Stavely Copper-Gold Project, Western Victoria – Exploration Update

## Diamond Drilling has Commenced at High-Grade Junction Copper-Silver Discovery

*Diamond drilling at Junction aims to confirm structural orientations controlling high-grade copper and silver mineralisation, extend the known mineralisation at depth, and inform additional drilling of the large nearby Junction porphyry copper-in-soils anomaly*

- Diamond drill rig has commenced drilling to test underneath the high-grade copper-silver intercepts from recent shallow air-core drilling at the Junction Prospect<sup>1</sup>, which returned assays including:
  - 14m @ 3.24% Cu, 34.5g/t Ag from 34m drill depth in SJAC105, including:
    - 8m at 4.62% Cu and 49.5g/t Ag from 34m, including:
    - 2m at 6.47% Cu and 59.5g/t Ag from 36m
  - 48m at 1.60% Cu and 14.8g/t Ag from 2m drill depth in SJAC112, including:
    - 8m at 2.53% Cu and 26.1g/t Ag from 34m
  - 40m at 1.59% Cu, 13.0g/t Ag from 10m drill depth in SJAC103, including:
    - 6m at 3.79% Cu and 18.8g/t Ag from 24m; and
    - 1m at 5.20% Cu and 34.2g/t Ag from 60m to EoH
  - 20m at 2.16% Cu and 21.6g/t Ag from 18m in SJAC116, including:
    - 4m at 3.83% Cu and 21.7g/t Ag from 32m
  - 20m at 2.48% Cu and 24.4g/t Ag from 32m in SJAC117, including:
    - 4m at 5.10% Cu and 51.6g/t Ag from 38m
  - 22m at 1.85% Cu and 19.6g/t Ag from 28m in SJAC113, including:
    - 6m at 3.15% Cu and 33.2g/t Ag from 32m
- The high-grade copper-silver mineralisation is interpreted to be hosted in a series of sigmoidal (curved) tension gash arrays – with outstanding rock-chip float samples to the north suggesting strong potential for structural repetitions, including:
  - 0.51% copper, 7.35g/t gold and 143g/t silver on the drill grid; and
  - 0.24% copper, 0.28g/t gold and 10.9g/t silver.

<sup>1</sup> See SVY:ASX announcement dated 1 October 2024

- **A new understanding of the structural controls on the high-grade copper-silver mineralisation at Junction could have significant implications for further discovery:**
  - **In the immediate Junction area, this indicates the potential for repeats to the north of the drilled high-grade copper-silver mineralisation;**
  - **It may also explain the largest copper-in-soil anomaly in the entire Stavely Project, ~200m east of Junction – which is an obvious target for testing the tension gash array as the control on mineralisation in that area; and**
  - **At the regional scale, it highlights the fertility of the Stavely structural trend over some 30 kilometres of strike.**
- **Structural measurements confirming the orientation of high-grade copper-silver mineralisation will inform additional diamond drilling under the largest copper-in-soils anomaly in the entire Stavely Project, located at the Junction Prospect.**

---

Stavely Minerals Limited (ASX Code: **SVY** – “Stavely Minerals”) is pleased to advise that diamond drilling has commenced testing the high-grade Junction copper prospect, located 2km south of the Cayley Lode deposit within its 100%-owned Stavely Copper-Gold Project in Victoria (Figures 1 and 2).

The new phase of diamond drilling follows on from the recent highly successful 21-hole air-core drilling program at the Junction Prospect, which returned multiple outstanding high-grade intercepts as announced on 1 October 2024.

A diamond drill rig has commenced to test beneath these outstanding results.

Stavely Minerals Executive Chair and Managing Director, Mr Chris Cairns, said: *“The very large and high tenor copper-in-soil anomaly at Junction, with surface samples to over 0.5% copper, has been enigmatic since it was first sampled in 1979.*

*“To be able to follow-up the high copper and silver grades returned from recent shallow air-core drilling with imminent diamond drilling is a fantastic opportunity, both to confirm the orientation of the structural controls to the high-grade mineralisation and to apply that new understanding to test the very large Junction copper-in-soils anomaly just 200m to the east.*

*“This is an exciting time for our team as we put some of these recent breakthroughs and learnings to the test with the diamond drill rig.*

*“A significant new discovery at Junction would clearly be transformational for the Stavely Project, where we have already defined a significant Mineral Resource at the Cayley Lode Deposit.”*

As previously outlined in the ASX announcement of 14 May 2024, the Junction Prospect is located approximately 2km south of the Cayley Lode Deposit, which hosts a Mineral Resource Estimate of **9.3Mt at 1.23% copper, 0.23g/t gold and 7g/t silver<sup>2</sup>** (see Table 1 for Mineral Resource Estimate classifications).

---

<sup>2</sup> Reported in compliance with the JORC Code 2012, see ASX announcement 14 June 2022. Stavely Minerals confirms that there is no new information or data that materially affects the Mineral Resource estimate and that all material assumptions and technical parameters underpinning the estimate in the cited market announcement continue to apply and have not materially changed.

The wet conditions of the Victorian winter are abating and the exploration season has commenced and is expected to extend through to the end of April next year.

Figure 1. Stavely Project and prospect location map.

While historic drilling at the Junction Prospect returned impressive intercepts, historic follow-up drilling failed to confirm a consistent structural orientation for the high-grade copper-gold-silver mineralisation. This uncertainty has now been resolved with the recent air-core drilling.

Significant historical intercepts at Junction include:

- **35m at 3.44% Cu and 26g/t Ag** from 24m drill depth to end-of-hole (EoH) in TGAC078
- **11m at 1.72% Cu and 26g/t Ag** from 33m in TGRC087
- **6m at 2.15% Cu and 8g/t Ag** from 2m and **6m at 3.90% Cu and 25g/t Ag** from 28m to EoH in PENP004
- **6m at 1.52% Cu and 19g/t Ag** from 42m, **5m at 1.12% Cu and 10g/t Ag** from 62m and **6m at 1.77% Cu and 21g/t Ag** from 72m to EoH in TGRC110
- **6m at 1.65% Cu and 16g/t Ag** from 37m in TGRC109

Given the spatial distribution of the historical drill intercepts and the presence of multiple intercepts in a number of these drill-holes (e.g., TGR110), it appeared that there may be a number of mineralised structures within the broader mineralised zone.

New air-core drilling assay results at the Junction Prospect include:

- **14m @ 3.24% Cu, 34.5g/t Ag** from 34m drill depth in SJAC105, including:
  - **8m at 4.62% Cu and 49.5g/t Ag** from 34m, including:
  - **2m at 6.47% Cu and 59.5g/t Ag** from 36m
- **48m at 1.60% Cu and 14.8g/t Ag** from 2m drill depth in SJAC112, including:
  - **8m at 2.53% Cu and 26.1g/t Ag** from 34m
- **40m at 1.59% Cu, 13.0g/t Ag** from 10m drill depth in SJAC103, including:
  - **6m at 3.79% Cu and 18.8g/t Ag** from 24m; and
  - **1m at 5.20% Cu and 34.2g/t Ag** from 60m to EoH
- **20m at 2.16% Cu and 21.6g/t Ag** from 18m in SJAC116, including:
  - **4m at 3.83% Cu and 21.7g/t Ag** from 32m
- **20m at 2.48% Cu and 24.4g/t Ag** from 32m in SJAC117, including:
  - **4m at 5.10% Cu and 51.6g/t Ag** from 38m
- **22m at 1.85% Cu and 19.6g/t Ag** from 28m in SJAC113, including:
  - **6m at 3.15% Cu and 33.2g/t Ag** from 32m
- **6m at 3.23% Cu and 9.2g/t Ag** from 2m in SJAC104, including:
  - **2m at 6.44% Cu and 9.5g/t Ag** from 2m; and
  - **4m at 1.15% Cu and 15.1g/t Ag** from 24m
- **2m at 1.09% Cu and 4.5g/t Ag** from 0m in SJAC108

An annotated drill collar plan is shown in Figure 3 and long-section and cross-sections are included as Figures 10 to 13.

The estimated true width of the intercepts is included in the drill-hole table at the end of this announcement.

As the mineralisation is hosted in NW-SE oriented tension gashes – with several mineralised zones likely to occur in each ‘gash’ and the pinching of those gashes towards the north-south oriented bounding structures, with quite thick central portions – the true widths of high-grade copper-silver can be quite variable.

In undertaking the air-core drilling, it was apparent that initial drill orientations to the ENE (e.g., SJAC103) were drilling along strike, while drill holes oriented towards the south-east were drilling down-dip (e.g., SJAC112).

Eventually, later-stage drilling to the north (e.g., SJAC116 and SJAC117) intersected the mineralisation more perpendicular to the strike and dip of the mineralisation, with true widths approximating 20m.

Figure 2. Cayley Lode and Junction Prospect location map with soil copper geochemistry (coloured dots) and structural context. Note the very large copper-in-soils geochemical anomaly east of Junction.

- **0.51% copper, 7.35g/t gold and 143g/t silver; and**
- **0.24% copper, 0.28g/t gold and 10.9g/t silver**

The assay results from rock-chip floats samples to the north of current drilling suggest good potential for structural repetitions.

A new understanding of the structural controls on high-grade copper-silver mineralisation at Junction could have significant implications for further discovery:

- In the immediate Junction area, there is excellent potential for repeats to the north of the drilled high-grade copper-silver mineralisation;
- Additionally, the sigmoidal tension gash array structural control may also explain the largest copper-in-soil anomaly in the entire project and is an obvious target for testing the tension gash array as the control on mineralisation in that area; and
- At the regional scale, this highlights the fertility of the Stavely structural trend over some 30 kilometres of strike.

Figure 4. Junction prospect rock-chip float selected assay results.

This new understanding of the structural controls on high-grade copper-silver mineralisation at Junction may have significant implications for regional exploration with an emerging recognition of the copper fertility along the ~30-kilometre long Stavelly structural trend (Figure 6).

Figure 6. A portion of the Stavelly structural trend showing the location of several significant copper prospects – the Toora Road prospect to the north and the S2 and S3 porphyry prospects to the south are not shown on the extent of this figure. Coloured gravity draped on grey-scale 1VD magnetics.

The Junction copper-in-soils anomaly was originally sampled in the late 1970's but has had sparse follow-up, largely due to land access issues. Consistent with the geochemical sampling programs from the era, samples were often only assayed for copper, lead and zinc with some latter also assayed for silver and fewer again assayed for gold. However, in porphyry systems those metals are often zoned with copper in the core and lead and zinc on the periphery (Figure 8 a to d). This generalised pattern is true at Junction with the distribution of copper also very closely related to a strong magnetic anomaly interpreted to be reflecting a porphyry at depth (Figures 6 and 7).

One simple method previously recommended by Dr Steve Garwin for identification of porphyry-style mineralisation – and which suits the limited suite of elements available – is to do a copper over zinc ratio (Figure 8d). The copper/zinc ratio clearly focuses attention to a large and coherent anomaly of soil samples – sampled at 100m-spaced lines and 20m-spaced samples.

Figure 7. Junction copper-in-soils anomaly overlain on total magnetic intensity, reduced to pole. Note that the Junction copper anomaly is very closely related to an underlying magnetic feature implying it may be related to a porphyry. Note also that drill hole TGAC078 was an historic hole in the area of the recent aircore drilling.

The Junction copper-in-soil anomaly was previously drilled with shallow rotary air blast (RAB) drilling in the late 1970's with two follow-up diamond drill holes (PEND1J and PEND6J) of 100m and 178m drill depth respectively. Further diamond drilling was completed in 2014 by Stavely Minerals with SMD002 (531m) and SMD005 (596.4m) (Figure 9). SMD002 did intercept 5m at 1.38% copper, 0.25g/t gold and 11.8g/t silver from 332m down-hole. Given the size and intensity of the copper-in-soils anomaly and the extent of copper mineralisation in the historic RAB drilling, the relative lack of material mineralised intercepts in the 4 diamond drill holes is enigmatic. One observation is that the diamond drill holes were all drilled towards or from similar orientations. If, as noted in recent aircore drilling completed in August, that high-grade copper and silver mineralisation has a strong structural control, mineralisation at the Junction porphyry prospect could also have a strong structural control.

Figure 9. Junction Porphyry Prospect historical RAB drilling with diamond drill hole traces.

If this is the case, and there are indications in the grade variances within the soil geochemistry, the previous diamond drilling at the Junction porphyry prospect may have been drilled sub-parallel to the orientation of the major structural controls. This possibility highlights the importance of getting oriented drill core from diamond drilling under the recent high-grade copper-silver aircore intercepts at Junction to confirm the orientation of the structural controls and then using that understanding to design a diamond drilling program that will properly test the Junction porphyry opportunity.

Figure 10. Junction Prospect oblique long-section.

Figure 11. Junction Prospect cross-section with SJAC116 and SJAC117. In this section, drill-holes are oriented roughly perpendicular to the strike and dip of mineralisation and reflect approximately true widths.

Figure 12. Junction Prospect cross-section with SJAC103 and SJAC113 with historic drill-holes. Note: SJAC113 is likely drilling down-dip of the copper-silver mineralisation, while SJAC103 is drilling through the section from front to back but is shown in its entirety projected to section. It is interpreted to be drilling along the strike of mineralisation and is likely located only within the upper zone of mineralisation. The top two zones are likely, in reality, only one zone expressed in three different drill holes (SJAC113, TGRC109 and TGRC110). The two lower zones in TGRC110 are interpreted to be genuinely different zones with TGRC110 drilled roughly perpendicular to the dip and strike of mineralisation.

Figure 13. Junction Prospect cross-section with SJAC104 and SJAC112. In this section, drill-holes are oriented oblique to the strike and dip of mineralisation and do not reflect true widths. SJAC112 is interpreted to be drilled approximately down-dip of one of the mineralised zones.

Yours sincerely,

**Chris Cairns**  
**Executive Chair and Managing Director**

| <b>Sampling techniques</b> | <i>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> | <p>The Junction Prospect has predominately been evaluated by shallow aircore and reverse circulation drilling to date.</p> <p>For diamond holes drilled by Stavely Minerals, SMD075 and SMD077 and holes drilled along strike from the Junction Prospect, SMD002 and SMD005 the entire hole has been sampled. PQ quarter core and HQ half core is submitted for analysis. In general 1m samples were sent for analysis.</p> <p>Diamond holes SMD189 and SMD190 drilled by Stavely Minerals were not sampled.</p> <p>For aircore holes SJAC101 to SJAC121, inclusive drilled by Stavely Minerals, all holes were sampled at 2m composite samples or at a 1m interval at the bottom the of hole. Samples for every metre are collected by the drill offside from the cyclone directly into a bucket (if dry) or, if wet, through a garden sieve to separate the coarse fraction from the sludge. The sample is then placed on a black plastic sheet on the ground. Samples are placed every metre in rows of 10.</p> <p>For the historical diamond drill holes drilled by Pennzoil, PEND1J, PEND2J , PEND3J and PEND6J samples were only selected where mineralisation was observed, it is unknown whether these were half or full core intervals. PEND4J and PEND5J were not sampled.</p> <p>For the North Limited aircore holes 3m composite samples were taken.</p> <p>For BCD reverse circulation holes TGRC082-88, TGRC108 – 111 and TGRC139-143, 1 or 2m composite samples were collected. 1m samples were collected from the bulk sample using a riffle splitter to collect a representative sample (of unknown proportion).</p> <p>For BCD aircore drilling, 2m composite samples were collected for holes TGAC074, TGAC075, TGAC077, TGAC078, TGAC079 and TGAC107. The sample collection method is unknown.</p> <p>BCD aircore holes TGAC076, TGAC080 and TGAC081 were not sampled.</p> <p>The Pennzoil Auger soil sampling was conducted by a mechanical auger rig, mounted on a Toyota Land Cruiser</p> |

|                              |                                                                                                    | <p>were routinely used to maximise drill core recovery. Core diameter is mostly PQ (85mm) or HQ3 (63.5mm). For diamond tails to RC drilling, HQ diameter core is produced.</p> <p>SMD002 was orientated at -50° towards azimuth 239° to a depth of 530.9m.</p> <p>SMD005 was orientated at -50° towards azimuth 208° to a depth of 696.4m.</p> <p>SMD075 was orientated at -50° towards azimuth 60° to a depth of 244.4m.</p> <p>SMD077 was orientated at -50° towards azimuth 60° to a depth of 404.8m.</p> <p>Aircore Drilling of SJAC101 to SJAC121, inclusive was carried out by Durock Drilling using a track mounted Aircore rig. The aircore rig used a 3.5" blade bite to refusal, generally just below the fresh rock interface.</p> <p>Historic North Limited aircore drilling was conducted in 1993 by contractor Luhrs Holding using an "Edson 3000 Rig".</p> <p>Historical aircore holes with prefix TGAC were drilled by Beaconsfield Gold Mines Pty Ltd in 2008 and 2009 by Wallis Drilling.</p> <p>Historical reverse circulation holes with prefix TGRC were drilled by BCD in 2009. Drilling was conducted by Budd Exploration Drilling P/L using a Universal drill rig.</p> |
| <b>Drill sample recovery</b> | <i>Method of recording and assessing core and chip sample recoveries and results assessed.</i>     | <p>Diamond core recoveries for Stavely Minerals holes were logged and recorded in the database.</p> <p>Core recovery for SMD002 averaged 98%, SMD005 averaged 99%, SMD075 averaged 97% and SMD077 averaged 99%. There were no issues with recovery for SMD189 and SMD190.</p> <p>Aircore drill recoveries for SJAC101 to SJAC121 were visually estimated as a semi quantitative range, and where significant recovery issues, they were recorded in the comments.</p> <p>The aircore sample for the interval 18 to 20m in SJAC109 was destroyed in preparation at the laboratory.</p> <p>Recoveries were not documented for Pennzoil or North Limited holes.</p> <p>For BCD percussion drilling, wet drilling and sampling conditions is often mentioned and is likely to have affected all drill holes. However, data and information is not available.</p>                                                                                                                                                                                                                                                                                                                                   |
|                              | <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i> | <p>Stavely Minerals diamond core is reconstructed into continuous runs on an angle iron cradle for orientation marking. Depths are checked against the depth given on the core blocks and rod counts are routinely carried out by the driller. Triple tube core barrels were routinely used to maximise drill core recovery.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

In rare cases there was poor sample return and in some cases wet samples.</p> <p>No details are available for the historical drill holes.</p>                                                                                                                                                                                                                                                                                                                                                                                                      |
|                                                       | <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i>                                  | <p>There are no issues with Stavely Minerals diamond core sample recovery at the Junction Prospect.</p> <p>In the Stavely Minerals aircore drilling program it is considered that both sample recovery and quality is adequate for the drilling technique employed.</p> <p>For BCD drilling, wet drilling and sampling conditions is often mentioned and is likely to have affected all drill holes. However, data and information is not available for assessing the effect these conditions have on grade.</p> <p>No details are available for the other historical drill holes.</p>                                                |
| <b>Logging</b>                                        | <i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i> | <p>For Stavely Minerals drilling geological logging of samples followed Company and industry common practice. Qualitative logging of samples including, but not limited to, lithology, mineralogy, alteration, veining and weathering. Diamond core logging included additional fields such as structure and geotechnical parameters.</p> <p>Magnetic Susceptibility measurements were taken for each 1m diamond core interval.</p> <p>For aircore drilling a small representative sample was retained in a plastic chip try for future reference and logging checks.</p> <p>All historical drill holes were geologically logged.</p> |
|                                                       | <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i>                                                                                            | <p>For all diamond drilling by Stavely Minerals, logging is quantitative, based on visual field estimates. Systematic photography of the core in the wet and dry form was completed.</p> <p>For all aircore drilling by Stavely Minerals, logging is quantitative, based on visual field estimates.</p> <p>For all historic drilling logging is quantitative, based on visual field estimates.</p>                                                                                                                                                                                                                                    |
|                                                       | <i>The total length and percentage of the relevant intersections logged.</i>                                                                                                                             | <p>For Stavely Minerals diamond drilling, detailed core logging, with digital capture, was conducted for 100% of the core by Stavely Minerals' on-site geologist at the Company's core shed near Glenthompson.</p> <p>For aircore drilling by Stavely Minerals, digital chip logging was conducted for 100% of chips.</p> <p>Historical holes have been logged in their entirety.</p>                                                                                                                                                                                                                                                 |
| <b>Sub-sampling techniques and sample preparation</b> | <i>If core, whether cut or sawn and whether quarter, half or all core taken.</i>                                                                                                                         | <p>For Stavely Minerals diamond drilling quarter core for the PQ diameter diamond core and half core for the HQ diameter core was sampled on site using a core saw.</p> <p>For historical holes, sub-sampling is not well documented. Holes drilled by BCD and North Limited the majority of the hole was sampled in 1-2m intervals. For Pennzoil diamond holes, samples were only selected where mineralisation was observed, it is unknown whether these were half or full core intervals. For Pennzoil reverse circulation holes 2m composite samples were collected.</p>                                                          |

|----------|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |                       | <p>total dissolution of most minerals and is considered an appropriate assay method for porphyry copper-gold systems.</p> <p>This technique is a four- acid digest with ICP-AES or AAS finish.</p> <p>The drill core was also analysed for gold using Method Au-AA23. Up to a 30g sample is fused at approximately 1,100°C with alkaline fluxes including lead oxide. During the fusion process lead oxide is reduced to molten lead which acts as a collector for gold. When the fused mass is cooled the lead separates from the impurities (slag) and is placed in a cupel in a furnace at approximately 900°C. The lead oxidizes to lead oxide, being absorbed by the cupel, leaving a bead (prill) of gold, silver (which is added as a collector) and other precious metals. The prill is dissolved in aqua regia with a reduced final volume. Gold content is determined by flame AAS using matrix matched standards. For samples which are difficult to fuse a reduced charge may be used to yield full recovery of gold. This technique approaches total dissolution of most minerals and is considered an appropriate assay method for detecting gold mineralisation.</p> <p><b>Aircore Drilling &amp; Rock Chip Samples</b></p> <p>The Stavely Minerals aircore samples were sent to the Australian Laboratory Services (“ALS”) in Adelaide. The soil samples were dried and sieved. The sieved - 80 mesh samples were analysed for gold by Method Au-TL43 and for a multi-element suite by Method ME-MS61 at ALS in Perth.</p> <p>Aircore samples were analysed by multielement ICPAES Analysis - Method ME-ICP61. A 0.25g sample is pre-digested for 10-15 minutes in a mixture of nitric and perchloric acids, then hydrofluoric acid is added and the mixture is evaporated to dense fumes of perchloric (incipient dryness). The residue is leached in a mixture of nitric and hydrochloric acids, the solution is then cooled and diluted to a final volume of 12.5mls. Elemental concentrations are measured simultaneously by ICP Atomic Emission Spectrometry. This technique approaches total dissolution of most minerals and is considered an appropriate assay method for porphyry copper-gold and epithermal systems.</p> <p>This technique is a four acid digest with ICP-AES or AAS finish.</p> <p>For over-range copper (&gt;1000ppm) assays the samples were re-assayed using the method Cu-OG62. For over-range silver (&gt;100ppm) assays the samples were re-assayed using the method Ag-OG62.</p> <p>For the ME-OG62 technic a prepared sample is digested with nitric, perchloric, hydrofluoric, and hydrochloric acids, and then evaporated to incipient dryness. Hydrochloric acid and de-ionized water is added for further digestion, and the sample is heated for an additional allotted time. The sample is cooled to room temperature and transferred to a volumetric flask (100 mL). The resulting solution is diluted</p> |

|----------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |                       | <p>to volume with de-ionized water, homogenized and the solution is analyzed by inductively coupled plasma - atomic emission spectroscopy or by atomic absorption spectrometry. Results are corrected for spectral interelement interferences.</p> <p>Gold by Method Au-TL43, is by aqua regia extraction with ICP-MS finish. Up to a 25g sample is digested in aqua regia, and the acid volume is partially reduced by evaporation. The solution is diluted to volume and mixed thoroughly. Gold content is measured by ICP mass spectrometry. Alternatively, an aliquot is taken, a complexing agent added and the gold complex is extracted into an organic solvent. Gold concentration can be measured by flame AAS using matrix matching standards.</p> <p>Trace level methods by aqua regia digest and ICP-MS finish are considered to be excellent for regolith, where gold anomalies indicating mineralisation below surface are well-characterised. Aqua regia dissolves native gold as well as gold bound in sulphide minerals.</p> <p>For over-range gold (&gt;1.0ppm) assays the samples were re-assayed using Au-AROR43. This method is an overlimit method which is used to analyse the same solution prepared from the Trace Level Au by aqua regia extraction method (25g).</p> <p>A finely pulverised sample (25 g) is digested in a mixture of 3 parts hydrochloric acid and 1 part nitric acid (aqua regia). This acid mixture generates nascent chlorine and nitrosyl chloride, which will dissolve free gold and gold compounds such as calaverite (AuTe<sub>2</sub>).</p> <p>Gold is determined by ICPMS directly from the digestion liquor. This method allows for the simple and economical addition of extra elements by running the digestion liquor through the ICPMS.</p> <p>Information on assaying details for historic holes are not well documented, the following information was gathered from previous annual technical reports:</p> <ul style="list-style-type: none"> <li>• Pennzoil: A base metal suite was assayed via AAS (digestion not specified) including Ag, Cu, Pb and Zn. Au was assayed via fire assay.</li> <li>• North Limited: A base metal suite (Cu, Ni, Pb &amp; Zn) was assayed via Mixed Acid digest, AAS detection (ICP-OES for CRAE) and Au was assayed via fire assay.</li> <li>• BCD: A base metal suite (Ag, As, Co, Cu, Cr, Fe, Mn, Ni, Pb, S &amp; Zn) by aqua regia digest ICP-OES methods and repeated assays for samples returning greater than 5000ppm Cu by Mixed Acid Digest ICP-OES detection. Au was assayed via fire assay.</li> </ul> <p><b>Pennzoil Auger Soil Samples</b></p> <p>The -80# auger soil samples were assayed for Cu, Pb and Zn at Australian Laboratory Service (ALS).</p> |

A collar plan with the drill hole locations is presented in the body of the report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                                                                | <i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i> | The Junction Prospect has not been sufficiently drilled to produce a Mineral Resource.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                                                                | <i>Whether sample compositing has been applied.</i>                                                                                                                                                                                 | <p>For Stavely Minerals diamond core for the entire hole is sampled. For diamond core PQ quarter core and HQ half core was submitted for analysis. Sample intervals were in general 1m.</p> <p>For the Stavely Minerals aircore drill holes, SJAC101 to SJAC121, inclusive, two-metre samples were composited for assaying.</p> <p>Historical Pennzoil diamond holes were selectively sampled with composite samples varying from 1 to 16m.</p> <p>Historical RC drill holes with the prefix PENP were drilled by Pennzoil of Australia and two metre composite samples were assayed for Au, Ag, Cu, Pb and Zn.</p> <p>Historical aircore drill holes with the prefix STAVRA were drilled by North Limited and three metre composite samples were assayed for Au, Cu, Pb and Zn.</p> <p>For historical aircore holes TGAC002 to TGAC125 approximately the top 15 to 16 metres was not sampled, after that one metre intervals samples were taken for the remainder of the holes.</p> <p>For BCD aircore holes two metre composite samples were collected and for the RC holes one meter samples were collected. The aircore and RC was assayed for Au, Ag, As, Co, Cu, Fe, Ni, Pb, S and Zn.</p> |
| <b>Orientation of data in relation to geological structure</b> | <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i>                                                                   | The Junction Prospect is still at a reconnaissance drilling stage. The aircore drilling was conducted at a variety of azimuths to determine the orientation of the mineralised structure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|                                                                | <i>If the relationship between the drilling orientation and the orientation of key</i>                                                                                                                                              | There is insufficient drilling data to date at the Junction Prospect to demonstrate continuity of mineralised domains                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Criteria                 | JORC Code explanation                                                                                                             | Commentary                                                                                                                                                                                                                                                                                                                                                         |

|                                          | <i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i> | All the exploration licences and the retention licence are in good standing and no known impediments exist.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Exploration done by other parties</b> | <i>Acknowledgment and appraisal of exploration by other parties.</i>                                                                            | <p><b>Stavely Project &amp; Black Range Joint Venture</b></p> <p>The Mt Stavely belt has been explored since the late 1960's, including programmes undertaken by mineral exploration companies including WMC, Duval, CRA Exploration, BHP, and North Limited.</p> <p>Exploration activity became focused on Thursday's Gossan and the Junction prospects following their discovery by Pennzoil of Australia Ltd in the late 1970s. North Limited continued to focus on Thursday's Gossan in the 1990s. North's best drill result at Thursday's Gossan came from VICT1D1 which gave 161m of 0.26% Cu from 43m, including 10m of 0.74% Cu from 43m from a supergene-enriched zone containing chalcocite.</p> <p>The tenement was optioned to CRA Exploration between 1995 and 1997. CRAE drilled several deep diamond drill holes into Thursday's Gossan, including DD96WL10, which intersected 186m from 41m of 0.15% Cu and DD96WL11, which intersected 261.7m from 38.3m of 0.13% Cu.</p> <p>EL4556 was further explored by Newcrest Operations Limited under option from New Challenge Resources Ltd between 2002 and 2004. Their main focus was Thursday's Gossan in order to assess its potential as a porphyry copper deposit. One of their better intersections came from drill hole VSTD01 on the northern edge of the deposit which gave 32m at 0.41 g/t Au and 0.73% Cu from 22m in supergene-enriched material.</p> <p>The Stavely Project was optioned to Beaconsfield Gold Mines Pty Ltd in 2006 who flew an airborne survey and undertook an extensive drilling programme focused on several prospects including Thursday's Gossan. One of their diamond drill holes at Thursday's Gossan, SNDD001, encountered zones with quartz-sulphide veins assaying 7.7m at 1.08 g/t Au and 4.14% Cu from 95.3m and 9.5m at 0.44 g/t Au and 2.93% Cu from 154.6m along silicified and sheared contacts between serpentinite and porphyritic intrusive rocks.</p> <p>Once Beaconsfield Gold Mines Pty Ltd had fulfilled their option requirements, title of EL4556 passed to their subsidiary company, BCD Metals Pty Ltd, who undertook a gravity survey and extensive drilling at prospects including Thursday's Gossan. They also commissioned a maiden Mineral Resource estimate for Thursday's Gossan.</p> <p>All work conducted by previous operators at Thursday's Gossan is considered to be of a reasonably high quality.</p> |

|          |                       | <p>The Junction Prospect forms the largest (1,200m x 500m) and highest tenor soil auger copper anomaly identified in the Stavely Project area. The anomaly is located 3.5km SSE of the Cayley Lode along a sub-cropping portion of the Stavely Volcanic Belt. Pennzoil drilled 5 diamond holes and 4 RC holes in the late 1970's and early 1980's. PENP004 returned 2m @ 5.10% Cu &amp; 6g/t Ag from 2m and 6m @3.90% Cu &amp; 25g/t Ag from 28m to EoH. In 1993 North Limited drilled 3 aircore holes at the vicinity of the Junction Prospect. These holes did not return any anomalous intercepts.</p> <p>In 2008 and 2009 BCD drilled 9 AC holes and 16 RC holes At the Junction Prospect. RC drilling methods were required where the ground conditions were too hard for AC methods. Drilling targeted a sub-circular copper soil anomaly and the previously drilled intersection in PENP004. Drill spacing was on a nominal spacing of 30x60m. Best results include 35m @ 3.69% Cu (TGAC078) and 12m @ 1.61% Cu (TGRC087). Peak results are listed in the table below. Mineralisation was predominantly observed in the oxide zone as chalcocite &amp; covellite sulphides with minor malachite. Limited drilling in the fresh zone remained a drill target. Drilling by BCD at the Junction Prospect was terminated early due to landholder access issues.</p> <table><tr><th>Hole ID</th><th>MGA East (m)</th><th>MGA N (m)</th><th>Depth From (m)</th><th>Significant Intersections</th><th>Total Depth (m)</th></tr><tr><td rowspan="2">TGAC078</td><td rowspan="2">642927</td><td rowspan="2">5833571</td><td>2</td><td>10m @ 2.18% Cu</td><td rowspan="2">59</td></tr><tr><td>24</td><td>35m @ 3.69% Cu</td></tr><tr><td>TGRC082</td><td>642905</td><td>5833552</td><td>26</td><td>13m @ 1.07% Cu</td><td>61</td></tr><tr><td>TGRC087</td><td>642882</td><td>5833535</td><td>33</td><td>12m @ 1.61% Cu</td><td rowspan="2">76</td></tr><tr><td></td><td></td><td></td><td>73</td><td>1m @ 1.13% Cu</td></tr><tr><td>TGRC109</td><td>642884</td><td>5833563</td><td>37</td><td>6m @ 1.65% Cu</td><td>65</td></tr><tr><td rowspan="3">TGRC110</td><td rowspan="3">642888</td><td rowspan="3">5833533</td><td>42</td><td>6m @ 1.52% Cu</td><td rowspan="3">78</td></tr><tr><td>60</td><td>7m @ 0.93% Cu</td></tr><tr><td>71</td><td>7m @ 1.59% Cu</td></tr><tr><td>TGRC139</td><td>642750</td><td>5833600</td><td>3</td><td>1m @ 1.26% Cu</td><td>49</td></tr></table> <p>In 2014 Stavely Minerals drilled diamond holes SMD002 and SMD005 approximately 500m along strike from the Junction Prospect. SMD002 was designed to test the northern end of the magnetic high surrounded by a magnetic low annulus and a copper soil/auger geochemical anomaly coincident with the magnetic high. SMD002 intercepted a high-grade zone of 5m @ 1.38% Cu &amp; 0.25</p> | Hole ID        | MGA East (m)              | MGA N (m)       | Depth From (m) | Significant Intersections | Total Depth (m) | TGAC078 | 642927 | 5833571 | 2 | 10m @ 2.18% Cu | 59 | 24 | 35m @ 3.69% Cu | TGRC082 | 642905 | 5833552 | 26 | 13m @ 1.07% Cu | 61 | TGRC087 | 642882 | 5833535 | 33 | 12m @ 1.61% Cu | 76 |  |  |  | 73 | 1m @ 1.13% Cu | TGRC109 | 642884 | 5833563 | 37 | 6m @ 1.65% Cu | 65 | TGRC110 | 642888 | 5833533 | 42 | 6m @ 1.52% Cu | 78 | 60 | 7m @ 0.93% Cu | 71 | 7m @ 1.59% Cu | TGRC139 | 642750 | 5833600 | 3 | 1m @ 1.26% Cu | 49 |

|                |                                                                      | <p>g/t Au from 332m. SMD005 was designed to target the core of the magnetic high which is coincident with the peak/ auger geochemical anomaly. SMD005 intercepted 3m @ 0.21% Cu from 161m.</p> <p>In 2020 Stavely Minerals drilled diamond holes SMD075 and SMD077 at the Junction Prospect. These holes were drilled at an orientation of 060 degrees and did not explain the presence of the high-grade copper in historical aircore holes. SMD077 intersected 3m @ 0.58% Pb from 275m. From a more recent interpretation it would appear that the holes drilled over and under the mineralised structure.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Geology</b> | <i>Deposit type, geological setting and style of mineralisation.</i> | <p><b>Stavely Project &amp; Black Range Joint Venture</b></p> <p>The Stavely Project and Black Range JV are located in the Mount Stavely Volcanic Complex (MSVC). Intrusion of volcanic arc rocks, such as the Mount Stavely Volcanic Complex, by shallow level porphyries can lead to the formation of porphyry copper ± gold ± molybdenum deposits.</p> <p>EL6870 is interpreted by Cayley et al. (2017) to host structurally dislocated and rotated segments of both the Stavely Belt and the Bunnugal Belt.</p> <p><b>Stavely Project</b></p> <p><b>Thursday's Gossan Prospect</b></p> <p>The Thursday's Gossan prospect is located in the Mount Stavely Volcanic Complex (MSVC). Intrusion of volcanic arc rocks, such as the Mount Stavely Volcanic Complex, by shallow level porphyries can lead to the formation of porphyry copper ± gold ± molybdenum deposits.</p> <p>The Thursday's Gossan Chalcocite deposit (TGC) is considered to be a supergene enrichment of primary porphyry-style copper mineralisation. Mineralisation is characterised by chalcopyrite, covellite and chalcocite copper sulphide mineralisation within a sericite, illite and kaolin clay alteration assemblage. Copper mineralisation is within a flat lying enriched 'blanket' of overall dimensions of 4 kilometres north-south by up to 1.5 kilometres east-west by up to 60 metres thick with an average thickness of approximately 20 metres commencing at an average depth below surface of approximately 30 metres. The majority (circa 60%) of the Mineral Resources reside within a higher-grade zone of approximate dimensions of 1 kilometre x 300 metres by 35 metres thick.</p> <p>The mineralisation at the Cayley Lode at the Thursday's Gossan prospect is associated with high-grade, structurally controlled copper-gold-silver mineralisation along the ultramafic contact fault.</p> <p>The Thursday's Gossan area hosts a major hydrothermal alteration system with copper-gold mineralisation over a 10 kilometre long corridor.</p> <p><b>Junction Prospect</b></p> |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | The Junction Prospect is predominately underlain by a package of sandstone and siltstone with some dacite porphyry. Trace to locally weak quartz+carbonate+sulphide+base metal veining was intersected in SMD077. In the aircore drilling mineralisation was predominantly observed in the oxide zone as chalcocite-covellite sulphides with minor malachite. |                                 | <i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i> | No material drill hole information has been excluded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |          |        |          |          |         |         |        |         |    |   |          |        |         |        |        |    |       |          |        |         |     |        |    |       |          |        |         |     |        |    |     |          |        |         |     |        |    |     |          |        |         |     |         |    |      |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |
| <b>Data aggregation methods</b> | <i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually</i>                                                                         | High-grade mineralisation exploration all copper/ and or gold intervals considered to be significant have been reported with subjective discretion.<br>No top-cutting of high-grade assay results have been applied, nor was it deemed necessary for the reporting of significant intersections.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |          |        |          |          |         |         |        |         |    |   |          |        |         |        |        |    |       |          |        |         |     |        |    |       |          |        |         |     |        |    |     |          |        |         |     |        |    |     |          |        |         |     |         |    |      |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |         |    |    |          |        |         |     |

| Criteria                                                                | JORC Code explanation                                                                                                                                                                                                                                                    | Commentary                                                                                                                                                                                                                                    |
|-------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                         | <i>Material and should be stated.</i>                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                               |
|                                                                         | <i>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i>            | In reporting exploration results, length weighted averages are used for any non-uniform intersection sample lengths. Length weighted average is (sum product of interval x corresponding interval grade %) divided by sum of interval length. |
|                                                                         | <i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i>                                                                                                                                                                       | Assumptions used for reporting of metal equivalent values are clearly stated.                                                                                                                                                                 |
| <b>Relationship between mineralisation widths and intercept lengths</b> | <i>These relationships are particularly important in the reporting of Exploration Results.<br/><br/>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i>                                              | There is insufficient drilling data to date to demonstrate continuity of mineralised domains and determine the relationship between mineralisation widths and intercept lengths.                                                              |
|                                                                         | <i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</i>                                                                                                 | Refer to the Tables and Figures in the text.                                                                                                                                                                                                  |
| <b>Diagrams</b>                                                         | <i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i> | Refer to Figures in the text. A plan view of the drill hole collar locations is included.                                                                                                                                                     |
| <b>Balanced reporting</b>                                               | <i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i>                                         | All copper and gold values considered to be significant have been reported. Some subjective judgement has been used.                                                                                                                          |

| Criteria                                  | JORC Code explanation                                                                                                                                                                                                                                                                                                                                                                        | Commentary                                                                                                                     |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Other substantive exploration data</b> | <i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i> | All relevant exploration data is shown on figures and discussed in the text.                                                   |
| <b>Further work</b>                       | <i>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).<br/><br/>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i>                                     | Diamond drilling has been planned to test the new interpretation of the copper mineralised structure at the Junction Prospect. |
