9th March , 2004

EGL WINS MAJOR ORDER FOR NEW TECHNOLOGY

The Environmental Group Limited (EGL) has been awarded a contract by Millennium Chemicals, titanium dioxide (TiO₂) pigment producers, to carry out the design, manufacture, supply and delivery of a scrubbing system. This system will improve Millennium's capacity to scrub airborne titanium tetrachloride produced during equipment cleaning.

The scrubbing system will use Turboscrubber™ fluid bed scrubbing technology to treat the gas, which requires a combination of fine particle collection and acid gas absorption in a non-fouling environment. This sale is further evidence of the applicability of this technology in the mineral processing industries and its acceptance by this market sector.

Millennium's selection of the technology follows a global review by the company and will in essence act as a demonstration of the technology for Millennium, one of the world's leading titanium dioxide producers with nine plants spread over four continents.

The contract, with a value of approximately \$230,000, is due for completion by July 2004.
