

Quarterly Report

for the period ending 30 June 2016

Highlights

- **On-going exploration has now delivered a total of six drill targets covering over 260 hectares at the Thali Silver/Lead/Zinc Project, Loei Belt, Northern Thailand.**
- **Maiden drill program finalised at the Thali Project.**
- **Venture secures six lithium prospects within the Greenbushes Mineral District, Western Australia.**

Introduction

During the June Quarter Venture continued to advance its Thailand Projects with new discoveries at the Thali Silver/Lead/Zinc Project, as well as finalization of the maiden drill program. The quarter also saw the Company further diversify its portfolio by securing six lithium prospects within the world class Greenbushes Mineral District in Western Australia.

Exploration at Thali during the quarter continued to deliver new discoveries, including high grade soil anomalies at the Thali Far North and Far East prospects (Refer to Figure Two). These latest discoveries have added significantly to the project with a total of six “walk up” drill targets covering over 260 hectares now identified. Venture has also finalised its maiden drill program, which includes a combination of RC and diamond drilling targeting the majority of high grade soil anomalies. Approval from local authorities for the drill program is currently being finalised.

The June Quarter also saw Venture secure a large land holding hosting numerous lithium prospects within the Greenbushes Mineral District. The Company utilised its extensive tin/tantalum database and tin experience to identify the new opportunities, as hard rock lithium prospects often occur with tin/tantalum prospects. Following the new acquisition, Venture is now completing reconnaissance work to confirm and prioritise its new lithium targets.

Figure One: Project Map | Thailand

South East Asia

Venture continues to progress its strategy of targeting South East Asia for exploration opportunities. Venture has identified an extensive belt of “skarn style” mineralisation throughout the region and continues to target base and precious metal opportunities.

Venture has established a low cost regional office in Bangkok and continues to build a cost effective portfolio of exploration projects over the medium term. The Company has had licenses granted over two project areas in Thailand (Pak Yang and Thali) and now awaits the granting of several additional licenses covering two other project areas.

Thali Project (Silver/Lead/Zinc)

The June Quarter has seen Venture continue to deliver exploration success from targeting its northern Thailand projects. At Thali the Company extended its surface sampling and mapping program, the results of which delivered two new discoveries namely the Thali Far East and Thali Far North prospects. These latest discoveries have seen Thali grow into a substantial exploration project which hosts silver/lead/zinc drill targets covering an area of over 260 hectares and extending over 7.5km of strike (Refer Figure Two).

Figure Two | Thali Project contoured soils | Silver (Ag)

Venture has now finalised its drill program, which includes a combination of RC and diamond drilling targeting the majority of high grade soil anomalies. Approval from local authorities for the drill program is currently being finalised.

Thali Geology

Venture's geological mapping of the new Thali base metal prospects shows the area is underlain by a mainly north striking sequence of sedimentary rocks, including limestone, intruded by a series of intermediate to felsic porphyries, diorite and granite. The observed base metal mineralisation is associated with gossanous veins and stockwork zones in sericite, silica and sulphide altered igneous rocks (mainly Thali North and Thali South), and with stockwork veined and sulphide-bearing calc-silicate skarn within the sedimentary host rocks (especially Thali East and North-East). Regional scale geological mapping suggests the host sedimentary rocks are of Permian-Triassic age, and the granitic intrusions of Triassic age; the Triassic granitoid suite is widely associated with base and precious metal deposits within the Loei Belt.

Pak Yang Project (Silver/Lead/Zinc/Copper)

The Pak Yang Project is located in the Loei Belt and is situated 20km east of Thali and hosts similar geology and style of mineralization. Results from the first surface sampling program successfully identified a large zinc system extending over 2km of strike (Refer Figure Three).

Figure Three | Pak Yang Project | Zinc soil anomaly

The recent discovery was the result of a surface sampling program targeting a sequence of metasediments, felsic porphyries and stockwork-veined granitoids, which are widely associated with base and precious metal deposits within the Loei Belt. The initial program identified anomalous zinc and lead, with zinc values peaking at 850ppm in soils. Having defined a significant base metal system the Company has submitted additional soil samples for silver analysis.

Focus for additional exploration at Pak Yang will centre on additional geological and structural mapping as well as the extension of known surface mineralization through additional soil sampling.

Tenure and Government Regulations

Venture has granted Prospecting Licenses over the Pak Yang and Thali Projects under which the Company has the right to prospect for minerals within the Prospecting Licence area. Should the Company discover significant and economically viable mineralization within either projects, Venture can then apply for an Extraction License (mining license equivalent) and name which base and/or precious metals the Company is looking to extract.

Lithium Prospects – Greenbushes Mineral District, Western Australia

The June Quarter saw Venture secure a number of highly prospective lithium tenements in the Greenbushes Mineral District, which hosts the world class Greenbushes Lithium-Tantalum Mine (produces ~40% of the world's lithium). Venture utilized its extensive tin/tantalum database and tin experience to identify new lithium opportunities and gain exposure to the rapidly growing lithium market. Often hard rock lithium prospects have historically been pegmatite hosted tin/tantalum prospects or mines, as in the case of Greenbushes. As Venture has reviewed multiple tin/tantalum projects from numerous jurisdictions over the past decade, the Company was uniquely placed to identify new lithium opportunities.

Following the new applications Venture is now the largest land holder in the Greenbushes Mineral District with six prospects already identified within the 1,000 square kilometres of tenure. The identified targets demonstrate surface geochemistry analogous to the Greenbushes Lithium-Tantalum Deposit (world's largest hard rock lithium mine).

Having completed the tenement applications the Company commenced a surface sampling program to verify the historical prospects. Following completion of the verification sampling and the granting of tenure the Company will finalise its exploration program going forward.

Prospect Identification

Venture utilized its extensive tin/tantalum database as a pathfinder for the previously unrecognised lithium opportunities. Having decided to target the Greenbushes Mineral District, the Company utilized a multi-element technique specifically developed to target Greenbushes-type pegmatite deposits. The technique involves sampling laterites over prospective metamorphic terrains, such as the Balingup Metamorphic Belt and assessing the geochemical concentrations of tin, tantalum, lithium, niobium, antimony and arsenic. This technique was successfully used to clearly define the Greenbushes Mine in the late 1980's.

Mt Lindsay Project, North West Tasmania

Introduction

The Mt Lindsay Project (148km²) is located in north-western Tasmania (Refer Figure Four) within the contact metamorphic aureole of the highly perspective Meredith Granite. The project sits between the world class Renison Bell Tin Mine (Metals X Ltd/Yunnan Tin Group >231kt of tin metal produced since 1968) and the Savage River Magnetite Mine (operating for > 45 years, currently producing approximately 2.5 Mtpa of iron pellets). Mt Lindsay has excellent access to existing infrastructure including hydro-power, water, sealed roads, rail and port facilities.

Venture owns 100% of the tenure that hosts both the Mt Lindsay Tin-Tungsten Deposit and all of the surrounding prospects.

Figure Four | Location Map for Mt Lindsay Tin-Tungsten Deposit/Riley DSO Deposit/Livingstone DSO Deposit

Since commencing exploration on the project in 2007, Venture has completed approximately 83,000m of diamond core drilling at Mt Lindsay and defined JORC compliant Measured, Indicated and Inferred Resources.

Tin-Tungsten Resources

Table Two | Resource Statement – Mt Lindsay Tin-Tungsten Project

Lower Cut (Tin equiv)	Category	Tonnes	Tin Equiv. Grade	Tin Grade	Tungsten Grade (WO ₃)	Mass Recovery of Magnetic Iron (Fe) Grade	Copper Grade	Contained Tin Metal (tonnes)	Contained Tin/ Tungsten Metal (tonnes)
0.20%	Measured	8.1Mt	0.6%	0.2%	0.1%	17%	0.1%	18,000	29,000
	Indicated	17Mt	0.4%	0.2%	0.1%	15%	0.1%	32,000	43,000
	Inferred	20Mt	0.4%	0.2%	0.1%	17%	0.1%	32,000	41,000
	TOTAL	45Mt	0.4%	0.2%	0.1%	17%	0.1%	81,000	113,000
0.45%	Measured	4.3Mt	0.8%	0.3%	0.2%	18%	0.1%	12,000	22,000
	Indicated	5.2Mt	0.7%	0.3%	0.2%	15%	0.1%	14,000	22,000
	Inferred	3.9Mt	0.6%	0.3%	0.1%	9%	0.1%	12,000	17,000
	TOTAL	13Mt	0.7%	0.3%	0.2%	14%	0.1%	38,000	61,000

Note: Reporting to two significant figures. Figures have been rounded and hence may not add up exactly to the given totals. Full details of the estimate are in the ASX announcement for the Quarterly Report on 17 October 2012.

Notes:

- The Sn equivalent formula used to calculate the Sn equivalent values for the Main and No.2 Skarns is as follows: Sn Equivalent (%) = Sn% + (WO₃% x 1.90459) + (mass recovery % of magnetic Fe x 0.006510) + (Cu% x 0.28019). Whereas for the Sn equivalent formula used to calculate the Sn equivalent values for the Stanley River South and Reward Skarns is as follows: Sn Equivalent (%) = Sn% + (WO₃% x 1.65217) + (Cu% x 0.34783).
- The mass recovery of the magnetic iron is determined mostly by Davis Tube Results (“DTR”).
- The Sn equivalent formulae uses a tin metal price of US\$23,000/t, an APT (Ammonium Para Tungstate) price of US\$380/mtu (1mtu = 10kgs of WO₃), a magnetite concentrate price of US\$110/t and a copper metal price of US\$8,000/t.
- Pilot scale metallurgical testwork has been completed on the Main and No.2 Skarns with results indicating the metallurgical recovery for tin is 72%, for WO₃ is 83%, for iron in the form of magnetite is 98% and for copper is 58%. The results of this testwork are stated in the ASX announcement of August 31 2012.
- It is the Company’s opinion that the tin, WO₃ and copper as included in the metal equivalent calculations for the Stanley River South and Reward Skarns have a reasonable potential to be recovered for when the Mt Lindsay Project goes into production.

The resource base at Mt Lindsay is hosted within two magnetite rich skarns (Main Skarn and the No.2 Skarn) which extend over a total strike of 2.8kms and remain open at depth. Additional indicated and inferred resources have been defined at the Reward and Stanley River South Prospects, which extend over an additional 1.1km of strike.

Recently, Venture has focussed efforts at Mt Lindsay on identifying additional high grade tin/tungsten targets in close proximity to the Mt Lindsay Deposit. The low cost exploration work is part of a broader strategy focussed on identifying high grade mineralization within trucking distance of the existing deposit that has the potential to further strengthen the economics of the Mt Lindsay Project.

Activities during the June Quarter

In recent Quarters, Venture has successfully defined eight new targets considered prospective for high grade tin/tungsten mineralization as well as targets prospective for copper and nickel mineralization (Refer Figure Five). These targets are hosted within the broader skarn units identified throughout the Mt Lindsay area of which to date only 10% have been drill tested.

During the June Quarter the Company continued the second phase of a reconnaissance program involving geological and structural mapping targeting both the Mt Ramsay and Stanley Tin Prospects.

Figure Five | Mt Lindsay - recently identified exploration targets

Riley DSO Hematite Project, North West Tasmania

The 100% owned Riley DSO Project is located 10km from the Mt Lindsay Deposit (Refer Figure Four and occurs as a hematite rich pisolitic and cemented laterite. The deposit is all at surface, located less than two kilometres from a sealed road that accesses existing rail and port facilities.

A maiden resource statement of 2mt @ 57% Fe was defined in 2012 which resulted in the Company doubling its overall DSO resource base, including the Livingstone Deposit, to 4.4mt @ 57% Fe.

Table Three | Resource Statement - Riley DSO Project

Resource	Tonnes	Fe (%)	Fe (%) Calcined	SiO ₂ (%)	Al ₂ O ₃ (%)	P (%)	S (%)	Cr (%)	LOI (%)
Indicated	2.0mt	57	61	3.7	2.6	0.03	0.08	2.8	7.7

*Refer to ASX announcement on 26 July 2012.

Following completion of the resource Venture engaged independent mining engineers, Rock Team to complete mining studies on the deposit and produce a reserve statement. With all the hematite resources at Riley located at or near surface, the study delivered a 90% conversion rate of resource to reserve.

Table Four | Reserve Statement - Riley DSO Project

Reserve	Tonnes	Fe (%)	Fe (%) Calcined	SiO ₂ (%)	Al ₂ O ₃ (%)	P (%)	S (%)	Cr (%)	LOI (%)
Probable	1.8mt	57	61	3.7	2.6	0.03	0.07	2.8	7.8

*Refer to ASX announcement on 26 July 2012.

Activities during the June Quarter

Following last year's Federal Court dismissal of the appeal against the environmental approvals for the Riley DSO Project, the Company now has unencumbered approvals for any future development of the Riley iron ore mine. The Federal Court decision in both the original case and the recent appeal awarded costs in favour of Venture. The Company will continue to actively seek the recovery of all legal costs associated with both cases.

During the June Quarter the Riley DSO Project remained on hold due to the sharp fall in iron ore prices over the past 2 years. Although the Company made the decision to suspend operations in August 2014, Venture had already completed extensive pre-production work at the Riley Project putting in place all the necessary requirements to commence mining. This work has placed Venture in a strong position should the iron ore price improve and afford the Company the opportunity to commence production with relatively short notice.

In recent months the iron ore market has strengthened with the price rallying off its lows. The Company will continue to watch the market closely and look for both the stabilization and consolidation of the price before considering any future production decision at the Riley Project.

Livingstone DSO Hematite Project, North West Tasmania

Located only 3.5km from the Mt Lindsay Tin-Tungsten Deposit is the 100% owned Livingstone DSO Hematite Deposit (Refer Figure Four). Livingstone consists of an outcropping hematite cap overlaying a magnetite rich skarn. The hematite occurs from surface, is consistent in grade and located only 2km from a sealed road which accesses existing rail and port facilities.

A maiden resource statement of 2.2mt @ 58% Fe was defined at Livingstone in 2011, which was followed by a positive and robust scoping study. Additional work later in 2011 included blending and sizing testwork and preliminary mining studies, all of which delivered positive results.

During the second half of 2012 the Company completed a resource upgrade, which resulted in 100% of the inferred resources being converted to the indicated category.

Table Five | Resource Statement Livingstone DSO Project

Resource	Tonnes	Fe (%)	Fe (%) Calcined	SiO ₂ (%)	Al ₂ O ₃ (%)	P (%)	S (%)	LOI (%)
Indicated	2.4mt	57	61	5.4	1.9	0.07	0.05	7.0

*Refer to ASX announcement on 26 July 2012.

Immediately following the resource upgrade Venture engaged independent mining engineers, Rock Team to complete mining studies on the deposit and produce a reserve statement. With the hematite resources at Livingstone consistent in nature and outcropping at surface the study delivered a 90% conversion rate of resource to reserve.

Table Six | Reserve Statement - Livingstone DSO Project

Reserve	Tonnes	Fe (%)	Fe (%) Calcined	SiO ₂ (%)	Al ₂ O ₃ (%)	P (%)	S (%)	LOI (%)
Probable	2.2mt	57	62	5.3	1.9	0.08	0.03	7.1

*Refer to ASX announcement on 26 July 2012.

Activities during the June Quarter

There was no field activity during the quarter.

Detailed information on all aspects of Venture Minerals' projects can be found on the Company's website www.ventureminerals.com.au.

Yours faithfully

Hamish Halliday
Managing Director

The information in this report that relates to Exploration Results and Exploration Targets is based on information compiled by Mr Andrew Radonjic, a full time employee of the company and who is a Member of The Australasian Institute of Mining and Metallurgy. Mr Andrew Radonjic has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Andrew Radonjic consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.
