

ASX ANNOUNCEMENT

29 January 2021

DECEMBER 2020 QUARTERLY REPORT

HIGHLIGHTS

PRODUCTION

- Gold production at Jaurdi in the December Quarter was 7,870 ounces, approximately 12% above the high-end guidance for the quarter
- Gold sales for the quarter were 8,212 ounces at an average sale price of \$2,518/oz for sale receipts of \$20.68 million (2,000 ozs delivered into the hedge book at an average price of \$2,526/oz)
- Cash costs (excluding royalties) of A\$929/oz
- Beacon had cash of \$15.31 million and 948 ozs of gold on hand as at 31 December 2020
- Ore stockpiles at 31 December 2020 contained 24,000 ounces of gold

FINANCIAL AND CORPORATE

- Debt of \$18.0 million (in the form of debentures) was repaid on 12 October 2020, one year ahead of the repayment due date
- The Company is now debt free
- Cash at the end of the Quarter was A\$15.31 million (A\$16.17 million on hand and 932 ozs of gold on hand at 28 January 2021)
- Capital expenditure for the quarter totalled A\$1.8 million which included the capital works, plant and equipment purchases and TSF construction and planning

EXPLORATION

- Initial aircore drilling south of Black Cat intercepted significant gold in primary weathered rock under the palaeochannel (now named Big Cat). Over 500 metres of potential strike and potential source of primary mineralisation identified for the Lost Dog palaeochannel deposit. In-situ intercepts include:
 - BCW032 11 metres @ 1.56 g/t Au from 50 metres
 - BCW063 5 metres @ 2.22 g/t Au from 47 metres
 - BCW033 2 metres @ 2.30 g/t Au from 49 metres
 - BCW058 2 metres @ 2.29 g/t Au from 73 metres
 - BCW063 5 metres @ 2.22 g/t Au from 47 metres

Intercepts from within the palaeochannel include:

 - BCW048 5 metres @ 9.87 g/t Au from 52 metres
 - Including 1 metre @ 43.20 g/t Au from 56 metres
 - BCW063 1 metre @ 8.24 g/t Au from 46 metres
- 13,446m of AC drilling and 920m of RC drilling completed during the quarter

BEACON MINERALS LIMITED ACN 119 611 559

Registered Address 144 Vivian Street, Boulder, WA 6432

Website www.beaconminerals.com Phone 08 9093 2477

- 15,000m of AC drilling planned from January 2021 to infill priority targets including, Big Cat, Lost Dog, Lost Dog East, Lynx and Trans-line PGE
- Aeromag survey to be completed (March 2021) over the Jaurdi Project to confirm and generate targets

Figure 1: Jaurdi Gold Project employees holding the gold bar poured for Beacon's first tonne of gold

Beacon Minerals Limited (ASX:BCN) (Beacon or the Company) is pleased to present its Quarterly Activities Report for the period ended 31 December 2020.

Beacon's performance during the December quarter reflects the consistent performance of the Jaurdi Gold Project.

Production Update for the December 2020 Quarter

- Bullion on hand and in transit of 948 ounces as at 31 December 2020
- Debt \$18.0 million (in the form of debentures) repaid on 12 October 2020, one year ahead of the repayment due date. On repayment of the debentures the Company is now debt free
- Strong balance sheet with A\$16.17 million on hand and 932 ozs of gold on hand at 28 January 2021
- Ore stockpiles contained 24,000 ozs at 31 December 2020
- Jaurdi Gold Project poured its first Tonne of Gold in December 2020

Beacon is pleased to provide the production numbers for the last four quarters at Jaurdi.

Quarter Ended	Gold Production Ounces (oz)
31 December 2020	7,870
30 September 2020	7,453
30 June 2020	6,711*
31 March 2020	6,905

*Restated from the 16 July 2020 June Production. Previously reported 6,642 ozs for the gold produced for the quarter and 1,825 ozs for the month of June 2020.

Quarter Ended	BCM's
31 December 2020	368,000
30 September 2020	365,000
30 June 2020	418,000
31 March 2020	406,000

Mining in Lost Dog Panel 2 was temporarily suspended in mid-November when the mining fleet moved to the Panther Pit.

The cutback at the Panther pit is scheduled to be completed in early March 2021 when it will transition to a TSF.

Infrastructure works included installation of 5 new process water bores and associated pipe lines.

Mined Ore Stocks

At 31 December 2020 ore stockpiles were surveyed and estimated to contain approximately 24,000 ounces of gold. The mining cost attributable to the ore stockpiles is \$3.35 million and have been included in the cash costs.

A summary of Beacon's key performance measures compared to the previous quarters are set out below:

Operation	Unit	December 2020 Qtr	September 2020 Qtr	9 Months to June 2020
Ore Mined	BCM	109,000	219,000	543,000
Waste Mined	BCM	259,000	146,000	636,000
Ore milled	DMT	139,530	129,784	383,886
Head grade	gpt	1.95	2.00	1.70
Tails grade	gpt	0.20	0.22	0.22
Recovered grade	gpt	1.75	1.78	1.48
Gold Produced	oz	7,870	7,453	18,265
Cost Summary				
Cash cost	\$/oz	929	953	1,202
Royalties	\$/oz	144	126	126
Total cash cost	\$/oz	1,073	1,079	1,328

Sales	Unit	December 2020 Qtr	September 2020 Qtr	9 Months to June 2020
Gold Sold	oz	8,212	6,930	16,357
Average Gold Sales Price	A\$/oz	2,518	\$2,570	\$2,365

Capital Expenditure for December 2020 Quarter	A\$'000
Capital works	448
Critical spares	570
Plant and Equipment	501
TSF Facility	335
Total	1,854

Gravity circuit components (Knelson concentrator and Acacia Leach Reactor) have been ordered from Consep and installation and commissioning has been planned for late April 2021 to coincide with ore availability from Panther.

Beacon has now purchased all long lead critical spares.

Tailings Dam Update

During the quarter Beacon advanced the design and approval process for:

- a new circular Integrated Waste Landform (IWL) Tailings Store Facility (TFS) facility 700 metres north of the Jaurdi Treatment Plant
- utilisation of the Panther pit when mining is complete

Final future tailings storage facilities will comprise:

- New IWL TFS circular tailings dam 700 metres north west of the treatment plant
- Lost Dog In-Pit TSF Panels 2, 3 and 4 when mining is complete
- Panther In-Pit TSF when mining is completed in March 2021

In combination, the above facilities will provide tailings storage for approximately 10 years at current processing rates. Combined with the extension of our borefield we are future proofing the operations.

Figure 2: Panther Pit on the 18 December 2020

COVID-19

There have been no COVID-19 related issues during the quarter.

The Company continues to maintain a local isolation residence in Coolgardie for any potential COVID-19 related issues arising at the Jaurdi mine site.

EXPLORATION UPDATE

During the quarter, Beacon continued to explore its near mill tenements, with a focus on testing conceptual targets and previously defined soil anomalies, including analogies to the Lost Dog deposit and soil anomalies adjacent to the Black Cat deposit.

Exciting results from maiden aircore drilling programmes at Black Cat have identified anomalous gold mineralisation at Big Cat and Lynx prospects as well as further mineralisation along the Palaeochannel system that hosts the Lost Dog deposit.

Assay results have been returned for 329 Aircore holes drilled across several targets for a total of 13,446m. A further 16 RC holes for 920m have been drilled at Golden Cat prospect. Ongoing exploration will continue into the March quarter starting with aircore drilling at the Trans-line PGE prospect 35km east of Kalgoorlie.

Managing Director/Chairman Graham McGarry said:

“Aircore drilling along with the upcoming Aeromag survey is expected to generate potential exploration targets for the future”

Lost Dog

A total of 76 vertical aircore drill holes were drilled for 2,992 metres on three north-south orientated traverses located 150 metres apart (Figure 3) to the East of Lost Dog. Results confirm that the Lost Dog gold mineralised system continues to the east for approximately 700 metres. Grades above 1 g/t Au are present as two parallel palaeochannel horizons at depths between 15 and 25 metres below surface (Figure 4). Significant intersections include:

- JD20E010 12 metres @ 1.01 g/t Au from 16 metres
Including 4 metres @ 2.28 g/t Au from 17 metres
- JD20E034 3 metres @ 1.10 g/t Au from 12 metres
- JD20E037 3 metres @ 1.41 g/t Au from 20 metres
- JD20E045 1 metre @ 11.75 g/t Au from 41 metres
- JD20E048 1 metre @ 2.13 g/t Au from 22 metres

Figure 3: Plan view of the vertical aircore drilling located east of the Lost Dog deposit

Figure 4: Cross section A – A' (see Figure 3) of the most westerly drill line of the recent drill programme east of the Lost Dog system

Along with the Eastern exploration drilling, 24 aircore holes were drilled to the north of the panel 3 pit design. This drilling confirmed the current northern boundary of mineralisation in this area.

Details of the drill holes completed at Lost Dog are contained in Appendix 1.

Big Cat Prospect

During October-November 2020, the Black Cat palaeochannel was again targeted for water and gold exploration (Area now described as the Big Cat prospect). This drilling followed on from initial aircore drilling completed in late 2017, which identified water resources within the palaeochannel along with several highly anomalous gold intercepts from both the transported (palaeochannel) and in situ (saprolite/saprock) parts of the regolith profile.

The recent aircore drilling programme added to the coverage provided by the 2017 campaign. The drilling continued to generate many highly anomalous gold intercepts from both the transported and in situ parts of the regolith profile, with the highlights being a number of highly encouraging gold intercepts from the in-situ ultramafic saprolite. Mineralisation within the ultramafic indicates the potential for a primary ore source below the palaeochannel. These intercepts occur within broader zones of >0.1g/t Au and are located on broad spaced traverses, up to 500m apart, providing a large previously unexplored area for further exploration assessment in respect to finding the primary source for Lost Dog's secondary mineralisation. (see figures 5-8). Further drill testing is currently being planned and is scheduled for February 2021. Follow up drilling is being planned for February 2021.

Some of the best In-situ intercepts include (details of the drill holes completed at Big Cat is contained in Appendix 1):

- **BCW032** **11 metres @ 1.56 g/t Au from 50 metres**
- **BCW063** **5 metres @ 2.22 g/t Au from 47 metres**
- **BCW033** **2 metres @ 2.30 g/t Au from 49 metres**
- **BCW058** **2 metres @ 2.29 g/t Au from 73 metres**
- **BCW063** **5 metres @ 2.22 g/t Au from 47 metres**

Intercepts from within the palaeochannel include:

- **BCW048** **5 metres @ 9.87 g/t Au from 52 metres**
 Including **1 metre @ 43.20 g/t Au from 56 metres**
- **BCW063** **1 metre @ 8.24 g/t Au from 46 metres**

Figure 5: Schematic plan view of the Jaurdi Gold Project. See drill lines A-C in blue

Figure 6: Cross section A – A' (see figure 3) of the Northern drill line of the recent drill programme at Big Cat prospect

Figure 7: Cross section B – B' (see figure 3) of the 'central' drill line of the recent drill programme at Big Cat prospect

Figure 8: Cross section C – C' (see figure 5) of the most southerly drill line of the recent drill programme at Big Cat prospect.

Lynx Prospect

During October 2020, drilling at the Lynx prospect auger soil anomaly was extended with a further 25 holes added to the program. Drilling has defined two gold-in-regolith (saprolite) anomalies, both require further aircore drilling to define their strike extent and tenor prior to deeper drill testing with RC. All holes have now had the one metre samples returned.

Best intercepts include:

- **JD20L032** **8 metres @ 1.31 g/t Au from 32 metres.**
 Including **4 metres @ 2.43 g/t Au from 36 metres.**
- **JD20L039** **6 metres @ 2.88 g/t Au from 31 metres (BOH).**
 Including **1 metre @ 15.3 g/t Au from 36 metres (BOH).**

Follow-up aircore drilling has been planned and is scheduled for February 2021. Details of the drill holes completed at the Lynx Prospect is contained in Appendix 1.

Golden Cat

First pass RC drilling was completed over the Golden Cat prospect during September 2020 with 16 angled RC holes being drilled for 920 metres. Assay results were delayed and only processed during the report period.

Results were not encouraging with just a few >0.1 ppm Au intercepts returned from the central parts of the auger soil anomaly.

Details of the drill holes completed at Golden Cat is contained in Appendix 1.

Alley Cat Prospect

A first pass aircore drilling program was completed over the Alley Cat trend auger soil anomalies which included 56 angled aircore holes for 1,138 metres. Six lines of aircore drilling were completed. Numerous anomalous intercepts above 0.1g/t Au were returned indicating that further aircore testing is warranted to better define the gold anomalous trends and corridors identified by this 6 line programme.

Best intercepts include:

- **JD20AC052 1m @ 1.17 g/t Au from 2 metres**
- **JD20AC054 1m @ 4.0 g/t Au from 20 metres (BOH)**

Details of the drill holes completed at Alley Cat are contained in Appendix 1.

Stockman's Prospect

During October and November 2020, tenements P16/2925 and P16/2926 were the focus of a reconnaissance aircore programme that had the primary objective of testing the lithological contact between the greenstone sequence to the west and the Bali Monzogranite to the east. Target generation activities completed during 2019-2020 highlighted the greenstone – Bali Monzogranite geological contact as being a target for primary gold mineralisation that might be the source of the palaeochannel-hosted gold, currently being mined at the Lost Dog gold mine.

There were very few results of interest, other than the intercepts from JD20AL050, which intersected anomalous gold mineralisation within ultramafic saprolite.

- **JD20AL050 5m @ 0.23 g/t Au from 44 metres**

Details of the drill holes completed at Stockman's are contained in Appendix 1.

Exploration Expenditure

Expenditure on exploration activities during the quarter was \$206,000.

Program for the March 2021 quarter

The next phase of aircore drilling will concentrate on infilling between the best gold intercepts from Phase 1. Along with these targets, first pass aircore drilling has already commenced at the Trans-line PGE project 35km east of Kalgoorlie. Drilling at Trans-line targets three surface PGE soils anomalies with peak values up to 287ppb Pd and 329ppb Pt.

The rig will then return to the Jaurdi Gold Project to complete infill drilling at Big Cat, Lost Dog, Lost Dog East and Lynx during February and March. Planned metres include:

- **Trans-line PGE 4,400m**
- **Lost Dog 1,300m**
- **Lost Dog East 1,500m**
- **Lynx 2,700m**
- **Big Cat 8,000m**

Following analysis of these results, and in conjunction with Aeromag survey data to be completed in March, the company anticipates reverse circulation drilling programs at the most prospective areas to commence in the June quarter.

CORPORATE UPDATE

Ordinary Shares on issue	2,873,232,777
Listed Options on issue	897,883,486
Unlisted Options on issue	70,000,000
Market capitalisation	\$106.211 million (0.037 share price)
Cash on hand (31 December)	\$15.31 million
Bullion on hand (31 December)	948 ozs
Debt (31 December)	Nil

Debentures

In October 2018 the Company issued \$18.0 million in debentures. Under the terms of the debentures the Company, may at any time after 24 months from the date of issue, repay some or all of the principal sum outstanding.

The Company was pleased to advise on 12 October 2020 that it had finalised the repayment of the \$18.0 million debentures, one year ahead of the repayment due date.

The Company has no debentures on issue and is now debt free.

Authorised for release by the Board of Beacon Minerals Limited.

Competent Persons Statement

The information in this report that relates to the Jaurdi Gold Project has been compiled by Mr Zane Padman, a full-time employee of Beacon Minerals. Mr Padman is a Member of the Australian Institute of Mining and Metallurgy. Mr Padman has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Padman consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

Disclaimer

This ASX announcement (Announcement) has been prepared by Beacon Minerals Limited ("Beacon" or "the Company"). It should not be considered as an offer or invitation to subscribe for or purchase any securities in the Company or as an inducement to make an offer or invitation with respect to those securities. No agreement to subscribe for securities in the Company will be entered into on the basis of this Announcement.

This Announcement contains summary information about Beacon, its subsidiaries and their activities which is current as at the date of this Announcement. The information in this Announcement is of a general nature and does not purport to be complete nor does it contain all the information which a prospective investor may require in evaluating a possible investment in Beacon.

By its very nature exploration for minerals is a high risk business and is not suitable for certain investors. Beacon's securities are speculative. Potential investors should consult their stockbroker or financial advisor. There are a number of risks, both specific to Beacon and of a general nature which may affect the future operating and financial performance of Beacon and the value of an investment in Beacon including but not limited to economic conditions, stock market fluctuations, gold price movements, regional infrastructure constraints, timing of approvals from relevant authorities, regulatory risks, operational risks and reliance on key personnel.

Certain statements contained in this announcement, including information as to the future financial or operating performance of Beacon and its projects, are forward-looking statements that:

- may include, among other things, statements regarding targets, estimates and assumptions in respect of mineral reserves and mineral resources and anticipated grades and recovery rates, production and prices, recovery costs and results, capital expenditures, and are or may be based on assumptions and estimates related to future technical, economic, market, political, social and other conditions;
- are necessarily based upon a number of estimates and assumptions that, while considered reasonable by Beacon, are inherently subject to significant technical, business, economic, competitive, political and social uncertainties and contingencies; and,
- involve known and unknown risks and uncertainties that could cause actual events or results to differ materially from estimated or anticipated events or results reflected in such forward-looking statements.

Beacon disclaims any intent or obligation to update publicly any forward-looking statements, whether as a result of new information, future events or results or otherwise. The words 'believe', 'expect', 'anticipate', 'indicate', 'contemplate', 'target', 'plan', 'intends', 'continue', 'budget', 'estimate', 'may', 'will', 'schedule' and similar expressions identify forward-looking statements.

All forward looking statements made in this announcement are qualified by the foregoing cautionary statements. Investors are cautioned that forward-looking statements are not guarantees of future performance and accordingly investors are cautioned not to put undue reliance on forward-looking statements due to the inherent uncertainty therein.

No verification: Although all reasonable care has been undertaken to ensure that the facts and opinions given in this Announcement are accurate, the information provided in this Announcement has not been independently verified.

SCHEDULE OF MINERAL TENEMENT INTERESTS

Beacon Minerals Limited provides the following schedule of mineral tenement interests held by the Company for the quarter ended 31 December 2020 as required by ASX Listing Rule 5.3.

Beacon Minerals Limited Mineral Tenement interest as at 31 December 2020;

TENEMENT	PROJECT/LOCATION	INTEREST AT THE BEGINNING OF THE QUARTER	INTEREST AT THE END OF THE QUARTER
	Jaurdi Gold Project		
M16/0529	Jaurdi, Coolgardie	100%	100%

Appendix 2: JORC Code, 2012 Edition – Table 1 Report – Air Core Drilling East of Lost Dog

Section 1 Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
Sampling techniques	Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.	RC Drilling Drill cuttings are extracted in one metre intervals from the RC return via cyclone, delivering approximately three kilograms of the recovered material into calico bags for analysis. The residual material is retained on the ground near the hole. Composite samples are obtained from the residue material for initial analysis, with the split samples remaining with the individual residual piles until required for re-split analysis or eventual disposal. Samples are collected to a nominal weight of 3-5kg and sent to the laboratory, split then pulverised to produce a 50-gram charge for analysis by fire assay. Aircore Drilling Residual material is collected in one metre intervals on the ground via bucket dumps Combined scoops from bucket dumps for composite samples. Split one metre samples taken from individual bucket dumps via scoop. Samples are collected to a nominal weight of 3-5kg and sent to the laboratory, split then pulverised to produce a 50-gram charge for analysis by fire assay. All geology input is logged and validated by geologists, incorporated into this is assessment of sample recovery. No defined relationship exists between sample recovery and grade. Nor has sample bias due to preferential loss or gain of fine or coarse material been noted.
	Include reference to measures taken to ensure sample representation and the appropriate calibration of any measurement tools or systems used.	For aircore, a single scoop sample is cut through the mound of sample collected on one metre intervals down hole to best represent the entire metre being sampled. Each one metre sample collected is placed in a calico bag. For RC, a cyclone cone splitter is used to split 1m regular cleaning of the cyclone to remove hung up clays
	Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may	The composited aircore samples were collected being 3 to 5 Kg in size. This sample was sent to the laboratory, split then pulverised to produce a 50-gram charge for analysis by fire assay.

BEACON MINERALS LIMITED ACN 119 611 559

Registered Address 144 Vivian Street, Boulder, WA 6432

Website www.beaconminerals.com **Phone** 08 9093 2477

Criteria	JORC Code explanation	Commentary
	be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.	
Drilling techniques	Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).	Aircore drilling was completed using a 89mm face sampling bit was used.
Drill sample recovery	Method of recording and assessing core and chip sample recoveries and results assessed.	Sample recoveries are recorded visually by the geologist. No significant sample recovery issues were encountered.
	Measures taken to maximise sample recovery and ensure representative nature of the samples.	When poor sample recovery is encountered, the geologist and driller endeavoured to rectify the problem to ensure maximum sample recovery.
	Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	None noted.
Logging	Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.	Each one metre interval was logged. All end of hole chip samples was collected with the aim of developing a geological map of the base of oxidation geology.
	Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.	All logging is qualitative in nature.
	The total length and percentage of the relevant intersections logged	Each one metre sample interval was logged in detail for geology, veining, alteration, mineralisation for the entire hole.
Sub-sampling techniques and sample preparation	If core, whether cut or sawn and whether quarter, half or all core taken.	No core drilling has been completed.
	If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.	Each AC sample was scoop sampled. Each RC sample was collected via cyclone cone splitter. All sampling was dry in nature.
	For all sample types, the nature, quality, and appropriateness of the sample preparation technique.	Sample preparation follows industry best practice standards and is conducted by internationally recognised laboratories; i.e. ALS Global

Criteria	JORC Code explanation	Commentary
	Quality control procedures adopted for all sub-sampling stages to maximise representation of samples.	For composite and AC sampling, care is taken in the field to scoop a representative sample of the one metre sample which forms part of the composited sample. ALS Global have laboratory standard procedures for sub sampling of the composites sent for analysis.
	Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.	Duplicate sampling was taken in the field and results were deemed adequate.
	Whether sample sizes are appropriate to the grain size of the material being sampled.	Sample sizes are deemed appropriate for the grain size of the material being sampled.
Quality of assay data and laboratory tests	The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.	ALS Laboratory (Kalgoorlie) was used for Au analysis carried out on the samples. The laboratory techniques below are for all samples submitted to ALS and are considered appropriate for the style of mineralisation. Au-AS26 – 50g fire assay The QA/QC data includes standards, duplicates, and laboratory checks. In-house QA/QC tests are conducted by the lab on each batch of samples.
	For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.	No geophysical tools were used.
	Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.	Beacon Minerals submitted standards, duplicates and blanks as part of their QA/QC regime which has been deemed to demonstrate acceptable levels of accuracy and precision for the sample types employed.
Verification of sampling and assaying	The verification of significant intersections by either independent or alternative company personnel.	All geological logging and sampling was completed in spreadsheets, which were then transferred to a database for validation and compilation. Electronic copies of all information are periodically backed up. BCN management have reviewed this data and are satisfied with the efficacy of the data collected by field geologists.
	The use of twinned holes.	No holes in this programme were twinned.
	Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.	Data is entered into Excel spreadsheets, validated and loaded into a Microsoft Access database. Data was exported from Microsoft Access for processing and visual verification in Surpac. All electronic data is routinely backed up.

BEACON MINERALS LIMITED ACN 119 611 559

Registered Address 144 Vivian Street, Boulder, WA 6432

Website www.beaconminerals.com **Phone** 08 9093 2477

Criteria	JORC Code explanation	Commentary
	Discuss any adjustment to assay data.	No adjustments of assay data were considered necessary.
Location of data points	Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.	A handheld Garmin GPS was used to define the location of exploration air core holes. Standard practice is for the GPS to be left at the collar for a period of 10 minutes to obtain a steady reading. Collars are subsequently picked up after using a RTK GPS.
	Specification of the grid system used.	Grid system used is MGA94 (Zone 51).
	Quality and adequacy of topographic control.	Elevation measurements were captured from the Garmin GPS. The accuracy of this measurement is well understood by BCN and is considered adequate for this early stage of exploration. Collars are subsequently picked up after using a RTK GPS.
Data spacing and distribution	Data spacing for reporting of Exploration Results.	Data spacing is variable dependent upon the individual orebody under consideration. A lengthy history of mining has shown that this approach is appropriate for the Mineral Resource.
	Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.	The data spacing for this early stage of exploration is considered appropriate to achieve total coverage across a defined drill line and adequate to determine the presence of gold mineralisation. The objective of this drilling is to ascertain the presence of mineralisation and there is no consideration for resource estimation at this early stage.
	Whether sample compositing has been applied.	Samples were composited typically on four metre intervals but may have been on three to five metre intervals depending on the end of hole depth.
Orientation of data in relation to geological structure	Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.	Sample orientation was appropriate for the early stage of exploration and the perceived strike of the structure which potentially hosts gold mineralisation.
	If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	The exact nature of the gold mineralisation at this early stage is not yet understood. The relationship between drill orientation and the perceived mineralised structure will not introduce any bias.
Sample security	The measures taken to ensure sample security.	The chain of custody is managed by the project geologist who placed the calico sample bags in polyweave sacks. Up to 5 calico sample bags were placed in each sack. Each sack was clearly marked. Detailed records were kept of all samples dispatched including the chain of custody.

Criteria	JORC Code explanation	Commentary
Audits or reviews	The results of any audits or reviews of sampling techniques and data.	Data is validated when loading into the database. BM Geological Services update all data into the Jaurdi database and there is nothing perceived to be erroneous with data capture.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.	Several third-party royalties exist across various tenements JGP, over and above the state government royalty. JGP tenure is currently in good standing. There are no known issues regarding security of tenure. There are no known impediments to continued operation. Beacon operates in accordance with all environmental conditions set down as conditions for grant of the leases.
	The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	The tenement is in good standing with the WA DMIRS.
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	There have been several campaigns of drilling undertaken on the leases by third parties; BHP – Utah Minerals International – (1989) Coolgardie Gold NL (1991-1997) Coronet Resources (2007) – Lost Dog Kinver Mining NL/Toro Mining Pty Ltd (1998-2013) A group of “prospectors” (2009) Fenton and Martin Mining Developments (2015). Beacon has completed multiple drilling programmes at Jaurdi Gold Project during its period of ownership.
Geology	Deposit type, geological setting and style of mineralisation.	The Jaurdi Gold Project is located in the Eastern Goldfields Superterrane of the Yilgarn Craton. It is located in the western-most parts of the regionally extensive Norseman-Wiluna greenstone belt and this portion of the belt forms part of the

BEACON MINERALS LIMITED ACN 119 611 559

Registered Address 144 Vivian Street, Boulder, WA 6432

Website www.beaconminerals.com **Phone** 08 9093 2477

Criteria	JORC Code explanation	Commentary
		Coolgardie Domain, itself the western-most part of the Kalgoorlie Terrane. The project tenure overlies parts of the Jaurdi Hills-Dunnsville greenstone sequence where it occurs to the immediate northwest of the Bali Monzogranite and to the immediate southwest of the Doyle Dam Granodiorite. The Jaurdi Gold Project also overlies a portion of the Bali Monzogranite. The Bali Monzogranite is poorly exposed. The greenstone-granite contact is foliated where exposed. Shear zones developed locally within the adjacent greenstones, may continue within the granite. Gold mineralised palaeochannel are known in the Jaurdi area The Bali Monzogranite and Dunnsville Granodiorite to the north, together occupy the core of the gently north plunging anticline. The tenements making up the project is located to the west of the anticlinal axis and immediately adjacent to the granite-greenstone contact.
Drill hole Information	A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: ▪ easting and northing of the drill hole collar ▪ elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar ▪ dip and azimuth of the hole ▪ down hole length and interception depth ▪ hole length. If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	All holes and significant assays are reported in Appendix 1.
Data aggregation methods	In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.	Grades are reported as down-hole length-weighted averages of grades above approximately 0.1 g/t Au. No top cuts have been applied to the reporting of the assay results. Intercepts averaging values significantly less than 0.1 g/t Au were assigned the text “NSI” (No Significant Intercept).
	Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the	Higher grade intervals are included in the reported grade intervals.

BEACON MINERALS LIMITED ACN 119 611 559

Registered Address 144 Vivian Street, Boulder, WA 6432

Website www.beaconminerals.com **Phone** 08 9093 2477

Criteria	JORC Code explanation	Commentary
	procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.	
	The assumptions used for any reporting of metal equivalent values should be clearly stated.	No metal equivalent values are used.
Relationship between mineralisation widths and intercept lengths	These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').	The geometry of the mineralisation within the palaeo system has been well established by the recent drilling and mining of the Lost Dog pit. There is no ambiguity with the geometry of this relatively simple alluvial system. If the geometry of mineralisation is known in respect to drill hole angles, then its nature has been reported. Mineralisation in early stage aircore drilling has been assumed to be supergene in nature.
Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	Refer to Figures in the body of text.
Balanced reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	No misleading results have been presented in this announcement. Complete results are contained in this announcement including holes with 'no significant intercepts.
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	There is nothing to report relevant to this drilling.
Further work	The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	Further exploration work is currently under consideration, the details of which are included in this release in brief. Further details will be released in due course.
