

Latest Assays Contribute to Niobe's Maiden Resource & Supports Further Resource Definition Drilling

- Sixty-five RC holes were completed at Niobe in March with sixty three holes intersecting pegmatite over 1,091m with multiple intersections in fifty three holes.
- Analytical results confirmed the presence of rubidium, lithium, caesium and tantalum mineralisation in intersected pegmatite intervals at multiple levels below the surface
- Best mineralisation grades had Li₂O up to 1.18%, Rb up to 7,624ppm, Cs up to 1,565ppm and Ta to 732ppm
- Grades and additional ground sampling around the Breakaway pegmatite suggest the structure remains open to the east and could extend parallel to the main pit.
- Encouraging results have initiated a further 3,000m drilling programme and building a resource model around the Main, East and Breakway pegmatites.
- Appointment of experienced lithium geologist, Stephen Barber as the Exploration Manager.

Aldoro Resources Limited (**Aldoro, The Company**) (ASX: ARN) is pleased to provide an exploration update from the Mineral Resource drilling program at the Niobe Project. Wet chemistry results from the sixty-three holes that intersected pegmatites have now been received, where the results include:

- NBRC027: 4m at 0.24%Li₂O, 1,527ppm Rb, 12ppm Ta and 1,565ppm Cs from 36m
- **NBRC010: 17m at 0.13%Li₂O, 1,717ppm Rb, 43ppm Ta and 177ppm Cs from 1m**
- NBRC024: 4m at 0.11%Li₂O, 2,538ppm Rb, 54ppm Ta and 430ppm Cs from 25m
- **NBRC011: 14m at 0.11%Li₂O, 1,741ppm Rb, 69ppm Ta and 272ppm Cs from 11m**
- NBRC013: 9m at 0.11%Li₂O, 2,356ppm Rb, 102ppm Ta and 222ppm Cs from 17m

Best individual assays were **1.81%Li₂O** in NBRC052 at 31-32m, **7,624ppm Rb** in NBRC046 at 42-43m, **1,565ppm Cs** in NBRC027 at 36-40m and 732ppm Ta NBRC053 at 61-62m.

The results of the 1Q 2022 phase of drilling at Niobe continued to encourage, with analytical results supporting the mineralisation present in the shallow intersected pegmatites. 300kg of mineralised samples have been dispatched to Professor Zhiguo He at the Central South University of China to fully understand the processing and beneficiation methodology for the Niobe ore (*see ASX announcement on May 2, 2022*).

On the 18th July 2022, the Company appointed **Stephen Barber** as their Exploration Manager. Stephen has over 30 years of exploration, mining and mineral resource estimation work experience in Australia, NZ and Indonesia. Stephen has spent the past six years exploring for lithium in the Pilbara, including his previous role of Exploration Manager for Morella (and its predecessor Altura Mining Ltd).

Mineralisation in Pegmatite intersections highlighted the Main, East and Breakaway pegmatites with results received from drilling in the vicinity of the Breakaway suggestive of an open structure that continues at length towards the east (Figure 1). This extension will be tested in the forthcoming Niobe drilling program.

Figure 1: The structural feature between the Breakaway (left) and Niobe Flats (right) pegmatites identified for drilling investigation. The pink areas are pegmatite outcrop/subcrop while the orange areas are inferred pegmatite covered by colluvium.

Forward Plan

Following receipt of the maiden Niobe drilling assays, Aldoro is now in the process of completing an assessment of the high-level resource potential of the contained Lithium and Rubidium within the completed drilling envelope at Niobe.

Additional down dip and extension drilling is planned to take place mid-July at Niobe to increase the potential resource size and build a resource model. Extensional drilling will focus on a fence line of drill holes to the north-east of the main pit pegmatite in addition to testing the eastern strike extension of the Breakaway pegmatite. The July program is anticipated to further build the rare metal resource that has been delineated at Niobe via the 1Q drilling program. The shallow nature of the mineralisation allows for the consideration of open pit exploitation.

In addition, planning is underway towards progressing the development of the pegmatites with heritage and environmental studies to be conducted with the aim of converting the current prospecting license to a mining license.

Figure 2: Drill site locations around the Main and East Pegmatites

Figure 3: Drill site locations at the Breakaway pegmatites.

Figure 4: Drill site locations around the South East Pegmatites.

Figure 5. Overview plan of Niobe, showing the drilling at Niobe, Niobe South-East, and Breakaway areas

The key lithium suite elements are summarised in Table 1 for each logged pegmatite intersection.

ENDS

About Aldoro Resources

Aldoro Resources Ltd is an ASX-listed (**ASX: ARN**) mineral exploration and development company. Aldoro has a portfolio of pegmatite critical minerals with the Wyemadoo and Niobe pegmatite projects located in the Murchison Province. Wyemadoo is an early stage project with a large corridor of pegmatite swarms with Lithium, Rubidium and Tungsten mineralisation. Drilling is currently underway in two high priority areas defined by a systematic rock chip sampling programme. The Niobe project is another pegmatite critical metal project with anomalous rubidium, lithium, caesium and tantalum mineralisation. The company also has a nickel focused advanced exploration at the Narndee Igneous Complex, which is prospective for Ni-Cu-PGE mineralisation.

Disclaimer

Some of the statements appearing in this announcement may be in the nature of forward-looking statements. You should be aware that such statements are only predictions and are subject to inherent risks and uncertainties. Those risks and uncertainties include factors and risks specific to the industries in which Aldoro operates and proposes to operate as well as general economic conditions, prevailing exchange rates and interest rates and conditions in the financial markets, among other things. Actual events or results may differ materially from the events or results expressed or implied in any forward-looking statement. No forward-looking statement is a guarantee or representation as to future performance or any other future matters, which will be influenced by a number of factors and subject to various uncertainties and contingencies, many of which will be outside Aldoro's control.

Aldoro does not undertake any obligation to update publicly or release any revisions to these forward-looking statements to reflect events or circumstances after today's date or to reflect the occurrence of unanticipated events. No representation or warranty, express or implied, is made as to the fairness, accuracy, completeness or correctness of the information, opinions or conclusions contained in this announcement. To the maximum extent permitted by law, none of Aldoro, its Directors, employees, advisors or agents, nor any other person, accepts any liability for any loss arising from the use of the information contained in this announcement. You are cautioned not to place undue reliance on any forward-looking statement. The forward-looking statements in this announcement reflect views held only as of the date of this announcement. This announcement is not an offer, invitation or recommendation to subscribe for or purchase securities by Aldoro. Nor does this announcement constitute investment or financial product advice (nor tax, accounting or legal advice) and is not intended to be used for the basis of making an investment decision. Investors should obtain their own advice before making any investment decision.

Competent Person Statement

The information in this announcement that relates to Exploration Results and other technical information complies with the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (JORC Code). It has been compiled and assessed under the supervision of Mark Mitchell, a technical (geological) director of Aldoro Resources Ltd. Mr Mitchell is a Member of the Australasian Institute of Geoscientists and has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the JORC Code. Mr Mitchell consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears.

This announcement has been approved for release to ASX by the Board of Aldoro Resources

JORC Code, 2012 Edition – Table 1

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	- Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. - Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. - Aspects of the determination of mineralisation that are Material to the Public Report. - In cases where ‘industry standard’ work has been done this would be relatively simple (eg ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.	- RC drilling produced 1m samples which were submitted to Intertek Genalysis Laboratory Services Perth for geochemical analysis - Cyclone sample splitter used to collect representative 1m splits for pegmatite intervals and 4m composites for country rock samples. Sample intervals were between 1m and 4m in length as determined by geological changes. Sampling was conducted - QAQC samples were included at a minimum of 1 in 20 samples, with extras added around zones of economic interest - Samples were dried, crushed, sub sampled with a charge analysed by sodium peroxide fusion method FP6/OES and FP6/MS in Al, B, Ba, Be, Ca, Cs, Fe, K, Li, Mg, Mn, Nb, P, Rb, S, Sn, Sr, Ta, W - A quality control/quality assurance system comprising CRM standards, blank sand and duplicates were used at random intervals to evaluate the assay process
Drilling techniques	Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).	Reverse Circulation using a Schramm T450 universal rig and a rock face sampling hammer with 127mm diameter (5”). The holes were orientated by compass and clinometer (rig). A gyro probe was sent down the hole at the end of each hole and orientation data recorded every 30m.
Drill sample recovery	- Method of recording and assessing core and chip sample recoveries and results assessed. - Measures taken to maximise sample recovery and ensure representative nature of the samples. - Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of	- Sample recoveries assessed qualitatively, no routine weighing or other assessment processes. - Standard drilling techniques used to maximise sample recovery with cone splitter on cyclone used to collect 2 individual splits 1/8th ratio (calico bags) and the remainder into a green plastic bag. - No relationship established as samples have not been analysed yet

Criteria	JORC Code explanation	Commentary
	<i>fine/coarse material.</i>	
Logging	- Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. - Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. - The total length and percentage of the relevant intersections logged.	- Aldoro drilling is logged using industry-standard semi-quantitative logging templates. The 1 metre detailed logs provide fair geological descriptions but lack some geotechnical information. 12 selected samples have also been collected for metallurgical studies. - The logging is qualitative but not quantitative - The RC chips have been logged on a 1 metre basis
Sub-sampling techniques and sample preparation	- If core, whether cut or sawn and whether quarter, half or all core taken. - If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. - For all sample types, the nature, quality and appropriateness of the sample preparation technique. - Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. - Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. - Whether sample sizes are appropriate to the grain size of the material being sampled.	- The size of the sample from the drilling method is the industry standard for the mineralisation style analytical technique. The cone splitter used on the cyclone is considered an appropriate technique for reducing bias in the sample collection - Sample preparation includes; drying, crushing, splitting and pulverising before analysis - QAQC standard samples of CRM pulps and coarse blank material were included routinely - It is not known whether grain size is a consideration in the sub-sampling technique as no size screening has been conducted
Quality of assay data and laboratory tests	- The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. - For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. - Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.	- Assay and laboratory procedures are industry standard. The technique is considered near total for the elements of interest. - A Bruker S1 Titan with factory calibration was used for pXRF readings, but these readings have not been reorted as wet geochemistry is considered a more appropriate analytical tool for assessment of the mineralisation. - Standard reference materials were analysed routinely by pXRF and found to be reporting withing acceptable limits - For reported historical drilling, QAQC procedures, accuracy, and precision have not been established

Criteria	JORC Code explanation	Commentary
Verification of sampling and assaying	- The verification of significant intersections by either independent or alternative company personnel. - The use of twinned holes. - Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. - Discuss any adjustment to assay data.	- Aldoro's visual intersections are logged, interpreted, and reported by the JORC Competent Person - QAQC procedures and documentation of primary data is not available for historic drilling - Twinned holes are not being used or reported - No adjustments are made to assay data
Location of data points	- Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. - Specification of the grid system used. - Quality and adequacy of topographic control.	- Drillhole collars are measured by handheld GPS and checked several times before drilling. Coordinates presented are in GDA94, UTM Zone 50S - Collar survey accuracy of reported historic drilling is unknown - Aldoro holes are surveyed by a Reflex GYRO SPRINT-IQ - No downhole survey information is available for reported historical drilling
Data spacing and distribution	- Data spacing for reporting of Exploration Results. - Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. - Whether sample compositing has been applied.	- Drill spacing was based on historical pegmatite intersections used to define Tantalum resource, these holes were not tested for Lithium, Rubidium and Caesium. - A Mineral Resource is not being reported - No sample compositing has been applied, but assay results are reported on a length weighted average
Orientation of data in relation to geological structure	- Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. - If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	- The orientation of drilling and sampling is as close to perpendicular to the interpreted key mineralised as possible - The orientation of drilling to key mineralised structures is an evolving interpretation
Sample security	The measures taken to ensure sample security.	Individual calico sample bags from the drilling were placed in polyweave bags and hand delivered to the assay laboratory in Maddington by company personnel

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	- Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. - The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	Niobe - The Niobe Project consists of a single prospecting licence P59/2137 100% held by Aldoro Resources Ltd located 70km of Mout Magnet and is currently valid until 25/3/2026. Several POW's are current 100303, 110752, and an excess tonnage approval. - There are no impediments to accessing the licence to conduct exploration with a Wajarri Yamatji site inspection conducted and clearing the work drill programmes No known impediments to exploring on either of the Niobe granted licence. A file notation boundary encroaches the SE corner of the licence and a this sliver of the northern boundary. It has not impeded and POW's which include drilling in the SE.
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	- Historical exploration was initially for beryl by prospectors then primarily for tantalum with the development of the Niobe resource. There has been no systematic exploration for Rubidium, lithium or Caesium despite the presence of LCT type pegmatites. - Late 1950's to 1984. Exploration was conducted by prospectors who located the main mineralised zones of the pegmatites and quarried these for beryl and included limited exploitation of eluvial tantalite and cassiterite. 1984 to 1999. Systematic exploration by Pancontinental Mining Ltd included geological mapping, rock chip sampling, drilling (RC, RAB, Diamond), costeaning, petrography, metallurgy, resource definition, trial mining and rehabilitation. Their focus was tantalum but included some lithium analysis. Geochemical analysis from 40 holes predominantly into the main Niobe pegmatite dilation but also into the northeast Niobe lobe were analysed for Li and included Cs, Ta, Rb, Nb, Sn, Na, and K. A total of 13 surface rock samples and 38 semicontinuous costean samples were also analysed with the same suite of elements. A total of 15 RC chip samples were petrographically described, 4 of which contained zinnwaldite. 1999-2003 Australian Gold Mines NL and Kemet Corporation formed Tantalum Australia and undertook assessment of the Dalgara and Warda Warra pegmatite fields with the view to exploit the tantalum

		mineralisation. Work included new geological mapping, conducted further drilling and resource investigation. They processed stockpile and tailings through the Dalgaranga tantalum plant. ○ 2007-2017 Diversity Resources Pty Ltd acquired the ground and operator Meridian 120 Mining Pty Ltd conducted a detailed review, undertaking new geological mapping, orientation soil sampling and compilation of a digital database. ○ 2018-2021 Meridian acquired the project and undertook further geological mapping, rock chip sampling and consolidation of the projects database. A total of 6 rock chip samples and 2 drill chip resamples were collected and analysed for Li, Cs, Nb, Rb, Sn and Ta.
Geology	• <i>Deposit type, geological setting and style of mineralisation.</i>	Niobe • The licence area is underlain by gabbroic rocks of the Niobe layered mafic intrusion. The Niobe mafics are separated from the main Windimurra mass by a major fault zone and a sliver of felsic and sedimentary schists. The layering trend at Niobe is very different from that of the main Windimurra mass. It generally strikes east-north-easterly, and dips to the north. Metamorphic grade at Niobe is possibly higher than at Windimurra • There are numerous pegmatite dykes at Niobe. Some contain lithium mica. Composite rock samples from the pegmatites have given assays up to 2.6% lithium oxide, 276 ppm tantalum, and 3296 ppm tungsten (0.42% WO₃) • The nearby granite pluton, immediately east of the licence area, is probably the parent source of the pegmatites this granite is named as part of the Wogala Suite. It is described as a metamorphosed monzogranite containing muscovite and biotite and local accessory fluorite • In a geochronology report (Wingate 2015) the same granite is said to be part of the Tuckanarra Suite and a sample of it from near the north-eastern corner of the current licence area is described as biotite monzogranite with quartz, K-feldspar, plagioclase, biotite and muscovite plus accessory minerals. Its magmatic crystallisation age was determined by the zircon uranium-lead method as 2,678 million years (plus or minus 8 million years) • Topaz, fluorite, beryl, lepidolite and trace tantalite have been recorded at Mount Niobe not far from the project area (suggesting strong fractionation of a granite/pegmatite magma capable of depositing rare metals)

Criteria	JORC Code explanation	Commentary
Drill hole Information	- A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: - easting and northing of the drill hole collar - elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar - dip and azimuth of the hole - down hole length and interception depth - hole length. - If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	- See ASX 27/8/21 for Historical drilling details, no drilling applies to this release. - No relevant information has been excluded all known rock chip samples and their corresponding analytical data has been presented in Tables 1 & 2.
Data aggregation methods	- In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. - Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. - The assumptions used for any reporting of metal equivalent values should be clearly stated.	- No data aggregation methods have been applied to the grab samples - No metal equivalents were used.
Relationship between mineralisation widths and intercept lengths	- These relationships are particularly important in the reporting of Exploration Results. - If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. - If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg ‘down hole length, true width not known’).	All results referenced are based on down-hole lengths and may not reflect the true width of mineralisation or thickness of host lithologies, which is unknown
Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should	Appropriate maps and tabulations are presented in the body of the announcement

Criteria	JORC Code explanation	Commentary
	<i>include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i>	
Balanced reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	- Both peak values and average values are reported and full analytical results are also tabulated. - All results are summarised in the body of the announcement
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	While other historical exploration data sets are available, these pertain to Tantalum and therefore are not completely relevant to this announcement. Historical Li-Rb-Cs drill results have previously release ASX 27/8/2021
Further work	- The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling). - Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	- Future work will consist of further down dip drilling, extension and infill drilling with positions determined by 3D modelling of the results to date in an attempt to build a resource. Diagramme are currently being created and were not available for this release. Drone aerial photography will be conducted and a DEM created . - Diagrammes are currently a work in progress..
