Product Line Layout and Development Progress / Cross Roller

Development of roller-type linear guides is ongoing.

- Strategically targeting the high-rigidity machine tool market to address the precision machining requirements of premium-tier clients
- Strengthening load-bearing capacity and vibration resistance to enhance overall product competitiveness

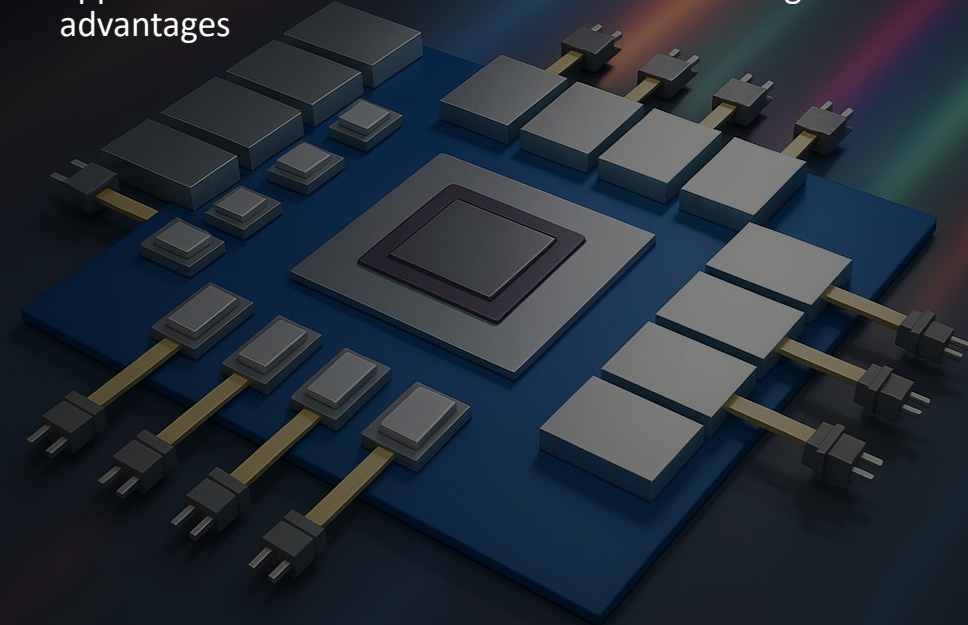

High precision, long service life

Low noise, low friction resistance,
and vibration-free linear motion.

Expanding New Applications for Cross Roller Slide Rails

- Deployment in silicon photonics alignment platforms within the optical communication sector
- Focusing on next-generation high-speed optoelectronic applications to establish differentiated technological advantages

Product Line Strategy and Development Progress – Ball Screw

High-efficiency ball screw products have entered the pilot production phase

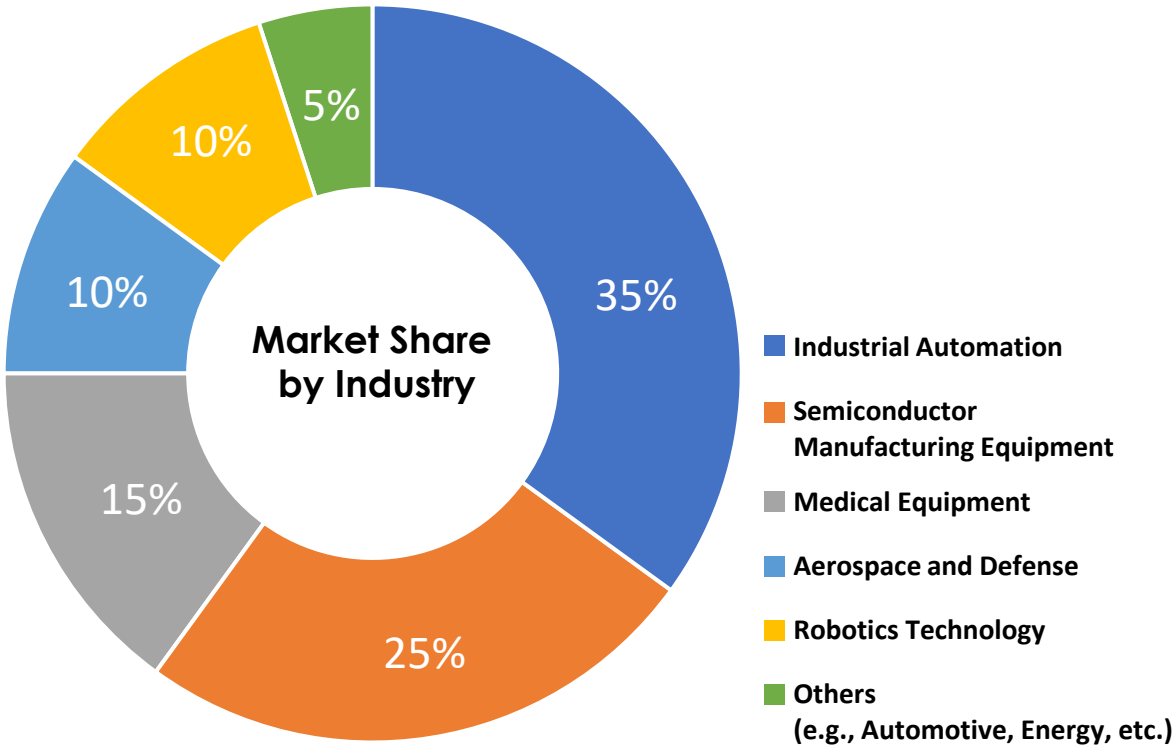

- Deployment of key processing equipment has been completed
- Pilot runs and precision calibration are in progress, with the goal of achieving stable mass production

Data Sources: IMARC Group, Market Research Future, The Business Research Company, and others

Aligning with the European Machine Tool Market

- Enhancing both precision and efficiency to meet European client requirements
- Strategically expanding into the high-end transmission system market

Data Sources: Market Research Future, IMARC Group, Verified Market Research, and others

A grayscale photograph of an industrial robotic arm in a factory setting. The arm is positioned in the center, with various mechanical components, cables, and sensors visible. The background shows a complex network of metal beams and other industrial equipment. The overall tone is technical and professional.

Laying the Groundwork for Robotics

Self-Driven R&D of Core Components

High-performance robotic joints are composed of self-developed motors, encoders, and drivers, integrated with externally procured reducers.

Development of Robotic Joints (JOINT)

General Joint (Rotary Axis):

Enables rotational motion while optimizing precision, load capacity, lifespan, and cost to meet a wide range of robotic applications.

Special Joint (Planetary Screw):

Provides linear motion or high-precision, high-thrust rotation.

Suitable for high-load, high-rigidity, and precise positioning scenarios.

Product Line Expansion

Leveraging self-developed joints, we design and introduce a diverse range of robotic products, such as robotic dogs, wheeled robots, humanoid robots, and robots with customized configurations.

Integration of Software and Hardware Strengths

Concrete Planning

We integrate large language models (LLM) and vision systems with our independently developed high-performance robotic hardware, enabling robots to possess enhanced versatility and flexibility, capable of understanding complex commands and perceiving their environment.

Objective

Achieve deep integration of near-term software capabilities and long-term hardware development.

Significance

This is the key to achieving truly intelligent robots by improving their autonomy and adaptability, thereby opening up wider application fields.
