31 March 2010

Drilling to Commence at the Jampang Gold Project in Indonesia

The Directors of Augur Resources Ltd ('Augur' or 'the Company') are pleased to advise that the first phase of drilling at the Jampang gold project in south-western Java is due to commence this week.

The drilling will initially focus on the Lipi prospect where gold mineralisation had been reported during the 1990s by Canadian mining company Mispac Resources Inc ('Mispac'). Two historical reverse circulation (RC) drill holes will be twinned during the initial phase of the drilling program to confirm the previous results. Drilling will also be undertaken to define further mineralisation along strike and below the historically reported mineralisation.

Augur is also planning for a significant RC drilling program to test a number of geophysical and geochemical anomalies to commence in May 2010.

JAMPANG GOLD PROJECT

The Jampang gold project is located approximately 150 kilometres south of Jakarta.

Location of the Central Jampang Gold Project, West Java, Indonesia.

The general geology of the area consists of Miocene/Oligocene andesite and dacite rocks overlain by recent volcanic tuffs. Historical mapping and drilling, indicates that gold bearing veins consistent with epithermal or mesothermal style mineralisation exist in the area.

Whilst the area covered by the IUPs (Izin Usaha Pertambangans or mining business licences) has undergone historical gold mining, limited modern exploration has been conducted with the exception of a three year program undertaken between 1996 and 1999 by Canadian mining company Mispec Resources Inc ('Mispec').

Mispec identified a major structural trend with numerous gold occurrences and zones of significant alteration within the project licence area. Mispec undertook approximately 32,000 metres of drilling on their Jampang leases, focused on a large alteration zone at the Cigarú prospect which covers the northern half of the licences. Within the Cigarú prospect a number of gold bearing zones were identified from the drilling. These zones remain open at depth and along strike.

Furthermore, Mispec undertook geophysical surveys at Cigarú subsequent to their main drilling program and identified anomalies associated with the known mineralisation and four additional anomalies which either have not been drill tested or have had only limited drill testing.

Mispec were planning to undertake further work at Jampang but were hampered in raising sufficient funds due to negative sentiment in the market in light of the 1997 Bre-X scandal, the Asian financial crisis and the prevailing price of gold.
