ANNOUNCEMENT

Julia Creek Drilling Programme 05 June 2007

Intermin Resources Ltd advises that it has completed a 150 hole (3,100 metres) Aircore drilling programme at the Company's Vanadium/Molybdenum project near Julia Creek in Queensland.

The recent drilling programme was designed to provide infill data on V/Mo mineralisation located in the Western Sector of the project near St Elmo station (Julia Creek).

It is believed that the new data will allow the calculation of a JORC compliant Indicated Resource for V/Mo mineralisation in the southern portion of the Company's western tenements to add to previously reported mineralisation in the eastern (Alisona) sector.

Drill hole samples have been forwarded to the laboratory for analysis and results are expected to be available in a few weeks. A number of the holes drilled were in previously tested locations to provide bulk samples for ongoing metallurgical work.

It is also expected that a programme of core hole drilling will be completed later this month to provide further bulk material for more specific mineral dressing testwork.

An update on these programmes will be provided when the assay data from the current programme becomes available.

Yours faithfully

M Ruane

On behalf of the Board
