ASX Announcement/Press Release | 15 August 2024**Gold Mountain Limited (ASX:GMN)****New results extend area of Highly Anomalous Rare Earths on Poções Prospect, Down Under Project, Brazil**

Gold Mountain Limited (ASX: GMN) ("Gold Mountain" or "the Company" or "GMN") is excited to announce it has received 30 additional stream sediment samples from the Poções tenements in the Down Under Project area. High grade results in stream sediment samples extend and consolidate the areas of high-grade results previously released 8 July 2024.

Highlights**Work Undertaken**

- Assays received from regional stream sediment sampling with peak values of **587 ppm** TREO.
- Potential for ultra-high grade hard rock monazite hosted REE-Nb-U-Sc mineralisation is also indicated from the new stream sediment sample results and are coincident with many of the higher value REE anomalies.
- All TREO anomalies identified compare favourably with orientation sampling carried out on known IAC type REE mineralisation.
- New applications were made by GMN on extensions of Poções anomalous catchments.
- Landowner agreements are being made as required to allow for drilling. Other permits with State and Federal Governments have been lodged.

Future Workplan

- Identification of specific drill sites has been undertaken to cover known well preserved lateritic weathering areas. Additional sites will be designed and applied for.
- Radiometric traversing will be undertaken within the most highly anomalous catchments and along all drill traverse lines to search for potential Ultra-high grade hard rock deposits.
- A program of stream sediment pan concentrate sampling is planned.

The Company previously identified broad contiguous catchment areas with strongly anomalous geochemical Rare Earth Element (REE) assay results. The current results infill gaps in previous coverage and extend the areas of very high-grade catchment. The geochemical values received from the laboratory have been plotted as anomalous Total Rare Earth Oxides (TREO) catchment areas.

Progress on permits

Permits have been lodged with relevant State and Federal authorities for environmental permits and access permits are required from landowners affected by drilling. Extensive landowner work and contact with local government offices has been maintained to assist in permits being issued. Progress to 9 August on landowner permits is shown in table 1.

Tenement Group	Total Drill Holes proposed	Landowner Agreed Access drillholes	Signed Contracts	Contracts under review by Landowners
Down Under Central	198	25	5	3
Irajuba	352	156	25	2
Poções	124	18	6	12
TOTALS	674	199	36	17

Table 1. Progress on Landowner agreements in the Down Under project area.

Images & Maps

Figure 1 covers the whole REE projects areas in Bahia.

Figure 1. Location of REE projects and prospect areas held by GMN.

Figure 2 shows new tenement applications lodged and accepted by the ANM covering part of the anomalous catchments from Poções.

Figure 2. Tenement holdings and new application made in the Poções prospect area.

Figure 3 shows GMN geochemical anomalies from stream sediment samples indicating potential for hard rock ultra-high grade mineralisation in the Poções prospects.

Figure 3. Stream sediment anomalies indicative of hard rock ultra-high grade type mineralisation.

Figure 4 shows TREO anomalies in the Poções area. Note that all anomalies are either within or above the range of values found in orientation sampling on known IAC mineralisation in the region. Strongly anomalous geochemical responses are now seen over 16 kilometres along strike.

Potential for ultra-high-grade mineralisation has also been demonstrated with the Nb-Sc-U anomalies found over an 11 km strike length.

Figure 4. TREO anomalies plotted as anomalous stream sediment catchments. Maximum value of 587 ppm TREO. New data added additional very high TREO values in the highest (purple) category. High grade stream sediment samples, coupled with the Nb-U-Sc anomalies (hexagons - see figure 3 for legend) are considered indicative of ultra-high grade hard rock mineralisation.

Competent Persons Statement

The information in this ASX release is based on information compiled by Peter Temby, a Competent Person who is a Member of Australian Institute of Geoscientists. No exploration results are included in this announcement apart from presenting mapping done as a part of stream sediment sampling. Peter Temby is an independent consultant working currently for Mars Mines Ltd. Peter Temby confirms there is no potential for a conflict of interest in acting as the Competent Person. Peter Temby has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Peter Temby consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

- END -

About Us

Gold Mountain (ASX:GMN) is a mineral explorer with projects based in Brazil and Papua New Guinea (PNG). These assets, which are highly prospective for a range of metals including rare earth elements, niobium, lithium, nickel, copper and gold, are now actively being explored.

Gold Mountain has gradually diversified its project portfolio. The Company has highly prospective rare earth element, niobium, copper and lithium licenses located within the eastern Brazilian lithium belt, spread over parts of the Borborema Province, São Francisco craton and Aracuai Orogen in north-eastern Brazil including in Salinas, Mines Gerais.

In PNG, Gold Mountain is exploring the Wabag Project, which covers approximately 950km² of highly prospective exploration ground in the Papuan Mobile belt. This project contains three targets, Mt Wipi, Monoyal and Sak Creek, all lying within a northwest-southeast striking structural corridor. The three prospects have significant potential to host a porphyry copper-gold-molybdenum system and, or a copper-gold skarn system. Gold Mountain's current focus is Mongae Creek, which has been subjected to several phases of exploration, and the potential to host a significant copper-gold deposit is high. The current secondary targets are, in order of priority, Mt Wipi, Lombokai and Sak Creek. A new target, potentially another epithermal/porphyry system has been identified and is about to be sampled.

Gold Mountain has also applied for a total of 1,048 km² in two exploration licences at Green River where high grade Cu-Au and Pb-Zn float has been found and porphyry style mineralisation was identified by previous explorers. Intrusive float, considered to be equivalent to the hosts of the majority of Cu and Au deposits in mainland PNG, was also previously identified.

Appendix 1 JORC Code, 2012 Edition – Table 1

Section 1 - Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections)

Criteria	JORC Code Explanation	Commentary
<i>Sampling techniques</i>	<i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> <i>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i>	<i>Style of mineralisation sought is Ion Adsorbed Clay type REE mineralisation as well as lag deposits of REE mineralisation derived from hard rock sources in the weathering profile.</i> <i>High grade hard rock deposits of REE hosted by mafic to ultramafic host rocks are also a style of mineralisation being sought.</i> <i>Stream sediment sampling was carried out in drainages over 500 metres long with spacing planned at approximate 1 km on drainages.</i> <i>Stream sediment samples weighed approximately 1 kg each. Sample is pre-processed to a -10 micron sample fraction that is submitted to the laboratory. They are not considered representative of the possible grade of mineralisation at depth</i>
<i>Drilling techniques</i>	<i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other</i>	<i>No drilling undertaken</i>

Criteria	JORC Code Explanation	Commentary
	<i>type, whether core is oriented and if so, by what method, etc).</i>	
<i>Drill sample recovery</i>	<i>Method of recording and assessing core and chip sample recoveries and results assessed.</i> <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i> <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i>	<i>No drilling undertaken</i>
<i>Logging</i>	<i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i> <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i> <i>The total length and percentage of the relevant intersections logged.</i>	<i>No drilling undertaken</i> <i>Stream sediment sampling is subjective however the fraction sampled and the preparation and analytical procedures used make the samples readily compared and more representative than -80 # samples.</i>
<i>Sub-sampling techniques and sample preparation</i>	<i>If core, whether cut or sawn and whether quarter, half or all core taken.</i> <i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i> <i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i> <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i> <i>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</i>	<i>No drilling undertaken</i> <i>All samples were collected at 1 kg bulks in the field, screened at approximately 2.5 mm then securely packaged</i> <i>Sample preparation undertaken prior to sample dispatch to ALS at Belo Horizonte was to separate in an apparatus using Stokes Law to produce a nominal -10 micron fraction for dispatch to the lab after drying</i> <i>Sample representativity of the catchment was well represented in the -10 micron samples</i>

Criteria	JORC Code Explanation	Commentary
	<i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i>	
<i>Quality of assay data and laboratory tests</i>	<i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i> <i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i> <i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i>	<i>The analytical techniques used are four acid digest and ICP-MS, the 4 acid digest method is a partial digest technique, however differences in the analytical values of certified reference materials by the two methods suggest that 4 acid digests are suitable for non-resource sampling in exploration work. ALS codes used were MS41L-REE.</i> <i>No standards duplicates or blanks accompany these initial samples that will not be used other than to indicate potentially interesting REE and REE pathfinder element contents of the variably weathered samples</i> <i>Checks of the analytical values of CRM's used by the laboratory against the CRM specification sheets were made to assess whether analyses were within acceptable limits</i>
<i>Verification of sampling and assaying</i>	<i>The verification of significant intersections by either independent or alternative company personnel.</i> <i>The use of twinned holes.</i> <i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i> <i>Discuss any adjustment to assay data.</i>	<i>No adjustments were made to any data.</i> <i>No verification will be undertaken for these initial samples, which will not be used in any resource estimate. The samples are to determine the levels of REE and other valuable elements in regional stream sediment samples</i>
<i>Location of data points</i>	<i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i> <i>Specification of the grid system used.</i> <i>Quality and adequacy of topographic control.</i>	<i>Data points are measured by hand held Garmin 65 Multiband instruments with accuracy to 3 metres</i> <i>Grid system used is SIRGAS 2000 which is equivalent to WGS84 for hand held GPS instruments</i> <i>Elevations are measured by hand held GPS and are sufficiently accurate for this stage of exploration.</i> <i>Stream sediment sample sites are measured by hand held Garmin 65 multiband instruments with 3 metre accuracy in open conditions.</i>

Criteria	JORC Code Explanation	Commentary
<i>Data spacing and distribution</i>	<i>Data spacing for reporting of Exploration Results.</i> <i>Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i> <i>Whether sample compositing has been applied.</i>	<i>Stream sediment sampling was carried out at approximately 1 km intervals on drainages over 500 metres long.</i> <i>No sample compositing undertaken</i>
<i>Orientation of data in relation to geological structure</i>	<i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i> <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i>	<i>No drilling undertaken.</i> <i>Main IAC target is expected to be flat lying or gently dipping, reflecting pre laterite surfaces with the high grade hard rock targets being 5-10 metres wide, steeply dipping and with unknown orientation.</i> <i>Many streams are controlled by regional structure which may also control mineralisation and may bias results to some degree. The close spacing of samples is thought to have removed much of the potential bias present.</i>
<i>Sample security</i>	<i>The measures taken to ensure sample security.</i>	<i>Stream sediment samples are taken to the GMN laboratory daily and kept under secure conditions. Prepared samples are securely packed and dispatched to ALS by reliable couriers or hand delivered by GMN personnel.</i>
<i>Audits or reviews</i>	<i>The results of any audits or reviews of sampling techniques and data.</i>	<i>No audits or reviews, except for comparison with known mineralised zones over which stream sediments sampling was undertaken.</i>

Section 2 - Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code Explanation	Commentary
<i>Mineral tenement and land tenure status</i>	<i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i> <i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i>	<i>GMN holds 67 tenements in the Down Under Project. GMN has 100% ownership of the 57 granted tenements and 10 tenement applications.</i> <i>There are no known serious impediments to obtaining a licence to operate in the area.</i>
<i>Exploration done by other parties</i>	<i>Acknowledgment and appraisal of exploration by other parties.</i>	<i>No known exploration for REE has been carried out on the exploration licence application areas. Exploration for other minerals is known over the licence areas with underground excavations for nickel, gold and chalcedony.</i>
<i>Geology</i>	<i>Deposit type, geological setting and style of mineralisation.</i>	<i>The target mineralisation in the region consists of Ionic adsorbed clay and residual heavy mineral concentrations of REE elements associated with deeply weathered profiles over Middle Archean ortho and para granulite facies rocks and Late Archean high K ferroan A type granitoid sequences. The Archean sequences were metamorphosed to granulite facies in the Transamazonian orogeny and then intruded by Paleoproterozoic post tectonic charnockitic granites. Post tectonic potassium rich pegmatites that crosscut regional gneissic foliation are also present.</i> <i>Concentrations of REE minerals are present in the Later Archean A type granitoids and in small mafic intrusive bodies which can host very high grade monazite hosted REE-Nb-U-Sc mineralisation. Mineralisation is predominantly Ionic Adsorbed Clay type. Post tectonic intrusive bodies are known to carry REE mineralisation so the age of mineralisation and the host rocks may be very different.</i>

Criteria	JORC Code Explanation	Commentary
<i>Drill hole Information</i>	<i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i> <i>o easting and northing of the drill hole collar</i> <i>o elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i> <i>o dip and azimuth of the hole</i> <i>o down hole length and interception depth</i> <i>o hole length.</i> <i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i>	<i>No drilling undertaken</i> <i>Locations of all stream sediment samples and of anomalies are shown on maps in this report.</i>
<i>Data aggregation methods</i>	<i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</i> <i>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i> <i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i>	<i>No drilling undertaken, no cut off grades applied</i> <i>All sample results were included in the interpretations of the stream sediment data and no cut off was applied to results. Value ranges for anomalous samples are given in legends on the maps</i>
<i>Relationship between mineralisation widths and</i>	<i>These relationships are particularly important in the reporting of Exploration Results.</i> <i>If the geometry of the mineralisation with respect to the drill hole angle</i>	<i>No drilling undertaken</i>

Criteria	JORC Code Explanation	Commentary
<i>intercept lengths</i>	<i>is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</i>	
<i>Diagrams</i>	<i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i>	<i>No drilling undertaken; plan views of tenement geochemical sample locations are provided</i>
<i>Balanced reporting</i>	<i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i>	<i>Ranges of anomalous values for various element groups are given in the legends to maps in the release.</i>
<i>Other substantive exploration data</i>	<i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i>	<i>Artisanal mining for nickel and chalcedony in underground workings has been carried out at two locations recorded by the CPRM and one underground excavation for gold not recorded by CPRM.</i>
<i>Further work</i>	<i>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i>	<i>Additional work is continuing regional stream sediment sampling, radiometric mapping, channel sampling and reconnaissance and grid soil auger sampling and mapping of outcrop to define areas for resource drilling.</i>
