EXPLORATION UPDATE

Yelverton

Drilling of the Adina #5 well was completed on the 30th of August with the well at 298metres. Casing and cementing have now been completed and perforating of the target coal seam, the Chapman Hill seam, will take place on Wednesday the 7th of September. The Chapman Hill seam is below the target coal seam in Adina #1, the Osmington seam, and has an approximate thickness of 4 metres.

Re-perforation of the Osmington seam in Adina #1 well will take place directly following the work at Adina #5.

The drilling rig is moving to the Adina #3 well location where surface casing has already been set to 50 metres. The target depth for this well is 350 metres and is expected (from seismic) to encounter more Permian coals than in the previous two wells.

Stephen Thomas
Managing Director
