Ecolomondo Secures $2.7 million in Additional Financing

Montréal, Québec, February 11, 2026 — Ecolomondo Corporation (TSXV: ECM) (OTCQB: ECLMF) (the "Company" or "Ecolomondo") announces that it has completed final documentation with Export Development Canada ("**EDC**") for a $2.7 million in additional financing to support the final stage of the ramp-up of operations at the Company's Hawkesbury tire-derived products ("TDP") facility.

The Company previously announced on January 12, 2026, that it had reached an agreement in principle with EDC for the financing to support additional capital investments and working capital requirements at the Hawkesbury, Ontario facility. In addition to the financing, EDC has agreed to a temporary principal and interest payment holiday on existing loans during the Company's 2026 operational ramp-up period.

As previously disclosed, the Hawkesbury TDP facility achieved record production during the week of January 12, 2026. During that period, the facility processed approximately 150,000 pounds of crumb rubber, producing approximately 60,000 pounds of recovered carbon black, 75,000 pounds of tire-derived oil, and 15,000 pounds of syngas, representing the processing of approximately 9,375 scrap tires.

"This additional financing provides important financial flexibility as we complete the final stage of the Hawkesbury facility ramp-up," said Jean-François Labbé, Interim Chief Executive Officer of Ecolomondo. "It also supports continued workforce expansion and a steady increase in production as we advance toward full operational capacity."

About Ecolomondo Corporation

Ecolomondo Corporation is a Canadian cleantech company specializing in its proprietary Thermal Decomposition Process ("TDP"), with headquarters in Québec, Canada. With over 25 years of experience, the Company has focused on the development, optimization, and deployment of turnkey TDP facilities.
Ecolomondo's TDP technology recovers high-value, reusable commodities from end-of-life tires, including recovered carbon black ("rCB"), oil, syngas, fibre, and steel. Through this process, the Company enables the conversion of waste into valuable resources, supporting the transition to a circular economy.
Ecolomondo aims to be a leading player in the global cleantech sector and an active contributor to sustainable, circular solutions for tire waste management. The Company's shares trade in Canada on the TSX Venture Exchange under the symbol **TSXV: ECM** and in the United States on the OTCQB under the symbol **OTCQB: ECLMF**. Revenue Streams of TDP Facilities

Revenue streams from the Hawkesbury TDP facility come the sale of end-products manufactured on-site, namely rCB, oil, steel and syngas, as well as tipping fees for the disposal of scrap tires.

Our Mission, Vision & Strategy

Ecolomondo's mission is to be a contributing participant in a dynamic Circular Economy and to increase shareholder value by producing and supplying large quantities of recovered resources to be re-used in the manufacture of new products.

Ecolomondo's vision is to be a leading producer and reseller of recovered resources by building and operating TDP facilities, strategically located in industrialized countries, close to feedstock, labor and offtake clients. Our strategy is to become a major global builder and operator of TDP turnkey facilities, for now specializing in the processing of ELTs. Our intent is to expand aggressively in North America and Europe. Our experience and modular technology should help us get there faster and better. We plan to keep performing ongoing research and development to ensure that Ecolomondo remains technologically advanced.

About TDP

The TDP process is technically proven and more advanced than most other pyrolysis technologies. Over the years, our Technological teams were able to overcome all uncertainties that plagued most competitors especially in these areas: pre-filtration, reactor cooling, reactor rotation, water recycling, processing of rCB, (hydrocarbon removal), mass monitoring, heat curve development, humidity and water removal, safety testing, system automation, emissions control and monitoring.

TDP is Environmentally Friendly – CO_2 Reduction

By producing rCB, TDP reduces GHG emissions by 90% versus the production of virgin carbon black. The production of rCB at the Hawkesbury and Shamrock facilities are expected to reduce CO2 emissions by 22,400 and 67,200 tons per year, respectively.
