

**BC FORM 53-901F
(Previously Form 27)**

SECURITIES ACT

**MATERIAL CHANGE REPORT UNDER SECTION 85(1) OF THE SECURITIES ACT
(BRITISH COLUMBIA)**

1. Reporting Issuer

Nevada Pacific Gold Ltd. (the "Issuer")
#250 – 625 Howe Street
Vancouver, BC
V6C 2T6

2. Date of Material Change

May 30, 2002

3. Press Release

Date of Issuance: May 30, 2002

Place of Issuance: Vancouver, British Columbia

4. Summary of Material Change

The Issuer announced the staking of mineral claims in Nevada.

5. Full Description of Material Change

The Issuer announced acquisition of the Clover Valley Gold Project through the location of 54 unpatented Federal lode mining claims (1080 acres). The property is located along the western edge of the Spruce Mountain mining district approximately 35 miles south of Wells, Elko County, Nevada.

Mining occurred in the Spruce Mountain mining district from approximately 1869 to 1930, producing 825 ounces of gold, 21.6 million pounds of lead, 3.2 million pounds of zinc, 1.04 million ounces of silver and 779,000 pounds of copper. During the mid 1980's, both Gold Fields Mining Corporation and Santa Fe Gold conducted reconnaissance gold exploration in the district. Several drill holes were reported to have intersected gold mineralization: 80 feet grading 0.076 oz gold/ton and an adjacent hole intersecting 40 feet of 0.037 oz gold/ton.

The Issuer had previously held claims in this area (lapsing in 1999); however, due to heavy competitor activity in 1997, the Issuer was unable to acquire ground where the 1980's drilling intercepted gold mineralization. Data compilation, geological mapping, rock chip sampling and a six-hole drill test were completed with low level gold values intersected. The Issuer now controls the area of the known gold occurrence and intends to target the mineralized zones encountered in the previous drilling. Adjacent areas that host alteration and anomalous gold mineralization at the surface will also be tested.

The target area for gold mineralization at Clover Valley is in the lower portion of the Pilot Shale together with related fault structures that is a proven host at the multi-million ounce Alligator

Ridge and Rain mines. The upper portion of the Pilot Shale is a thin-bedded, impermeable mudstone that may have acted as a barrier to upward moving mineralizing fluids, thus trapping gold bearing solutions within the lower portion of the Pilot Shale.

6. Reliance on Section 85(2) of the Act

Not applicable.

7. Omitted Information

Not applicable.
