

## High-Grade Gold Results Confirm Resource Growth Potential at Spring Hill

### HIGHLIGHTS

New results reported for five holes, extensive visible gold observed in two additional Link Zone holes with results pending.

#### Visible Gold Extends High-Grade Link Zone

- Extensive Visible Gold intersected in SDH26-009, (120m up dip of the previously reported Link Zone discovery hole) - Assays pending.
- Extensive Visible Gold also intersected in SDH25-010a, (120m down plunge of the current Link zone wireframe) – Assays pending.
- 4.5m @ 4.72 g/t Au from 239.5m including 1.5m @ 12.66 g/t Au (SDH25-031).
- 7.0m @ 2.55 g/t Au from 324m (SDH26-003).
- 6.7m @ 2.79 g/t Au from 130m (SDH26-005).
- 39.0m @ 0.87 g/t Au from 244m including 6.3m @ 2.93 g/t Au from 276m (SDH26-004).

#### New Footwall Lode Identified Outside Current Resource – Sits Parallel to Macau zone

- 11.5m @ 0.73g/t Au from 117.5m, 15m @ 0.94g/t Au from 221.1m(SDH26-004)
- 3.4m @ 2.68 g/t Au from 231.6m (SDH26-003).
- 3.3m @ 2.82g/t Au from 263m and 6m @ 1.57g/t Au from 294m (SDH26-002).

#### Macau Zone – Drilling Continues to Deliver

- 17.5m @ 1.69 g/t Au from 213.5m, including 4.9m @ 4.61 g/t Au (SDH25-031).
- 7.8m @ 1.58 g/t Au from 443m including 1.0m @ 7.26 g/t Au (SDH26-002).

#### Photon Assay Optimization Testwork from Hong Kong

- 113m @ 1.14 g/t Au from surface, sub parallel to mineralisation including 18m @ 4.62 g/t Au from surface (SDH26-005). Samples from this hole to be utilised for photon assay optimisation testwork in conjunction with Chrysos Corporation.

Plates 1 and 2- Visible gold intersected in SDH26-009, up dip from the previous Link Zone intercepts

**Cautionary Statement:** Visual estimates of mineral abundance should never be considered a proxy or substitute for laboratory analyses where concentrations or grades are the factor of principle economic interest. Visual estimates also potentially provide no information regarding impurities or deleterious physical properties relevant to valuations. The Company expects to receive the laboratory analytical results of the recent core samples in the current quarter.

## Executive Commentary

**Executive Chairman Ashley Pattison commented:**

*“These latest drilling results continue to demonstrate the significant growth potential emerging at Spring Hill beyond the current resource base.*

*Cube Consulting is currently undertaking a full remodelling of the Spring Hill deposit as part of the upcoming Mineral Resource Estimate update, which is expected over the coming month or*

*so. The evolving geological interpretation is already highlighting additional growth opportunities both within and outside the current resource envelope.*

*The Link Zone continues to deliver encouraging high-grade results, with recent drilling intersecting visible gold both up-dip and down-dip of the current interpreted mineralised zone. These results continue to support the scale and continuity potential of the Link Zone and reinforce its importance within the broader Spring Hill system.*

*Importantly, drilling has also identified a new mineralised footwall lode outside the current Mineral Resource Estimate, reinforcing our view that Spring Hill remains substantially underexplored.*

*As our understanding of the structural controls associated with the Macau–Link Zone relationship improves, we are identifying additional areas across the project where similar repeating mineralised structures may occur. We look forward to testing these emerging targets through future drilling programs.*

*We are also increasingly seeing evidence for the development of down-plunge high-grade shoots within the broader system, which may represent important targets for future resource growth and potential underground development opportunities.”*

**PC Gold Ltd (ASX: PC2)** (“PC Gold” or “the Company”) is pleased to report strong results from ongoing drilling targeting the Link Zone and surrounding Macau and Hong Kong zones at the Spring Hill Gold Project, confirming that Spring Hill is evolving from a conventional open pit resource into a broader mineralised system with growing underground development potential.

### **Link Zone Update**

Drilling has targeted broad-spaced up-dip and down-dip extensions to test continuity of the interpreted Link Zone mineralised domain. The most recent drilling has intersected extensive VG in SDH26-009, 220m up dip of previously reported intercepts with assays pending (Plate 1, gold in Link Zone and Plate2, new Footwall Lode).

**Plates 1 and 2- Visible gold intersected in SDH26-009, up dip from the previous High Grade Link Zone intercepts**

**PC GOLD**

More recently, a follow up hole which was just completed, SDH26-010a has also intersected extensive VG on the predicted plunge of the current interpreted Link zone (Plates 3, 4 and 5)

Plate 3 - Visible gold from  
SDH26-010a at 240m.

Plate 4 - Visible gold from  
SDH26-010a at 246m.

Plate 5 - Visible gold from  
SDH26-010a at 231.7m.

Significant results from within the Link Zone include:

- **4.5m @ 4.72 g/t Au** from 239.5m including **1.5m @ 12.66 g/t Au** (SDH25-031).
- **7.0m @ 2.55 g/t Au** from 324m (SDH26-003).
- **6.7m @ 2.79 g/t Au** from 130m (SDH26-005).

Drilling of the Link Zone has been challenging from surface given the interpreted orientation of the structure however current holes are being drilled under controlled drilling situations with far greater success to avoid hole swings and lifting in the stratigraphy being targeted.

**Figure 2: Cross section of Macau Link Zone for new results**

### Geological Interpretation – Additional Targets

Initial interpretation of the Link Zone indicates it is hosted within a parasitic fold caused by displacement along an axial planar feature, see Figure 3. Future drilling will target both up and down-plunge of the Link Zone, focussing on kinks in the Hong Kong and Macau Lodes. The aim being to define an area of elevated grade amenable to underground mining, see Figure 5. The intersection of the axial planar feature and the Lower Pelite have to date returned the best grades, within a hematite – maghemite horizon that is persistent at the same stratigraphic location within the Lower Pelite horizon.

This interpretation has highlighted other areas within the Spring Hill tenements where additional structures similar to the Link Zone may be present, Exploration will follow up with work to test these areas soon, see Figure 4.

Figure 3: Interpretation of the Link Zone

Figure 4: Link zone and plunge and target areas

PC GOLD

Figure 5: Look alike Link structures occur approximately every 340m along strike within the MRE

Detailed geological modelling continues to define the geometry and plunge of the Link mineralised zones, supporting further drilling and evaluation of potential underground development opportunities.

In relation to the visible gold logged in holes SDH26-009 and SDH26-010a from the Link Zone, Appendix 2 contains all the information required to be reported in accordance with the JORC Code.

### **Footwall Lode Discovery**

Recent drilling has also identified a previously unrecognised mineralised lode in the footwall of the Macau Lode in two drill holes that is interpreted to represent a parallel structure within the broader Spring Hill system. Notable intercepts reported to date include:

- **11.5m @ 0.73g/t Au** from 117.5m, **15m @ 0.94g/t Au** from 221.1m, **39.0m @ 0.87 g/t Au** from 244m including **6.3m @ 2.93 g/t Au** from 276m (SDH26-004).
- **3.4m @ 2.68 g/t Au** from 231.6m (SDH26-003).
- **3.3m @ 2.82g/t Au** from 263m and **6m @ 1.57g/t Au** from 294m (SDH26-002).

This lode was also intersected in hole SDH26-009. Assays are pending.

### **Hong Kong Lode / Chrysos Collaboration Testwork Program**

Drill hole SDH26-005 was drilled down dip from the northern end of the proposed Hong Kong open pit where the mineralisation outcrops at surface. Within the Hong Kong mineralisation, the hole intersected **113m @ 1.14 g/t Au** from surface, sub parallel and within the Hong Kong Zone in (SDH26-005). That interval included **18m @ 4.62 g/t Au** from surface.

**PC GOLD**

The hole tested a true thickness of 10m, within a much wider 64m wide mineralised zone at this location.

This hole was designed to target the Link Zone at depth, up dip from the 2025 discovery holes. In addition, the half core comprising the interval above is being used by PC Gold for a collaboration test program in conjunction with Chrysos Corporation Ltd, the owner of Photon Assay technology, where by the half core will be assayed in its entirety to determine whether or not the Photon Assay technology is still under calling the insitu grade of the Spring Hill deposit. This program will essentially determine if a 500g sample size is the optimal sample size for a coarse gold deposit such as Spring Hill or whether we should in fact be assaying more sample to arrive at a representative grade for the Spring Hill Deposit.

This work is not only paramount for future MRE updates, but more importantly for the future grade control drilling programs at Spring Hill as part of the open pit and underground mine plans.

#### **Next Steps**

- Ongoing drilling with three rigs currently operating on the Link and Main zones
- Targeting additional Link-style mineralisation across the project as shown in Figure 4
- Ongoing geological interpretation and resource modelling by Cube with the updated MRE due out in June 2026.
- Complete the Chrysos collaboration testwork program on hole SDH26-005.

#### **About PC Gold**

PC Gold Limited is a gold exploration and development company focused on unlocking the full potential of its flagship Spring Hill Gold Project in the Northern Territory. With a Mineral Resource Estimate reported in accordance with the JORC Code of 25.6Mt @ 1.0g/t Au for 821Koz Au (at a 0.5g/t Au Cut of Grade), a strong balance sheet, and a highly experienced team, PC Gold is executing a clear strategy to transition Spring Hill toward production.

The Spring Hill Project is a virgin gold system hosting mineralisation within granted mining leases, with environmental approvals already in place to commence open-pit mining. This positions PC Gold to move swiftly through development milestones.

The Company is advancing Spring Hill through a dual-stream strategy:

- Infill drilling to upgrade Resource confidence and support conversion to Reserves.

- Aggressive extensional exploration to grow the global Spring Hill Resource inventory.

All modifying factors required for future development — including mining, metallurgy, infrastructure, and permitting — are being progressed in parallel, to ensure a streamlined path toward feasibility and production.

A breakdown of the Spring Hill Mineral Resource Estimate by category and various Cut Off Grades (COG) is as follows:

| COG        | Indicated   |            |              | Inferred    |            |              | Total       |            |              |
|------------|-------------|------------|--------------|-------------|------------|--------------|-------------|------------|--------------|
|            | Tonnes (Mt) | Au g/t     | Oz Au ('000) | Tonnes (Mt) | Au g/t     | Oz Au ('000) | Tonnes (Mt) | Au g/t     | Oz Au ('000) |
| 0          | 21.1        | 0.7        | 505          | 22.3        | 0.7        | 503          | 43.4        | 0.7        | 1,008        |
| 0.3        | 17.6        | 0.9        | 483          | 19.2        | 0.8        | 482          | 36.8        | 0.8        | 966          |
| <b>0.5</b> | <b>13.0</b> | <b>1.0</b> | <b>424</b>   | <b>12.6</b> | <b>1.0</b> | <b>397</b>   | <b>25.6</b> | <b>1.0</b> | <b>821</b>   |
| 0.7        | 8.6         | 1.2        | 341          | 7.3         | 1.3        | 295          | 15.9        | 1.2        | 636          |

**Notes:**

1. Figures may not add up due to rounding.
2. All Mineral Resources are classified as Indicated and Inferred.
3. All Mineral Resources have been depleted by surface trial mining and Underground Adits.
4. Grade Capping has been applied to high grade outliers. Each domain has been capped based on their unique geology and grade distribution.
5. No minimum mining SMU parameters applied to the Mineral Resources.
6. The average bulk density is assigned based on average mean values by weathering type: oxide = 2.57 g/cm<sup>3</sup>; transition = 2.69 g/cm<sup>3</sup>; Fresh = 2.77 g/cm<sup>3</sup>.
7. The Mineral Resource was estimated in accordance with the JORC Code.

### **Competent Person's Statement**

Information in this announcement that relates to exploration results is based on and fairly represents work undertaken by Mr Peter Harris, a Competent Person who is a Member of the Australian Institute of Geoscientists. Mr. Harris has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a 'Competent Person' as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves' ("JORC Code"). Mr. Harris is an employee of PC Gold Ltd and Mr. Harris consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears.

Past Exploration Results and Mineral Resource estimates reported in this announcement were first reported by the Company in accordance with ASX Listing Rules 5.7 and 5.8 in its Prospectus lodged with ASIC and dated 13 August 2025 (as amended by the Supplementary Prospectus lodged with ASIC and dated 10 September 2025) (the **Prospectus**). The Company confirms that it is not aware of any new information or data that materially affects the information included in the Prospectus and that in the case of the Mineral Resource estimates, that all material assumptions and technical parameters underpinning the estimates in the Prospectus continue

**PC GOLD**

to apply and have not materially changed. The Company confirms that the form and content in which the Competent Person's findings are presented here have not been materially modified from the Prospectus. Refer to the Prospectus for further information.

**Disclaimer**

This release may include forward-looking statements. These statements are based on PC Gold management's expectations and beliefs concerning future events as of the time of the release of this announcement. Forward-looking statements are necessarily subject to risks, uncertainties and other factors, some of which are outside the control of PC Gold, which could cause actual results to differ materially from such statements. PC Gold makes no undertaking to subsequently update or revise the forward looking or aspirational statements made in this release to reflect events or circumstances after the date of this release, except as required by applicable laws and the ASX Listing Rules.

## APPENDIX 1 – DIAMOND DRILLING – HOLE DETAILS

Notes:

- Results are based on ore grade 500g photon assay for Au.
- Intersections are from diamond core drilling with half-core samples or from RC drilling with 1m representative samples.
- Core sample intervals were constrained by geology, alteration or structural boundaries, intervals varied between a minimum of 0.2 metres to a maximum of 1.2 metres.
- Mean grades have been calculated on a 0.3g/t Au lower cut-off grade with no upper cut-off grade applied, and maximum internal waste of 3.0 metres.
- All intersections are downhole intervals, and reflect approximate true widths unless otherwise stated.
- All downhole deviations have been verified by downhole camera and or downhole gyro
- Collar coordinates surveyed by PCGOLD using Garmin GPS.
- The Company maintains a QA/QC program in compliance with the requirements of JORC 2012.
- The assay laboratories responsible for the assays was Intertek Pty Ltd, Perth, WA.

Notes:

- Results are based on ore grade 500g photon assay for Au.
- Intersections are from diamond core drilling with half-core samples or from RC drilling with 1m representative samples.
- Core sample intervals were constrained by geology, alteration or structural boundaries, intervals varied between a minimum of 0.2 metres to a maximum of 1.2 metres.
- Mean grades have been calculated on a 0.3g/t Au lower cut-off grade with no upper cut-off grade applied, and maximum internal waste of 3.0 metres.
- All intersections are downhole intervals, and reflect approximate true widths unless otherwise stated.
- All downhole deviations have been verified by downhole camera and or downhole gyro
- Collar coordinates surveyed by PCGOLD using Garmin GPS.
- The Company maintains a QA/QC program in compliance with the requirements of JORC 2012.
- The assay laboratories responsible for the assays was Intertek Pty Ltd, Perth, WA.

## APPENDIX 2 – VISIBLE GOLD LOGGING DETAILS

| <b>Sampling techniques</b>   | <ul style="list-style-type: none"> <li><i>Nature and quality of sampling</i></li> <li><i>measures taken to ensure sample representivity.</i></li> <li><i>Aspects of the determination of mineralisation that are Material to the Public Report.</i></li> </ul>                                                                                    | <ul style="list-style-type: none"> <li>Diamond drill core of HQ-3 size (61.1mm diameter) was collected from both the reported intervals as part of the evaluation of Link Zone, Macau, Hong Kong and the recently defined Footwall Lode at Spring Hill. The core is oriented based on the driller's mark from the down-hole orientation tool, and the bottom of core line marked along with the down-hole direction, recoveries measured, and logged in detail for lithology, mineralisation, and structure. The sample intervals are marked with sample numbers and photographed. Core is processed in an automated core cutting facility on site at Spring Hill. Cut sheets are provided to the core cutting operator listing the required sample intervals, and their corresponding numbers and instructions for CRMs, blanks, and duplicates, if any.</li> <li>Diamond core will be sawn in half, and one half of the core was used for assaying. The remaining half is retained in the core trays. Samples are taken generally on 1 m intervals, since the sheeted vein systems at Spring Hill contain numerous millimetre- to decimetre- thickness veins on which sampling of individual veins is impractical. Shorter sample intervals are taken at defined contacts of lithological units where relevant. Following cutting, the half core intervals are placed in pre-numbered calico bags. The half core is dried and crushed at the Intertek sample preparation facility in Darwin, using jaw crushers, with the entire sample crushed to nominal -2 mm. The crushed product is then split, and 500g placed into a jar to be freighted to Intertek Perth for Photon assay, which has a lower detection limit of 0.02grams per tonne Au.</li> </ul> |
| <b>Drilling techniques</b>   | <ul style="list-style-type: none"> <li><i>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit, or other type, whether core is oriented and if so, by what method, etc).</i></li> </ul> | <p>Drill Type and details used at Spring Hill (2025 and 2026)</p> <ul style="list-style-type: none"> <li>Drilling at Spring Hill in 2025 and 2026 has been a combination of reverse circulation drilling (RC) and diamond core drilling, all of which has been HQ-3, using the services of two core drilling contractors and one RC contractor.</li> <li>RC drilling was completed using a 5 ¾ inch drop centre hammer.</li> <li>Some Diamond drill holes for resource purposes will be drilled from RC pre-collars, followed by HQ3 coring.</li> </ul> <p>Wherever possible oriented core was collected, using state of the art downhole devices. Single shot surveys were run at generally 30 m intervals, presently a down-hole north- seeking gyro is being used to monitor hole direction and adjust drill parameters accordingly.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

At Spring Hill, numerous alluvial, eluvial and hard rock workings were in operation, mainly by Chinese miners. The extensive surface workings suggest that significant amounts of gold were extracted. About 20,000 oz of gold production was recorded between 1880 and 1905, and the area was worked intermittently until 1966. The major hard rock workings were on the Main (or Western) Lode where oxidised ore was mined in a shaft to a depth of up to 109 m, but there was also widespread eluvial and alluvial work on the steep slopes and narrow, high-energy gullies that drain the range.</li> <li>From 1933 to 1938, the Spring Hill Gold Mining Company drove an adit from the east side of Spring Hill with the portal 120 m below the surface exposure of the Main Lode. In 1949, Northern Territory Prospecting and Development Co. extended the adit to 427 m, reached the Main Lode, and carried out a little development work. Another company, Spring Hill Gold NL later carried out some stoping on the East Lode, but production was limited by a lack of water to process ore through the battery near the adit portal. Total gold produced from the Main Adit East Lode stopes was 20.2 kg gold at an average ore grade of 18.6 g/t Au.</li> <li>From 1985 to September 1988 Territory Resources NL held the key leases over the major mined areas. The Main Adit was reopened, mapped and sampled where possible.</li> <li>Ross Mining NL acquired the project from Territory Resources in 1988, and soon after formed an exploration joint venture with Billiton Australia (at the time, the metals</li> </ul> |

|          |                       | <p>division of The Shell Company of Australia Limited), who carried out a major programme of work as operators from November 1988 until it withdrew from the Spring Hill Joint Venture in March 1992.</p> <ul style="list-style-type: none"> <li>• In 1989-91, Billiton installed a 25m line spaced grid over the tenements that was used for geological mapping, soil sampling and a ground magnetic survey, followed by costeans, reverse circulation and diamond drilling, as well as some metallurgical testwork, petrology, a TEM survey, structural mapping and mineralisation modelling. This resulted in encouragement, with a 300 m extension to the Hong Kong Vein System recognised on the west side of the Property by 1990.</li> <li>• In the north part of the deposit, as far as 11900N, soil results produced discrete geochemical anomalies over veining of the Lasagne vein system, between 10400N and 11900N. The Lasagne system is largely within Gerowie Tuff, with a variety of vein styles including saddle reefs, bedding parallel, and tension gash styles, dominantly on the west limb of the main anticline. The tension gash style is parallel to the orientation of the Hong Kong System. While veining is strongly developed, the grades returned at Lasagne were low, with the best result being 0.47 g/t Au. It was noted that the veins are quartz- rich and have a lower sulphide content than those that carry gold further south in the vein systems in Mount Bonnie Formation.</li> <li>• The 1989-91 drilling program proceeded in five phases: <ul style="list-style-type: none"> <li>○ In June 1989, 25 RC holes were drilled for 2,428 m at targets from earlier grid soil BLEG sampling. In October 1989, an additional 26 RC holes for 2,600 m were drilled, focusing on optioned leases to assist with exercise decisions, as well as infill at "Strawberry Pastry" (later renamed Macau?), Hong Kong, and a southern extension of Hong Kong at the time called "Toothpaste".</li> <li>○ Diamond drilling in 1990 of 608 m in holes SHDH001 to SHDH007 at Hong Kong and the main anticline. The best intersection was in SHDH001 at Hong Kong, where 30 m at 1.82 g/t Au was intersected between 67 m and 96 m.</li> <li>○ Drilling of RC holes SHRC052 to SHRC067 hit individual intersections of significance at Main Lode, Middle Lode and Hong Kong, while four holes drilled at Lasagne were unsuccessful.</li> <li>○ In 1991, drilling of RC holes SHRC068 to SHRC078 (863 m), then later a second program drilled SHRC079 to SHRC087(688m).</li> <li>○ Diamond drilling in 1991 consisted of four holes, SHDH008 to SHDH010 (775 m), which were extensions of SHRC077, SHRC072, and SHRC078 respectively; and the 50 m vertical HQ hole, RM001, to obtain samples for metallurgical test work from the main lens of the Hong Kong sheeted vein system.</li> </ul> </li> <li>• Billiton completed a column leaching test on the presumably oxidised crushed core from hole RM001, which</li> </ul> |

|----------|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |                       | <p>produced a recovery of 73% of Au over 83 days, with 50% recovery in the first 6 days.</p> <ul style="list-style-type: none"> <li>• Billiton also reinterpreted the resource distribution and re-estimated the resource based upon their exploration.</li> <li>• In May 1991, Billiton were able to purchase 100% of the Union Reefs Project (MLN1109) and appear to have withdrawn from their other joint ventures with Pegasus at Mount Todd and with Ross Mining at Spring Hill after this success at Union Reefs.</li> <li>• In March 1992, Ross Mining NL reached agreement to purchase Shell's 50% in Spring Hill and finalised the agreement on 3rd August 1992. Ross Mining then proceeded to explore the Spring Hill Project in their own right. In the remainder of 1992, Ross Mining compiled the Billiton data and produced an updated Mineral Resource estimate on the Hong Kong Sheeted Vein Resource (Indicated and Inferred resources of 3.4 Mt at 1.5 g/t Au for 158 k Oz Au, not constrained by pit optimisation shells).</li> <li>• Ross Mining conducted an active exploration program on the Spring Hill titles during 1993 and 1994. The first phase of this was detailed field checking, including mapping and sampling of selected portions of the project area based on the previous results to develop a detailed proposal for field work, accompanied by drilling of 13 RC holes, SHRC089 to SHRC101 for 1,287m in October 1993 to follow up early findings (Melville, 1994).</li> <li>• This resulted in Ross elevating the exploration intensity at Spring Hill in 1994, (Sheldon, Scrimgeour and Edwards, 1994). This work identified extensions to the Hong Kong Vein System, and new mineralised zones at Steve's Gully, Vein Heaven, and Zbonsky Trend, confirmed with RC drilling. Diamond drilling also extended the dimensions of the mineralised envelope along strike and to depth. The Hong Kong Zone was extended by 250 m to the north and 225 m to the south.</li> <li>• Following this program, the project moved to pre- feasibility studies in 1995, including water quality monitoring, environmental monitoring, metallurgical testwork, resource/ reserve estimations, scoping studies, and rehabilitation.</li> <li>• In the mid- 1990s Ross Mining was acquired by Placer Dome. All titles were surrendered on 12th March 2001.</li> <li>• During 2003, the subsequent owner of the Project, Tennant Creek Gold (NT) Pty Ltd, commissioned McDonald Speijers to undertake a first pass economic assessment of the mineralisation and to create a preliminary pit design for the Hong Kong, Main, Middle and East Zones.</li> <li>• In 2007 Western Desert Resources Limited (WDR) acquired the project from Tennant Creek Gold (NT) Pty Ltd.</li> <li>• In mid-2011 WDR Gold entered into a joint venture agreement with TM Gold Pty Ltd (a subsidiary of Thor Mining PLC) for a 25% share in the project. TM Gold subsequently purchased 100% of the project. Thor Mining completed DD drilling, metallurgical testwork, a high-resolution aeromagnetic survey and screen fire assay</li> </ul> |

The stratigraphy at Spring Hill falls within the South Alligator Group and Finnis River Group of the Cosmo Supergroup, in greenschist facies metamorphosed sediments, which are isoclinally folded along north- west trending axes in an embayment with lobes of the Cullen Batholith to the north- east and south- west. The main anticline at Spring Hill plunges at a moderate angle to the southeast.</li> <li>• Spring Hill also falls within the Pine Creek Shear Zone, a north- west / south- east trending strike- slip fault system that follows the same embayment between the Cullen Batholith lobes and appears to have been reactivated multiple times during and after granite emplacement. The Pine Creek Shear Zone is most likely a major control on gold mineralisation. The bulk of discovered mineralisation at Spring Hill has been deposited in structures in the Mount Bonnie Formation of the South Alligator Group.</li> <li>• These structural events controlling the distribution of gold mineralisation in and near the Pine Creek Shear Zone deposits most commonly follows a pattern of association with fold structures, in particular anticlines, in ferruginous quartz vein zones with a variety of structural controls. Spring Hill is one of the group of deposits in and around the Pine Creek Shear Zone that share similar characteristics.</li> </ul> |
| <b>Drill hole Information</b> | <ul style="list-style-type: none"> <li>• <i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i> <ul style="list-style-type: none"> <li>○ <i>easting and northing of the drill hole collar</i></li> <li>○ <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i></li> <li>○ <i>dip and azimuth of the hole</i></li> <li>○ <i>down hole length and interception depth</i></li> <li>○ <i>hole length.</i></li> </ul> </li> <li>• <i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the</i></li> </ul> | <ul style="list-style-type: none"> <li>• Tabulation of recent drillholes is contained in the supplementary data accompanying the IPO report. The data for holes relevant to this release are described within the tables contained in this release.</li> <li>• For the sake of completeness, the following background information is provided in relation to the drill holes.</li> <li>• Easting, Northing and RL of the drill hole collars are in the coordinates of MGA94 Zone 52.</li> <li>• Dip is the inclination of the hole from the horizontal. For example, a vertically down drilled hole from the surface is - 90°. Azimuth is reported in magnetic degrees as the direction toward which the hole is drilled.</li> <li>• Down hole length of the hole is the distance from the surface to the end of the hole, as measured along the drill trace. Depth is the distance down the hole as measured along the drill trace. Intersection width is the downhole distance of an intersection as measured along the drill trace.</li> <li>• Drill hole length is the distance from the surface to the end of the hole, as measured along the drill trace.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                           |
