Best Silver Grades seen to date at Sorpresa Project
- Assays reported for Roadside and Trench 31 locations

Further encouraging assays are reported for the Sorpresa Gold and Silver mineralization, encompassing percussion drill holes Fi 196 to Fi 216. This report focuses on assays in the silver dominant areas of Sorpresa. In addition, location details for the next series of completed percussion drilling are provided. Refer to **Appendix 2** for all details.

Summary of Key Results and Drilling Activities

- **At the silver dominant Roadside Area, drill hole Fi 214 has produced the highest grade intersection for Silver seen to date within the Sorpresa Project at any location, exceeding Fi 212 (previously reported)**
  - **24m @ 173g/t silver(Ag) [1] from 12m, including 2m @ 943g/t silver(Ag) AND 2m @ 480g/t Ag**
  - Also contained is a gold credit of 20m @ 0.72g/t Au [2] from 18m
  - Essentially Fi 214 has a silver zone of 41m Ag from 1m
  - Most holes (2011 and 2012) at the Roadside area have shown a strong component of silver mineralization
- **The potential for Bonanza grades of Silver exists at Roadside location within Sorpresa**
  - New stepout holes to the east track the mineralization into an upper level of the IP chargeability anomaly
  - Field examination of the deeper drilling suggests important mineralization is present, including silver
  - **North Roadside** is also providing positive indications of mineralization encountered in the new drilling
- **Trench 31 (TR31) Area Drill Assays on the NE extensions provided further gold intersections**
  - The best hole was Fi 202 with 3m @ 3.89g/t Au from 1m AND 18m @ 1.12g/t Au from 24m
- **An additional 2,490m of Percussion Drilling has been completed on Roadside Areas and Trench 31 Area**
  - Mineralisation is being sought down dip in various locations
  - The IP Chargeability anomaly is accessible nearer the surface at Roadside Area and is being tested
  - Samples will be despatched for assay during the next two weeks

The Executive Chairman, John Kaminsky, stated:

"We are again pleased to be able to report record grades in our last round of assays. Hole Fi 214 was clearly the standout result with **24m @ 173g/t Silver including a 2m zone at 943g/t Silver.**

The Roadside Area is taking on an important direction now, with its high silver signature seen throughout this area. The Company has essentially hit silver in large widths in most of its drilling (based on assays received to date for 2011 and 2012 drilling). High grades and bonanza potential are clearly possible in this setting over an expanding Roadside area.

Based on field microscope and XRF observation the Company believes this trend is likely to continue into the latest drilling and is looking forward to seeing the next round of assays for the Roadside areas, including North and East, within the Sorpresa project area.

I must say, I have enjoyed being part of the operational team for all of our drill programs in 2011 and 2012. Whilst this places extra demands on me in these periods, there is no substitute for doing the work in the field with Colin and the team. I believe our ability to closely track the mineralization and stay nimble to the trends as they unfold has had a direct influence on our success rate to date."

[1] **Ag was determined by 4 acid digest method Ag-OG62 on 50g subsample charge with AAS finish at ALS Laboratories**
[2] Au was determined by fire assay method AA26 on 50g subsample charge with AAS finish at ALS Laboratories

The Head of Exploration, Colin Plumridge, commented:

"The latest assays demonstrate we are still seeing the mineralization in most of our drill holes. Silver intersections at Roadside are now common place and are the dominant mineral feature at that location. We are witnessing the fact the silver and gold positions are not a total hand in glove overlap at Roadside, but this is to be expected given the metals have different mobility and chemistry.

In the new round of drilling just completed, we used both rigs as flexibly as possible, quickly chasing down what we were seeing in the mineralization, especially at Roadside. Environmental permitting is something the Company has spent considerable time ensuring we maintain to the highest standards. Careful planning and siting of drill holes is not trivial logistics in this permitted location, but we have made the program work well for us, even considering some difficulties with the drill rig. The program looks to have provided promising developments at Roadside and we still managed approx. 2,500m of recent drilling.

The latest Roadside drilling has now been able to begin testing the IP response in areas where the chargeability values trend closer to surface. Whilst these locations are not the highest IP chargeability anomalies, they are the cheapest to access. By placing some drill holes across this part of the IP, it has allowed important integration of the known surface geochemistry, the encountered mineralization and mapped geology, both surface and down hole to occur. This is the considered and responsible approach we have decided to adopt.

We are seeing sulphides and graphitic horizons in the fresh zone at Roadside which is encouraging towards the interpretation of the IP response. It appears the mineralization has an association to the IP, but the spatial relationship still requires more work to better understand this. We will have more to say on this later, once we have had a chance to review the data in detail, with input from the next round of assays and geological logging.

The results announced during the last month, plus the focused drilling programs just completed in October leave the Company very well placed. I remain excited and eagerly await the next round of assays."

Recent Sorpresa Information Thread

The Company provides a **hyperlink thread** of the Sorpresa Gold Mineralisation area of recent ASX and video materials as follows. The thread provides important views previously expressed, that will assist the reader with understanding the Company's technical consideration and outlook for the work it is undertaking:

1. ASX October 10th 2012 Highest Gold and Silver Grades seen to date at Sorpresa Project
2. ASX September 17th 2012 First Gold Sections Created at Sorpresa Project – New Assay Results
3. ASX August 31st 2012 New Gold in Soil Zones Located 4km South of Sorpresa
4. ASX July 31st 2012 Quarterly Exploration Activities June 2012
5. ASX July 26th 2012 Successful Intersections at Sorpresa Gold Project
6. ASX June 13th 2012 High Grade Gold Intersection Sorpresa Project – Fifield NSW
7. ASX May 28th 2012 Sorpresa Gold Project has Increased Potential at Depth
8. ASX April 30th 2012 Quarterly Exploration Activities March 2012
9. ASX January 31st 2012 (Quarterly Exploration Activities December 2011)
10. ASX January 2012 Sorpresa Gold Project – Trench 31 Area Review Video

13. ASX Assays Confirm Significant Gold and Silver at Sorpresa Project 6th July 2011

Metal Prices

As at 1st November 2012, the approx. trading prices (Kitco.com) for metals in New York based on opening Ask in USD were as follows:

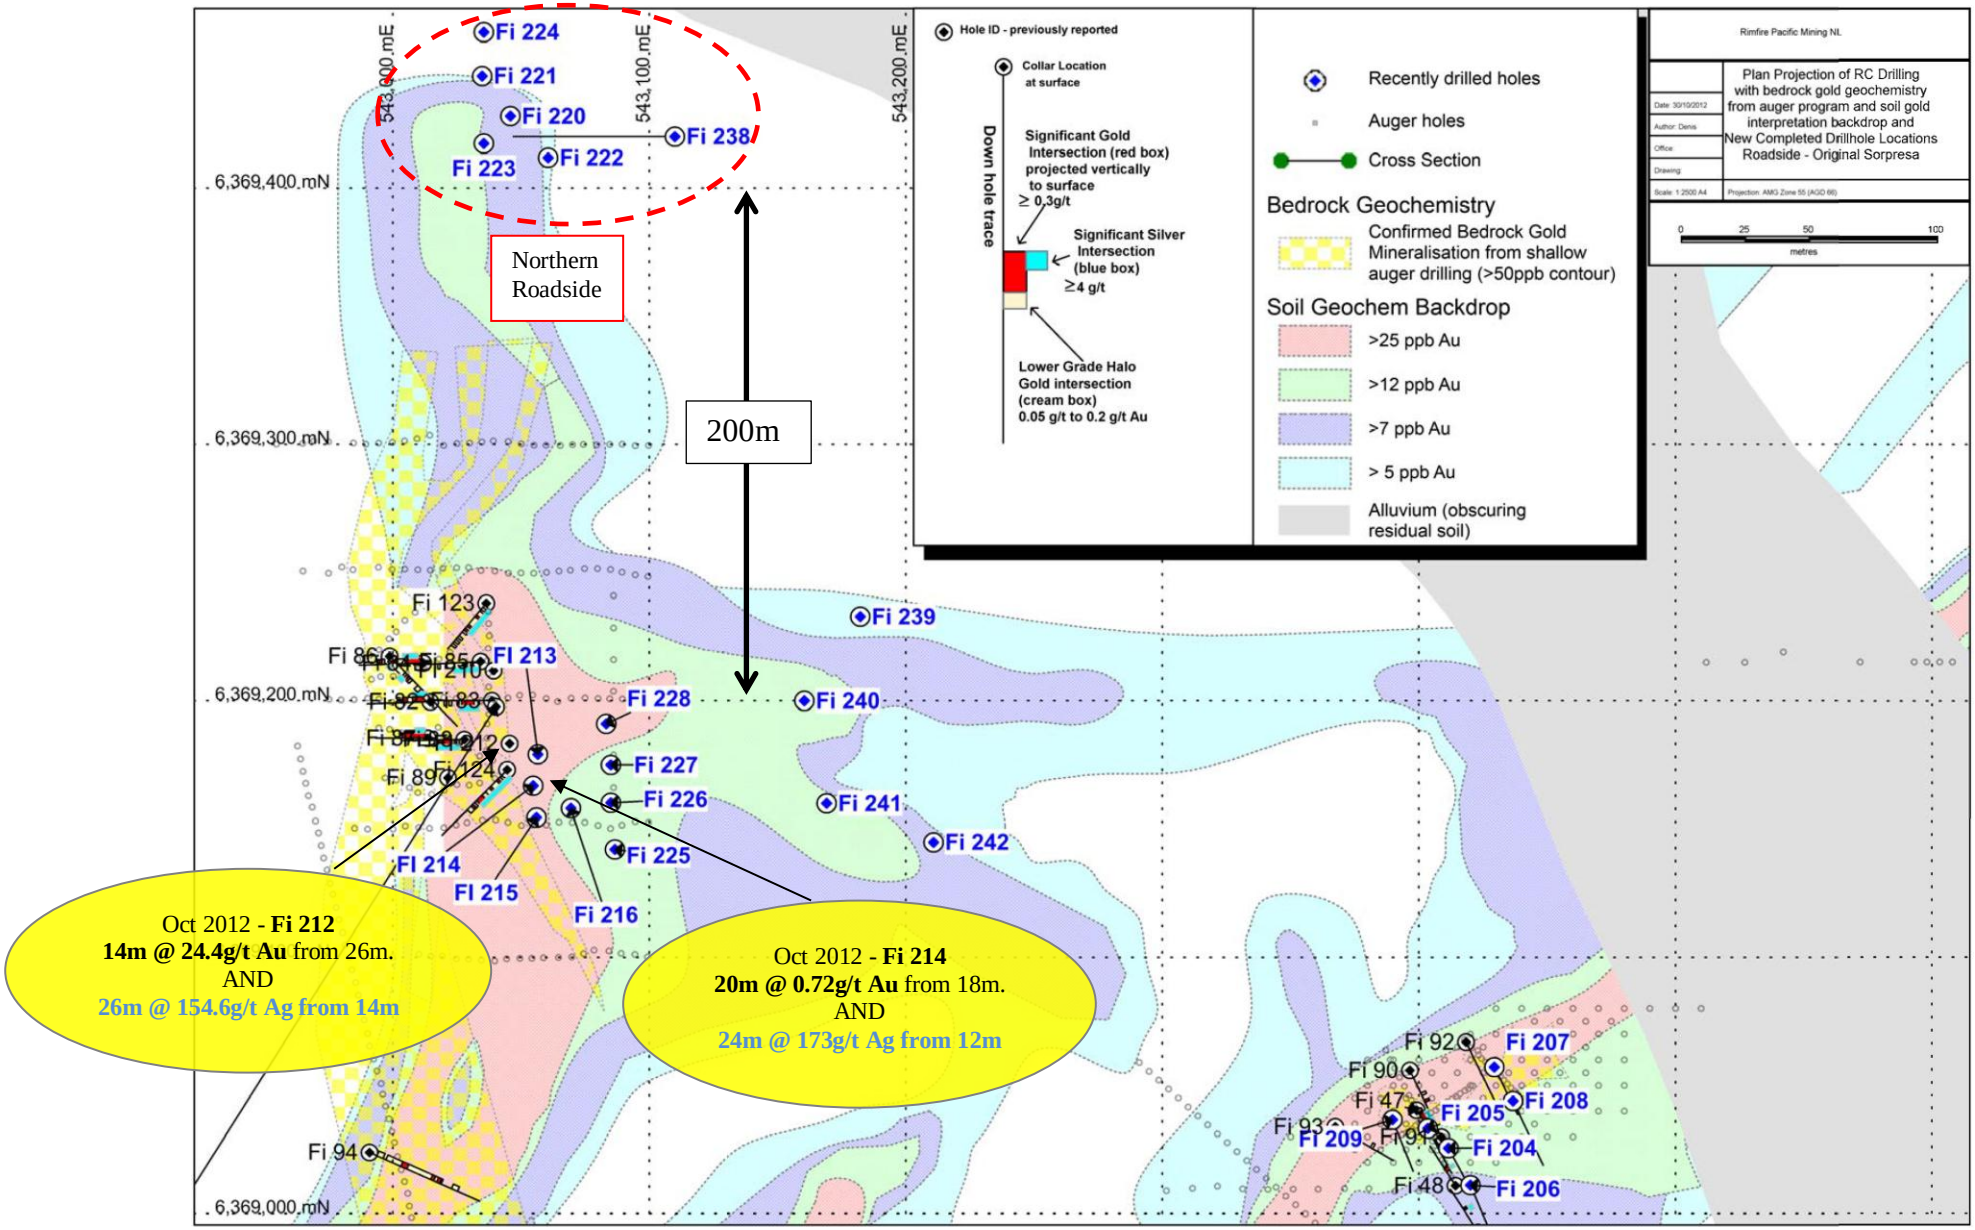
Gold	$1,716/oz
Platinum	$1,577/oz
Silver	$32/oz

JOHN KAMINSKY
Executive Chairman

The information in the report to which this statement is attached that relates to Exploration Results is compiled by Mr Colin Plumridge, who is a Member of The Australian Institute of Mining and Metallurgy, with over 40 years experience in the mineral exploration and mining industry. Mr Plumridge is employed by Plumridge & Associates Pty. Ltd. and is a consulting geologist to the Company. He has sufficient experience, which is relevant to the style of mineralisation and type of deposit under consideration and to the activity, which is being undertaken to qualify as Competent Persons as defined in the 2004 edition of the "Australian Code for Reporting of Mineral Resources and Ore reserves". Mr Plumridge consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

APPENDIX 1

Plan View Drilling Collar Hole Locations at "Roadside Area" Sorpresa Project Area with Previous Percussion Drilling Shown (On a backdrop of Gold in Bedrock Auger Zones and Soil Geochemistry previously established)



Note: Holes Fi 220 to Fi 242 have been drilled and await sample splits for subsequent assay.

APPENDIX 2
