

16 August 2021

The Manager  
Company Announcements Office  
ASX Limited  
Level 4  
Exchange Centre  
20 Bridges Street  
Sydney NSW 2000

Dear Sir

**2021 BEKISOPA DRILLING PROGRAMME UPDATE**

Pursuant to the requirements of Listing Rules, please find attached an announcement authorised by the AKORA board of directors.

Yours faithfully

JM Madden  
Company Secretary

## **2021 Drilling Campaign continues to demonstrate the potential of Bekisopa as a major future iron ore project**

### **13 drill holes completed for 734 Metres in previous month**

- All holes intercepted iron mineralisation from surface with several also at depth
- High-grade massive, weathered iron mineralisation at surface in all holes
- 44 metres maximum iron mineralisation intercept
- +300 metre total lengths along southern drill grid parallel to the magnetic anomaly
- Ideal iron mineralisation cross sections for an initial zero stripping ratio mining operation
- Excellent total drill core recovery at 96%
- Iron Mineralisation continues in the Northern and Southern Zones on the main 10430 tenement, next drilling will focus on the Central zone iron mineralisation
- Drilling continues to confirm the extent of iron mineralisation and potential for a significant resource at Bekisopa
- Completed 23 shallow diamond drill holes (<100m) in the first two months of the 2021 drilling campaign, with encouraging intercepts and all drilling, logging and preparation continuing according to plan
- First batch of assay pulps and crushed samples were dispatched and arrived in Perth – on 13 August 2021
- Drill core from the second batch of 6 drill holes prepared and ready for dispatch from Antananarivo with the third batch in the Antananarivo preparation laboratory, all on track

Over the next months there is additional shallow and then deeper diamond drilling to complete, another 20 or so drill holes, in total for over 4000 metres, as AKORA moves to defining a JORC compliant resource at its flagship Bekisopa project.

**AKORA Resources (ASX: AKO, AKORA, the Company) is pleased to update shareholders on progress with the 2021 Bekisopa drilling campaign. Drilling has advanced safely with very encouraging iron mineralisation intercepts observed confirming mineralisation along the 6km strike.**

**First month's drilling was completed on July 13<sup>th</sup>, 2021, with 10 holes for 660 metres (see ASX Announcement 20 July 2021).**

**Second month's drilling was completed on August 9<sup>th</sup>, 2021, with 13 holes for 734 metres.**

All 13 drill holes completed during this second month of shallow drilling intercepted iron mineralisation at surface with several also intercepting mineralisation at depth. The complete drill hole details and intercepts are included in Table 1 of Appendix 1. The iron mineralisation observed in the drill core from this second sequence of holes contains what appears to be high-grade, weathered, massive mineralisation in the near surface intercepts and extensive lengths of massive and coarse disseminated mineralisation at depth, see Figure 1 and Appendix 1. The mineralisation appears from the on-site logging and magnetic susceptibility readings to contain high iron contents.

**Figure 1**

**Weathered Massive, high-grade, iron mineralisation at surface, 0 to 3.86m, in BEKD24 and high-grade massive mineralisation at depth of 35 to 38.87m in BEKD35.**

**Based on the on-site logging and magnetic susceptibility readings, expectation is for similar iron contents to those recorded in the 2020 drilling programme.**

Figure 2 shows the location of the first 23 shallow drill holes of the 2021 drilling campaign with their iron intercepts noted, the second month's drill results are noted in blue text.

**Figure 2**  
2021 Bekisopa drilling campaign drilling location plan, showing the first 10 drill holes, BEKD13 to 22, and the second months drill holes, BEKD23 to 35, locations and their iron mineralisation intercepts.

This second month of drilling comprised 5 holes in the northern zone. The 5 northern holes all intercepted iron mineralisation from near surface and 4 intercepted two layers of iron mineralisation at depth, each with downhole thicknesses of between 12 and 33m, refer Figure 3.

The 8 holes in the south are slightly off to the west from the successful 2020 BEKD09, 10 and 11 drill holes. The 8 drill holes in the south have highlighted a continuous zone of iron mineralisation from surface to depths of up to 44 metres downhole, refer Figure 4 and 5.

The second month's drilling continues to be very encouraging. Confirming continuous iron mineralisation from surface and across drill grids which is all favorable for the development of a significant resource tonnage at Bekisopa.

**Figure 3**

Cross section of Bekisopa 2021 drill holes BEKD25 to 27 alongside the 2020 BEKD02 drill hole results. All three 2021 drill holes intercepted weathered iron mineralisation at surface and confirm the presence of additional iron mineralisation at depth and dipping to the west. Total combined true mineralisation width of some 40-50 metres.

**Figures 4 (a to d)**

Bekisopa 2021 drill holes BEKD28 to 35, 8 closely spaced drill holes, in an area of high magnetic intensity have all intercepted iron mineralisation from surface. These cross sections show continuity in both the east-west direction at a 50m spacing, Figure 4 (a to d), and north-south direction, Figure 5, with an average mineralisation depth of 20m, ranging from 4m in the southern extent, hole BEKD28, through to 44m in the north, hole BEKD35.

**Figure 5**

Bekisopa 2021 drill holes BEKD28 to 35, 8 closely spaced drill holes, in an area of high magnetic intensity have all intercepted iron mineralisation from surface. The long section shows continuity in the north- south direction, drilling spaced at 100m, and shows a true-length of plus 300m, parallel to the magnetic anomaly orientation of north-south, with an average mineralisation depth of 20m, ranging from 4m in the south (right side of the figure) through to 44m in the north (left side of the figure).

**Ideal iron mineralisation for a zero-stripping ratio mining operation.**

**Figure 6**

Drill rig completing Bekisopa drill hole BEKD25 in the north, showing iron rich surface soils and this drill hole intercepted weathered massive iron mineralisation at surface and a second layer of mineralisation at depth.

The next and last phase of shallow drilling is in the central zone and aims to add additional iron mineralisation information and volume to the holes completed there in 2020 (see the ASX Announcement on 13 April, 2021). On completion of these central zone shallow drill holes, drilling of the deeper holes in the northern and southern zones will commence.

The attached Appendix contains drill core details and photos from the second 13 drill holes BEKD 23 to 35. These show drill core with massive weathered and massive and coarse disseminated iron mineralisation. Our initial interpretation combined with the on-site logging is that these drill cores should generate comparable iron assays and product grade process trial results to those achieved from 2020 drilling campaign.

## **Conclusion**

The 2021 Bekisopa drilling campaign for +4000 metres continues safely and successfully with weathered massive iron mineralisation intercepts from surface for these initial shallow drill holes, plus some deeper un-weathered iron mineralisation confirming depth potential. The drill core shows what appears to be high-grade, weathered, massive iron mineralisation near surface, with extensive high-grade massive and coarse disseminated iron at depth, so far, down to 107.3 metres downhole.

## **Bekisopa Drilling – August and September**

Drilling will continue in the central zone over the rest of August, completing the remaining 6 shallow holes in this campaign. Then the drilling team will take a short break while the geologists complete the logging and preparation of these last shallow drill hole cores. Two drilling crews will return to the Bekisopa site, after a deserved break, and with the new larger drill rig complete around 20 deeper 150 to 250m holes to confirm iron mineralisation continuity at depth giving further volume for the development of the Bekisopa JORC resource. The drilling campaign will move onto a 24 hour a day roster with the arrival of the larger drill rig to ensure completion of the 4000+ metre drilling in October.

## **Drilling Progress Reporting and Communication**

Drill core from the first batch of samples, drill holes 13 to 18 (see ASX Announcement 20 July 2021), have been dispatched and arrived in Perth on 13 August 2021 for chemical assay and processing trials.

The second batch of drill core samples, drill holes 19 to 24, have been prepared and ready for dispatch to ALS Perth around 21 August 2021<sup>1</sup>. The third batch, drill holes 25 to 30, are in the Antananarivo preparation lab and expected to be dispatch in the week of 28 August 2021.

The cycle of drilling, logging, preparation then dispatch to ALS Perth is well underway and all continues on schedule, leading to a proposed JORC Resource estimation by years end. The drilling and assay results will be continually reported on over the coming months leading up to reporting of the maiden Bekisopa JORC compliant resource by the end of the year assuming the drilling equipment, sample preparation, international logistics and resource estimation continues to plan.

**About AKORA Resources**

AKORA Resources (ASX: AKO) is an exploration company engaged in the exploration and development of the Bekisopa Project, the Tratramarina Project and the Ambodilafa Project, iron ore projects in Madagascar, in all totalling some 308 km<sup>2</sup> of tenements across these three prospective exploration areas. Bekisopa Iron Ore Project is a high-grade magnetite iron ore project of >4km strike and is the key focus of current exploration drilling and resource modelling.

**Competent Person's Statement**

The information in this report that relates to Exploration Targets, Exploration Results, and related scientific and technical information, is based on, and fairly represents information compiled by Mr Antony Truelove. Mr Truelove is a consulting geologist to Akora Resources Limited (AKO). He is a shareholder in Akora Resources Limited, holding 4,545 Shares he purchased in 2011, some 8 years prior to being engaged as a consultant. Mr Truelove is a Member of the Australasian Institute of Mining and Metallurgy (MAusIMM) and a Member of the Australian Institute of Geoscientists (AIGS). Mr Truelove has sufficient experience which is relevant to the styles of mineralisation and types of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the JORC Code. Mr Truelove consents to the inclusion in this report of the matters based on his information in the form and context in which it appears including sampling, analytical and test data underlying the results.

**Competent Person's Statement**

The information in this report that relates to Mineral Processing and related scientific and technical information, is based on, and fairly represents information compiled by Mr Paul Bibby. Mr Bibby is a Metallurgist and Managing Directors of Akora Resources Limited (AKO), as such he is a shareholder in Akora Resources Limited. Mr Bibby is a Fellow of the Australasian Institute of Mining and Metallurgy (FAusIMM). Mr Bibby has sufficient experience which is relevant to the styles of mineralisation and its processing under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the JORC Code. Mr Bibby consents to the inclusion in this report of the matters based on his information in the form and context in which it appears including analytical, test data and mineral processing results.

## Appendix 1

Bekisopa 2021 drilling campaign details for drill holes BEKD 23 to 35 are shown in Table 1, with drill core iron mineralisation photos from BEKD23 to 30 following in this Appendix.

| Hole ID, BEKD | Utm38sX* | Utm38sY * | Azm Degrees | Incline Degrees | Length m | TCR % | From m | To m   | Length m | Mineralisation |

**Table 1**  
**Drill hole locations and initial results for the second months 13 holes in the**  
**Bekisopa 2021 Drilling Campaign.**  
**Iron mineralisation intercepts range in thickness from 2.2 to 44.2m.**

The following series of drill core photos for BEKD 23 to 35 continue to show the occurrence of weathered massive iron mineralisation at surface, which is excellent from a mining perspective. It appears from on-site logging and magnetic susceptibility readings that we should expect high-grade iron contents and product grade results from these drill cores.

BEKD23 to 27 are shallow drill holes in the northern zone designed to identify the eastern extent of the iron mineralisation. All holes intercepted surface iron mineralisation and confirmed at least two layers of iron mineralisation are present at depth.

BEKD28 to 35 are shallow drill holes in the southern zone and slightly west of the 2020 exploratory drilling. All these holes intercepted surface iron mineralisation and confirm an area of continuous iron mineralisation that appears from on-site logging and magnetic susceptibility measurements to have high-grade iron content and extend to depths of at least 44m downhole.

**BEKD23 - 0 to 2.2m Weathered Massive Iron Mineralisation**

**BEKD23 - 33.5 to 37.35m Coarse and Fine Disseminated Iron Mineralisation**

**BEKD24 - 0 to 3.86m Weathered Massive Iron Mineralisation**

**BEKD24 - 53.6 to 57.37m Coarse and Fine Disseminated Iron mineralisation**

**BEKD25 - 8 to 11.96m Massive Iron Mineralisation**

**BEKD25 - 41.94 to 45.66m Coarse Disseminated Iron Mineralisation**

**BEKD26 - 0 to 2.45m Weathered Massive Iron Mineralisation**

**BEKD26 - 35 to 38.8m Fine and Coarse Disseminated Iron Mineralisation**

**BEKD27 - 0 to 2m Weathered Massive Iron Mineralisation**

**BEKD28 - 0 to 3.2m Weathered Massive Iron Mineralisation**

**BEKD29 - 0 to 4m Weathered Massive Iron Mineralisation**

**BEKD30 - 0 to 3.9m Weathered Massive Iron Mineralisation**

**BEKD31 - 0 to 5.37m Weathered Massive Iron Mineralisation**

**BEKD32 - 0 to 4.18m Weathered Massive Iron Mineralisation**

**BEKD33 - 0 to 3.85m Weathered Massive Iron Mineralisation**

**BEKD34 - 0 to 3m Weathered Massive Iron Mineralisation**

Following is a series of **BEKD35 drill core** photos showing the continuity and change in iron mineralisation from the at surface weathered massive iron mineralisation into massive iron mineralisation at depth changing to coarse then fine iron mineralisation outside of the defined iron mineralisation zone at 44.15m.

**BEKD35 - 0 to 2m Weathered Massive Iron Mineralisation**

**BEKD35 - 24.7 to 27.45m Massive Iron Mineralisation**

**BEKD35 - 27.45 to 31.3m Massive Iron Mineralisation**

**BEKD35 - 31.3m to 35m Massive Iron Mineralisation**

**BEKD35 - 35 to 38.87m Massive Iron Mineralisation**

**BEKD35 - 38.87m to 42.3m Massive transition to Coarse Disseminated Iron Mineralisation**

**BEKD35 - 42.31 to 44.15m Coarse and Fine Disseminated Iron Mineralisation**

Iron mineralisation zone finishes at 44.15m depth, then Gneiss showing less iron

## JORC Code

**Table 1 Section 1 Sampling Techniques and Data  
BEKISOPA PROJECT**

| Criteria                   | JORC Code explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Each sample batch is accompanied by a Chain of Custody form.</li> <li>One box of samples was incorrectly sent to ALS Ireland and one to ALS Perth rather than the other way around. The laboratory subsequently sent the one box from Ireland to Perth and the box incorrectly sent to Perth was assayed in Perth. No tampering of either of these boxes was observed.</li> </ul> |
| <b>Audits or reviews</b> | <ul style="list-style-type: none"> <li><i>The results of any audits or reviews of sampling techniques and data.</i></li> </ul> | <ul style="list-style-type: none"> <li>No audit has been conducted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## JORC Code

**Table 1 Section 2 Reporting of Exploration Results**  
(Criteria listed in the preceding section also apply to this section)

| Criteria                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | JORC Code explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |             |                  |               |             |                  |                                               |                                     |                 |               |                                     |              |     |       |    |     |            |            |            |                       |      |     |       |    |    |            |            |            |                       |      |     |       |    |     |            |            |            |                       |      |               |       |     |    |            |            |            |                            |      |               |       |     |    |            |            |            |                            |      |  |  |  |  |  |  |  |  |  |  |            |     |      |    |    |            |            |            |                       |      |     |       |    |    |            |            |            |                       |      |     |       |    |   |            |            |            |                                               |      |  |  |  |  |  |  |  |  |  |  |          |      |       |    |    |            |            |            |                       |      |       |    |     |            |            |  |              |      |

Final reports on both episodes of work are available and have been utilised in the recent IGR included in the Akora prospectus. Airborne magnetics was flown for the government by Fugro and has since been obtained, modelled and interpreted by Cline Mining and Akora.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |       |     |     |            |            |            |                                  |      |  |
| <b>Geology</b>                           | <ul style="list-style-type: none"> <li>Deposit type, geological setting and style of mineralisation.</li> </ul>                         | <ul style="list-style-type: none"> <li>The tenure was acquired by AKO during 2014 and work since then has consisted of: <ul style="list-style-type: none"> <li>Data compilation and interpretation;</li> <li>Confirmatory rock chip sampling (118 samples) and mapping;</li> <li>Re-interpretation of airborne geophysical data;</li> <li>Ground magnetic surveying (305 line kilometres);</li> <li>The 2020 drilling programme of 1095.5m diamond core drilling in 12 drill-holes.</li> <li>The current programme that to date includes 579.6m in 9 drillholes (BEKD13 to 21)</li> </ul> </li> <li>The recent drilling has shown that the surface mineralisation continues at depth, with at most a 25% increase in grade due to weathering effects. However, it should be noted that some downslope creep of scree from these units may exaggerate apparent width at surface.</li> <li>The mineralisation occurs as a series of magnetite bearing gneisses and calc-silicates that occur as zones between 50m and 150m combined true width.</li> <li>The mineralisation occurs as layers of massive magnetite (sometimes altered to hematite) between 1m and 7m true width plus a lower grade zone that consists of lenses, stringers, boudins and blebs of magnetite aggregates that vary from 1cm to 10's of cm wide within a calc-silicate/gneiss unit (informally termed "coarse disseminated" here). These units sometimes have an outer halo of finer disseminated magnetite (informally termed "disseminated" here).</li> <li>This wide mineralisation halo provides a large tonnage potential over the 6-7km strike of mapped mineralisation and associated magnetic anomaly within the Akora tenement.</li> <li>The bands and blebs of massive magnetite aggregates along with preliminary LIMS testwork suggest that a good iron product may be obtained using a simple crush to -2mm followed by magnetic separation.</li> </ul> |       |     |     |            |            |            |                                  |      |  |
