

## Reconnaissance sampling program commences at Ngala Hill PGE Project to follow up historical targets

### **HIGHLIGHTS**

- ***Targeted reconnaissance sampling program commences at DY6's highly prospective PGE, Cu & Ni project at Ngalla Hill, Southern Malawi***
- ***At Ngala Hill, 3 key target zones of palladium rich Pd+Pt+Au+Cu mineralisation have been identified from historical trenching and limited drill testing***
- ***DY6 will undertake a rock chip and soil sampling program to follow up on known high grade areas as well as aiming to expand the zone of mineralisation***
- ***No significant modern exploration including electromagnetics (EM) to target massive sulphides has been undertaken at Ngala Hill***
- ***Trenching by Placer Dome in 2000 included results of:***
  - ***12m at 3g/t PGE+Au; and***
  - ***70m at 1.12g/t PGE+Au, including 8m at 3.3g/t PGE+Au***
- ***The main mineralised zone has only had limited modern drilling***

DY6 Metals Ltd (ASX: DY6) ("DY6", the "Company"), a strategic metals explorer targeting Heavy Rare Earths (HREE) and Niobium (Nb) in southern Malawi, is pleased to report it is preparing for commencement of a reconnaissance program at the Company's highly prospective PGE project at Ngala Hill in southern Malawi. The Company has commenced community engagement with local community members at the project site with the purpose to facilitate awareness of the exploration program planned by DY6.

The Company's CEO, Mr Lloyd Kaiser said: "Our team in Malawi has actively built strong relationships with local communities across our projects and this early engagement at Ngala Hill is setting the foundation between the Company and the community as we prepare to mobilise the geo team and embark on our first exploration campaign at Ngala."

**Figure 1: Location of the Ngala Hill PGE Project in southern Malawi**

## **Background on the Project**

The Ngala Hill ultramafic chonolith is an arcuate-shaped intrusion, with dimensions of approximately 2.4km by 0.7km and was intruded into the underlying Proterozoic Basement Complex gneisses. The Ngala Hill Project is characterised by an intrusive ultramafic suite of pyroxenites and hornblende-pyroxenites that intrude basement gneisses. The pyroxenite facies of the ultramafic complex is prospective for platinum group elements (PGEs), predominantly palladium, and associated copper.

Initial work at Ngala Hill in the late 1960s included geochemical sampling programs undertaken by the British and Malawian Geological Surveys. Phelps Dodge started an exploration program for PGEs on Ngala Hill in 1999 with approximately 600 m of trenching. Metapyroxenite and amphibolite with an PGE-gold-copper nickel association was intersected trenching and yielded 1.41g/t Pt+Pd+Au and 1,430 ppm Cu over a length of 64m.

In 2000, Placer Dome confirmed further anomalies with encouraging results received from several trenches including 12m at 3g/t PGE+Au and 70 m at 1.12g/t PGE+Au, including 8m at 3.3g/t PGE+Au.

Three zones of palladium-platinum-gold-copper mineralisation were defined at Ngala Hill, including:

- Main Zone striking parallel to the main spine of Ngala Hill for approximately 2 km;

- Massive Sulphide Zone comprising laminated, outcropping 10 cm thick massive sulphide band with associated quartz breccias; and
- Western Sill potentially mineralised at a similar topographic level to the Main Zone.

### DY6 Sampling Program

DY6 has commenced a reconnaissance mapping and rock chip sampling program to validate and potentially expand the significant area of interest at Ngala Hill.

The critical first stage of community consultation is underway which will allow the support logistics to be planned and costed with more certainty. The Company is not aware of any potential difficulties, but lack of general community knowledge of exploration processes and requirements needs to be addressed at the earliest stages of activity. Ground activities are expected to commence in early Q3 initially prioritising targets by previous explorers covered by the ultramafic intrusion.

### Competent Persons Statement

*The Information in this announcement that relates to exploration results, mineral resources or ore reserves is based on information compiled by Mr Allan Younger, who is a Member of the Australasian Institute of Mining and Metallurgy. Mr Younger is a consultant of the Company. Mr Younger has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration and to the activity that he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the 'Australian Code for Reporting Exploration Results, Mineral Resources and Ore Reserves' (the JORC Code). Mr Younger consents to the inclusion of this information in the form and context in which it appears in this announcement. Mr Younger holds shares in the Company.*

## Annexure A: JORC Code, 2012 Edition – Table 1 report

### Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

| Criteria            | JORC Code explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Commentary                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sampling techniques | <ul style="list-style-type: none"> <li>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> <li>Aspects of the determination of mineralisation that are Material to the Public Report.</li> <li>In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverized to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</li> </ul> | <ul style="list-style-type: none"> <li>Not recorded in historic data but presumably field rock chip samples of outcrop were taken by field staff from outcrops utilising a geo-pick and hand tool.</li> <li>Not recorded in historic data samples were selected more on the basis of understanding lithotypes rather than being fully representative of mineralisation.</li> </ul> |
| Drilling techniques | <ul style="list-style-type: none"> <li>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <ul style="list-style-type: none"> <li>No recent drilling is utilised on this program or reported in this announcement.</li> </ul>                                                                                                                                                                                                                                                 |

- The area of Ngalla Hill was mapped by the Geological Survey of Nyasaland and its successor the Geological Survey of Malawi.
- Initial sampling was completed in the 1960's then Phelps Dodge completed rock chip, soil sampling and trenching program in 1999-2000.
- Two diamond drillholes were planned with only one drilled which failed to reach its target.
- Placer Dome took over the exploration completing more than 600m of trenching followed by a 4-hole diamond drilling program with disappointing results.
- In 2007 MM Mining completed a soil sampling program and reputedly completed a drill program; no results or information regarding this program are in the public domain.
- In 2016, a private company, Sabila Capital, completed a handheld XRF soil sampling program in 3 phases totalling 646 sample sites.
- #2 Rock chip samples were also collected. A subsequent 100m x 100m soil or auger sampling program for 177 samples was completed.

## Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)
