

## CEL's Hualilan Gold Project Operational Update

### Highlights

- Drilling underway with 18 holes for 2,444 metres of the current 7,500 metre drilling program completed and the rig drilling ahead at 74 metres in drill hole GNDD-030
- Pulps from first 2 holes successfully air-freighted to Canada on April 20 for final assaying
- Pulps from Hualilan drilling will be air-freighted to Canada until COVID-19 restrictions in Peru are lifted, avoiding delays associated with assays normally being completed in Peru
- Samples from the first 7 holes submitted for assay with ALS Laboratories (Mendoza), with pulps from the second batch of samples due for air-freighting to Canada next week
- Operations unaffected by the cancelling of commercial passenger flights in Argentina until September due to CEL's operational model of self-sufficient local based technical teams

The Board of Directors of Challenger Exploration Limited (CEL or the Company) is pleased to announce that normal operations, including drilling, have recommenced at the Company's Hualilan Gold Project in Argentina. Drilling has restarted following the receipt of all special Government approvals surrounding COVID-19. CEL has now completed 18 holes for 2,444 metres of a planned 7,500 metres (Table 1) with the Foraco diamond core rig drilling ahead at 74 metres in drill hole GNDD-030.

Due to COVID-19 restrictions in Peru, CEL has reached an agreement with ALS Laboratories under which pulps of samples from Hualilan will be air-freighted to Vancouver (Canada), for final assay rather than Lima (Peru). This clears delays caused by the COVID-19 related shutdown in Peru. This includes the holes where processing of samples has been completed.

Pulps of samples from the first two holes arrived in Vancouver for final assay on April 20, with a second batch due for transport next week. CEL expects results shortly from samples air-freighted to Canada for final assay. Results from the balance of the 7,500 metre program should be available within normal timeframes, now the delays due to final assays in Peru have been avoided.

While provincial borders remain closed in Argentina, CEL has been granted authorisation to transport core samples across the province border to Mendoza for preparation and air-freighting to Vancouver for assay. Additionally, 100% of the Company's staff involved in supervision of the drilling, core logging, core sampling and submission of samples for assay, and its drilling contractors on site, are San Juan based.

The company notes that the Government of Argentina has issued a decree banning ticket sales for all domestic and international commercial flights until September 1 2020. Cargo flights remain unaffected and CEL has liaised with ALS Laboratories (Mendoza) who have advised that the ban on

commercial ticket sales will not impact their ability to airfreight Hualilan Project core pulps to Canada for final assay. The ban will also not impact CEL's operations at the Hualilan Gold project given the Company's operational model of employing a self-sufficient team of high-quality local based geoscientists at each of its projects.

**About Challenger Exploration**

Challenger Exploration Limited (ASX: CEL) is developing two key gold/copper projects in South America.

1. **Hualilan Project**, located in San Juan Province Argentina, is a near term development opportunity. It has extensive historical drilling with over 150 drill-holes and a Non-JORC historical resource <sup>(#2)</sup> of 627,000 Oz @ 13.7 g/t gold which remains open in most directions. In the 15 years prior to being acquired by CEL the project was dormant. CEL's focus is to redefine the scope of the Hualilan Project by defining and then increasing a Resource to JORC reporting standard.
2. **El Guayabo Project** was last drilled by Newmont Mining in 1995 and 1997 targeting gold in hydrothermal breccias. Historical drilling has demonstrated potential to host significant copper and associated gold and silver mineralisation. Historical drilling has returned a number of intersections of plus 100m of intrusion related breccia and vein hosted mineralisation. The Project has multiple targets including breccia hosted mineralization, an extensive flat lying late stage vein system and an underlying porphyry system target neither of which has been drill tested.
3. **Karoo Basin** provides a wildcard exposure to 1 million acres shale gas application in the world class Karoo Basin in South Africa in which Shell is the largest application holder in the basin.

*#2 For details of the foreign non-JORC compliant resource and to ensure compliance with LR 5.12 please refer to the Company's ASX Release dated 25 February 2019. These estimates are foreign estimates and not reported in accordance with the JORC Code. A competent person has not done sufficient work to clarify the foreign estimates as a mineral resource in accordance with the JORC Code. It is uncertain that following evaluation and/or further exploration work that the foreign estimate will be able to be reported as a mineral resource. The company is not in possession of any new information or data relating to the foreign estimates that materially impact on the reliability of the estimates that materially impacts on the reliability of the estimates or CEL's ability to verify the foreign estimates estimate as minimal resources in accordance with Appendix 5A (JORC Code). The company confirms that the supporting information provided in the initial market announcement on February 25 2019 continues to apply and is not materially changed.*

**Competent Person Statement – Exploration results**

The information in this release provided under ASX Listing Rules 5.12.2 to 5.12.7 is an accurate representation of the available data and studies for the material mining project. The information that relates to sampling techniques and data, exploration results and geological interpretation has been compiled Dr Stuart Munroe , BSc (Hons), PhD (Structural Geology), GDip (AppFin&Inv) who is a full-time employee of the Company. Dr Munroe is a Member of the AusIMM. Dr Munroe has over 20 years' experience in the mining and metals industry and qualifies as a Competent Person as defined in the JORC Code (2012).

Dr Munroe has sufficient experience of relevance to the styles of mineralisation and the types of deposits under consideration, and to the activities undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results. Dr Munroe consents to the inclusion in this report of the matters based on information in the form and context in which it appears. The Australian Securities Exchange has not reviewed and does not accept responsibility for the accuracy or adequacy of this release.

## JORC Code, 2012 Edition – Table 1 report template

### Section 1 Sampling Techniques and Data -Hualilan Project

(Criteria in this section apply to all succeeding sections.)

| Criteria                   | JORC Code explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |           |      |         |           |     |         |       |         |            |             |          |     |     |       |         |            |             |          |     |     |      |          |            |             |          |     |     |      |         |            |             |          |     |     |      |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|------|---------|-----------|-----|---------|-------|---------|------------|-------------|----------|-----|-----|-------|---------|------------|-------------|----------|-----|-----|------|----------|------------|-------------|----------|-----|-----|------|---------|------------|-------------|----------|-----|-----|------|
| <b>Sampling techniques</b> | <ul style="list-style-type: none"><li>- Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</li><li>- Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li><li>- Aspects of the determination of mineralisation that are Material to the Public Report.</li><li>- In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</li></ul> | <p>Diamond core (HQ3) was cut longitudinally on site using a diamond saw. Samples lengths are from 0.5m to 2.0m in length (average 1m), taken according to lithology, alteration and mineralization contacts.</p> <p>Core samples were crushed to approximately 85% passing 2mm. A 500g or a 1 kg sub-sample was taken and pulverized to 85% passing 75um. A 50g charge was analysed for Au by fire assay with AA determination. Where the fire assay gold grade returned was &gt; 10 g/t a 50g charge was analysed for Au by Fire assay with gravimetric determination.</p> <p>A 10g charge was analysed for 48 elements by 4-acid digest and ICP-MS determination. Elements determined were Ag, As, Ba, Be, Bi, Ca, Ce, Co, Cr, Cs, Cu, Fe, Ga, Ge, Hf, In, K, La, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Rb, Re, S, Sb Sc, Se, Sn, Sr, Ta, Te, Th, Ti, Tl, U, V, W, Y, Zn and Zr. Ag &gt; 100 g/t, Zn, Pb and Cu &gt; 10,000 ppm and S &gt; 10% were re-analysed by the same method using a different calibration.</p> <p>Sample intervals were selected according to geological boundaries. There was no coarse gold observed in any of the core.</p> |           |      |         |           |     |         |       |         |            |             |          |     |     |       |         |            |             |          |     |     |      |          |            |             |          |     |     |      |         |            |             |          |     |     |      |
| <b>Drilling techniques</b> | <ul style="list-style-type: none"><li>- Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>Drilling of HQ3 core (triple tube) was done using a LM90, truck mounted drill machine that is operated by Foraco Argentina S.A. (Mendoza) and a trailer mounted Hydrocore drill machine operated by Energold Drilling (Mendoza). Where possible the core is being oriented using a Reflex tool.</p> <p>Collar details for drill holes completed by CEL are shown below. Collar locations for drill holes after GNDD010 are surveyed with a handheld GPS:</p> <table><thead><tr><th>Hole_id</th><th>East</th><th>North</th><th>Elevation</th><th>Dip</th><th>Azimuth</th><th>Depth</th></tr></thead><tbody><tr><td>GNDD001</td><td>504803.987</td><td>6601337.067</td><td>1829.289</td><td>-57</td><td>115</td><td>109.0</td></tr><tr><td>GNDD002</td><td>504793.101</td><td>6601312.095</td><td>1829.393</td><td>-60</td><td>115</td><td>25.6</td></tr><tr><td>GNDD002A</td><td>504795.405</td><td>6601311.104</td><td>1829.286</td><td>-60</td><td>115</td><td>84.5</td></tr><tr><td>GNDD003</td><td>504824.427</td><td>6601313.623</td><td>1827.768</td><td>-70</td><td>115</td><td>90.2</td></tr></tbody></table>                               | Hole_id   | East | North   | Elevation | Dip | Azimuth | Depth | GNDD001 | 504803.987 | 6601337.067 | 1829.289 | -57 | 115 | 109.0 | GNDD002 | 504793.101 | 6601312.095 | 1829.393 | -60 | 115 | 25.6 | GNDD002A | 504795.405 | 6601311.104 | 1829.286 | -60 | 115 | 84.5 | GNDD003 | 504824.427 | 6601313.623 | 1827.768 | -70 | 115 | 90.2 |

| <b>Drill sample recovery</b>                          | <ul style="list-style-type: none"> <li>- Method of recording and assessing core and chip sample recoveries and results assessed.</li> <li>- Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> <li>- Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</li> </ul>                                                                                                                                                                                                                                                                                                                             | <p>Drill core is placed into wooden boxes by the drillers and depth marks are indicated on wooden blocks at the end of each run. These depths are reconciled by CEL geologists when measuring core recovery.</p> <p>Triple tube drilling has been being done to maximise core recovery.</p> <p>A possible relationship has been observed between sample recovery and Au, Ag or Zn grade whereby low core recoveries have resulted in underreporting of grade. Insufficient information is not yet available to more accurately quantify this. Core recovery is influenced by the intensity of natural fracturing in the rock. A positive correlation between recovery and RQD has been observed. The fracturing is generally post mineral and not directly associated with the mineralisation.</p> |
| <b>Logging</b>                                        | <ul style="list-style-type: none"> <li>- Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</li> <li>- Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</li> <li>- The total length and percentage of the relevant intersections logged.</li> </ul>                                                                                                                                                                                                                                                                                                   | <p>All the core is logged for recovery, RQD, weathering, lithology, alteration, mineralization and structure to a level that is suitable for geological modelling, resource estimation and metallurgical test work. Where possible logging is quantitative. Geological logging is done in MS Excel in a format that can readily be transferred to a database which holds all drilling, logging, sample and assay data.</p>                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Sub-sampling techniques and sample preparation</b> | <ul style="list-style-type: none"> <li>- If core, whether cut or sawn and whether quarter, half or all core taken.</li> <li>- If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</li> <li>- For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> <li>- Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</li> <li>- Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</li> <li>- Whether sample sizes are appropriate to the grain size of the material being sampled.</li> </ul> | <p>Competent drill core is cut longitudinally using a diamond saw for sampling of ½ the core. Soft core is split using a wide blade chisel. The geologist logging the core indicates on the drill core where the saw cut is to be made to ensure half-core sample representivity.</p> <p>Sample intervals are selected based on lithology, alteration and mineralization boundaries. Sample lengths average 1.16m. No second-half core samples have been submitted. The second half of the core samples has been retained in the core trays for future reference.</p> <p>The sample preparation technique is considered appropriate for the style of mineralization present in the Project.</p> <p>Sample sizes are appropriate for the mineralisation style and grain size of the deposit.</p>    |
| <b>Quality of assay data and laboratory tests</b>     | <ul style="list-style-type: none"> <li>- The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li> <li>- For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>The MSA laboratory used for sample preparation in San Juan has been inspected by Stuart Munroe (Exploration Manager) and Sergio Rotondo (Country Manager) prior to any samples being submitted. The laboratory procedures are consistent with international best practice and are suitable for samples from the Project. The ALS laboratory in Mendoza has not yet been inspected by CEL representatives.</p>                                                                                                                                                                                                                                                                                                                                                                                   |

| -           | <i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</i> | CEL submitted blank samples which were strategically placed in the sample sequence immediately after samples that were suspected of containing high grade Au, Ag, Zn or Cu to test the lab preparation contamination procedures.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |        |        |        |  |  |       |          |          |        |        |        |             |      |     |  |  |  |     |      |    |  |  |  |   |       |     |  |  |  |   |      |     |  |  |  |   |      |     |  |  |  |   |      |     |  |  |  |
|             |                                                                                                                                                                                                                       | Three different Certified Standard Reference pulp samples (CRM) with known values for Au, Ag, Pb, Cu and Zn have been submitted with samples of drill core to test the precision and accuracy of the analytic procedures and determination of the MSA laboratory in Canada. 22 reference samples were analysed in the samples submitted in 2019. As highlighted below, for CRM 1, one sample returned an Au value > 2 standard deviations (SD) above the certified value. For CRM 2, one sample returned an Au value < 2SD below the certified value. For CRM 3, one sample returned a Cu value > 2SD above the certified value. All other analyses are within 2SD of the expected value. The standards demonstrate suitable precision and accuracy of the analytic process. No systematic bias is observed. |        |        |        |  |  |       |          |          |        |        |        |             |      |     |  |  |  |     |      |    |  |  |  |   |       |     |  |  |  |   |      |     |  |  |  |   |      |     |  |  |  |   |      |     |  |  |  |

| Exploration done by other parties | - Acknowledgment and appraisal of exploration by other parties. | <p>Intermittent sampling dating back over 500 years has produced a great deal of information and data including sampling, geologic maps, reports, trenching data, underground workings, drill hole results, geophysical surveys, resource estimates plus property examinations and detailed studies by several geologists. Prior to the current exploration, no work has been completed since 2006.</p> <p>There is 6 km of underground workings that pass through mineralised zones. Records of the underground</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                 |                    |                |         |            |   |              |             |                |         |            |   |       |             |                |         |            |   |         |             |                |         |            |   |           |             |                |         |            |   |      |        |               |        |            |           |           |  |  |  |  |  |                         |                |                      |         |            |     |             |  |  |  |  |  |                         |                |                |         |            |     |      |        |        |            |             |           |          |            |         |   |                    |       |

|                               |                                                                                                                                                                                                                                  | <p>geology and sampling are currently being compiled and digitised, as are sample data, geological mapping, trench data, adit exposures, and drill hole results. Geophysical surveys exist but have largely yet to be check located and digitised.</p> <p>Drilling on the Hualilan Project (Cerro Sur and Cerro Norte combined) extends to over 150 drill holes. The key historical exploration drilling and sampling results are listed below.</p> <ul style="list-style-type: none"><li>- 1984 – Lixivia SA channel sampling &amp; 16 RC holes (AG1-AG16) totaling 2,040m</li><li>- 1995 - Plata Mining Limited (TSE: PMT) 33 RC holes (Hua- 1 to 33) + 1500 samples</li><li>- 1998 – Chilean consulting firm EPROM (on behalf of Plata Mining) systematic underground mapping and channel sampling</li><li>- 1999 – Compania Mineral El Colorado SA (“CMEC”) 59 core holes (DDH-20 to 79) plus 1,700m RC program</li><li>- 2003 – 2005 – La Mancha (TSE Listed) undertook 7447m of DDH core drilling (HD-01 to HD-48)</li><li>- Detailed resource estimation studies were undertaken by EPROM Ltda. (EPROM) in 1996 and CMEC (1999, revised 2000) both of which were written to professional standards and La Mancha 2003 and 2006.</li><li>- The collection of all exploration data by the various operators was of a high standard and had appropriate sampling techniques, intervals and custody procedures were used.</li></ul> |          |          |        |             |          |        |             |
| <b>Geology</b>                | <ul style="list-style-type: none"><li>- <i>Deposit type, geological setting and style of mineralisation.</i></li></ul>                                                                                                           | <p>Mineralisation occurs in all rock types, but it preferentially replaces limestone, shale and sandstone and occurs in fault zones.</p> <p>The mineralisation has previously been classified as a Zn-Cu distal skarn (or manto-style skarn) with vein-hosted Au-Ag mineralisation. It has been divided into three phases – prograde skarn, retrograde skarn and a late quartz–galena event the evolution of the hydrothermal system and mineral paragenesis is the subject of more detailed geometallurgical work.</p> <p>Gold occurs in native form, in tellurides (hessite) and as inclusions with pyrite and chalcopyrite. The mineralisation also commonly contains chalcopyrite, sphalerite and galena.</p> <p>Mineralisation is either parallel to bedding, in bedding-parallel faults or in east-west striking, steeply dipping, siliceous, quartz-dominated veins that cross the bedding at a high angle. The veins have thicknesses of 1–4 m and contain abundant sulphides. The intersection between the bedding-parallel mineralisation and east-striking cross veins seems to be important in localising the mineralisation.</p>                                                                                                                                                                                                                                                                                          |          |          |        |             |          |        |             |

The performance of the drilling program, collection of data and sampling procedures were initiated during these visits.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Geological interpretation</b> | <ul style="list-style-type: none"> <li>- Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.</li> <li>- Nature of the data used and of any assumptions made.</li> <li>- The effect, if any, of alternative interpretations on Mineral Resource estimation.</li> <li>- The use of geology in guiding and controlling Mineral Resource estimation.</li> <li>- The factors affecting continuity both of grade and geology.</li> </ul> | <p>The interpretation is considered appropriate given the stage of the project and the nature of activities that have been conducted. The interpretation captures the essential geometry of the mineralised structure and lithologies with drill data supporting the findings from the initial underground sampling activities.</p> <p>The most recent resource calculation (2006 and 2003 – La Mancha) used all core drilling at the time and detailed underground channel sampling collected by EPROM, CMEC and La Mancha. Overlying assumptions included a reduction of the calculated grade in each resource block by a factor of 10% to account for possible errors in the analyses and samples. An arbitrary reduction factor was applied to the 2006 resource whereby the net reported tonnage was reduced by 25% for indicated resource blocks, 50% for inferred resource blocks, and 75% of potential mineral resource blocks. The reason for the application of these tonnage reduction factors was not outlined in the resource report. It is noted that at the time of this report La Mancha was in a legal dispute concerning the project with its joint venture partner and given the acquisition of a 200,000 Oz per annum producing portfolio the project was likely no longer a core asset for La Mancha at that time. Additionally, under the original acquisition agreement La Mancha had to issue additional acquisition shares based on resource targets.</p> <p>The effect of removing the assumptions relating to application of the arbitrary tonnage reduction factors applied increases the overall resource tonnage by in excess of 50%. Removing these correction factors would bring the overall tonnage and grade close the earlier (2003, 1999, and 1996)</p> |

If a computer assisted estimation method was chosen include a description of computer software and parameters used.</li> <li>- The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</li> <li>- The assumptions made regarding recovery of by-products.</li> <li>- Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).</li> <li>- In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.</li> <li>- Any assumptions behind modelling of selective mining units.</li> <li>- Any assumptions about correlation between variables.</li> <li>- Description of how the geological interpretation was used to control the resource estimates.</li> <li>- Discussion of basis for using or not using grade cutting or capping.</li> <li>- The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if</li> </ul> | <p>The historic resource estimation techniques are considered appropriate. The 2003 and 2006 resources used a longitudinal section polygonal method was used for estimating resources, with individual blocs representing weighted averages of sampled underground and/or areas of diamond drill pierce points with zones of influence halfway to adjacent holes. The area of the block was calculated in AutoCad directly from the longitudinal sections.</p> <p>Check assaying by PG Consulting returned values in the check assay sample which were 3.4% and 13% greater for Au and Ag than the original assays. A number pf previous resource estimates were available to check the 2006 resource estimate when the arbitrary tonnage reduction factors are removed brings the overall tonnage and grade close the earlier (2003, 1999, and 1996) tonnage and grade estimates albeit indifferent categories which are considered more appropriate.</p> <p>It was assumed only gold silver and zinc would be recovered and that no other by products would be recovered. This is viewed as conservative given metallurgical data pointing to the production of a salable zinc concentrate.</p> <p>Based on the preliminary metallurgy estimation of deleterious elements or other non-grade variables of economic significance was not required.</p> <p>The minimum mining width of 0.8m was assumed for veins less than 0.6m and for wider widths a dilution of 0.2m was used to calculate the grade.</p> |

This is based on the assumed mining cost at the time of the estimate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Mining factors or assumptions</b>        | - <i>Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.</i> | <p>The Mineral Resource Estimate considered the assumptions outlined below which are considered appropriate;</p> <ul style="list-style-type: none"> <li>- Metal prices: Au US\$550 Oz, Ag US\$10 Oz</li> <li>- Metallurgical Recovery; Au – 80%, Ag – 70% Zn - nil</li> <li>- Operating cost: US\$55t based on underground cut and fill mining and flotation and cyanidation combined</li> </ul> <p>The minimum mining width of 0.8m was assumed for veins less than 0.6m and for wider widths a dilution of 0.2m was used to calculate the grade.</p>                                                                                                                                                        |
| <b>Metallurgical factors or assumptions</b> | - <i>The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.</i>                             | Historical metallurgical test-work is currently under review however the assumptions used (80% Au recovery, 70% Ag and no zinc recovery) seem conservative. The most recent test work was conducted in 2000 and was a preliminary assessment only. This work was conducted at Lakefield Labs (cyanidation) and CIMM Labs (flotation) in Chile. While this work is preliminary it indicates recoveries for differential flotation in conjunction with a Knelson concentrator at 80% each for gold and silver and 50% for zinc regardless of the type of material (sulphide or oxidized).                                                                                                                       |
| <b>Environmental factors or assumptions</b> | - <i>Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and</i>                                                                                                                                                                                                                                                                               | It is considered that there are no significant environmental factors, which would prevent the eventual extraction of gold from the project. Environmental surveys and assessments will form a part of future pre-feasibility.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Classification</b> | <ul style="list-style-type: none"> <li>- <i>The basis for the classification of the Mineral Resources into varying confidence categories.</i></li> <li>- <i>Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).</i></li> <li>- <i>Whether the result appropriately reflects the Competent Person's view of the deposit.</i></li> </ul>                                                                                                         | <p>The Mineral Resource Estimate has both Indicated and Inferred Mineral Resource classifications under the National Instrument 43-101 code and is considered foreign. These classifications are considered appropriate given the confidence that can be gained from the existing data and results from drilling.</p> <p>The reliability of input data for the 2003 and 2006 resources is acceptable as is the confidence in continuity of geology and metal values, quality, quantity and distribution of the data. Appropriate account has been taken of all relevant factors with the exception of studies into the appropriateness of the application of a top cut.</p> <p>The reported 2006 NI43-101 (non-JORC Code compliant Measured and Indicated) estimate for the Hualilan Project is measured resource of 164,294 tonnes averaging 12.6 grams per tonne gold and 52.1 g/t silver and 2.5% zinc plus an indicated resource of 51,022 tonnes averaging 12.4 grams per tonne gold and 36.2 g/t silver and 2.6% zinc plus an inferred resource of 213,952 tonnes grading 11.7 grams per tonne gold and 46.6 g/t silver and 2.3% zinc. (Source La Mancha resources Toronto Stock Exchange Release April 7, 2007 - Interim Financials) – See Table 1.</p> <p>The 2006 estimate did not include the east-west mineralised Magnata Vein despite the known mineralisation in the Magnata Vein being drilled on a 25 x 50-metre spacing. The 2003 NI43-101 (non-JORC Code compliant) estimate attributed approximately half of its measured and indicated</p> |

This report concluded that “Detailed resource calculations made by three different groups are seen to be realistic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Discussion of relative accuracy/confidence</b> | <ul style="list-style-type: none"> <li>- Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.</li> <li>- The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.</li> <li>- These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.</li> </ul> | <p>There is sufficient confidence in the data quality, drilling methods and analytical results that they can be relied upon. The available geology and assay data correlate well. The approach or procedure are deemed appropriate given the confidence limits. The main two factors which could affect relative accuracy is grade continuity and top cut.</p> <p>Grade continuity is variable in nature in this style of deposit and has not been demonstrated to date and closer spaced drilling is required to improve the understanding of the grade continuity in both strike and dip directions. It is noted that the results from the twinning of three holes by La Mancha are encouraging in terms of grade repeatability.</p> <p>The deposit contains very high grades, and there is a potential need for the use of a top cut. It is noted that an arbitrary grade reduction factor of 10% has already been applied to the resource as reported.</p> <p>No production data is available for comparison</p> |
