13 July 2021

## RC Drilling Identifies Further High-Grade Gold Mineralisation at Mulgabbie

OzAurum Resources Ltd (**ASX: OZM** or **OzAurum** or the **Company**) is pleased to announce further results from the Company's large-scale 20,000 meter (m) Reverse Circulation (RC) drilling campaign, which has so far identified significant wide zones of gold mineralisation. The current RC results include 16 holes for 2,414m of drilling at the Mulgabbie North Project, situated North East of Kalgoorlie.

### Highlights

- Significant high grade gold mineralisation intersected, with mineralisation open along strike and at depth.
- RC holes that intersected significant gold mineralisation include:
  - **10m @ 2.8 g/t gold (Au)** –(from 17m) including **1m @ 21.6 g/t Au** MNORC 074
  - **11m @ 2.14 g/t Au** – (from 27m) including **1m @ 19.75 g/t Au** MNORC 065
  - **2m @ 7.30 g/t Au** –(from 19m) MNORC 075
  - **9m @ 1.89 g/t Au** – (from 73m within 20m @ 1.22 g/t Au) MNORC 079
  - **5m @ 3.20 g/t Au**-(from 72m within 19m @ 1.1 g/t Au and including **1m @ 6.30 g/t Au**) MNORC 76
  - **4m @ 3.14 g/t Au** – (from 133m within 14m @ 1.26 g/t Au) MNORC 079
- Assays pending for RC holes that have intersected a new fault with associated quartz veining and sulphide mineralisation
- Drone magnetometer survey being completed over Mulgabbie North area to assist with current interpretation of cross cutting faults along the Relief Shear
- New exciting targets identified- located 1km north and south of current RC drilling along Relief Shear to be tested with future RC drilling

## Mulgabbie North RC Drilling Results

The 16 holes that were drilled for 2,414m at the Mulgabbie North Project are a continuation of OzAurum's 20,000m RC drilling campaign that commenced in February this year. To date, a total of 104 RC holes have been drilled at Mulgabbie North for 15,811m.

The current RC drill campaign has identified further high-grade gold mineralisation at Mulgabbie. Most notably, RC holes **MNORC 074** intersected **10m @ 2.80 g/t Au** from 27m including **1m @ 21.60 g/t Au** and MNORC 065 intersected **11m @ 2.14 g/t Au** from 17m including **1m @ 19.75 g/t Au**.

Numerous RC drill holes intersected higher grade gold mineralisation within wide lower grade intervals indicating Mulgabbie North is situated within a large mineralised gold system. Gold Mineralisation at Mulgabbie North is currently open at depth and along strike at both the Ben and James Prospects.

These excellent RC results, combined with recently announced aircore (AC) results defining new zones of mineralisation (see ASX announcement on 21 June 2021), further highlight the potential of Mulgabbie North to be a significant gold project.

A further 24 RC holes for 3,160m have been drilled with assays still pending at the labs. The aim of these drill holes was to test Mulgabbie North's previously discovered AC gold anomalies and the southern extension of the Ben Prospect. Some of these holes have intersected wide zones of quartz veining with associated pyrite and arsenopyrite mineralisation. At the Ben prospect a significant fault has also been intersected in 4 RC holes that have associated quartz veining and mineralisation. The Company is eagerly awaiting the results from these holes.

Recent drilling at Mulgabbie North has discovered wide zones of weak to moderate hematite alteration in some RC holes. Specifically, the hematite alteration indicates oxidised fluids from an intrusive complex suggesting proximity to the mineralising centre - likely to be within OzAurum's 100% owned Mulgabbie North tenure.

## Upcoming RC drilling and Planned Exploration Activities:

The additional planned RC drilling at Mulgabbie North will further test strike and depth extensions of gold mineralisation at the James and Ben Prospects that are situated on the Relief Shear, as well as, western air core gold anomalies and associated mineralisation. In addition, two new exciting targets on the Relief Shear are located 1km north and south of current RC drilling and will be tested with upcoming RC drilling.

A drone magnetometer survey is currently being completed at the Mulgabbie North area that will assist with the current interpretation of cross cutting faults along the Relief Shear.

Gold mineralisation at these prospects is hosted in the intermediate-felsic volcanoclastic units. The RC drilling program at Mulgabbie North will further scope out the extent of known mineralisation aimed at making a significant gold discovery.

Utilising best practice RC drilling, sampling and assay protocols will allow for a potential future JORC 2012 compliant resource to be estimated with confidence at Mulgabbie North. Systematic RC drilling is being undertaken on a 20m x 20m and 40m x 100m spacings.

Due to the current high demand on assay laboratories, the Company is experiencing long delays with receiving assay results, with up to an 8-week turnaround time.

RC is being undertaken on a 3 week on 3 week off campaign basis due to long delays in receiving assay results from the assay laboratory.

## OzAurum's Chief Executive Officer, Andrew Pumphrey, said:

*"The additional high-grade gold intercepts achieved through the current RC drilling campaign are very encouraging and provide us with even greater confidence in the Mulgabbie Project. We believe that these results, and the many results still pending in the assay labs, have the potential to unlock a*

significant gold project at Mulgabbie. We look forward to updating the market on additional results as they become available.”

The Company will continue to provide regular market updates on exploration activities and report on drilling results as soon as they become available.

### About OzAurum

OzAurum Resources Ltd (ASX: OZM) is a Western Australian gold explorer with advanced gold projects located 130 km north east of Kalgoorlie. The Company's objective to make a significant gold discovery that can be brought in production.

For more information on OzAurum Resources Ltd and to subscribe to our regular updates, please visit our website at [www.ozaurumresources.com](http://www.ozaurumresources.com) or contact our Kalgoorlie office via email on [info@ozaurumresources.com](mailto:info@ozaurumresources.com).

### Competent Persons Statement

The information in this report that relates to exploration results is based on information compiled by Andrew Pumphrey who is a Member of the Australian Institute of Geoscientists and is a Member of the Australasian Institute

of Mining and Metallurgy. Andrew Pumphrey is a full-time employee of OzAurum Resources Ltd and has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr Pumphrey has given his consent to the inclusion in this report of the matters based on the information in the form and context in which it appears.

|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sampling techniques | <i>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> | <p>The Mulgabbie North Deposit 16 RC holes (MNORC 065 - 080 2,414m), azimuth 225° dipping -60°.</p> <p>The RC samples are collected from the drill rig cyclone in a green plastic bag in 1m intervals and are laid out in rows of either 20, 30 or 40 samples. A 2-4kg representative sample is split via the rig mounted cone splitter and placed on top of the green plastic for that metre interval.</p> <p>Diamond drilling completed using one metre sampling lengths, core half cut adjacent to bottom of hole orientation line.</p> <p>Aircore samples are laid out in rows of 10.</p>                                                                           |
|                     | <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i>                                                                                                                                                                                  | <p>All sampling is undertaken using OzAurum Resources sampling procedures and QAQC in line with industry best practise which includes certified standards on average every 30 samples.</p> <p>The RC drill rig provides a sample at the end of each metre of drilling. A 2-4 kg sample is collected from the drill rig via a cone splitter which is representative of that metre.</p> <p>PQ diamond core was half cut to produce a 2-4 kg sample for analysis.</p> <p>Aircore composite samples weighing between 2-4 kg are collected from four one metre samples via a sample scoop with even quantities of each 1m sample collected to form the composite sample.</p> |

| Quality of assay data and laboratory tests | <i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i>                                                                                 | The nature, quality and appropriateness of the assaying and laboratory procedures are industry standard for Archaean mesothermal lode gold deposits. The fire assay technique will result in a total assay result. In cases where visible gold has been observed or a fire assay grade has exceeded 100 g/t or coarse gold is suspected then a screen fire assay (Au-SCR22AA) has been undertaken on those samples and reported instead of the fire assay result. |

| <b>Data aggregation methods</b>                                         | <i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.</i>                                                 | All one metre diamond drill results are reported in Appendix 1 Section 2 of JORC table 1. Holes include up to 2m of internal dilution - host unit was intersected in the 2m diluted section with significant alteration. A bottom cut-off grade of 0.1 g/t was used, and no top cut grade was applied. The procedure applied to the aggregate intercepts quoted is length weighted average (sum product of interval x corresponding interval assay grade), divided by sum of interval lengths and rounded by one decimal place. |
|                                                                         | <i>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|                                                                         | <i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i>                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Relationship between mineralisation widths and intercept lengths</b> | <i>These relationships are particularly important in the reporting of Exploration Results.</i>                                                                                                                                                                | These drill holes are designed to drill perpendicular to the Relief Shear that strikes at 315°. The dominant mineralisation geometries seen at the Mulgabbie North gold project are;<br><br>1. Shear zone hosted mineralisation on the lithological contact which strikes 315° and is moderately dipping to the east at -75°.                                                                                                                                                                                                   |
|                                                                         | <i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i>                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
