Large Massive Sulphide Zone Discovered in Surprise Creek

Stewart, BC – Mountain Boy Minerals Ltd (Mountain Boy) reports that the 2016 exploration program has discovered a large Kuroko massive sulphide zone (Ataman zone) within the Surprise Creek claims. The property consists of 7,472 ha within 19 claims at headwaters of Surprise Creek. The discovered zone is along a ridge extending into a wide valley bottom. The zone is 13 km north of paved highway 37A and an electric transmission line. The nearest road access is a former mine road 5 km south on an adjoining property.

The Surprise Creek property is a 50/50 joint venture with Great Bear Resources with Mountain Boy being the operator. The zone which is exposed over a vertical height of 600 m and a width of at least 200 m has been traced through float boulders into an adjoining valley approximately 1.3 km away. The geological crew has identified the potential vent area (potential source of high grade mineralization) to this system within the exposed portion of the zone. A variety of mineralization types are indicated as follows:

1. Chert with disseminated galena (VMS style mineralization)
2. Thinly banded exhalite with pyrite and sphalerite mineralization.
3. Thinly banded exhalite with pyrite, galena and sphalerite mineralization.
4. Black matrix breccia with pyrite and galena.
5. Shear zones with barite, galena and sphalerite.
6. Sedimentary rock with syngenetic sphalerite and galena mineralization.
7. Finely laminated barite with sphalerite
8. Quartz-sericite-pyrite alteration (footwall zone) cut by quartz veins with galena and sphalerite.

Results from rock samples collected, mostly within the quartz-sericite-pyrite bearing quartz veins, in 2010 by Great Bear from this area ranged up to 0.87 g/t Au, 68.5 g/t Ag, 3.85% lead and 2.28% zinc. Several mineralized barite float boulders sampled assayed up to 62.7g/t Ag, 3.85% Pb and 1.9% Zn. Work by Great Bear indicated a zone

measuring about 350 m by 750 m. *The Company has not verified these results and using them for reference purposes only.*
Ed. Kruchkowski, P. Geo., a qualified person under National Instrument 43-101, is in charge of the exploration programs on behalf of the Company and is responsible for the contents of this release. E. Kruchkowski is not independent of Mountain Boy as he is the president and a director of the Company.

Mountain Boy Minerals Ltd. is a Canadian based mineral exploration company with diverse property and resource holdings around the Stewart region in British Columbia's golden triangle. It owns 20% of the Silver Coin project, a gold-silver-base metals project that has a 43-101 compliant resource calculated. The Company is also exploring silver-base metals on its American Creek and Bear Valley properties as well as copper-gold on their Stewart area claims.
