

CHAMPION IRON

CAPITAL MARKETS DAY

November 13th, 2023 (Montréal)

A RARE SOLUTION
TO DECARBONIZE STEELMAKING

CHAMPION IRON 

DISCLAIMER

This presentation (the "Presentation") contains information about Champion Iron Limited ("Champion" or the "Company"), current as at the date hereof or as at such earlier date as may be specified herein. This Presentation does not constitute or form part of, and should not be construed as, an offer to sell or issue or the solicitation of an offer to buy or acquire securities of Champion or any of its subsidiaries or affiliates or any other person in any jurisdiction or an inducement to enter into investment activity, does not constitute marketing material in connection with any such securities and there is no current offering or soliciting for the sale of securities in any jurisdiction.

This Presentation and the information contained herein is for information purposes only, may not be reproduced or distributed to others, at any time, in whole or in part, for any purpose, and may not be used for any other purpose, without the prior written consent of Champion, and all recipients agree that they will use this Presentation solely for information purposes. Acceptance of this Presentation by any person constitutes an agreement to be bound by the terms of this disclaimer.

In making any future investment decision, you must rely on your own examination of Champion, including the merits and risks involved. This Presentation should not be construed as financial, legal, tax, accounting, investment or other advice or a recommendation with respect to any potential future investment. You should consult your own advisors as needed to make a future investment decision and determine whether it is legally permitted to make an investment under applicable legal requirements, including securities or similar laws or regulations.

FORWARD-LOOKING STATEMENTS

This Presentation contains certain information and statements, which may be deemed "forward-looking information" within the meaning of applicable securities laws (collectively referred to herein as "forward-looking statements"). Forward-looking statements are statements that are not historical facts and are generally, but not always, identified by the use of words such as "plans", "expects", "is expected", "budget", "scheduled", "estimates", "continues", "forecasts", "projects", "predicts", "intends", "anticipates", "aims", "targets" or "believes", or variations of, or the negatives of, such words and phrases or state that certain actions, events or results "may", "could", "would", "should", "might" or "will" be taken, occur or be achieved. Inherent in forward-looking statements are risks, uncertainties and other factors beyond the Company's ability to predict or control.

SPECIFIC FORWARD-LOOKING STATEMENTS

All statements in this Presentation, other than statements of historical facts, that address future events, developments or performance that Champion expects to occur are forward-looking statements. These statements may include, but are not limited to, management's expectations regarding: the Company's Phase II expansion project, its expected achievement of nameplate capacity, throughput, recovery rates, economic and other benefits, impact on nameplate capacity, milestones and associated costs; Bloom Lake's life of mine, recovery rates, production, expanded nameplate capacity, flowsheet, mine design, project economics, capital expenditures, economic and other benefits and potential opportunities beyond life of mine; the project to upgrade the Bloom Lake iron ore concentrate to a higher grade with lower contaminants and to convert approximately half of Bloom Lake's increased nameplate capacity of 15 Mtpa to commercially produce a Direct Reduction ("DR") quality pellet feed iron ore, expected project timeline, economics, capital expenditures, budget and financing, production metrics, technical parameters, project layout, flowsheet, environmental footprint, permitting and approvals, job creation, efficiencies, economic and other benefits and expected premium that high quality DRPF products will attract; the study evaluating the re-commissioning of the Pointe-Noire Iron Ore Pelletizing Facility to produce DR grade pellets, including its anticipated completion timeline, economics, production metrics, technical parameters, project layout, capital expenditure and expected premium that high quality DRPF products will attract; the Kami Project's study, its purpose, including evaluating the potential to produce a Direct Reduction grade product, and anticipated completion timeline, expected project economics, production metrics, flowsheet, project layout, mine design, milestones and partnership opportunities; the shift in steel industry production methods towards reducing emissions and green steel production methods and Electric Arc Furnaces ("EAFs"), including expected rising demand for higher-grade iron ore products and related market deficit and higher premiums, and the Company's participation therein, contribution thereto and vision and positioning in connection therewith, including the transition of the Company's product offering (including producing high quality DRPF products) and expected benefits thereof; green steel, emission reduction and other Environmental, Social and Governance related initiatives, programs, objectives, targets and expectations and the Company's positioning in connection therewith; the cold pelletizing technology, its potential to substantially reduce emissions linked to the agglomeration of iron ore and related studies, partnerships and initiatives; greenhouse gas and CO2 emissions reduction initiatives, objectives, targets and expectations; collaboration between First Nations and Champion and related targets, objectives and expected benefits; Champion's program to reduce work-related incidents and related targets and objectives; diversity and inclusion targets and objectives; optimization work programs, safe tailings strategy, their objectives and expected results and impact on production, cash costs and financial results; expected production volumes and costs and their impact on and financial results; recovering lower stripping levels; the refinancing of the Company's credit facility, its completion, drawdowns and reimbursements thereunder and its impact on liquidity and the Company's growth projects; "Cluster II" opportunities; the Company's ability to reach average LoM Fe recovery at targeted levels; and the Company's growth and opportunities generally.

DEEMED FORWARD-LOOKING STATEMENTS

Statements relating to "reserves" or "resources" are deemed to be forward-looking statements as they involve the implied assessment, based on certain estimates and assumptions, that the reserves and resources described exist in the quantities predicted or estimated and that the reserves can be profitably mined in the future. Actual reserves and resources may be greater or less than the estimates provided herein.

RISKS

Although Champion believes the expectations expressed in such forward-looking statements are based on reasonable assumptions, such forward-looking statements involve known and unknown risks, uncertainties and other factors, most of which are beyond the control of the Company, which may cause the Company's actual results, performance or achievements to differ materially from those expressed or implied by such forward-looking statements. Factors that could cause the actual results to differ materially from those expressed or implied by forward-looking statements include, without limitation: the results of feasibility studies; changes in the assumptions used to prepare feasibility studies; project delays; continued availability of capital and financing and general economic, market or business conditions; fluctuations in foreign currency exchange rates; general economic, competitive, political and social uncertainties; market disruptions, including pandemics or significant health hazards, severe weather conditions, natural disasters, terrorist activities, financial crises, political crises, wars and other military conflicts (including the ongoing military conflict between Russia and Ukraine), or other major events, or the prospect of these events; future prices of iron ore; increased public concern about the environmental impact of the Company's products or their perceived safety; decreased social acceptance and increased social action to reduce the use of fossil fuels, which may negatively impact consumer perception; cyber events or attacks (including ransomware, state sponsored and other cyberattacks) failure of plant, equipment or processes to operate as anticipated; delays in obtaining governmental approvals, necessary permitting or in the completion of development or construction activities; the impact of COVID-19 on the global economy, the iron ore market and Champion's operations, including the effectiveness of Champion's efforts to respond to the COVID-19 pandemic; the pace of economic recovery when the COVID-19 pandemic subsides and the heightened impact it has on many of the risks described herein and in other reports Champion files with the Canadian Securities Administrators (the "CSA") and the Australian Securities and Investments Commission (the "ASIC"); as well as those factors discussed in the section entitled "Risk Factors" of the Company's 2023 Annual Information Form, the risks and uncertainties discussed in the Company's management's discussion and analysis for the fiscal year ended March 31, 2023 and the risks discussed in other reports Champion files with the CSA and the ASIC, all of which are available on SEDAR+ at www.sedarplus.ca, the ASX at www.asx.com.au and the Company's website at www.championiron.com. There can be no assurance that such information will prove to be accurate as actual results and future events could differ materially from those anticipated in such forward-looking statements. Accordingly, readers should not place undue reliance on forward-looking statements.

ADDITIONAL UPDATES

The forward-looking statements in this Presentation are based on assumptions management believes to be reasonable and speak only as of the date of this Presentation or as of the date or dates specified in such statements. Champion undertakes no obligation to update publicly or otherwise revise any forward-looking statements contained herein, whether as a result of new information or future events or otherwise, except as may be required by law. If the Company does update one or more forward-looking statements, no inference should be drawn that it will make additional updates with respect to those or other forward-looking statements. Champion cautions that the foregoing list of risks and uncertainties is not exhaustive. Investors and others should carefully consider the above factors as well as the uncertainties they represent and the risks they entail.

NON-IFRS AND OTHER FINANCIAL MEASURES

Certain financial measures used by the Company to analyze and evaluate its results are non-IFRS financial measures or ratios and supplementary financial measures. Each of these indicators is not a standardized financial measure under the IFRS and might not be comparable to similar financial measures used by other issuers. These indicators are intended to provide additional information and should not be considered in isolation or as a substitute for measures of performance prepared in accordance with IFRS. The non-IFRS and other financial measures included in this Presentation are earnings before interest, tax, depreciation and amortization ("EBITDA"), adjusted EPS, total cash cost, net average realized selling price per dmt sold and gross average realized selling price per dmt sold. When applicable, a quantitative reconciliation to the most directly comparable IFRS measures is provided in section 21 - Non-IFRS and Other Financial Measures of the Company's management's discussion and analysis ("MD&A") for the three-month and six-month periods ended September 30, 2023, available on SEDAR+ at www.sedarplus.ca and the ASX at www.asx.com.au and the Company's website at www.championiron.com. For cumulative results since the 2018 restarts, refer to annual MD&A. On August 22, 2023, Champion announced the updated mineral resource and reserve estimates for Bloom Lake reported in the technical report prepared pursuant to National Instrument 43-101 - Standards of Disclosure for Mineral Projects ("NI 43-101") and Chapter 5 of the ASX Listing Rules entitled "Mineral Resources and Mineral Reserves for the Bloom Lake Mine, Fermont, Québec, Canada" by BBA Inc., SRK Consulting (U.S.), Inc., Soutex and Quebec Iron Ore Inc. dated September 28, 2023 and filed on October 3, 2023 (the "2023 Technical Report"). Champion is not aware of any new information or data that materially affects the information included in the 2023 Technical Report and confirms that all material assumptions and technical parameters underpinning the estimates in the 2023 Technical Report continue to apply and have not materially changed. The 2023 Technical Report is available on SEDAR+ at www.sedarplus.ca.

Mr. Vincent Blanchet, P. Eng., Engineer at Quebec Iron Ore Inc., the Company's subsidiary and operator of Bloom Lake, is a "qualified person" as defined by NI 43-101 and has reviewed and approved, or has prepared, as applicable, the disclosure of the scientific and technical information contained in this Presentation and has confirmed that the relevant information is an accurate representation of the available data and studies for the relevant projects. Mr. Blanchet's review and approval does not include statements as to the Company's knowledge or awareness of new information or data or any material changes to the material assumptions and technical parameters underpinning the 2023 Technical Report. Mr. Blanchet is a member of the Ordre des ingénieurs du Québec.

Certain information contained in this Presentation has been obtained from published sources prepared by third parties and has not been independently verified and no representation or warranty, express or implied, is made with respect to, and no undue reliance shall be placed on, the information or opinions contained herein or in any verbal or written communication made in connection with this Presentation.

Reference to P62: Platts TSIOIEX 62% Fe CFR China; P65: Platts IO Fines 65% Fe CFR China.

This Presentation has been authorized for release to the market by the CEO of Champion, David Cataford.

All amounts are in Canadian dollars unless otherwise stated.

Q&A and Closing remarks	30 min	

CHAMPION IRON

MESSAGE FROM OUR FIRST NATIONS PARTNERS

UASHAT MAK MANI-UTENAM

MIKE MCKENZIE

CHIEF, UASHAT MAK MANI-UTENAM

JEAN-CLAUDE THERRIEN PINETTE

HEAD OF POLITICAL CABINET

INTRODUCTION

CHAMPION IRON 

TSX: CIA | ASX: CIA | OTCQX: CIAFF

VISION

Leverage the force of responsible materials to decarbonize and brighten the future.

MISSION

**Produce responsible materials
with ingenuity to reduce the carbon
footprint with and for those who
seek change.**

UPHOLDING VALUES FOR A SUSTAINABLE FUTURE

PRIDE

Develop a collective sense of belonging in all spheres of iron ore mining

INGENUITY

Leverage employee creativity and expertise to achieve and maintain efficient practices aimed at operational excellence

RESPECT

It is our guiding principle: respect for people, for communities, for the environment, and for the resources at the very core of the organization

TRANSPARENCY

Promote transparent communications through active listening and open dialogue

INTRODUCTION

LARGEST PUBLICLY LISTED PURE-PLAY HIGH-GRADE IRON ORE PRODUCER GLOBALLY

- 2nd largest hub of high-grade exports globally
- **High-purity iron ore** produced with renewable power and with one of the lowest carbon intensity
- 9.3%¹ management ownership
- 8.4% Québec government shareholding²
- >US\$4.5B cumulative investments at Bloom Lake
- >1,100 employees at the mine site and head office in Montreal

Source: Champion Iron Limited

Notes: 1. Management ownership including board of directors as of September 4, 2023 | 2. Through Investissement Québec (Ressources Québec)

SUSTAINABILITY COMMITMENT

CHAMPION IRON 

TSX: CIA | ASX: CIA | OTCQX: CIAFF

SUSTAINABILITY COMMITMENT

THE COMPANY OF TOMORROW NOW

				
Health & Safety <i>Core priority</i> → Zero fatalities → Introduced training programs to identify work-related incidents → Ultimate target of zero harm	Environment <i>Minimizing impact</i> → No major environmental violation → Achieved 96% recycled water at site → 100% compliance with the MAC tailings protocol	Community <i>Active participation</i> → Committed to local sourcing and to First Nations suppliers → Active support to First Nations communities	Inclusion <i>More representation</i> → Committed to having women represent at least 30% of the Board of Directors → Diversity and cultural training completed by 100% of employees	GHG <i>Reduction initiatives</i> → 40% emissions reduction target at site by 2030 → Targeting carbon neutral by 2050

Source: Champion Iron Limited

2022 SUSTAINABILITY REPORT PERFORMANCE HIGHLIGHTS

DEMONSTRATED CONTRIBUTION TO SOCIETY AND COMMUNITY

Ministers Fitzgibbon and Lafrenière visiting Bloom Lake in March 2023

Since Bloom Lake recommissioning (FY 2019¹)

- **\$848M** income, mining and municipal taxes paid²
- **\$470M** gains for Investissement Québec from investments since 2016³
- Approximately **\$1.5B** sourcing from regional suppliers and **\$450M** paid out in salaries and benefits
- **\$26M** community investment

Source : Champion Iron Limited

Notes: 1. As of Year Ended March 31, 2023 | 2. Includes \$1.6M in mining lease payments | 3. Realized and unrealized gains comprised of, a) Ressources Québec initial 36.2% position in MFQ worth \$45.3M in 2016, bought back in 2019 for \$211M, b) Ressources Québec initial investment in CIA of \$7.5M, market value of 43.5M shares (based on share price of \$6.8 as of November 9, 2023) of approximately \$296M and cumulative dividend of \$17M

Inauguration of the new Fermont skatepark

As of October 31st, 2023

- **> 1,100** employees
- **58** local and First Nations jobs
- **Largest First Nations employer** on the Québec Côte-Nord
- Commemorated National Day for Truth and Reconciliation and declared National Indigenous Peoples Day an occasion for employees to honour First Nations culture

A SAFE WORKING ENVIRONMENT IS TOP PRIORITY

- No major environmental issue since the recommissioning of Bloom Lake in 2018
- Fully compliant result following multiple regulatory audits by provincial and federal authorities
- Increased training and awareness programs, resulting in improved health and safety statistics
- Committed to a 2.0 incident frequency target for QIO's employees, zero fatalities and an ultimate target of zero harm¹

SAFETY PERFORMANCE

RESPONSIBLE TAILINGS CONSTRUCTION METHOD

Bloom Lake Mining Project **THE SAFE TAILINGS MANAGEMENT STRATEGY**

COMMITTED TO REDUCE CARBON EMISSIONS

- **Substantial investments completed since recommissioning in 2018, enabling the Company's CO₂ emission intensity per tonne to be reduced by approximately 30% compared to the previous owner**
- **Committing to greenhouse gas (GHG) emission reductions of 40% at site by 2030¹**
- **The Company is also committed to be carbon neutral by 2050**
- **Targets are in line with the Paris Agreement 2°C scenarios and the Canadian government GHG reduction plan²**

Source: Champion Iron Limited Sustainability Report 2022

Notes: 1. Based on 2014 emission intensity with additional consideration for the targeted nameplate capacity of 15 Mtpa | 2. GHG alignments are science based

ENVISIONED ROADMAP TO NET ZERO 2050

VISION TO REDUCE GHG EMISSIONS THROUGH THREE STAGES OF INITIATIVES

Source : Champion Iron Limited

Note: 1. 2023 LoM ends in FY41 with residual production. FY40 is therefore the last full financial year of production. For GHG calculation, 2039 is the last full calendar year of production. See disclosure page for statement regarding the 2023 Technical Report.

WORK PROGRAMS IDENTIFIED TO REDUCE EMISSIONS IN LINE WITH THE COMPANY’S TARGETS

Source : Champion Iron Limited

MARKET DYNAMICS

CHAMPION IRON 

TSX: CIA | ASX: CIA | OTCQX: CIAFF

STEEL IS CRITICAL FOR THE TRANSITION TO A LOW CARBON ECONOMY

High-Purity Iron ore ("HPI") used in steelmaking is essential for low carbon technologies

STEEL IS CRITICAL TO ENABLE INFRASTRUCTURE REQUIRED FOR DECARBONIZATION

→ Under the Accelerated Energy Transition (AET) of 1.5°C, over 3.5 billion additional tonnes of steel will be required by 2050, representing over 50% of total material used across infrastructure and applications

GLOBAL VOLUME OF MATERIAL REQUIRED TO REACH AET 1.5 ACROSS SELECT ENERGY TRANSITION APPLICATIONS¹

Canada will need an additional 113Mt of steel by 2050 to reach net zero targets

THE STEEL INDUSTRY NEEDS TO EVOLVE TO LIMIT EMISSIONS

- Steelmaking increased its share of global emissions in the last 20 years, now representing **8%-10% of global CO₂ emissions**¹
- **85% of steelmaking emissions are generated by the reduction and smelting of iron ore**²

High-Purity Iron ore contributes to reducing emissions in steelmaking

STEELMAKING METHODS AND REQUIRED SUPPLY CHAIN

DR QUALITY IRON ORE DEMAND WILL INCREASE ACROSS STEELMAKING METHODS

- To decarbonize the steel industry, a major transition away from BF-BOF to DRI-EAF must occur by 2050
- DRI-EAF steelmaking market share is expected to increase from 5% to 25% by 2050
- Due to limited availability of scrap steel traditionally used in EAFs, high-quality DRI will be required to supplement the industry and achieve the emission reduction targets in line with the 1.5°C pathway

SIGNIFICANT DRI DEMAND GROWTH IS EXPECTED

METAL DEMAND GROWTH BY 2050 EXPECTED UNDER A GLOBAL ENERGY TRANSITION (AET 2.0°C SCENARIO)¹

Expected DRI demand growth compares favorably with other metals required for the global energy transition required to limit global warming to 2.0 degrees Celsius¹

DRI-EAF STEELMAKING WILL INCREASE DEMAND FOR PELLETS AND HIGH-PURITY IRON

CUMULATIVE HISTORICAL PRODUCTION¹

2,300 Mt

6x

More demand for DR pellets by 2050 than the cumulative historical production to support the steel industry's transition to DRI-EAF steelmaking

FORECAST DEMAND (2023-2050)

14,400 Mt

The increase in demand translates into an additional 348 Mtpa of high-purity iron needed by 2050², equivalent to an additional ~40 average scale mines

SIGNIFICANT DEFICIT OF DR GRADE IRON ORE EXPECTED AS A RESULT OF DRI DEMAND GROWTH

DR GRADE IRON ORE SUPPLY/DEMAND BALANCE BY 2031

(Mtpa)

→ Global DR quality iron ore concentrate demand is expected to exceed **300 Mtpa by 2031**

→ As a result of limited expected supply, the market deficit is expected to be approximately **109 Mtpa by 2031**, representing approximately **50% of current supply** and **2x current seaborne market**

→ Potential suppliers of DR quality iron ore concentrate expected to be concentrated in a few countries including Brazil, Russia, Sweden, Canada and Ukraine

Sources: Champion Iron Limited, Minepans by McKinsey

Notes: 1. Based that all DRI production will require DR grade material (excluding SAF-DRI-BOF route) | 2. Including 50% of Baffinland lumps; Considering 3.7Mt of pig iron logistically constrained due to Russia/Ukraine conflict; Includes net imports of 6Mt of OBMs, -14Mt of obsolete scrap and 0.2Mt of prime scrap; Supply = generation + net import; Includes both pig iron and HBI/DRI

DR QUALITY IRON ORE SUPPLY GROWTH IS REQUIRED FOR THE GREEN STEEL TRANSITION

WHY IS HIGHER GRADE AND LOWER IMPURITY IRON ORE IMPORTANT?

- Reduces energy consumption and coal in traditional steelmaking
- Processed in a more energy efficient manner as fewer impurities need to be processed
- Qualifies for lower emitting steelmaking methods, including DRI/EAF steelmaking

IRON ORE CONCENTRATE SPECIFICATIONS

HIGH-PURITY IRON (HPI)	DIRECT REDUCTION (DR)	COMMENTS
> 65% Iron Content	> 67% Iron Content	Not all ore can be economically upgraded to a higher Fe iron ore concentrate
< 5.5% Alumina & Silica	< 2.5% Alumina & Silica	Lower acid-gangue increases energy efficiency and iron yield
< 0.1% Phosphorus	< 0.1% Phosphorus	Lower impurities increases quality and usability in steelmaking
< 1.4% Impurities	< 1.4% Impurities	Impurities can include copper, manganese, titanium, vanadium etc.

GLOBAL IRON ORE SUPPLY

MARKET LEADING HIGH-PURITY DR QUALITY PRODUCT IN A GROWING MARKET

SUMMARY OF IRON AND GANGUE CONTENTS

Few deposits can produce DR quality iron ore concentrate required in DRI-EAF steelmaking to produce advanced steels. Champion's 69% Fe iron ore concentrate is expected to be a market leading DR quality product

THE LABRADOR TROUGH IS STRATEGICALLY POSITIONED TO MEET DEMAND FOR HIGH-PURITY IRON ORE

Sources: Wood Mackenzie, Corporate Reports, PFS Studies, Public Information (can include estimates); Data as of 2022.

Notes: Billion Metric tonne reserves; Resources are estimated on a Measured, Indicated, and Inferred Basis. Global snapshot is not exhaustive, (1) Port capacity estimate could not be reasonably identified, (2) Port not yet constructed, (3) Port not yet constructed, (4) Rest of Canada data is not exhaustive (Mont Wright, Carol Lake, Fire Lake, Baffinland...), (5) Simandou includes Blocks 1-4 (6) Spare port capacity estimated; Green-40+, Yellow-20-39, Red-0-19, (7) Champion Iron Limited reported distance from Bloom Lake to Pointe Noire.

CANADIAN IRON ORE IS PRODUCED WITH ONE OF THE LOWEST CARBON INTENSITY GLOBALLY

Benefiting from renewable hydropower capacity generating 53% of all energy consumed on site², Champion has an industry leading position in emission intensity per tonne of iron ore produced of 9.8 Kg of CO₂/t

EXTRACTING HPI IN CANADA WILL HELP REDUCE STEELMAKING EMISSIONS GLOBALLY

0.018t of CO₂e
emitted by HPI
production in
Canada¹

100x

1.96t of CO₂e/t
steel-related emissions¹
abated with DRI-EAF steel
produced with HPI in
Canada

A transition of Bloom Lake's 15 Mtpa nameplate capacity to DRPF quality could reduce nearly 9.7 Mt of CO₂e/year in the steelmaking process², representing over 100x the emissions generated by the Company

Sources: Champion Iron Limited, data by Minespans by McKinsey

Notes: 1. For one tonne of steel produced elsewhere, assuming average mining emissions in Canada of 12.6 kg CO₂e per tonne of iron ore concentrate and 1.47 tonne of pellet feed iron ore concentrate per tonne of steel produced. Comparing emissions between BF-BOF steel production using coal as a reductant with ROW average mining emissions of 49 kg of CO₂e per tonne iron ore concentrate and DRI-EAF using hydrogen as a reductant with HPI produced in Canada, using 1.50 tonne of iron ore concentrate per tonne of steel produced with BF-BOF, and assuming 2.0t of CO₂e/t of steel delta between ROW - BF-BOF and Canada - DRI-EAF | 2. Emissions compared to traditional steelmaking method of BF-BOF

CHAMPION'S 66.2% FE IRON ORE CONCENTRATE ATTRACTS A PREMIUM OVER THE P62 INDEX

CHAMPION'S GROSS REALIZED PRICE VS P65 AND P62 INDEX
(US\$/DMT)

→ Since 2018 restart: Champion's quarterly gross realized price averaged US\$130.0/dmt¹, compared to the P65 high-grade index average of US\$130.2/dmt, representing an average premium of 15% compared to the P62 index

LONG-TERM IRON ORE CONSENSUS PRICES ARE WELL BELOW HISTORICAL AVERAGE

- P62 and P65 index consensus prices are 25% and 18% below their respective historical averages¹
- Iron ore supply growth is limited by low price expectations, inflationary pressures, rising cost of capital, increasing ESG expectations and long lead time to deliver projects compared to other commodities

P62, P65 AND DR PELLETS HISTORICAL AND CONSENSUS PRICES

Sources: Champion Iron Limited, Bloomberg, Platts data, Wood Mackenzie

Notes: 1. Historical average from 2009 to 2022 for P62 and P65 and 2015-2022 for DR pellets | 2. P62 and P65 consensus as of July 2023, including BMO, Bank of America, B. Riley FBR, Canaccord Genuity, Citi, CLSA, Cormark, Euroz, Goldman Sachs, Laurentian Bank, Macquarie, Paradigm, Raymond James, RBC Securities, Scotiabank, TD Bank

HIGH-PURITY IRON OFFERS THE OPPORTUNITY TO CAPTURE PREMIUMS ACROSS THE GREEN STEEL SUPPLY CHAIN

STEEL VALUE CHAIN AVERAGE PRICES (2021-2023 YTD)¹
(US\$/T CFR CHINA)

Sources: Champion Iron Limited, Platts data, Fastmarkets, Wood Mackenzie
Notes: Numbers may not add up due to rounding. | 1. 58, 62, 65% index, BF 6 DR pellet, Scrap = CFR China; HBI = FOB New Orleans, adjusted for shipping; Pig Iron = FOB Brazil, adjusted for shipping; HRC = CFR China | 2. Scrap and HRC in US/EU have on average been trading above Chinese prices.

RIISING DEMAND AND EMERGING PREMIUMS FOR GREEN STEEL

- Recent acceleration in announcements related to green steel supply agreements
- Prominent steelmakers and commodity index providers recently introduced green steel premium mechanisms, including:
 - A Nordic based steelmaker initiated an anticipated €300/tonne premium for near-zero emission steel
 - A US-based steelmaker initiated a US\$40/tonne surcharge for steel produced with DRI/HBI
 - First European flat green steel premium¹ index launched with an inaugural assessment at €200-300/tonne of CO₂ reduced steel

TRACKED GREEN STEEL SUPPLY AGREEMENTS

CARBON COSTS ADJUSTMENTS

- Carbon Border Adjustment Mechanism (CBAM) implemented by the EU aims to address the issue of carbon leakage and encourage decarbonization practices globally
- CBAM will be implemented in 2026, and reach its full impact by 2034, which will impact the iron and steel sector
- As CBAM financial obligations are progressively deployed, carbon emission considerations will be an increasingly important cost component in international steel trade

AVERAGE CARBON COST IN STEEL PRODUCTION (US\$/T STEEL)

CARBON COSTS ADJUSTMENTS CASE STUDIES: EU AND CHINA

- Post-2034, all EU steel producers will be exposed to carbon cost obligations
- BOF producers carbon costs are forecasted to be nearly 16 times higher than their EAF peers once CBAM is fully deployed

- In China, significant CBAM will be expected to be passed onto steel producers who want to export to the EU market
- Similar legislation recently proposed in the US with "Foreign Pollution Fee Act of 2023"

INDUSTRY INSIGHTS

Disclaimer:

This section of the Presentation (included in slides 43 to 77) (the “CIX Presentation”) is a presentation by CIX Inc. (Continuous Improvement Experts). The CIX Presentation has been prepared by CIX Inc. The CIX Presentation contains 3rd party information, has not been prepared by, and does not reflect opinions of, Champion Iron Limited

PRESENTER BIO

- Jeremy was born in Tonbridge, England in 1961 and emigrated to Canada in 1966. Jeremy grew up in Ottawa and attended Queen's University in Kingston, Canada, earning a BSc in Chemical Engineering in 1983 followed by an MSc in Chemical Engineering in 1985.
- Jeremy is a founding partner and President of Continuous Improvement Experts (CIX). Previously, he has held senior positions at Transfield Services, Tenova, WorleyParsons, Nupro Corporation, Bechtel Corporation, Florida Steel and Hatch Associates.
- Jeremy was made an honorary member of the American Institute of Mining, Metallurgical and Petroleum Engineers. He is a distinguished Member of the AIST, a recipient of the John Bell Award for advancing EAF technologies and a Fellow of the International Iron Metallurgy Association (IIMA). He is the past chairman of the AIST EAF Committee and the past chairman of the WorldSteel EAF Technology Committee. He is also a frequent contributor to AIST conferences, a frequent session chairman at its annual convention and the author of over 100 technical papers and articles.
- Jeremy's steelmaking experience spans direct reduction, smelting reduction, EAF steelmaking, blast furnace operations, BOF operations, ladle metallurgy, vacuum treatment and casting operations for all grades of steel.

CRUDE STEEL PRODUCTION BY PROCESS IN 2022

FUTURE STEELMAKING PRODUCTION BY PROCESS

Source: IEA Energy Technology Perspectives 2020

OVERVIEW OF THE STEELMAKING PROCESS

INTEGRATED STEEL PLANT

- Huge associated infrastructure – high cost of investment
- Several environmental concerns
- Utilizes 70-85 % hot metal in BOF charge, 15-30 % scrap (depends on HM chemistry)

EAF

- Less associated infrastructure – requires large electrical power supply
- Can utilize up to 100 % ore-based metallics ("OBMs") or 100 % scrap depending on the product being made
- EAF route can produce any product currently made by integrated route

H2-DRI-EAF: PREFERRED SOLUTION TO DECARBONIZE STEEL

Sources: Primetals, ULCOS

USE OF BF PELLETS AND INTERMEDIATE ELECTRIC SMELTING

- A potential solution for the use of lower grade BF pellets as DRI feedstock is an intermediate smelting/melting step between DR plant and steel plant. This technology is already offered by suppliers and plant builders (Tenova, Primetals, Metso Outotec, Hatch and SMS) whereby lower grade DRI is refined under reducing conditions in an electric smelter (e.g. submerged arc furnace, open slag bath furnace) prior to being charged to the steel plant or cast into pig iron ingots. This technology is expected to be utilized by Thyssenkrupp Steel, ArcelorMittal (Dunkerque and Gijon), Acciaierie d'Italia (Taranto). **Aggregate volume of DRI from these plants is estimated at -11 mt (requiring -16 mt pellets)**
- Tata Steel Ijmuiden's transition to green steelmaking will involve DR plants coupled with intermediate electric smelting capability. This solution is under active consideration for the medium term by iron ore producers in Western Australia whose Pilbara ores are difficult and expensive to beneficiate

ALTERNATIVE DR PROCESS ROUTES

OTHER POTENTIAL ROUTES

- Molten electrolysis (Boston Metals)
- Electrolytic process (Electra)
- Plasma process

INTERMEDIATE ELECTRIC SMELTING

USING AN INTERMEDIATE STEP TO ENABLE THE USE OF LOW-GRADE IRON ORE IN DRI-EAF IS SIGNIFICANTLY MORE COMPLEX AND COSTLY

Electrical energy supplied by three transformers – energy is required for melting, final reduction

Hot DRI transport connects direct reduction plant with Smelters

Reducing atmosphere in the furnace ensures CO rich off gas – off gas is collected and prepared for further usage.

Slag is adjusted to fit for application in cement industry. Slag is tapped on one side and granulated right after tapping.

Large furnace ensure big surface between slag and metal and good slag reduction, big hot heel to buffer hot metal before tapping as well as long refractory lifetime

Tapping System for hot metal tapping into torpedo car. Existing hot metal logistics can be reused

Charging system for carbon carrier, fluxes and other additions (e.g. recycling materials, scrap)

THE PROBLEM WITH SCRAP

PROPORTION OF SCRAP USED IN STEELMAKING

DEVELOPED ECONOMIES HAVE ALREADY OPTIMIZED SCRAP COLLECTION WHILE EMERGING ECONOMIES WILL FACE CHALLENGES IN SCRAP COLLECTION

Source: WorldSteel

SCRAP SUPPLY CHALLENGES

- Rising residual levels – copper, tin, nickel, molybdenum/chrome
- Extraneous materials – dirt, oil, grease fluff, coatings
- Proximity of scrap to steelmaking hubs – logistics of collection/transportation and associated CO₂ footprint
- Lack of common global nomenclature for scrap grades and large degree of variability in obsolete scrap
- Declining availability of prime/prompt scrap
- Copper content in products expected to rise with increased electrification

End-of-life scrap availability

Source: WorldSteel

Global scrap availability, Mt

A SOLUTION IS NEEDED TO ACHIEVE HIGH SCRAP RECYCLE RATE

- In North America, the short-term solution is dilution; this is evidenced by the high use of ore-based materials (pig iron, DRI and HBI) in the charge mix to dilute residual levels in the recycled steel
- The added benefits of DRI and HBI on GHG emissions will also be a factor leading to increased use
- Currently, OBMs enable the recycling of high-residual obsolete scrap; without OBMs, a significant amount of obsolete scrap would not be recycled, but would be destined for landfills
- “Prime” scrap availability is shrinking in many mature economies as manufacturers become more efficient and generate lower quantities of scrap
- As steel technology evolves (i.e. advanced high-strength steels), the quantity of steel used is also shrinking
- At the same time, several automakers are calling for high quality flat products made without pig iron

THE CHALLENGE WITH RESPECT TO SCRAP RESIDUAL LIMITS

Key Drivers

- A shortage in prime scrap
- Rising copper levels in obsolete scrap
- Increased EAF based steel production

Impacts

- Result in shortages of higher quality scrap to support the steel industry
- The demand for “clean” iron units will grow considerably
- This demand can only be satisfied with OBMs (MPI, GPI, DRI and HBI)

SCRAP PRODUCTS AND RESIDUAL LIMITS FOR CERTAIN STEEL

As the average copper content in recycled scrap increases, more ore-based material is required to dilute the residuals in the scrap to produce certain steel products

AN EXAMPLE WITH COPPER RESIDUALS IN SCRAP

- Currently, the average copper content of scrap recycled in North America is about 0.25–0.30 weight %
- Even at this level, to make a product with 0.10 wt. % Cu max, it is necessary to blend around 65% OBM to achieve the targeted chemistry
- It is expected by 2050, the average copper content in obsolete scrap could reach 0.50 wt.%

NECESSARY OBM CONTENT OF THE SCRAP MIX

		Desired product maximum copper content (wt.% Cu)						
		0.10	0.20	0.25	0.30	0.40	0.50	
Obsolete scrap copper content (wt. % Cu)	0.10	0%						Current average North American scrap
	0.20	51%	0%					
	0.25	61%	20%	0.0%				
	0.30	67%	34%	17%	0.0%			
	0.40	75%	50%	38%	25%	0.0%		2050 expected scrap
	0.50	80%	60%	50%	40%	20%	0.0%	
	0.60	84%	67%	59%	50%	33%	17%	

By 2050, it may not be possible to produce even basic steel products such as rebar using only obsolete scrap, without the use of OBMs to dilute the scrap residual impurities

VARIOUS STEEL PRODUCTS AND SCRAP RESIDUALS

TYPICAL MAXIMUM RESIDUALS LEVELS FOR DIFFERENT STEEL GRADES

	S	Cu	N	Mo	Cr	Sn	Total

No.2 Heavy Melt	0.07	0.55	0.20	0.04	0.18	0.04	1.08
DRI/HBI	0.005	0.002	0.009	<0.001	0.003	trace	0.02

DRI produced with high-purity iron ore is the key to produce high-grade, low residual steel grades

THE SOLUTION: ORE-BASED METALLICS ("OBMs")

PAST

- Ore based metallics “OBMs” (pig iron, DRI and HBI) are derived from iron ore as opposed to scrap
- OBMs have been utilized in EAF operations for many years
- In the early days, geographical areas lacked sufficient scrap to support EAF operations turned to DRI
- This was most prominent in areas that have access to cheap and plentiful natural gas
- Chronologically, the next phase in OBM utilization involved the use of pig iron in the EAF
- The reasons for this were many – improved carbon yield to the bath, increased productivity and more consistent operations
- Eliminated the need for charge carbon
- Resulted in increased oxygen utilization in the EAF
- The next big milestone in OBM utilization occurred when EAF operations transitioned to the production of flat products
- Insufficient supply of prompt scrap necessitated the utilization of DRI, HBI and pig iron to achieve the desired product chemistry
- This trend continued as EAFs moved into the production of higher and higher quality flat products resulting in the use of larger and larger quantities of OBMs

PRESENT AND FUTURE

- As the world moves into the next evolution of steelmaking, and consider the scrap market out to 2050, **OBMs are no longer a luxury, but have become a core feedstock for EAF steelmaking**

OTHER CONSIDERATIONS FOR OBM UTILIZATION

- Helps to close the loop on the circular economy
- Enables utilization of more medium/low grade scrap
- Greater steelmaking capacity moving to EAF based production
- Consistency of EAF operations
- Pacing of operations

EXAMPLE OF MERCHANT MATERIAL FLOW FOR HBI

Source: Midrex

MERCHANT DR PELLETT SHORT-TERM DEMAND PROJECTION

- Iron ore pellet prices are largely a function of demand for the Chinese steel industry
- In the latter part of 2021, as China reduced integrated steel production, pellet prices have dropped
- However, increased demand globally for EAF based steelmaking has placed increased demand on EAF feedstocks

MERCHANT DR PELLETT DEMAND

MERCHANT DR PELLETT SUPPLY

Source: C Barrington

Notes: Numbers may not add up due to rounding | 1.45 tonne pellets required per 1 tonne DRI

DRI DEMAND LONG-TERM PROJECTIONS

Metallics demand			
Metallics undergo a major overhaul			
Mt —	Scrap	DRI	Hot Metal
Base (2021)	750	117	1369
Base (2050)	1200 (1.6x)	279 (2.4x)	1150 (0.84x)
AET1.5 (2050)	1294 (1.7x)	549 (4.7x)	608 (0.45x)

x: change as compared to Base (2021)

*Metallics demand will have to evolve under AET1.5 –
Scrap pool needs doubling from current levels
DRI production must rise five-fold to touch 550Mt
Hot metal to halve from current levels*

Wood Mackenzie: October 2022
“Iron and steel’s US\$ 1.4 trillion shot at decarbonization”

AET = Accelerated Energy Transition

Source: CIX

Note: Numbers may not add up due to rounding

DRI UTILIZATION ENABLES HIGHER GRADE STEEL PRODUCTS

- For flat products, wires, springs, there is a much greater need for OBMs to reduce residual contents
- Demand is higher in developed countries for flat products vs. lower grade products like rebar
- Many announced EAF projects in North America are for higher flat products

GLOBAL MERCHANT PIG IRON SUPPLY

MPI pricing has traditionally been closely related to the price of iron ore pellets. In the past 2 years, it has coupled more closely to the pricing of prime scrap and even obsolete scrap. This is because flat product producers began to produce higher quality shredded scrap, thus reducing demand for MPI.

PRE-RUSSIA/UKRAINE CONFLICT MERCHANT PIG IRON PRODUCTION BY COUNTRY

PRE-RUSSIA/UKRAINE CONFLICT MERCHANT DRI/HBI PRODUCTION BY COUNTRY

GRANULATED PIG IRON PRODUCTION BY COUNTRY

VALUE-IN-USE (“VIU”) CONCEPT

LOW IS GOOD

- **% ACID GANGUE (SiO_2 , Al_2O_3)** - Higher gangue results in increased kWh, higher yield losses, higher flux requirements, higher slag generation
- **% OTHER GANGUE** - May consider % P if over a target level, % S in some cases. Ore source determines S and P levels - want low levels
- **% OTHER RESIDUAL** - May assign additional value due to lack of Cu and other residuals
- **% FeO** - This can be recovered but takes reductant and energy
- **% H_2O** - Represents a yield loss and impacts energy consumption
- **% FINES** - Some fine materials will be lost to the off-gas system (yield loss)
- **% C** - Requirements depend on how you operate the EAF

HIGH IS GOOD

- **% Fe TOTAL** - As high as possible
- **% METALLIZED Fe (PURE Fe)** - Want this as high as possible
- **DRI/HBI QUALITY** - Use of high % of DRI/HBI is only economical if the quality is high (QASCO/SULB)
- **DRI TEMPERATURE** - Hot charging is preferred - temperature as high as practical (integrated site advantage)
- **% C** - Requirements depend on how you operate the EAF

IMPACT OF ACID GANGUE CONTENT IN EAF EXPLAINED

- The higher the gangue content, the greater the flux requirement in the EAF
- Fluxes combine to form calcium silicate, di-calcium silicate – consumes about 740 kWh per tonne of slag
- Larger slag quantity results in greater yield loss – both FeO in the slag and Fe droplets trapped in the slag
- Need more MgO in order to protect furnace refractories
- + 0.5% acid gangue in DRI result in approximately + 20 Kwh/t melting power in EAF
- + 0.5% acid gangue in DRI result in + 0.09 kg/t electrode consumption in EAF
- + 0.5% acid gangue in DRI result in approximately + 2-4 minutes of Power On time

Bloom Lake's expected DR quality iron ore would result in cost savings for steelmakers compared to competing products

STEELMAKING

- DRI and HBI have evolved into a high-quality charge material for the EAF with multiple benefits
- Benefits are highly dependent on practices and local plant parameters
- Benefits are best quantified using a VIU model
- Roof feeding gives considerable benefits

SCRAP vs. OBMs

- Demand for OBMs will continue as OBMs will be used to increase the recycling rate of steel scrap
- Currently, hydrogen based DRI/HBI is projected to have the lowest carbon footprint for production
- Gangue level in DRI/HBI has a significant impact on Scope 3 emissions for the EAF steelmaking process
- Demand for OBMs will be a function of the quality of the recycled scrap

CHAMPION'S SOLUTION

- The projected chemistry of DRI/HBI produced using Champion's DR quality iron ore is projected to bring significant benefits to the EAF steelmaking process beyond what are currently achieved utilizing current DR grade pellets
- DRI/HBI made using Champion's DR quality iron ore is projected to provide energy savings, increased Fe yield and reduced operating costs as compared to current commercial DR grade pellets
- DRI/HBI made using Champion's DR quality iron ore is projected to provide reduced carbon footprint for EAF steelmaking

BLOOM LAKE A WORLD CLASS ASSET

- Significant investments completed to recommission the Bloom Lake Phase I in 2018 and complete the Phase II expansion in 2022
- Q2/FY24 quarterly production of 3.45M wmt, representing over 90% of Bloom Lake's expanded nameplate capacity of 15 Mtpa
- Benefiting from ongoing optimization work programs, the Company expects to reach and maintain Bloom Lake's expanded nameplate capacity in the near-term

BLOOM LAKE PRODUCTION (M WMT/YEAR)

Recently commissioned mining equipment

Proven and completed processing plant

Commissioned third-party infrastructure

Note: 1. FY2019 reflects Bloom Lake's commissioning year

PRODUCTION AND OPERATIONS

- Since 2018 restart: Bloom Lake mine consistently exceeded mining tonnage targets set out in the Phase I restart study, demonstrating bulk mining expertise, while ore grades reconciled with expectations
- Recent performance: Material mined rate negatively impacted by delays in delivery of mining equipment. Lower stripping levels expected to be recovered with the recent commissioning of additional equipment. Head grade in line with latest LoM

2023 BLOOM LAKE TECHNICAL REPORT HIGHLIGHTS

- **Confirmed 18 years' LoM** based on the mineral reserves
- **40% increase** in Measured and Indicated ("M&I") Resources
- **360% increase** in Inferred Resources
- Mineral resources and reserves based on a long-term price of US\$110.24/t and US\$99.0/t, respectively, compared to the 3 and 5-years average P65 iron ore price of US\$148.6/t and US\$128.5/t¹
- Technical Report mineral reserves exclude DRPF and nearby exploration potential
- Sizeable resources offers opportunity beyond LoM, including debottlenecking Bloom Lake to produce beyond its 15 Mtpa expanded nameplate capacity

MINERAL RESOURCES (15% Fe Cut-Off Grade, Undiluted)						
Category	Tonnes (M dmt)	Fe (%)	CaO (%)	Sat (%)	MgO (%)	Al ₂ O ₃ (%)
Measured	186.7	30.4	1.3	5.5	1.3	0.3
Indicated	1,065.5	28.4	1.3	6.1	1.2	0.5
Total M+I	1,252.2	28.7	1.3	6.0	1.2	0.5
Inferred	246.3	26.6	1.4	6.4	1.2	0.5

MINERAL RESERVES (15% Fe Cut-Off Grade, Diluted)						
Category	Diluted Ore Tonnes (M dmt)	Fe (%)	CaO (%)	Sat (%)	MgO (%)	Al ₂ O ₃ (%)
Proven	183.7	30.0	1.3	5.6	1.3	0.3

GROWTH OPPORTUNITY DIRECT REDUCTION PELLET FEED (DRPF)

CHAMPION IRON 

TSX: CIA | ASX: CIA | OTCQX: CIAFF

DIRECT REDUCTION PELLET FEED

POSITIVE IMPACT FOR ALL STAKEHOLDERS

- Project to upgrade the Phase II plant (7.5 Mtpa) from **66.2% to a 69% Fe** (industry leading DR quality iron ore)
- Expected to attract significant additional pricing premium over the P65 index
- One of the few iron ore deposits in the world capable of upgrading to DR quality
- Project designed to be carbon neutral and not expected to create additional environmental impact
- Construction phase of the Project expected to create approximately 150 jobs with 70 permanent quality jobs once completed

Opportunity for regional communities to benefit from the transformation to DRPF, while creating a positive impact globally by contributing to greener steelmaking

DIRECT REDUCTION PELLET FEED

PROJECT USING PROVEN AND OPTIMIZED TECHNOLOGIES

Significant research and development, combining local and global expertise, resulting in an efficient project expected to significantly reduce energy consumption

DIRECT REDUCTION PELLET FEED

A TRANSFORMATIONAL PROJECT SUPPORTED BY ROBUST ECONOMICS

PROJECT MILESTONES

- Positive findings of the study released in January 2023 include robust economics
- **\$28.9M in investments completed as of September 30, 2023**, from the **\$62M initial budget** approved by the Board
- **Project's final investment decision** expected in the near-term for a potential commissioning in calendar H2/2025

Contingencies	76.2	56.9
TOTAL	470.7	351.3

DIRECT REDUCTION PELLET FEED

5 LEVERS TO JUSTIFY PREMIUMS FOR DR PELLET FEED QUALITY IRON ORE

Premium pricing for DR quality iron ore over BF feed

Higher Fe content versus DR benchmark should attract additional premiums vs other DR quality iron ore

Lower gangue versus DR benchmark should attract additional premium vs other DR quality iron ore

Potential freight savings to service leading DRI/EAF hubs in EU and US

Potential carbon cost savings in steelmaking

P65 AND DR PELLET PREMIUM
(US\$/T)

Bloom Lake's DRPF is expected to capture a significant portion of the DR pellet premium and attract additional premiums compared to other DR quality iron ore due to its higher quality specifications

GROWTH OPPORTUNITY

KAMI PROJECT

CHAMPION IRON 

TSX: CIA | ASX: CIA | OTCQX: CIAFF

A HIGH-PURITY IRON RESOURCE EXPECTED TO PRODUCE DR QUALITY IRON ORE

- Strategically located near available infrastructure only a few kilometers southeast of Bloom Lake in the province of Newfoundland and Labrador
- Potential to access the same rail and port infrastructure as Bloom Lake

TAKING INITIATIVE TO MOVE THE PROJECT FORWARD

Study expected in the near-term

Initial project includes one concentrator to produce DR quality iron ore

Similar geology and flowsheet is anticipated to also be similar to Bloom Lake

Operating costs are anticipated to be similar to Bloom Lake

Preliminary rendering of the proposed Kami concentrator

TAKING INITIATIVE TO MOVE THE PROJECT FORWARD

Open pit – Looking West

Concentrator Area – Looking South

Ongoing work with government authorities to assess previously issued permits required for the project

Company expects to sequence the project with other organic growth opportunities to preserve its prudent approach to capital management

Opportunity to attract partners and accelerate project development

PEER IRON ORE CONCENTRATE GREENFIELD PROJECTS CAPITAL INTENSITY AVERAGED US\$290¹ PER TONNE OF CAPACITY IN THE PREVIOUS CYCLE (UNADJUSTED FOR INFLATION)

High-grade iron ore projects, critical for the green steel transition, require significant capital investments

"HIGH-GRADE, LOW-IMPURITY" IRON ORE ON THE PROVINCIAL CRITICAL MINERAL LIST

- High-grade and low impurity iron ore was listed on the province of Newfoundland and Labrador's critical minerals list joining other minerals such as nickel, copper and cobalt
- Identified as critical due to its **positive impact** in **reducing greenhouse gas emissions** in steelmaking and the **potential for further value-added activity as a green steel input**
- Newfoundland and Labrador provincial government is **actively investing** to support the implementation of the Critical Minerals Plan

GROWTH OPPORTUNITY REGIONAL EXPLORATION

CHAMPION IRON 

TSX: CIA | ASX: CIA | OTCQX: CIAFF

DE-RISKING ONE OF THE WORLD'S LARGEST HIGH-PURITY IRON ORE RESOURCE OPPORTUNITIES

- **One of the largest undeveloped hubs of high-purity iron ore resources globally**
- **\$9.3M** in exploration and evaluation expenditures in FY23, including over 2,200 meters drilled
- **Repurchased most royalties** on regional resources in recent years

CLUSTER II

GROWTH OPPORTUNITY PELLETIZING

CHAMPION IRON 

TSX: CIA | ASX: CIA | OTCQX: CIAFF

CHAMPION IS EVALUATING THE OPPORTUNITY FOR ADDITIONAL PRODUCT TRANSFORMATION TO INCREASE ITS PARTICIPATION IN THE GREEN STEEL SUPPLY CHAIN

DIRECT REDUCTION PELLETS

STUDY STAGE

Study to produce DR pellets at the Pointe-Noire pellet plant

COLD BONDED PELLETS

SEMI-INDUSTRIAL PROTOTYPE

Collaborating with BSL to de-risk a promising cold pelletizing technology

POINTE-NOIRE PELLET PLANT

ADVANCING A STUDY WITH A MAJOR INTERNATIONAL STEELMAKER

-  Opportunity to leverage the DR quality iron ore from the DRPF project and produce DR pellets
-  Direct access to port and Champion's existing loadout
-  Potential to reconnect to **renewable power and water access**
-  High end metallization and metallurgical properties
-  Champion's ore is proven to be able to produce a **high strength pellet**
-  High tumble index with lower degradation during handling

POINTE-NOIRE PELLET PLANT

STUDY COMPLETION EXPECTED IN THE NEAR-TERM

The project study is expected in the near-term with significant required investments and it represents another growth opportunity in keeping with Champion's prudent capital management approach

COLD BONDED PELLETS

CHAMPION IS AN EARLY INVESTOR AND COLLABORATOR IN AN INDUSTRY LEADING SOLUTION

Champion is collaborating to de-risk a technology to produce some of the lowest CO₂ intensity cold bonded pellet globally

PERFORMING IN HIGH TEMPERATURE SIMULATION

→ Champion has been developing **Cold Bonded Pellets** (“CBP”) in partnership for 4½ years to identify the best combination between:

Process

Binder

Iron ore

→ CBP are stable in different BF operational modes, simulating various clients, and are expected to qualify for DR-EAF route

→ CBP reached a satisfactory strength level comparable to seaborne fired pellets

COLD PELLETTIZING SAMPLE EQUIPMENT

Source: Champion Iron Limited

BLAST FURNACE DEGRADATION TEST

As pellets descend in the furnace, intense heat causes iron to react with CO gas from burning coke resulting in the iron's “reduction” (loss of oxygen). Due to the need for CO and other gases to percolate, it is important the pellets retain integrity and not generate fines.

CLOSING REMARKS

NOTES ON HISTORICAL ESTIMATES USED IN THE PRESENTATION

1. The historical Kami Project resource estimates are based on the National Instrument 43-101 technical report entitled "Feasibility Study of the Rose Deposit and Resource Estimate for the Mills Lake Deposit of the Kamistiasusset (Kami) Iron Ore Property, Labrador" prepared for Alderon Iron Ore Corp. by BBA Inc., Stantec and Watts, Griffis and McQuat Ltd. dated January 9, 2013, and having an effective date of December 17, 2012. The historical Kami Project reserve estimates are based on the National Instrument 43-101 (NI 43-101) technical report entitled "Updated Feasibility Study of the Kamistiasusset (Kami) Iron Ore Property, Labrador" prepared for Alderon Iron Ore Corp. by BBA Inc., Gemtec Ltd., Watts, Griffis and McQuat Ltd. and Golder Associates Ltd. dated October 31, 2018 and having an effective date of September 26, 2018. Kami Project mineral resources include Kami Project mineral reserves. The historical mineral resources and reserves mentioned are strictly historical in nature, are non-compliant with NI 43-101 and the JORC Code (2012 edition) and should therefore not be relied upon. A qualified person or competent person has not done sufficient work to upgrade or classify the historical estimates as current "mineral resources", "mineral reserves" or "ore reserves", as such terms are defined in NI 43-101 and the JORC Code (2012 edition), and it is uncertain whether, following evaluation and/or further exploration work, the historical estimates will be able to be reported as mineral resources, mineral reserves or ore reserves in accordance with NI 43-101 or the JORC Code (2012 edition). Champion is not treating the historical estimates as current mineral resources, mineral reserves or ore reserves. These reserves and resources are not material mining projects and are for properties adjacent to or near the Company's existing mining tenements and therefore the reports on these mineralisations have not been prepared in accordance with the JORC Code (2012 edition) and the ASX Listing Rules. As stated above, the Company has initiated work to revise the Kami Project's scope and update the feasibility study.
2. The historical Moiré Lake resource estimates are based on the NI 43-101 technical report entitled "Technical Report and Mineral Resource Estimate on the Moiré Lake Property" by P&E Mining Consultants Inc. dated May 11, 2012 and having an effective date of March 28, 2012. The historical mineral resources mentioned are strictly historical in nature, are non-compliant with NI 43-101 and the JORC Code (2012 edition) and should therefore not be relied upon. A qualified person or competent person has not done sufficient work to upgrade or classify the historical estimates as current "mineral resources", "mineral reserves" or "ore reserves", as such terms are defined in NI 43-101 and the JORC Code (2012 edition), and it is uncertain whether, following evaluation and/or further exploration work, the historical estimates will be able to be reported as mineral resources, mineral reserves or ore reserves in accordance with NI 43-101 or the JORC Code (2012 edition). Champion is not treating the historical estimates as current mineral resources, mineral reserves or ore reserves. These reserves and resources are not material mining projects and are for properties adjacent to or near the Company's existing mining tenements and therefore the reports on these mineralisations have not been prepared in accordance with the JORC Code (2012 edition) and the ASX Listing Rules.
3. The historical Lac Lamélie resource estimates are based on the National Instrument 43-101 (NI 43-101) technical report entitled "NI 43-101 Technical Report and Mineral Resource Estimate on the Lac Lamélie South Resources Quebec - Canada" by Met-Chem, a division of DRA Americas Inc. dated July 28, 2017, and having an effective date of January 26, 2017. The historical mineral resources mentioned are strictly historical in nature, are non-compliant with NI 43-101 and the JORC Code (2012 edition) and should therefore not be relied upon. A qualified person or competent person has not done sufficient work to upgrade or classify the historical estimates as current "mineral resources", "mineral reserves" or "ore reserves", as such terms are defined in NI 43-101 and the JORC Code (2012 edition), and it is uncertain whether, following evaluation and/or further exploration work, the historical estimates will be able to be reported as mineral resources, mineral reserves or ore reserves in accordance with NI 43-101 or the JORC Code (2012 edition). Champion Iron Limited is not treating the historical estimates as current mineral resources, mineral reserves or ore reserves. These reserves and resources are not material mining projects and are for properties adjacent to or near Champion Iron Limited's existing mining tenements and therefore the reports on these mineralisations have not been prepared in accordance with the JORC Code (2012 edition) and the ASX Listing Rules.
4. The historical Consolidated Fire Lake resource and reserve estimates are based on the National Instrument 43-101 technical report entitled "Preliminary Feasibility Study of the West and East Pit Deposits of the Fire Lake North Project" by BBA Inc., P&E Mining Consultants Inc. and Rail Cantech Inc. dated February 22, 2013 and having an effective date of January 25, 2013. The historical mineral resources and resources mentioned are strictly historical in nature, are non-compliant with NI 43-101 and the JORC Code (2012 edition) and should therefore not be relied upon. A qualified person or competent person has not done sufficient work to upgrade or classify the historical estimates as current "mineral resources", "mineral reserves" or "ore reserves", as such terms are defined in NI 43-101 and the JORC Code (2012 edition), and it is uncertain whether, following evaluation and/or further exploration work, the historical estimates will be able to be reported as mineral resources, mineral reserves or ore reserves in accordance with NI 43-101 or the JORC Code (2012 edition). Champion Iron Limited is not treating the historical estimates as current mineral resources, mineral reserves or ore reserves. These reserves and resources are not material mining projects and are for properties adjacent to or near Champion Iron Limited's existing mining tenements and therefore the reports on these mineralisations have not been prepared in accordance with the JORC Code (2012 edition) and the ASX Listing Rules.
5. The historical Quinto Claims resource estimates are based on the National Instrument 43-101 technical reports entitled "Mineral Resource Technical Report, Peppier Project, Quebec" (as regards Peppier Lake), "Mineral Resource Technical Report, Lamelee Project, Quebec" (as regards Lamélie) and "Mineral Resource Technical Report, Hobdad Project, Quebec" (as regards Hobdad), each by G H Wahl & Associates Consulting dated February 15, 2013 and having an effective date of December 31, 2012. The historical mineral resources mentioned are strictly historical in nature, are non-compliant with NI 43-101 and the JORC Code (2012 edition) and should therefore not be relied upon. A qualified person or competent person has not done sufficient work to upgrade or classify the historical estimates as current "mineral resources", "mineral reserves" or "ore reserves", as such terms are defined in NI 43-101 and the JORC Code (2012 edition), and it is uncertain whether, following evaluation and/or further exploration work, the historical estimates will be able to be reported as mineral resources, mineral reserves or ore reserves in accordance with NI 43-101 or the JORC Code (2012 edition). Champion Iron Limited is not treating the historical estimates as current mineral resources, mineral reserves or ore reserves. These reserves and resources are not material mining projects and are for properties adjacent to or near Champion Iron Limited's existing mining tenements and therefore the reports on these mineralisations have not been prepared in accordance with the JORC Code (2012 edition) and the ASX Listing Rules.
6. The historical Harvey Tuttle resource estimates are based on the National Instrument 43-101 technical report entitled "Technical Report and Resource Estimate on the Harvey-Tuttle Property Québec, Canada" by P&E Mining Consultants Inc. dated April 13, 2011 and having an effective date of February 25, 2011. The historical mineral resources mentioned are strictly historical in nature, are non-compliant with NI 43-101 and the JORC Code (2012 edition) and should therefore not be relied upon. A qualified person or competent person has not done sufficient work to upgrade or classify the historical estimates as current "mineral resources", "mineral reserves" or "ore reserves", as such terms are defined in NI 43-101 and the JORC Code (2012 edition), and it is uncertain whether, following evaluation and/or further exploration work, the historical estimates will be able to be reported as mineral resources, mineral reserves or ore reserves in accordance with NI 43-101 or the JORC Code (2012 edition). Champion Iron Limited is not treating the historical estimates as current mineral resources, mineral reserves or ore reserves. These reserves and resources are not material mining projects and are for properties adjacent to or near Champion Iron Limited's existing mining tenements and therefore the reports on these mineralisations have not been prepared in accordance with the JORC Code (2012 edition) and the ASX Listing Rules.
7. The historical Penguin Lake resource estimates are based on the National Instrument 43-101 technical report entitled "43-101 Technical Report and Mineral Resource Estimate on the Penguin Lake Project" by MRB & Associates dated February 3, 2014 and having an effective date of May 1, 2013. The historical mineral resources mentioned are strictly historical in nature, are non-compliant with NI 43-101 and the JORC Code (2012 edition) and should therefore not be relied upon. A qualified person or competent person has not done sufficient work to upgrade or classify the historical estimates as current "mineral resources", "mineral reserves" or "ore reserves", as such terms are defined in NI 43-101 and the JORC Code (2012 edition), and it is uncertain whether, following evaluation and/or further exploration work, the historical estimates will be able to be reported as mineral resources, mineral reserves or ore reserves in accordance with NI 43-101 or the JORC Code (2012 edition). Champion Iron Limited is not treating the historical estimates as current mineral resources, mineral reserves or ore reserves. These reserves and resources are not material mining projects and are for properties adjacent to or near Champion Iron Limited's existing mining tenements and therefore the reports on these mineralisations have not been prepared in accordance with the JORC Code (2012 edition) and the ASX Listing Rules.
8. Certain resources mentioned are foreign estimates from an Australian perspective.

NOTES ON MINERAL RESOURCES AND MINERAL RESERVES FOR THE BLOOM LAKE MINE

Mineral Resources

1. Mineral resources are not mineral reserves and have not demonstrated economic viability under the assumptions contained in the 2023 Technical Report. All figures have been rounded to reflect the relative accuracy of the estimates.
2. The resource estimate is reported undiluted at a cut-off grade of 15% iron.
3. The 2023 resource shell is based on a long-term P65 iron price of US\$110.24/dmt, a premium of US\$2.04/dmt for the 66.2% Fe concentrate and an exchange rate of 1.27. It was made using Geovia Whittle (software version 4.7.2).
4. The qualified person ("QP") for the mineral resource estimate, as defined by NI 43-101, is Erik Ronald, P. Geo., of SRK. The effective date of the estimate is April 1, 2023.
5. The geological interpretations for the Bloom Lake deposit were based on lithological logging, analyses from drill core, grade control data, geological maps, historical models, and ground magnetic surveys. The geology and controls on the mineralization are considered well understood.
6. The mineralized iron formation units in the lithology model include iron formation, silica iron formation, and limonite. The iron formation model further differentiates the iron formation units into operational quality categories of low (under 0.6%), moderate and elevated (over 16%) CaO + MgO values.
7. All 3D digital geological modelling was performed using Leapfrog Geo™ software. In the QP's opinion, the geological model is appropriate for the size, grade distribution, and geometry of the mineralized zones and is suitable for mineral resource estimation of the Bloom Lake project.
8. The mineral resource model is based on 6.0 m composite intervals within the iron formation. Grade capping was reviewed but deemed unnecessary and was not applied. Ordinary kriging (OK) was used for the estimation of CaO, Fe, MgO, and SAT. Al2O3 was estimated into the block model using inverse distance weighting to a power of three (ID3) estimation.
9. Mineral Resources were classified into measured, indicated, and inferred mineral resources categories based on the geological understanding of mineralization and structure on the property, the quality of the underlying drilling data, history of mining production and reconciliation, mineralization and grade continuity, and drillhole spacing.
10. The QP is satisfied that the mineral resources were estimated following CIM Estimation of Mineral Resource and Mineral Reserves Best Practices Guidelines (November 2019). The mineral resources may be affected by further infill and exploration drilling that may result in increases or decreases in subsequent mineral resource estimates. The mineral resources may also be affected by subsequent assessments of mining, environmental, processing, permitting, taxation, socio-economic, and other factors.

Mineral Reserves

1. The mineral reserves were estimated using the Canadian Institute of Mining, Metallurgy and Petroleum (CIM) Standards for Mineral Resources and Reserves, Definitions and Guidelines prepared by the CIM Standing Committee on Reserve Definitions and adopted by the CIM Council on May 10, 2014.
2. The QP for the mineral reserve estimate, as defined by NI 43-101, is Olivier Hamel, P. Eng., of Quebec Iron Ore Inc. ("QIO"), a subsidiary of the Company. The effective date of the estimate is April 1, 2023.
3. In the ultimate pit design, all measured resources and associated dilution/ore loss were converted to proven mineral reserves. All indicated resources and associated dilution/ore loss were converted into probable mineral reserves.
4. Stockpiles are excluded from reserve calculations due to their small size (<1 Mt).
5. Bulk density of ore is variable but averages 3.39 t/m3 (pre-dilution).
6. Remaining strip ratio is 0.96:1 (including overburden).
7. Mining dilution was calculated using a 2-m contact skin.
8. The average mining dilution is 1.73% at a grade of 0% Fe. Dilution was applied block by block and shows a wide range of local variability.
9. The average ore loss is 1.91% at a grade of 29% Fe. Ore loss was applied block by block and shows a wide range of local variability.
10. Mineral reserves are based on a mining surface projected to April 1, 2023. The last survey was done in Q3 2022.
11. Mineral reserves are estimated at a cut-off grade of 15% Fe (diluted), which has historically been used. Current cost/revenue model allows to calculate a break-even cut-off grade and the result of 14.1% Fe supports the current practices.
12. Mineral reserves are estimated using a long-term iron ore reference price (Platt's 65%) of USD99/dmt and an exchange rate of 1.27 CAD/USD. A price adjustment to 66.2% of USD1.83/dmt was added.
13. Reserve open pit optimization was conducted using Geovia Whittle (software version 4.7.2) to determine the optimal economic shape of the open pit to guide the pit design process.
14. SAT stands for SATMAGAN, an industry standard device that measures the magnetic content by weight of a sample. This value is assumed to be the magnetite content by weight.
15. The author is not aware of any known environmental, permitting, legal, title-related, taxation, socio-political or marketing issues, or any other relevant issues not reported in the 2023 Technical Report, that could materially affect the mineral reserve estimate.
16. Numbers may not add up due to rounding.
