ANNOUNCEMENT TO THE AUSTRALIAN SECURITIES EXCHANGE: 27 NOVEMBER 2012

## MAIDEN DRILLING PROGRAM COMMENCES AT RUHUHU PROJECT

The Directors of Select Exploration Limited ("Select" or "the Company") are pleased to advise that the Company's maiden drilling program has commenced at the Ruhuhu Project area located in southern Tanzania.

Following the recent coal discovery at surface, the Company revised its proposed initial drilling campaign from a non-core stratigraphic drilling program to focused diamond drilling of up to 2,000m (weather permitting) aiming to confirm the continuity and orientation of the coal seam(s) on PL 7051/2011 and PL 7048/2011.

The coal outcrop occurs on the northern margin of the basin adjacent to the Precambrian basement. The seam is dipping at approximately 20 degrees to the south (toward the centre of the basin). Field mapping of the stratigraphy to the south indicates a shallow dip of 5-10 degrees to the north and the coal seam is interpreted to follow this trend which drilling will determine.

Location of PL 7051/2011 and PL 7048/2011

Coal from outcrop on PL 7051/2011

The outcrop is located within a sequence of carbonaceous mudstone and interbedded sandstone and is interpreted to lie in the same stratigraphic position as the adjacent Ngaka mine and Katewaka/Mchuchuma coal occurrences within the same basin.

A trenching program has been completed and samples have been dispatched for analysis. Results of this analysis are expected in the coming weeks.
