KUNYIT TRENCHING AND SAMPLING PROGRAM.

The Directors of Coziron Resources Ltd ("**Coziron**") are pleased to announce that a trenching and sampling program has commenced at the Sungai Kunyit Iron Ore Project ("**Kunyit**") located in Western Sumatra, Indonesia.

A total of nine (9) trenches have been proposed and targets have been determined from recent geological mapping and ground magnetic surveying, undertaken in the last quarter of 2006. The magnetic survey was designed to test the lateral extent of magnetite mineralisation located around the Bukit 1, Bukit 2 and Bukit 3 prospects.

Results from the survey have proven a highly anomalous magnetic response located between Bukit 1 and Bukit 2 prospects, which cover a total strike length of approximately 1.5 kilometres.

Lower background readings have been recorded around the Bukit 3 prospect.

Six trenches will target the Bukit 1 and Bukit 2 anomalous magnetic response, whilst 3 others will target areas between Bukit 2 and Bukit 3. Each trench will extend approximately 150 metres in length and will be excavated with a mechanical excavator; expected depths gained will be approximately 5-7 metres. All associated geological face mapping and sampling will be undertaken concurrently.

Historic exploration and rock chip/grab sampling has returned assays of up to 66.30%Fe.

Magnetic mineralization occurring at the Kunyit project is aligned at 30-40° and corresponds with a line of major fault structures throughout the area. The geological model proposed is a shear hosted metasomatic deposit within a sub-vertical structure. Mineralisation appears to be an irregular dyke-like body with occasional thickenings that have weathered to leave resistant pods or boulders of the harder more massive magnetite on the hilltops.

Trenching data, along with recent geophysical work, will prove invaluable for generating drill holes targets at the Kunyit project area.

For further information regarding the Kunyit Iron Ore Project, please see the website at www.coziron.com.
