ECOLOMONDO INCREASES OUTPUT AT ITS HAWKESBURY TDP FACILITY

Montreal, QC, October 8, 2025 -- **Ecolomondo Corporation** (TSXV: ECM) (OTCQB: ECLMF) (the "**Company**" or "**Ecolomondo**"), a leading Canadian innovator in sustainable scrap tire recycling technology, is proud to announce a steady increase of output in its thermal decomposition department at the Hawkesbury TDP facility.

In order to support the increased demand for its end-products, the Company reports that it achieved new production levels and recently performed 4 double batches in 4 days, all in automatic mode. During these 4 production days, the TDP facility processed 60 tons of crumb rubber and recovered approximately 24 tons of recovered carbon black ("**rCB**"), 6 tons of syngas and 350 barrels of tire-derived oil, the equivalent of over 2 tanker loads of oil.

The Company recently announced record revenues for the month of September 2025 from its Hawkesbury TDP facility, an increase of 325% over September 2024. Revenue streams from the Hawkesbury TDP facility come from the sale of end-products manufactured on-site, namely rCB, oil, steel and syngas, as well as tipping fees for the disposal of scrap tires. Despite this strong performance, the Company notes that it continues to operate at a loss; this is largely due to the Hawkesbury TDP facility still being in its ramp-up phase.

To support the increasing pace of production, Ecolomondo continues to hire and train additional mechanics, operators and supervisory staff for all 3 departments of the Hawkesbury TDP facility; tire shredding, thermal and rCB processing.

"We are proud to achieve this stable and consistent increase in the output at our Hawkesbury facility, particularly in the thermal decomposition department," said JF Labbé, Interim CEO of the Company. He added "It demonstrates the efficiency of Ecolomondo's proprietary TDP technology, and the control system that assures the repetitiveness of the process and the consistency of its end-products."

About Ecolomondo Corporation
Ecolomondo Corporation, headquartered in Québec, is a Canadian cleantech company that takes pride in its proprietary Thermal Decomposition technology (TDP). It has a 25-year history and during this time has been focused on its development of its technology and the deployment of TDP turnkey facilities. TDP recovers high value re-usable commodities from scrap tire waste, notably rCB, oil, syngas, fiber and steel. Ecolomondo expects to be a leading player in the cleantech space and be an active contributor to the global circular economy. Ecolomondo trades in Canada on the TSX Venture Exchange under the symbol (TSXV:ECM) and in the United States under the symbol (OTCQB:ECLMF). To learn more, visit www.ecolomondo.com

Revenue Streams of TDP Facilities
Revenue streams from the Hawkesbury TDP facility come the sale of end-products manufactured on-site, namely rCB, oil, steel and syngas, as well as tipping fees for the disposal of scrap tires.

About the Hawkesbury Plant – A 2-Reactor TDP Facility
The Hawkesbury facility building is 46,200 sq.ft and has an indoor clearance of 28 feet. It is modern and houses 3 main production departments, tire shredding, thermal decomposition and recovered carbon black refining. Once fully operational, this facility is expected to process approximately 1 million scrap tires per year mostly comprised of car, SUV and truck tires resulting in the production of approximately 4,000 MT of recovered carbon black, 5,000 MT of pyrolysis oil, 2,000MT of steel, and 1,200 MT of process gas.

About the Shamrock Project – A 6-Reactor TDP Facility
Processing capabilities for the Shamrock facility is projected at 5 million end-of-life tires per year, yielding approximately 15,000 MT of recovered carbon black, 18,000 MT of oil, 7,500 MT of steel, and to process 4,500 MT of syngas; roughly three times the size of the Company’s Hawkesbury (Ontario) plant output that is expected to soon commence regular commercial operations. Facility construction is expected to begin by the third quarter of 2025 and projected to cost approximately US$93 million.

Our Mission, Vision & Strategy
Ecolomondo’s mission is to be a contributing participant in a dynamic Circular Economy and to increase shareholder value by producing and supplying large quantities of recovered resources to be re-used in the manufacture of new products.

Ecolomondo’s vision is to be a leading producer and reseller of recovered resources by building and operating TDP facilities, strategically located in industrialized countries, close to feedstock, labor and offtake customers.

Our strategy is to become a major global builder and operator of TDP turnkey facilities, for now specializing in the processing of ELTs. Our intent is to expand aggressively in North America and Europe. Our experience and modular technology should help us get there faster and better. We plan to keep performing ongoing research and development to ensure that Ecolomondo remains technologically advanced.

ISCC Certification

A confirmation of the Company's successful process lies in the recent International Sustainability and Carbon Certification ("ISCC") for its Hawkesbury TDP facility, another step forward that should help improve demand for TDP. ISCC is a Global Sustainability Certification System and offers chain-of-custody certification systems to ensure traceability and feedstock identity, which can add commercial value to the Company's end-products as they remain traceable in the supply chain.

Environmental, Social & Governance (ESG)

On the social aspect the Company plans to measure global health and safety, injury rate and gender diversity, and finally in the corporate governance aspect, the Company is measuring ethics and anticorruption, ESG reporting and board independence.

About TDP

The TDP process is technically proven and more advanced than most other pyrolysis technologies. Over the years, our Technological teams were able to overcome all uncertainties that plagued most competitors especially in these areas: pre-filtration, reactor cooling, reactor rotation, water recycling, processing of rCB, (hydrocarbon removal), mass monitoring, heat curve development, humidity and water removal, safety testing, system automation, emissions control and monitoring.

TDP is Environmentally Friendly – CO_2 Reduction

By producing rCB, TDP reduces GHG emissions by 90% versus the production of virgin carbon black. The production of rCB at the Hawkesbury and Shamrock facilities are expected to reduce CO_2 emissions by 15,000 and 45,000 tons per year, respectively.
