 2)

In September 2019, a self-securitisation was structured, implemented through the sale of a loan portfolio originated by Intesa Sanpaolo to the vehicle company Brera Sec S.r.l. This transaction is the Group's second Residential Mortgage Backed Security ("RMBS") securitisation (the first Brera Sec S.r.l. securitisation was closed during the year).
Intesa Sanpaolo has acquired a minority interest (5%) in the newly established vehicle, purchased on the market, and control (95%) is held by a corporate entity outside the Group (Dutch-registered foundation known as a Stichting).
Intesa Sanpaolo takes care of the accounting management for the vehicle, whereas the corporate administration will be carried out by Securitisation Services S.p.A.
The transaction involved the issuance by the vehicle company of two tranches of securities: a senior tranche listed on the Luxembourg Stock Exchange, with a rating assigned by two rating agencies (Moody's and Morningstar DBRS) and an unlisted junior tranche without rating.
Both the senior security and the junior security were subscribed by Intesa Sanpaolo.
The senior security issued through the transaction, with a Moody's Aa3 and a Morningstar DBRS A (High) rating, can be used as collateral for refinancing operations in the Eurosystem.
The total sale consideration was 7.5 billion euro. The sale price of the portfolio was settled through the issuance of securities on 27 November 2019 for a total of 7.5 billion euro.

As at 31 December 2024, the value of the outstanding securities was 3,644 million euro for the senior securities and 860 million euro for the junior securities.
The transaction is due to be extinguished in the first quarter of 2025, with the full repurchase of the loan portfolio at the end of January for 4.4 billion euro, with completion of the closure on the payment date of 17 March 2025.

Brera Sec S.r.l. (SEC 3)
In October 2021, an additional self-securitisation was structured, implemented through the sale of a loan portfolio, originated by Intesa Sanpaolo, to the vehicle company Brera Sec S.r.l. This transaction is the Group's third Residential Mortgage Backed Security ("RMBS") securitisation.
Intesa Sanpaolo takes care of the accounting management for the vehicle, whereas the corporate administration will be carried out by Securitisation Services S.p.A.
The transaction involved the issuance by the vehicle company of two tranches of securities: a listed senior tranche, with a rating assigned by two rating agencies (Moody's and Morningstar DBRS) and an unlisted junior tranche without rating.
Both the senior security and the junior security were subscribed by Intesa Sanpaolo.
The senior security issued through the transaction, with a Moody's Aa3 and a Morningstar DBRS A (High) rating, can be used as collateral for refinancing operations in the Eurosystem.
The total sale consideration was 7.7 billion euro. The sale price of the portfolio was settled through the issuance of securities on 1 December 2021 for a total of 7.7 billion euro.
As at 31 December 2024, the value of the outstanding securities was 5,760 million euro for the senior securities and 725 million euro for the junior securities.

Clara Sec S.r.l.
In 2020, a self-securitisation was structured involving receivables arising from performing personal loans within the consumer credit area and disbursed to consumer households, originated by Intesa Sanpaolo to the vehicle company Clara Sec S.r.l.
The securitisation is a revolving transaction and Intesa Sanpaolo has the option to sell the vehicle further loan portfolios with similar characteristics and quality, which the Vehicle will purchase by drawing on the receipts generated by the portfolio segregated over time.
Intesa Sanpaolo has acquired a minority interest (5%) in the newly established vehicle, which was purchased on the market, and control (95%) will remain with an entity from outside the Group (Dutch-registered foundation known as a Stichting).
Intesa Sanpaolo takes care of the accounting management for the vehicle, whereas the corporate administration will be carried out by Securitisation Services S.p.A.
The transaction involved the issuance by the vehicle company of two tranches of securities: a listed senior tranche, with a rating assigned by two rating agencies (Moody's and Morningstar DBRS) and an unlisted junior tranche without rating.
Both the senior security and the junior security were subscribed by Intesa Sanpaolo.
The senior security issued through the transaction, with a Moody's A1 and a Morningstar DBRS AA (Low) rating, can be used as collateral for refinancing operations in the Eurosystem.
The total sale consideration was 7.6 billion euro. The sale price of the portfolio was settled through the issuance of securities on 23 June 2020 for a total of 7.2 billion euro.
In 2024, the following transactions were completed:
- in January, buyback of non-performing loans for 8 million euro;
- in April, sale for an amount of 1.1 billion euro;
- in November, sale for an amount of 1.2 billion euro.

As at 31 December 2024, the value of the outstanding securities was 6,350 million euro for the senior securities and 824 million euro for the junior securities.

Giada Sec S.r.l.
In November 2020, a self-securitisation was structured, implemented through the sale of a portfolio of loans, disbursed to companies belonging to the small business, SME and Corporate segment and originated by Intesa Sanpaolo, to the vehicle company Giada Sec S.r.l.
The securitisation is a revolving transaction and Intesa Sanpaolo has the option to sell the vehicle further loan portfolios with similar characteristics and quality, which the Vehicle will purchase by drawing on the receipts generated by the portfolio segregated over time.
Intesa Sanpaolo has acquired a minority interest (5%) in the newly established vehicle, purchased on the market, and control (95%) is held by a corporate entity outside the Group (Dutch-registered foundation known as a Stichting).
Intesa Sanpaolo takes care of the accounting management for the vehicle, whereas the corporate administration will be carried out by Securitisation Services S.p.A.
The transaction involved the issuance by the vehicle company of two tranches of securities: a listed senior tranche, with a rating assigned by two rating agencies (Moody's and Morningstar DBRS) and an unlisted junior tranche without rating.
Both the senior security and the junior security were subscribed by Intesa Sanpaolo.
The senior security issued through the transaction, with a Moody's A1 and a Morningstar DBRS A (High) rating, can be used as collateral for refinancing operations in the Eurosystem.
The total sale consideration was 10.1 billion euro. The sale price of the portfolio was settled through the issuance of securities on 21 December 2020 for the same amount.
In 2024, the following transactions were completed:
- in January, buyback of non-performing loans for 13.4 million euro;
- in June, sale for an amount of 1.3 billion euro;
- in September, buyback of non-performing loans for 113.6 million euro;
- in October, sale for an amount of 1.6 billion euro.

As at 31 December 2024, the value of the outstanding securities was 6,610 million euro for the senior securities and 3,485 million euro for the junior securities.

Giada Sec S.r.l. (GIADA BIS)

In October 2022, a new self-securitisation was structured, implemented through the sale of a loan portfolio originated by Intesa Sanpaolo, disbursed to small and medium enterprises ("SMEs"), including sole proprietorships and loans granted to corporate customers not belonging to the large corporate segment, to the special purpose vehicle Giada Sec S.r.l.
The securitisation is a revolving transaction and Intesa Sanpaolo has the option to sell the vehicle further loan portfolios with similar characteristics and quality, which the Vehicle will purchase by drawing on the receipts generated by the portfolio segregated over time.
Intesa Sanpaolo takes care of the accounting management for the vehicle, whereas the corporate administration will be carried out by Securitisation Services S.p.A.
The transaction involved the issuance by the vehicle company of two tranches of securities: a listed senior tranche, with a rating assigned by two rating agencies (Moody's and Morningstar DBRS) and an unlisted junior tranche without rating.
Both the senior security and the junior security were subscribed by Intesa Sanpaolo.
The senior security issued through the transaction, with a Moody's A1 and a Morningstar DBRS A (High) rating, can be used as collateral for refinancing operations in the Eurosystem.
The total sale consideration was 15.2 billion euro. The sale price of the portfolio was settled through the issuance of securities on 5 December 2022 for a total of 15.2 billion euro.
In 2024, the following transactions were completed:

- in January, buyback of non-performing loans for 45 million euro;
- in April, sale for an amount of 1.6 billion euro;
- in September, buyback of non-performing loans for 228 million euro;
- in November, sale for an amount of 891 million euro.

As at 31 December 2024, the value of the outstanding securities was 10,250 million euro for the senior securities and 4,940 million euro for the junior securities.

During 2024, the Brera Sec S.r.l. self-securitisation structured in 2017 was extinguished.

SECTION 5 – OPERATIONAL RISK

QUALITATIVE INFORMATION

The qualitative information, including legal risk and the tax disputes, is contained in Part E of the Notes to the consolidated financial statements.

QUANTITATIVE INFORMATION

From 31 December 2010, Intesa Sanpaolo has been using the full AMA Method to determine its capital requirements, and the resulting capital absorption amounted to 1,742 million euro as at 31 December 2024.

Part F – Information on capital

SECTION 1 – PARENT COMPANY'S SHAREHOLDERS' EQUITY

A. Qualitative information

Qualitative information on capital and capital management policies is contained in Part F of the Notes to the consolidated financial statements.

Own Funds, risk-weighted assets (RWAs) and solvency ratios as at 31 December 2024 were calculated according to the harmonised rules and regulations for banks and investment firms contained in Directive 2013/36/EU (CRD) and in Regulation (EU) 575/2013 (CRR) as amended, which transpose into the European Union the standards defined by the Basel Committee on Banking Supervision (the Basel Framework), and on the basis of Bank of Italy Circular 285.
The CRR, as cited above, was supplemented by Commission Delegated Regulation (EU) 241/2014 with regard to regulatory technical standards for own funds requirements for institutions, in turn amended first by Commission Delegated Regulation (EU) 2015/923 on indirect and synthetic holdings and then by Commission Delegated Regulation (EU) 2020/2176 on the prudential treatment of software assets, illustrated below.
On 19 June 2024, Regulation (EU) 2024/1623 (also known as CRR3) amending Regulation (EU) 575/2013 (CRR) as regards requirements for credit risk, credit valuation adjustment risk, operational risk, market risk and the output floor was published in the Official Journal of the European Union. The Regulation will apply generally commencing as of 1 January 2025, with the exception of some provisions of lesser import, for which their application was brought forward to 9 July 2024 (the date the Regulation itself came into force) and the provisions on the FRTB framework concerning market risk, which instead will apply as of 1 January 2026.

As is now well-known, with regard to IFRS 9, the transitional period (2018-2022) provided for by Regulation (EU) 2017/2395 to mitigate the capital impacts of its introduction ended on 31 December 2022. Moreover, from June 2020 the Intesa Sanpaolo Group has not applied either the new transitional IFRS 9 rules (in force up to 31 December 2024), or the FVOCI prudential filter (ended on 31 December 2022), which were both introduced by Regulation (EU) no. 2020/873 (CRR Quick Fix) in the context of the pandemic.

Regulation (EU) 2019/630 of 17 April 2019 amending the CRR has been in effect since 26 April 2019; the Regulation introduces a deduction from CET 1 in the event of insufficient minimum coverage of the losses on non-performing exposures (minimum loss coverage), determined on the basis of differentiated provisioning percentages for guaranteed and non-guaranteed exposures, as well as a pre-established calendar by which to achieve this coverage objective (calendar provisioning).

With effect from 30 September 2019, following permission from the ECB, Intesa Sanpaolo calculates capital ratios applying the so-called Danish Compromise - under which insurance investments are risk weighted instead of being deducted from capital.

Finally, with effect from December 2020, Intesa Sanpaolo has applied Commission Delegated Regulation (EU) 2020/2176, which amends Commission Delegated Regulation (EU) 241/2014 as regards the deduction of software assets from Common Equity Tier 1 items. The above Regulation, which is intended to support the transition to a more digitalised banking sector, introduced the concept of prudential amortisation applied to all software assets over a three-year period, regardless of their estimated useful lives for accounting purposes.

B. Quantitative information

B.1 Parent Company's shareholders' equity: breakdown

4. Closing balance	**-1,916**	**-277**	**-8**

B.4 Valuation reserves relating to the defined benefit plans: annual changes

During the year, these reserves recorded a positive change in items taken to the Statement of comprehensive income of 10 million euro (of which a positive change of 13 million euro relating to pension funds and a negative change of 3 million euro relating to employee termination indemnities). As at 31 December 2024 there was an overall negative reserve equal to 177 million euro for defined benefit plans.

SECTION 2 – OWN FUNDS AND CAPITAL RATIOS

Reference is made to the Intesa Sanpaolo Group's "Basel 3 Pillar 3" public disclosure as at 31 December 2024 for the disclosure on own funds and capital adequacy.

Part G – Business combinations

SECTION 1 – TRANSACTIONS CARRIED OUT IN THE YEAR

During the year, no business combinations were undertaken, pursuant to IFRS 3, involving the acquisition of control over businesses or legal entities.

Annual changes in goodwill

(millions of euro)

	31.12.2024
Initial goodwill	**67**
Increases	**-**
- Goodwill recorded in the year	-
- Positive foreign exchange differences and other changes	-
Decreases	**-**
- Impairment recorded in the year	-
- Disinvestments	-
- Negative foreign exchange differences and other changes (reclassified among assets held for sale)	-
Final goodwill	**67**

It is worth mentioning here, in the interest of completeness of information only, the corporate transaction which involved the contribution of a business line by Intesa Sanpaolo in the first quarter of 2024. This transaction – which, it should be noted, was therefore not a business combination, narrowly defined nor within the scope of IFRS 3 as it was between legal entities belonging to the same Group – took the form, more specifically, of the contribution of a business line mainly consisting of customer relationships from Intesa Sanpaolo to Isybank.

SECTION 2 – TRANSACTIONS CARRIED OUT AFTER THE END OF THE YEAR

No business combinations within the scope of IFRS 3 have been undertaken since the end of 2024.

SECTION 3 – RETROSPECTIVE ADJUSTMENTS

No adjustments are recognised in the current year that relate to business combinations that occurred in previous reporting periods.

Part H – Transactions with related parties

A) TRANSACTIONS WITH RELATED PARTIES

1. Procedural features

The Board of Directors of Intesa Sanpaolo S.p.A. adopted, in compliance with the procedures set out by regulations, the Group Procedures regulating the conduct of Transactions with Related Parties of Intesa Sanpaolo S.p.A., Associated Entities of the Group and Relevant Parties pursuant to Art. 136 of the Consolidated Law on Banking.
These Procedures, most recently updated in December 2024, take into account both the rules issued by Consob, pursuant to Article 2391-bis of the Italian Civil Code, and the supervisory provisions introduced by the Bank of Italy on 12 December 2011 in terms of risk assets and conflicts of interest of banks and banking groups with respect to "Associated Entities", issued in accordance with Article 53, paragraphs 4 et seq. of the Consolidated Law on Banking and ICRC (Interdepartmental Committee for Credit and Savings) Resolution 277 of 29 July 2008, as well as the rules established by Article 136 of the Consolidated Law on Banking.

The Procedures apply to the entire Intesa Sanpaolo Group with respect to the following aspects:
- the criteria for identifying Related Parties and Associated Entities;
- the process of analysis, decision-making and information for corporate bodies in connection with transactions with Related Parties and Associated Entities;
- market disclosure for transactions with Related Parties;
- the prudential limits and periodic reporting obligations towards the Bank of Italy for at-risk assets in respect of Associated Entities;
- the rules governing organisational controls and safeguards;
- the general rules for disclosure and abstention about the management of the personal interests by management body members, employees and company staff, including other than Associated Entities.

Pursuant to the Procedures, the following are considered Related Parties of Intesa Sanpaolo: parties that exercise significant control or influence, subsidiaries and associates, joint ventures, pension funds of the Group, Management Body Members and Key Managers of Intesa Sanpaolo and their close family members and significant shareholdings.
The set of Associated Entities of the Group consists of the Associated Entities of each bank of the Group (including the Parent Company) and each monitored significant intermediary with own funds greater than 2% of the total of consolidated own funds. The following are considered to be Associated Entities for each bank or monitored significant intermediary of the Group: i) shareholders that exercise control, significant influence or that are required to request authorisation pursuant to Article 19 of the Consolidated Law on Banking or that may appoint a member of the management or strategic supervisory body and the relative corporate groups; ii) subsidiaries, associated companies subject to joint control and associates, as well as the companies they control, also jointly with others; iii) management body members and their relative close family members up to the second degree and significant shareholdings.

As a form of self-regulation, the Bank has extended the regulations on transactions with Related Parties, as well as on risk assets and conflicts of interest with Associated Entities to:
- Intesa Sanpaolo shareholders and their groups that hold an equity investment in the share capital with voting rights of the Bank that exceeds the minimum threshold set out in regulations on the communication of significant equity investments in listed companies, calculated considering only shares owned or under management, as well as entities jointly controlled by them with others;
- companies in which management body members of Intesa Sanpaolo or their close family members i) hold executive offices or the office of chair of the management body; ii) hold a qualifying equity investment equal to or exceeding 10% of the capital or voting rights of that entity, or a position of significant influence;
- companies which the Group has notable investments in and financial links with, attributable to at least two of the following indicators:
  - the counterparty holds an equity investment in Intesa Sanpaolo's capital between 1% and the minimum threshold set out in regulations on the communication of significant equity investments in listed companies;
  - an entity of the Intesa Sanpaolo Group holds an equity investment in the counterparty exceeding 10% of the voting rights;
  - significant credit exposure of the Group to the counterparty.

This approach allows closer monitoring of transactions with the main entities in potential conflict of interest risk.

The Procedures set forth the assessment process that must be followed by the Parent Company and subsidiary companies when carrying out transactions with Related Parties of Intesa Sanpaolo, Associated Entities of the Group and Relevant Parties pursuant to Art. 136 of the Consolidated Law on Banking, to ensure appropriateness of the transactions. The Procedures also require detailed examination of the reasons and interests behind the transaction, their effects on financials and the terms of the transaction.

In line with the regulations implemented by Consob and by the Bank of Italy, a regime of full or partial exemptions from the application of the regulations is also envisaged.
With regard to the decision-making for transactions with Related Parties of Intesa Sanpaolo and Associated Entities of the Group, the procedure distinguishes between:

- transactions involving smaller amounts: with a value of less than or equal to 250 thousand euro for individuals and 1 million euro for persons other than natural persons (excluded from application of the regulations);
- less significant transactions: with a value higher than the small-amount thresholds (250 thousand euro for individuals and 1 million euro for persons other than natural persons) but lower than or equal to the most significant thresholds indicated below;
- most significant transactions: with a value higher than the threshold of 5% of the indicators defined by Consob and by the Bank of Italy (approximately 2.8 billion euro for the Intesa Sanpaolo Group);
- transactions attributed to the shareholders' meeting, in accordance with the law or with the Articles of Association.

The process for the approval of transactions with Related Parties of Intesa Sanpaolo and Associated Entities of the Group reserves an important role for the Committee for Transactions with Related Parties, which meets the independence requirements laid down in the Corporate Governance Code for Listed Companies and Article 148 of the Consolidated Law on Finance, as well as the independence requirements contemplated by applicable laws and regulations, including those specific to the banking sector (Italian Ministerial Decree 169/2020). The Committee for Transactions with Related Parties can make use of independent experts, where considered appropriate, according to the degree of importance of the transaction, its specific economic or structural characteristics and the nature of the related party or associated entity.
For most significant transactions, the Committee must be promptly involved in the analysis and negotiation phases, receiving a complete and timely flow of information, with the right of the Committee to request additional information and make observations.
All transactions – that are not exempt based on the Procedures – undertaken by the Parent Company with one of its related parties or associated entities are subject to approval by the Board, after consulting the Committee for Transactions with Related Parties.
The Procedures set out specific controls in the event that a less significant or most significant transaction is approved in spite of a negative opinion of the Committee for Transactions with Related Parties.

Transactions undertaken by subsidiaries with Related Parties of Intesa Sanpaolo and Associated Entities of the Group must be approved by the Board of Directors of the subsidiaries concerned, subject to prior authorisation from the Parent Company released in accordance with the procedure described above.

The Procedures also define the general criteria for the information to be provided, at least quarterly – also pursuant to Article 150 of the Consolidated Law on Finance – to the directors and the control body regarding transactions with Related Parties and Associated Entities completed in the reference period by the Parent Company or by its subsidiaries. All of the above is aimed at providing a complete overview of the transactions of greater importance, as well as the volumes and the main features of all those delegated. Reports must include all transactions, even if exempt from the decision-making procedure, for amounts greater than the small-amount thresholds. Transactions of less significant importance in the form of intragroup loans and bank funding are excluded from this requirement (provided they do not regard a subsidiary with significant interests of another Related Party or Associated Entity and are not carried out at market or standard conditions). For ordinary intragroup less significant transactions carried out at market conditions, reporting is on an aggregate annual basis.

Transactions undertaken by Italian subsidiary banks with Related Parties and Associated Entities of the Group that have not been considered exempt must, subject to authorisation by the Parent Company, be approved by the relative Board of Directors, upon obtaining the opinion of a Committee of independent directors set up within the Board of Directors of the bank itself. Furthermore, specific reporting rules apply to transactions by the Bank's Bodies.

The Procedures also apply to transactions with Relevant Persons pursuant to Art. 136 of the Consolidated Law on Banking, which must be applied by all the Italian Banks of the Intesa Sanpaolo Group, including the Parent Company. This provision requires the adoption of a more thorough decision-making procedure (unanimous decision by the management body, excluding the vote of the interested member, and favourable vote of members of the control body) in order to allow the bank management body members to contract obligations, directly or indirectly, with the bank of which they act as management body members.
Furthermore, the requirements envisaged by the Italian Civil Code (Article 2391) and Article 53 of the Consolidated Law on Banking governing directors' personal interests are confirmed.
In particular, Article 2391 of the Italian Civil Code requires each Board Member to report every interest held, in his/her own name or on behalf of third parties, that may be significant in carrying out his/her management function, with reference to a specific transaction. In accordance with the abovementioned provision, the Board has jurisdiction over decisions regarding transactions – including those with Related Parties – in which the Managing Director possesses an interest on his/her own account or through a third party and must therefore abstain from the decision, entrusting the Board as per Article 2391 of the Italian Civil Code.
In addition, Article 53 of the Consolidated Law on Banking requires banks' directors to abstain from voting on resolutions where they have a conflict of interest on their own behalf or on behalf of third parties.
Finally, the Procedures set forth the documentation and disclosure requirements vis-a-vis competent authorities for information on loans provided to related parties by Group banks headquartered in a European Member State, as governed by European regulations (Article 88 of Directive 2013/36, as amended).

2. Information on balances with related parties

Receivable and payable balances with related parties as at 31 December 2024 – other than those intragroup – amount to a total that is insignificant compared to the size of the Bank's capital base. Likewise, the weight of income and charges with related parties on the Parent Company's operating margin is insignificant.

	31.12.2024	
	Amount (millions of euro)	**Impact (%)**
Total financial assets [1]	54,475	9.0

(1) Including caption 160 of the Income statement

The table below reports the main terms of reference of transactions with each category of related party, as classified by IAS 24 (referring to the subsequent paragraph for information relating to compensation to the members of the management and control bodies), with the category of Significant Shareholders of Intesa Sanpaolo and their corporate groups (subsidiaries also controlled jointly with others, parent companies and companies subject to joint control) with an equity investment with voting rights in the Bank greater than the minimum threshold set out in regulations on communications of significant equity investments in listed companies calculated only based on shares owned or under management, as well as with the additional subjects included in the scope set as a form of self-regulation.
With regard to Equity Investments, please see the tables in the Notes to the Parent Company's financial statements – Part B – Information on the Parent Company's balance sheet – Assets – Section 7.
The following table does not show the impact of related party transactions on the Group's cash flows, as this was not significant.
For greater clarity and in line with the reports sent to the Supervisory Authorities, note that the off-balance sheet items were detailed on two separate columns by grouping on one side the guarantees/commitments given and on the other the guarantees/commitments received. The first category also includes the revocable commitments issued totalling 81 billion euro, almost entirely to subsidiaries.

(*) As a form of self-regulation, shareholders and their groups that hold a stake in the share capital that exceeds the minimum threshold set out in regulations on the communication of significant shareholdings in listed companies, calculated considering only shares owned or under management, as well as entities jointly controlled by them.

(**) As a form of self-regulation, companies that meet the conditions of at least two of these indicators: i) the counterparty holds a stake in Intesa Sanpaolo's capital with an amount between 1% and the minimum threshold set out in regulations on the communication of significant shareholdings in listed companies; ii) an entity of the ISP Group holds a stake in the counterparty exceeding 10% of the voting rights; iii) significant credit exposure of the Group to the counterparty. The amounts shown largely refer to the companies of the JP Morgan Group.

(***) As a form of self-regulation, companies in which management body members of Intesa Sanpaolo or their close family members i) hold executive offices or the office of chair of the management body; ii) hold a qualifying holding equal to or exceeding 10% of the capital or voting rights of that entity, or on which those persons may exercise a significant influence.

For the illustration of the associated companies and companies under joint control - and the companies controlled by them - that are most significant at Group level, see the description in the corresponding paragraph of the Notes to the consolidated financial statements.

3. Information on transactions with related parties

Most significant transactions

During the year, the Parent Company did not carry out any transactions that qualified as non-ordinary "most significant transactions" and/or at non-market or non-standard conditions subject – in accordance with the Group Procedures regulating the conduct of Transactions with Related Parties of Intesa Sanpaolo S.p.A., Associated Entities of the Group and Relevant Parties pursuant to Art. 136 of the Consolidated Law on Banking – to the obligation to publish a market disclosure document.

Transactions exempt from this obligation include the early closure of the Brera SEC – a company subject to significant influence from Intesa Sanpaolo – securitisation resolved upon by the Board of Directors of Intesa Sanpaolo and previously submitted to the Committee for Transactions with Related Parties, which provided a favourable opinion.

Please note that the most significant transactions during the year are those that exceed the threshold of 5% of Own Funds at consolidated level (approximately 2.8 billion) or of the other indicators defined by the Consob regulation.

Most significant intragroup transactions

With regard to the most significant intragroup transactions – exempt pursuant to the above internal Procedures from the strict decision-making procedure and the obligation to publish a market disclosure document, unless other related parties hold significant interests in the subsidiary – the sale by Intesa Sanpaolo of the assets and loan under the ISP CB Ipotecario programme to increase the amount of the Ipotecario issuance was completed during the year.

Other significant transactions

The transactions entered into with related parties fall within the scope of Intesa Sanpaolo's ordinary activities and are usually performed at market or standard conditions, based on valuations of mutual economic convenience, in line with the internal procedures mentioned above.

With respect to transactions with Shareholders – which hold equity investments with voting rights greater than the minimum threshold set out in regulations on communications of significant equity investments in listed companies calculated only based on shares owned or under management – and with entities with significant shareholding or financial relationships (to which the provisions governing transactions with related parties have been extended as a form of self-regulation), these mainly consisted of ordinary transactions in financial instruments and the signing of supply contracts at market conditions.
These included the following in particular:
- transactions in OTC financial instruments carried out by Intesa Sanpaolo S.p.A., as part of its ordinary operations, with the companies of the JP Morgan Chase & Co. and BlackRock Inc. groups, as well as Compagnia di Sanpaolo, Cassa di Risparmio di Firenze and Cassa di Risparmio in Bologna;
- service agreements with companies of the BlackRock Inc. group, under ESG-impact projects (for a total value of approximately 2 million euro) and in the NZBA sector (for a total value of approximately 2.5 million euro);
- subscription of a commitment in the closed-end Global Renewable Power fund managed by Blackrock group companies for an amount of approximately 90 million euro;
- signing of a shareholders' agreement with the shareholders of Redo Sgr including Fondazione Cariplo as part of the corporate reorganisation of Redo Sgr;
- ordinary credit facilities in favour of BlackRock Inc. and the Compagnia di Sanpaolo and Cassa di Risparmio in Bologna foundations.

Relations between Intesa Sanpaolo and the management body members, key managers and parties associated to them refer to the Group's normal business activities and are defined applying, where conditions recur, the terms reserved to all employees, in full respect and transparency of terms applied.

With regard to the transactions with jointly-controlled subsidiaries and associates, as well as with significant investees due to the presence of important equity and financial ties, mention should be made of:
- the signing of a commercial agreement with Bancomat S.p.A., under the broader project aimed at the acquisition of an interest in Bancomat S.p.A. by Fondo Strategico Italiano with consequent dilution of the shareholding in Bancomat S.p.A. from 31.6% to 18%;
- sales of a portfolio of UTP loans to the UTP Italia Fund and a portfolio of non-performing loans to the Efesto Fund;
- ordinary credit transactions in favour of ISM Investimenti S.p.A., Intermarine S.p.A., Euromilano S.p.A., Digit'ed S.p.A. and two companies of the Camfin group;
- the signing of commercial agreements and supply contracts with Mooney S.p.A.;
- the extension of the duration of an existing commercial agreement with Forvalue S.p.A. until 31/12/2027;
- transactions in OTC financial instruments with Cassa di Risparmio di Fermo S.p.A.;
- the signing of supply contracts with Destination Gusto S.r.l. and an application management contract with Marketwall S.r.l.

Concerning the transactions with subsidiaries carried out in 2024, please note that these are normal internal business activities of a multifunctional banking group. They are usually regulated at the conditions at which the Parent Company accesses the reference markets, which are not necessarily the same conditions that would be applicable if the Group's counterparties operated independently. These conditions are, in any case, applied in compliance with the reputation and fairness criteria and with the aim of creating value for the Group.

Among intragroup transactions and with other entities consolidated line by line, attention should be drawn to:
- the support given by the Parent Company to the financial needs of the other Group companies by providing risk capital and loans and by subscribing securities issued by the subsidiaries;
- the channelling of foreign funding by specialist Group companies in favour of the Parent Company and, in part, of other subsidiaries;
- the Parent Company's investment of subsidiaries' liquidity;
- the structured finance transactions carried out within the Group;
- outsourcing arrangements, which govern services of an auxiliary nature rendered by the Parent Company to other Group companies;
- the agreements with Group companies on the distribution of products and/or services or, more generally, intragroup support and consultancy;
- the conclusion of the ISP CB Pubblico programme;
- an insurance distribution agreement and a service agreement with Intesa Sanpaolo Assicurazioni S.p.A.

Intragroup transactions included:
- a capital contribution payment of 1 billion euro and a loan for a maximum amount of 1.25 billion euro in favour of Fideuram – Intesa Sanpaolo Private Banking S.p.A., as part of the capital strengthening plan for the Private Banking Division, as well as a subordinated loan in favour of Intesa Sanpaolo Assicurazioni S.p.A. as part of the strengthening of the own funds of Fideuram Vita S.p.A.;
- the subscription of a share capital increase of 26 million euro in favour of Pravex Bank Joint-Stock Company;
- the recapitalisation of Intesa Sanpaolo Innovation Center S.p.A. for a total of 11 million euro;

- the subscription of units of the ECRA private debt alternative investment fund established by Eurizon Capital Real Asset SGR for 3 million euro, with a remaining commitment of around 12 million euro;
- the subscription of a commitment for a total of 200 million euro in the newly established Neva II and Neva II Italia funds, which will invest in companies with a strong ESG/Climate focus;
- the completion, with the second business line, of the contribution of business lines by Intesa Sanpaolo S.p.A. to Isybank S.p.A.

Additional information on the Intesa Sanpaolo Group's reorganisation operations is provided in Part G of the Notes to the consolidated financial statements and of the Notes to the Parent Company's financial statements. For more information on changes in the Parent Company's equity investment portfolio, see Section 7 of the Notes to the financial statements – Part B – Information on the balance sheet – Assets.

The operations with pension funds included transactions in OTC financial instruments carried out by Intesa Sanpaolo S.p.A., as part of its ordinary operations, with the Fondo Pensioni per il Personale Cariplo.

For information on the operations with the Special Purpose Entities over which the Group exercises control even in the absence of an equity investment, consolidated in accordance with IFRS 10, see the Notes to the consolidated financial statements - Part E – Information on risks and the relative hedging policies.

Other significant information

With reference to the equity investments in associates or companies subject to joint control, value adjustments/impairment losses were recognised for a total of 160 million euro, mainly attributable to Lendlease Msg Heartbeat for 80 million euro, Intrum Italy S.p.A. for 42 million euro, Back2Bonis for 17 million euro, Idea CCR Comparto Crediti for 9 million euro, Efesto for 5 million euro, RSCT Fund Comparto Crediti for 3 million euro, Retail & Leisure Fund for 2 million euro, and other minor items for 2 million euro.

For Pension Funds in which Intesa Sanpaolo is co-obliged by virtue of guarantees given, during the year uses were made related to the individual capitalisation offers for the supplementary benefits and the streamlining of the Pension Funds, as indicated in the Notes to the financial statements – Part B – Information on the Balance Sheet – Liabilities, Post employment defined benefit plans, to which reference is made.

Other significant subsequent events

There were no significant events after the end of the reporting period.

B) INFORMATION REGARDING COMPENSATION OF THE MEMBERS OF MANAGEMENT AND CONTROL BODIES AND KEY MANAGERS

In accordance with the provisions of IAS 24, within the current organisational structure of the Parent Company, the following – in addition to the members of the Board of Directors (including the members of the Management Control Committee and the Managing Director and CEO) – are considered "Key Managers": the Manager responsible for preparing the Company's financial reports, the Heads of the Divisions, the Chief Officers responsible for Governance or Control Areas, the Deputy of the Head of the IMI Corporate & Investment Banking Business Division, and the Heads of the Head Office Departments reporting directly to the Managing Director and CEO or the Chair of the Board of Directors.

The following table shows the amounts of the main benefits paid in 2024 to members of the Management and Control Bodies, as well as to other Key Managers who fall within the notion of "related party". This also includes the maximum amounts of the variable portion of remuneration which shall be paid in cash and/or shares of the Parent Company, based on the Group's remuneration and incentive policy, subject to the verification of achievement of the assigned targets and the decisions of the competent bodies of the Parent Company.

(millions of euro)

	MANAGEMENT BODIES/ CONTROL BODIES (1)		OTHER MANAGERS (2)		TOTAL as at 31.12.2024	
	Amount due	Amount paid	Amount due	Amount paid	Amount due	Amount paid
Short-term benefits (3)	7	7	33	26	40	33
Post-employment benefits (4)	-	-	2	2	2	2
Other long-term benefits (5)	-	-	7	-	7	-
Termination benefits (6)	-	-	3	-	3	-
Share-based payments (7)	-	-	21	-	21	-
Total	**7**	**7**	**66**	**28**	**73**	**35**

(1) Includes 19 members.

(2) Includes 26 members.

(3) Includes fixed and variable remuneration of Directors that may be treated as equivalent to labour cost and social security charges paid by the company for its employees.

(4) Includes company contribution to pension funds and provisions for employee termination indemnities pursuant to law and company regulations.

(5) Includes an estimate of provisions for employee seniority bonuses.

(6) Includes benefits due under the employment contract for termination of employment and non-competition agreements.

(7) Includes the cost referring to the variable portion of short-/long-term remuneration to be paid in Intesa Sanpaolo shares.

As previously noted in Part H of the Notes to the consolidated financial statements, detailed information on remuneration policies, pursuant to Art. 123 ter of the Consolidated Law on Finance, is published annually in the "Report on Remuneration", which includes:

- a detailed indication of the compensation paid to the members of the management and control bodies and, in aggregate, the Key Managers, as well as the stock option plans reserved for the members of the Board of Directors and Key Managers;
- the details and the evolution of the stock option plans relative to Key Managers;
- the shares of the Parent Company and subsidiaries held by the members of the Management and Control bodies, Key Managers and other associated entities.

Part I – Share-based payments

A. QUALITATIVE INFORMATION

Description of share-based payments

Annual incentive plan based on financial instruments

The Supervisory Provisions regarding remuneration and incentive policies and practices in banks and in banking groups, issued on 30 March 2011 (now integrated in Circular 285 of the Bank of Italy) required, inter alia, that a portion of annual incentives paid to "Risk Takers" be granted through the assignment of financial instruments, over a multi-year time horizon. As a result, the Intesa Sanpaolo Group sets up annual incentive plans linked to performance. In fulfilment of these plans:

- with regard to the results for 2019, and in implementation of the Shareholders' Meeting resolution of 27 April 2020, on 16, 17 and 18 November 2020 the Group totally purchased - through its IMI Corporate & Investment Banking Division, in charge of the programme execution - 25,400,000 Intesa Sanpaolo ordinary shares (representing approximately 0.13% of the share capital of the Parent Company) at an average purchase price of 1.852 euro per share, for a total value of 47,046,279 euro. In addition, the purchase programme has been implemented in service of the 2018-2021 Incentive Plan for financial advisors of the Fideuram – Intesa Sanpaolo Private Banking and Sanpaolo Invest networks and to grant severance payments to Risk Takers upon early termination of employment, as envisaged by the Supervisory Provisions;
- with regard to the results for 2020, and in implementation of the Shareholders' Meeting resolution of 28 April 2021, on 13 and 14 September 2021 the Group totally purchased - through its IMI Corporate & Investment Banking Division, in charge of the programme execution - 20,000,000 Intesa Sanpaolo ordinary shares (representing approximately 0.10% of the share capital of the Parent Company) at an average purchase price of 2.391 euro per share, for a total value of 47,822,401 euro. In addition, the purchase programme has been implemented in service of the former UBI Banca Group's shared-based payment incentive system for Risk Takers in regard to 2020 and residual shares from the former UBI Banca Group's incentive systems for previous years, as well as to grant severance payments to Risk Takers upon early termination of employment, as envisaged by the Supervisory Provisions;
- with regard to the results for 2021, and in implementation of the Shareholders' Meeting resolution of 29 April 2022, from 12 to 14 September 2022 the Group totally purchased – through its IMI Corporate & Investment Banking Division, in charge of the programme execution – 46,216,652 Intesa Sanpaolo ordinary shares (representing approximately 0.24% of the share capital of the Parent Company[218]) at an average purchase price of 1.8932 euro per share, for a total value of 87,496,321.48 euro. In addition, the purchase programme has been implemented in service of the Privredna Banka Zagreb (PBZ) Group's shared-based payment incentive system in regard to 2021 and the residual portions in financial instruments from previous plans, the Long-Term Incentive Plans reserved for the Financial Advisors of the Networks of the Fideuram - Intesa Sanpaolo Private Banking Group, as well as to grant severance payments upon early termination of employment;
- with regard to the results for 2022, and in implementation of the Shareholders' Meeting resolution of 28 April 2023, from 11 to 13 September 2023 the Group totally purchased – through its IMI Corporate & Investment Banking Division, in charge of the programme execution – 32,000,000 Intesa Sanpaolo ordinary shares (representing approximately 0.18% of the share capital of the Parent Company) at an average purchase price of 2.4697 euro per share, for a total value of 79,031,462.67 euro. The purchase programme has also been implemented in service of the incentive systems of several subsidiaries (i.e. the 2022 Incentive System of the Private Banking Network belonging to the Italy Network of Intesa Sanpaolo Private Banking; the 2022 Incentive System of the Relationship Managers belonging to the International Commercial Networks of the Fideuram – Intesa Sanpaolo Private Banking Group; and the 2022 Incentive System of the non-employee Financial Advisors belonging to the Commercial Networks of the Fideuram – Intesa Sanpaolo Private Banking Group) and any payment of consideration granted in conjunction with early termination of employment (severance).
- with regard to the results for 2023, and in implementation of the Shareholders' Meeting resolution of 24 April 2024, from 9 to 11 September 2024 the Group totally purchased – through its IMI Corporate & Investment Banking Division, in charge of the programme execution – 21,000,000 Intesa Sanpaolo ordinary shares (representing approximately 0.11% of the share capital of the Parent Company) at an average purchase price of 3.7154 euro per share, for a total value of 78,023,430.57 euro. The purchase programme has also been implemented in service of the incentive systems of several subsidiaries (i.e. the 2023 Incentive System of the Private Banking Network belonging to the Italy Network of Intesa Sanpaolo Private Banking; the 2023 Incentive System of the Relationship Managers belonging to the International Commercial Networks of the Fideuram – Intesa Sanpaolo Private Banking Group; and the 2023 Incentive System of the non-employee Financial Advisors belonging to the Commercial Networks of the Fideuram – Intesa Sanpaolo Private Banking Group) and any payment of consideration granted in conjunction with early termination of employment (severance).

[218] The percentage has been calculated, in compliance with the terms of the resolution approved at the Intesa Sanpaolo Shareholders' Meeting of 29 April 2022, on the 19,430,463,305 ordinary shares without nominal value composing the share capital of 10,084,445,147.92 euro before the execution, on 30 June 2022, of the capital increase under the 2022-2025 LECOIP 3.0 Long-term Incentive Plan based on financial instruments (which raised the share capital to 10,368,870,930.08 euro divided into 19,977,435,963 shares) and, then, the annulment of the own shares purchased in execution of the buyback programme disclosed to the market on 24 June 2022 and launched on 4 July 2022 (the share capital composition changed following the reduction in the number of its constituent shares, while its amount remained unchanged at 10,368,870,930.08 euro). The shares purchased represented around 0.24% of the share capital when considering the 19,267,277,397 constituent shares at the time of purchase.

The above Shareholders' Meetings also authorised the sale on the regulated market of any shares exceeding requirements, or their retention for any future incentive plans.
The above shares shall be assigned to the beneficiaries in compliance with the implementing regulations set forth in the above incentive systems. Generally, according to these regulations, the beneficiaries must remain in service up to the time the shares are actually delivered to them, and the deferred portion (either in cash or in financial instruments) of the incentive is subject to an ex post correction mechanism – the "malus condition" – according to which the relative amount paid and the number of shares assigned, if any, may be reduced by the level of achievement, in the year to which the deferred portion refers, of specific income statement-balance sheet targets which measure the sustainability of the results achieved over time.

Long-Term Incentive Plans 2022-2025: Performance Share Plan and LECOIP 3.0 Plan

At the time of launching the 2022-2025 Business Plan, two new long-term incentive plans were launched targeting different clusters of employees:

- Performance Share Plan (PSP) reserved for the Group Management, including the Managing Director and CEO, the remaining Group Top Risk Takers and other Group Risk Takers (in Italy and abroad);
- LECOIP 3.0 Plan reserved for all the Professionals employed by the Group in Italy.

With regard to Management, Intesa Sanpaolo has adopted a plan specifically linked to the achievement of the Business Plan targets and with an adequate risk/return profile in respect of the role held and the levels of ambition and challenge of the Business Plan, and which envisages the adoption of Performance Shares as a financial instrument. Participation in the PSP was also offered until 31 December 2023 to newly hired managers and in the event of promotions to recognise career advancement.
In detail, the Performance Share Plan provides for the assignment of new Intesa Sanpaolo ordinary shares deriving from a capital increase without payment, upon achievement of key performance conditions of the Business Plan, subject to the application of de-multipliers based on sustainability targets, as well as subordinated to gateway conditions and individual access (compliance breach).
Any shares accrued will be paid out over a 4/5-year time horizon according to payout schedules established depending on the sub-cluster of the beneficiary, the amount of the total variable remuneration, and its weight compared to the fixed remuneration. The deferred portions are also subject to the verification of malus conditions, defined in a mirrored manner to the gateway conditions.
For Professionals, basically in line with the LECOIP 2.0 Plan, a retention plan called "LECOIP 3.0" has been structured with the aim of continuing the work of strengthening the personnel's identity and sense of belonging, consistently with the Group's inclusive organisational culture.
The LECOIP 3.0 Plan is assigned as certificates issued by JP Morgan, i.e. share-based financial instruments, and envisages:

- the assignment of newly issued ordinary shares of Intesa Sanpaolo deriving from a share capital increase without payment (Free Shares) for an amount equivalent to the Variable Result Bonus advance for 2022 (employees may opt to receive the advance in cash and, therefore, not to participate in LECOIP 3.0);
- the assignment, free of charge, of additional shares in exchange for the same share capital increase without payment (Matching Shares) based on the role held and seniority, and the subscription, in set proportions with respect to the free shares received, of newly issued ordinary Intesa Sanpaolo shares deriving from a share capital increase with payment reserved for employees, at a discounted issue price (Discounted Shares) against market value.

The Certificates reflect the terms of certain options that have Intesa Sanpaolo ordinary shares as their underlying instruments, and will allow employees to receive, at maturity, in the absence of trigger events, an amount in cash (or in Intesa Sanpaolo ordinary shares) that is equal to the original market value of the Free Shares and the Matching Shares, plus a portion of any appreciation, compared to the original market value, related to the amount of the Free Shares, Matching Shares and Discounted Shares.
In residual cases, the amount will be paid according to specific payout schedules that provide for deferral and payment of part of the bonus in financial instruments. These schedules are differentiated according to the cluster the beneficiaries belong to when the bonus is accrued, as well as the amount of the total variable remuneration, and its weight compared to the fixed remuneration.
The Performance Share Plan and the LECOIP 3.0 Plan were subject to the approval of the ordinary Shareholders' Meeting of 29 April 2022.
The extraordinary session of the Shareholders' Meeting resolved on granting a power of attorney to the Board of Directors to increase the share capital pursuant to Article 2443 of the Italian Civil Code, conducive to the implementation of the plans.
On 21 June 2022, ISP's Board of Directors exercised the authority granted to it by the Shareholders' Meeting for capital increases in favour of the Group's employees to service the implementation of the 2022-2025 LECOIP 3.0 Plan.
Both the long-term incentive plans in question (the Performance Share Plan and the LECOIP 3.0) fall within the scope of IFRS 2 and qualify as equity-settled share-based payment plans.
For the Performance Share Plan, the fair value of the equity instruments that are subject to the plan is calculated at the assignment date. The Plan envisages the presence of service and performance conditions, which must be considered in order to determine the number of shares for the measurement of the cost of the plan. These estimates will be subject to review during the accrual period and until the expiry. Additionally, the determination of the fair value of the plan needs to take into account the presence of "market" performance conditions.
The cost of the plan, so defined, is attributed to the income statement (as labour costs) pro rata temporis along the accrual period of the benefit, as a balancing entry for a specific shareholders' equity reserve. Upon the occurrence of the events that imply the loss of the rights to the benefits of the plan (performance targets, gateway conditions and the discontinuation of employment) for the employees, if the estimate made previously needs to be adjusted, ISP changes the cost of the plan with a corresponding adjustment to Shareholders' Equity.
With regard to the LECOIP 3.0 Plan, at the assignment date, the fair value of the equity instruments that are subject to the plan is calculated (equivalent to the sum of the fair value of the shares assigned free of charge and the fair value of the discount for the paid shares) and no longer modified.

The Plan envisages the presence of non-market service and performance conditions (trigger events), which must be considered in order to determine the number of shares for the measurement of the cost of the plan. These estimates will be subject to review during the vesting period and until the expiry. The cost of the plan, so defined, is attributed to the income statement (as labour costs) pro rata temporis along the period of accrual of the benefit, as a balancing entry for a specific shareholders' equity reserve.
Upon the occurrence of the events that imply the loss of the rights to the benefits of the LECOIP 3.0. Certificate (trigger events and the discontinuation of employment) for the employees, Intesa Sanpaolo recognises a financial asset (the "transferred receivable" representing the Certificates) as a balancing entry in Shareholders' Equity. In particular, the Certificates entered in the Group's financial statements are classified, in accordance with the provisions of IFRS 9, under caption 20.c) Financial assets measured at fair value through profit or loss: Other financial assets mandatorily measured at fair value. At the same time, if the estimate made previously needs to be adjusted, the cost of the plan is changed with a corresponding adjustment to Shareholders' Equity.

B. QUANTITATIVE INFORMATION

Evolution of the annual incentive plans based on financial instruments in 2024

	Number of shares	Average strike price (euro)	Residual life
Financial instruments outstanding as at 31 December 2023	23,031,915	-	2024/2028
Financial instruments granted during the year (a)	18,536,077	-	2024/2028
Financial instruments no longer assignable (b)	31,180	-	-
Financial instruments vested during the year and assigned	14,114,526	-	-
Financial instruments outstanding as at 31 December 2024	27,422,286	-	2025/2029
of which: vested and assigned as at 31 December 2024	-	-	-

(a) Including the shares deriving from corporate transactions.
(b) Shares no longer deliverable to the beneficiaries following the related employment agreement ceasing and/or due to the application of the so-called malus conditions.

In addition to the shares specified above, in accordance with the Provisions of the Bank of Italy regarding remuneration and the Remuneration and Incentive Policies of the Group, during 2024, 897,237 shares were assigned with reference to remuneration granted in the event of early termination (severance). The retention period of those shares, assigned over a multi-year time horizon, ends between April 2025 and January 2030.

Breakdown by residual life

Residual life (a)	Number of shares
2025	5,537,379
2026	9,721,979
2027	6,757,256
2028	3,890,103
2029	1,515,569

(a) Fine retention period.

Evolution of long-term share-based instruments: Performance Share Plan (PSP) and LECOIP 3.0

	PERFORMANCE SHARE PLAN (PSP)			
	Number of Performance Share at 31.12.2023	**Changes in the year (a)**	**Number of Performance Share at 31.12.2024**	**Fair value**
Total beneficiaries (all the Management, including the Managing Director and CEO, the other Group Top Risk Takers and the remaining Group Risk Takers – both Italian and foreign perimeter)	119,708,524	-3,218,660	116,489,864	1.0195

(a) Number of Performance Shares awarded that will not be awarded to employees due to failure to meet tenure or other vesting conditions.

	LECOIP PLAN 3.0												
	Free Shares at June 2022		**Matching Shares at June 2022**		**Discounted Shares at June 2022**		**Sell to cover shares at June 2022 (a)**		**Total number of shares assigned at June 2022**	**Number of LECOIP Certificates at 31.12.2023**	**Changes in the year (c)**	**Number of LECOIP Certificates at 31.12.2024**	**Average fair value 31.12.2024**
	Number of shares	Average unit fair value	Number of shares	Average unit fair value	Number of shares	Average unit fair value (b)	Number of shares	Average unit fair value (b)					
Total employees	30,964,490	1.7800	34,286,674	1.7800	344,304,070	0.3409	75,951,342	1.7800	485,506,576	63,549,942	-861,325	62,688,617	7.5200

(a) Assigned shares allocated to cover the payment relating to the employee's tax burden.

(b) Fair value of the subscription discount.

(c) Number of Certificates for which Intesa Sanpaolo shall take over the rights that would have been recognised to the employees by virtue of the Certificates due to failure to comply with the condition of continuation of employment for the duration of the Plan and other vesting conditions.

Part L – Segment reporting

Segment reporting is provided in the consolidated financial statements.

Part M – Disclosure of leases

This section provides the information required by IFRS 16 that is not included in other parts of the financial statements, divided between lessee and lessor.

SECTION 1 - LESSEE

QUALITATIVE INFORMATION

Intesa Sanpaolo essentially has real estate and company car lease contracts in place. There are also other types of lease contracts, for residual non-material amounts, mainly relating to hardware.
As at 31 December 2024, there were 5,441 lease contracts (5,614 as at 31 December 2023), 2,886 of which (3,052 as at 31 December 2023) relating to real estate leases, for a total value of rights of use of 928 million euro (1,057 million euro as at 31 December 2023). The decrease in the number of contracts was due to the activities aimed at optimising the use of spaces, which resulted in the termination of several leases.

Real estate lease contracts mainly include properties designated for use as offices or bank branches. The contracts within Italy normally have a term of more than 12 months and typically have renewal and termination options that can be exercised by the lessor and the lessee in accordance with the law or specific contractual provisions. Generally, these contracts do not include the option to purchase at the end of the lease or significant restoration costs for the Bank. The lease contracts typically include an option for early release prior to the contractual maturity, and, in such cases, they do not impose any penalties on the Bank. On the basis of the characteristics of the Italian lease contracts and the provisions of Law 392/1978, in the event of the signing of a new lease contract with a contractual term of six years and the option to automatically renew the contract after six years for another six years, the total term of the lease will be set at twelve years. This general rule is superseded if there are new elements or specific contractual provisions.
The contracts relating to other leases mainly involve motor vehicles. These are long-term rental contracts relating to the company fleet made available to employees (mixed use) or to the organisational structures of the individual companies. These contracts generally have a four-year term, with monthly payments, no renewal option and do not include the option to purchase the asset. The contract may be extended depending on the management of the car fleet and there may be a penalty in the event of early termination.

No sale or leaseback transactions were entered into during the year.

Several sub-leasing transactions are in place, mainly with Group companies.

The Bank makes use of the exemptions allowed by IFRS 16 for short-term leases (i.e. with a term of less than or equal to 12 months) or leases of low value assets (i.e. with a value of 5 thousand euro or less). The related costs are shown in Table 10.5 “Other administrative expenses: breakdown”.

QUANTITATIVE DISCLOSURES

Part B – Assets in the Notes to the financial statements contains information on the rights of use acquired through leases (Table 8.1 – Property and equipment used in operations: breakdown of assets measured at cost and Table 8.4 – Investment property: breakdown of assets measured at fair value) and Part B – Liabilities contains information on the Lease payables (Table 1.1 – Financial liabilities measured at amortised cost: breakdown of amounts due to banks, Table 1.2 – Financial liabilities measured at amortised cost: breakdown of amounts due to customers and Table 1.6 Lease payables).
In particular, as at 31 December 2024 the rights of use acquired through leases amounted to 928 million euro (1,057 million euro as at 31 December 2023), of which 869 million euro (1,027 million euro as at 31 December 2023) relating to real estate leases. As at 31 December 2024 lease payables amounted to 955 million euro (1,081 million euro as at 31 December 2023).
See the above sections for more details.

Part C of the Notes to the financial statements contains information on the interest expense on lease payables and other charges connected to rights of use acquired through leases, and on the income from sub-leasing transactions.
The table below provides a breakdown of the amortisation and depreciation charges for assets consisting of the right of use among the various categories, in line with the disclosure of property and equipment.

(millions of euro)

TOTAL	**168**	**162**

As at 31 December 2024, there was no property and equipment relating to commitments for lease agreements not yet commenced.

SECTION 2 - LESSOR

QUALITATIVE INFORMATION

The Bank operates mainly in finance leasing of industrial and commercial real estate, both already built and to be built. The Bank is also present on the market with lease products relating to capital goods, industrial vehicles, boats and pleasure craft. The risks associated with the ownership rights to the leased assets are managed through the compulsory subscription of an all-risk insurance policy, either offered through concessionary agreements or taken out directly by the customer with their insurer.
Operating leases are exclusively related to the leasing of owned real estate assets.

QUANTITATIVE DISCLOSURES

The Notes to the financial statements report the following:
- finance leases (Part B - Assets - Table 4.1 – Financial assets measured at amortised cost: breakdown of amounts due from banks and Table 4.2 – Financial assets measured at amortised cost: breakdown of loans to customers);
- assets leased under operating leases contained in caption 80 Property and equipment and described in Part B - Assets (Table 8.4 - Investment property: breakdown of assets measured at fair value); this consists of real estate no longer used in operations by the Bank, which is leased to third parties or held for possible appreciation in value.

Part C of the Notes to the financial statements contains information on interest income on finance leases and other income from finance and operating leases.

2. Finance leases

2.1. Breakdown by time bands of payments to be received and reconciliation with finance leases recorded as assets

This table provides the breakdown by time bands of lease payments to be received and the reconciliation between lease payments to be received and finance leases in accordance with IFRS 16, paragraph 94. In particular, the lease payments to be received, representing the sum of the minimum payments due as principal and interest, are shown net of the adjustment allowances and the unguaranteed residual value due to the lessor. The reconciliation with finance leases, shown in the financial statements under financial assets measured at amortised cost, is performed by subtracting the unearned finance income and adding the unguaranteed residual value.

(millions of euro)

Time bands	31.12.2024	31.12.2023
	Payments to be received	Payments to be received
Up to 1 year	1,352	1,533
Between 1 and 2 years	1,096	1,263
Between 2 and 3 years	909	1,055
Between 3 and 4 years	717	858
Between 4 and 5 years	529	659
Over 5 years	1,341	1,704
Total lease payments to be received	**5,944**	**7,072**
Reconciliation with loans	160	536
Not accrued gains (+)	1,270	1,740
Unguaranteed residual value (-)	-1,110	-1,204
Loans for leases	**5,784**	**6,536**

2.2. Other information

2.2.1 Classification of finance leases by type of leased asset

The table shows the classification of finance leases by credit quality (performing and non-performing) and by type of leased asset. The amounts are shown net of adjustments.

(millions of euro)

Finance leases	Performing exposures	Non-performing exposures
A. Real estate assets	**4,226**	**259**
B. Operating assets	**882**	**12**
C. Movable assets	**401**	**4**
- Motor vehicles	202	2
- Aircraft and rolling stock	199	2
- Other	-	-
D. Intangible assets	**-**	**-**
- Trademarks	-	-
- Software	-	-
- Other	-	-

2.2.2 Classification of assets under finance leases

The table below provides a breakdown by category of leased asset (not yet transferred to property and equipment) relating to lease receivables, net of adjustments.

(millions of euro)

	Unexercised assets	Assets withdrawn following termination	Other assets
A. Real estate assets	**-**	**5**	**4,480**
B. Operating assets	**-**	**-**	**894**
C. Movable assets	**-**	**-**	**405**
- Motor vehicles	-	-	204
- Aircraft and rolling stock	-	-	201
- Other	-	-	-
D. Intangible assets	**-**	**-**	**-**
- Trademarks	-	-	-
- Software	-	-	-
- Other	-	-	-
TOTAL	**-**	**5**	**5,779**

Unexercised assets are assets still held by customers, for which the repurchase option has not been exercised, related to positions that do not show any deterioration in credit quality. Assets withdrawn following termination relate to terminated contracts, where the customer has not yet been released from the contractual obligations, despite having returned the asset covered by the lease contract. The category Other assets includes the assets underlying the other lease receivables not included in the previous columns.

3. Operating lease

This refers to lease instalments to be received for owned real estate assets.

3.1. Breakdown of payments to be received by time bands

(millions of euro)

Time bands	31.12.2024 Payments to be received for leases	31.12.2023 Payments to be received for leases
Up to one year	3	3
Over one year up to 2 years	2	5
Over 2 years up to 3 years	3	4
Over 3 years up to 4 years	7	7
Over 4 years up to 5 years	8	6
For over 5 years	35	19
Total	**58**	**44**

3.2. Other information

There is no other information that needs to be reported in addition to that already contained in this section.

Certification of the Parent Company's financial statements pursuant to Art. 154 bis of Legislative Decree 58/1998

1. The undersigned Carlo Messina (as Managing Director and CEO) and Elisabetta Stegher (as Manager responsible for preparing the Company's financial reports) of Intesa Sanpaolo, taking into account the provisions of Article 154 bis, par. 3 and 4 of Legislative Decree 58 of 24 February 1998, do hereby certify to:
   - the adequacy in relations to the Company's features and
   - the actual application of the administrative and accounting procedures employed to draw up the Parent Company's financial statements during 2024.

2. Verification of the appropriateness and effective application of the administrative and accounting procedures employed to draw up the Parent Company's financial statements as at 31 December 2024 was based on methods defined by Intesa Sanpaolo consistently with the COSO and – as to the IT component – COBIT models, which are internationally accepted frameworks for internal control systems[219].

3. The undersigned also certify that:

   3.1 The Parent Company's financial statements as at 31 December 2024:
   - have been prepared in compliance with applicable international accounting standards recognised by the European Community pursuant to European Parliament and Council Regulation 1606/2002 of 19 July 2002;
   - correspond to the results of the books and accounts;
   - give a true and fair presentation of the assets, liabilities, profit or loss and financial position of the issuer.

   3.2 The report on operations includes a fair review of the development and operating margin, as well as of the position of the issuer, together with a description of the main risks and uncertainties.

27 February 2025

Carlo Messina Managing Director and CEO	Elisabetta Stegher Manager responsible for preparing the Company's financial reports

[219] The COSO Framework was prepared by the Committee of Sponsoring Organizations of the Treadway Commission, the U.S. organisation dedicated to improving the quality of financial reporting through ethical standards and an effective system for corporate governance and organisation. The COBIT Framework - Control OBjectives for IT and related technology is a set of rules prepared by the IT Governance Institute, the U.S. organisation whose aim is to define and improve the standards of corporate IT.

Independent auditor's report pursuant to article 14 of Legislative Decree no. 39, dated 27 January 2010 and article 10 of EU Regulation no. 537/2014

(Translation from the original Italian text)

To the Shareholders of
Intesa Sanpaolo S.p.A.

Report on the Audit of the Financial Statements

Opinion

We have audited the financial statements of Intesa Sanpaolo S.p.A. (the "Bank"), which comprise the balance sheet as at 31 December 2024, the income statement, the statement of comprehensive income, the changes in shareholders' equity and the statement of cash flows for the year then ended, and the notes to the financial statements, including material accounting policy information.

In our opinion, the financial statements give a true and fair view of the financial position of the Bank as at 31 December 2024, and of its financial performance and its cash flows for the year then ended in accordance with IFRS accounting standards as issued by the International Accounting Standards Board as adopted by the European Union and with the regulations issued for implementing article 9 of Legislative Decree no. 38/2005 and article 43 of Legislative Decree no. 136/2015.

Basis for Opinion

We conducted our audit in accordance with International Standards on Auditing (ISA Italia). Our responsibilities under those standards are further described in the *Auditor's Responsibilities for the Audit of the Financial Statements* section of our report. We are independent of Intesa Sanpaolo S.p.A. in accordance with the regulations and standards on ethics and independence applicable to audits of financial statements under Italian Laws. We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our opinion.

Key Audit Matters

Key audit matters are those matters that, in our professional judgment, were of most significance in our audit of the financial statements of the current year. These matters were addressed in the context of our audit of the financial statements as a whole, and in forming our opinion thereon, and we do not provide a separate opinion on these matters.

A member firm of Ernst & Young Global Limited

We identified the following key audit matters:

Key Audit Matters	Audit Responses
Classification and measurement of loans to customers (loans) measured at amortised cost	
Loans to customers (loans) measured at amortised cost recorded in the financial assets, line item 40 b) (the "Loans"), amount to Euro 347,897 million as at 31 December 2024 and represent approximately 52.8% of total assets in the balance sheet. The breakdown of such loans is included in tables 4.2 and 4.3 in Part B, section 4, of the notes to the financial statements. The disclosure of the changes in the quality of the Loans, the classification and measurement criteria adopted is provided in the notes to the financial statements in Part A – Accounting policies, in Part B – Information on the Parent Company's balance sheet, in Part C – Information on the Parent Company's income statement and in Part E – Information on risks and relative hedging policies. The classification of the Loans in the appropriate stage and the related measurement are relevant for the audit both because the amount of such loans is significant to the financial statements as a whole and because they are determined by the Directors through the use of estimates. These estimates have a high degree of complexity and subjectivity, involve internally developed models and include subjective elements in order to identify and measure exposures that show evidence of a significant increase in credit risk since the date of initial recognition or evidence of impairment. The processes for the classification and the measurement of the Loans consider both internal and external information, including the historical performance of exposures and related collection histories, the borrowers' overall exposure to the banking system, expected cash flows and related estimated collection dates, the assessment of any guarantees, the impact	In relation to this matter, our audit procedures included, among others: - gaining an understanding of the policies, valuation models, processes and controls applied by the Bank; - the assessment of the configuration and implementation of key controls, including those relating to the relevant IT applications, and the execution of tests of controls to test their operational effectiveness; - the analysis of the changes in the breakdown of the Loans compared to the previous year and the discussion of the results with management; - the performance of substantive procedures to verify, on a sample basis, the correct classification and measurement of credit exposures; - the assessment of the adequacy of the disclosures provided in the notes to the financial statements. The aforementioned procedures have been performed also with the support of our risk management, valuation, modelling and economics and information technology specialists.

of macroeconomic variables, any emerging risks, and future scenarios, also related to Loans' sales and risks of the Bank's customers' operating sectors.	
Classification and measurement of financial assets and liabilities at fair value on a recurring basis (levels 2 and 3)	
Financial instruments measured at fair value on a recurring basis, classified as level 2 and level 3 of the fair value hierarchy, amount to a total assets balance of Euro 42,728 million and a total liabilities balance of Euro 63,101 million as at 31 December 2024. The related breakdown is included in table A.4.5.1, Part A of the notes to the financial statements. The disclosures on the classification and measurement is provided in the notes to the consolidated financial statements in Part A - Accounting policies, in Part B - Information on the Parent Company's balance sheet, in Part C - Information on the Parent Company's income statement and in Part E - Information on risks and relative hedging policies. The measurement of such financial instruments is relevant to the audit because their amount is significant to the financial statements as a whole and because of the multiplicity and complexity of the valuation models and parameters used as well as and for the subjective estimation elements considered by the Directors. The valuation of these financial instruments is performed by the Bank through the use of complex models, consistent with the prevailing valuation practices, which are fed by directly observable inputs or, when not observable in the market, estimated internally based on qualitative and quantitative assumptions.	In relation to this matter, our audit procedures included, among others: - gaining an understanding of the policies, valuation models, processes and controls applied by the Bank; - the assessment of the configuration and implementation of key controls, including those relating to the relevant IT applications, and the execution of tests of controls in order to verify their operational effectiveness; - the comparative analysis of the portfolio composition against the previous year and the discussion of the results with management; - the performance of substantive procedures to verify, on a sample basis, the correct classification and measurement; - the assessment of the adequacy of the disclosures provided in the notes to the financial statements. The aforementioned procedures have been performed also with the support of our risk management, valuation, modelling and economics and information technology specialists.

Responsibilities of Directors and of the Management Control Committee for the Financial Statements

The Directors are responsible for the preparation of the financial statements that give a true and fair view in accordance with IFRS accounting standards as issued by the International Accounting Standards Board as adopted by the European Union and with the regulations issued for implementing article 9 of Legislative Decree no. 38/2005 and article 43 of Legislative Decree no. 136/2015 and, within the terms provided by the law, for such internal control as they determine is necessary to enable the preparation of financial statements that are free from material misstatement, whether due to fraud or error.

The Directors are responsible for assessing the Bank's ability to continue as a going concern and, when preparing the financial statements, for the appropriateness of the going concern assumption, and for appropriate disclosure thereof. The Directors prepare the financial statements on a going concern basis unless they either intend to liquidate the Bank or to cease operations, or have no realistic alternative but to do so.

The Management Control Committee is responsible, within the terms provided by the law, for overseeing the Bank's financial reporting process.

Auditor's Responsibilities for the Audit of the Financial Statements

Our objectives are to obtain reasonable assurance about whether the financial statements as a whole are free from material misstatement, whether due to fraud or error, and to issue an auditor's report that includes our opinion. Reasonable assurance is a high level of assurance, but is not a guarantee that an audit conducted in accordance with International Standards on Auditing (ISA Italia) will always detect a material misstatement when it exists. Misstatements can arise from fraud or error and are considered material if, individually or in aggregate, they could reasonably be expected to influence the economic decisions of users taken on the basis of these financial statements.

As part of an audit in accordance with International Standards on Auditing (ISA Italia), we have exercised professional judgment and maintained professional skepticism throughout the audit. In addition:

- we have identified and assessed the risks of material misstatement of the financial statements, whether due to fraud or error, designed and performed audit procedures responsive to those risks, and obtained audit evidence that is sufficient and appropriate to provide a basis for our opinion. The risk of not detecting a material misstatement resulting from fraud is higher than for one resulting from error, as fraud may involve collusion, forgery, intentional omissions, misrepresentations, or the override of internal control;
- we have obtained an understanding of internal control relevant to the audit in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the Bank's internal control;
- we have evaluated the appropriateness of accounting policies used and the reasonableness of accounting estimates and related disclosures made by the Directors;
- we have concluded on the appropriateness of Directors' use of the going concern basis of accounting and, based on the audit evidence obtained, whether a material uncertainty exists related to events or conditions that may cast significant doubt on the Bank's ability to continue as a going concern. If we conclude that a material uncertainty exists, we are required to draw attention in our auditor's report to the related disclosures in the financial statements or, if such disclosures are inadequate, to consider this matter in forming our opinion. Our conclusions are based on the audit evidence obtained up to the date of our auditor's report. However, future events or conditions may cause the Bank to cease to continue as a going concern;

- we have evaluated the overall presentation, structure and content of the financial statements, including the disclosures, and whether the financial statements represent the underlying transactions and events in a manner that achieves fair presentation.

We have communicated with those charged with governance, identified at an appropriate level as required by ISA Italia, regarding, among other matters, the planned scope and timing of the audit and significant audit findings, including any significant deficiencies in internal control that we identify during our audit.

We have provided those charged with governance with a statement that we have complied with the ethical and independence requirements applicable in Italy, and we have communicated them all matters that may reasonably be thought to bear on our independence, and where applicable, the actions taken to eliminate relevant risks or the safeguard measures applied.

From the matters communicated with those charged with governance, we have determined those matters that were of most significance in the audit of the financial statements of the current period and are therefore the key audit matters. We have described these matters in our auditor's report.

Additional information pursuant to article 10 of EU Regulation no. 537/2014

The Shareholders of Intesa Sanpaolo S.p.A., in the general meeting held on 30 April 2019, engaged us to perform the audits of the financial statements for each of the years ending 31 December 2021 to 31 December 2029.

We declare that we have not provided prohibited non-audit services, referred to article 5, par. 1, of EU Regulation no. 537/2014, and that we have remained independent of the Bank in conducting the audit.

We confirm that the opinion on the financial statements included in this report is consistent with the content of the additional report to the Management Control Committee in their capacity as audit committee, prepared pursuant to article 11 of the EU Regulation no. 537/2014.

Shape the future with confidence

Report on Compliance with other Legal and Regulatory Requirements

Opinion on the Compliance with Delegated Regulation (EU) no. 815/2019

The Directors of Intesa Sanpaolo S.p.A. are responsible for applying the provisions of the European Commission Delegated Regulations (EU) no. 815/2019 for the regulatory technical standards on the specification of a single electronic reporting format (ESEF – European Single Electronic Format) (the "Delegated Regulation") to the financial statements as at 31 December 2024, to be included in the annual financial report.

We have performed the procedures under the auditing standard SA Italia no. 700B, in order to express an opinion on the compliance of the financial statements as at 31 December 2024 with the provisions of the Delegated Regulation.

In our opinion, the financial statements as at 31 December 2024 have been prepared in the XHTML format in compliance with the provisions of the Delegated Regulation.

Opinion and statement pursuant to article 14, paragraph 2, subparagraphs e), e-bis) and e-ter) of Legislative Decree no. 39, dated 27 January 2010 and pursuant to article 123-bis, paragraph 4, of Legislative Decree no. 58, dated 24 February 1998

The Directors of Intesa Sanpaolo S.p.A. are responsible for the preparation of the report on operations and of the report on corporate governance and ownership structure of Intesa Sanpaolo S.p.A. as at 31 December 2024, including their consistency with the related financial statements and their compliance with the applicable laws and regulations.

We have performed the procedures required under audit standard SA Italia no. 720B, in order to:

- express an opinion on the consistency of the report on operations and of specific information included in the report on corporate governance and ownership structure as provided for by article 123-bis, paragraph 4, of Legislative Decree no. 58/1998, with the financial statements;
- express an opinion on the compliance with the applicable laws and regulations of the report on operations, excluding the section related to the consolidated sustainability statement contained in the report on operations of the consolidated financial statements, and the above mentioned specific information included in the report on corporate governance and ownership structure pursuant article 123-bis, paragraph 4, of Legislative Decree no. 58, dated 24 February 1998;
- issue a statement on any material misstatement in the report on operations and in certain specific information contained in the report on corporate governance and ownership structure pursuant article 123-bis, paragraph 4, of Legislative Decree no. 58, dated 24 February 1998.

In our opinion, the report on operations and the specific information contained in the report on corporate governance and ownership structure pursuant article 123-bis, paragraph 4, of Legislative Decree no. 58, dated 24 February 1998, are consistent with the consolidated financial statements of the Intesa Sanpaolo Group as at 31 December 2024.

Furthermore, in our opinion, the report on operations, excluding the section related to the consolidated sustainability statement contained in the report on operations of the consolidated financial statements, and the specific information contained in the report on corporate governance and ownership structure pursuant article 123-bis, paragraph 4, of Legislative Decree no. 58, dated 24 February 1998, comply with the applicable laws and regulations.

Shape the future
with confidence

With reference to the statement required by article 14, paragraph 2, subparagraph *e-ter)*, of Legislative Decree no. 39, dated 27 January 2010, based on our knowledge and understanding of the entity and its environment obtained through our audit, we have no matters to report.

Our opinion on compliance with applicable laws and regulations does not extend to the section of the Report on Operations related to consolidated sustainability statement. The conclusion on the compliance of this section with the applicable standards governing its preparation criteria and the compliance with the disclosure requirements pursuant to article 8 of (EU) Regulation 852/2020 are formulated by us in the attestation report pursuant to article 14-bis of Legislative Decree no. 39, dated 27 January 2010.

Milan, 20 March 2025
