

15 June 2026

New Deep Target Identified Increasing Kokoseb's Underground Potential

Wia Gold Limited (ASX: WIA) (**Wia** or the **Company**) is pleased to report assay results from 19,819 metres of recent drilling at its 2.93Moz **Kokoseb Gold Project** in Namibia.

Results from twenty-nine Diamond Drill holes (**DD**) have:

- Identified a new high-grade mineralised horizon beneath the Central Zone.
- Extended high-grade mineralisation beyond the current open pit Mineral Resource Estimate (MRE).
- Further demonstrated the internal continuity, scale and robustness of the high-grade plunging shoots.

A further ten Reverse Circulation (**RC**) holes were completed, including eight infill holes within the open pit area and two below the Scoping Study¹ pits in the Southern Zone, validating internal grade continuity.

Assay results from the 39 drill holes include:

- New high-grade target identified in the Central Zone, supporting underground growth potential:
 - 9.0m @ 10.64 g/t Au from 811.0m, inc. 4.0m @ 22.76 g/t Au in KDD147
 - 9.0m @ 2.24 g/t Au from 801.0m, inc. 3.0m @ 3.18 g/t Au in KDD137
- Strong continuity demonstrated in Central and Southern Zones high-grade plunging shoots and Western Zone deep target:
 - 10.8m @ 5.43 g/t Au from 322.2m, inc. 4.0m @ 11.10 g/t Au in KDD139
 - 15.0m @ 2.18 g/t Au from 414.0m in KDD143
 - 12.0m @ 1.86 g/t Au from 555.0m, inc. 3.0m @ 3.04 g/t Au in KDD152
 - 8.7m @ 2.66 g/t Au from 648.4m in KDD162
 - 5.0m @ 4.51 g/t Au from 666.0m, inc. 1.0m @ 20.24 g/t Au in KDD148
 - 9.0m @ 2.59 g/t Au from 575.0m, inc. 4.0m @ 4.83 g/t Au in KDD156
 - 19.0m @ 1.52 g/t Au from 281.0m, inc. 3.0m @ 3.09 g/t Au in KRC580

An updated MRE is currently being calculated and will encompass all historical sampling up to and including the period covered by this announcement.

The Kokoseb Definitive Feasibility Study (DFS) remains on schedule for completion in Q3 2026.

Six diamond drill rigs are currently advancing the definition drilling of high-grade zones to support future underground resource potential.

¹ Refer ASX Announcement dated 30 September 2025

Commenting on the results, Wia Managing Director and CEO, Henk Diederichs, said:

“The discovery of a new high-grade target beneath the Central Zone, together with the strong continuity demonstrated in the existing high-grade shoots in both the Central and Southern Zones, further strengthens Kokoseb’s underground potential. Mineralisation has been extended to 580 metres of strike below the Scoping Study pit shell, and both high-grade shoots remain open at depth. With six diamond rigs operating, we are continuing underground resource definition ahead of an updated MRE and the Definitive Feasibility Study in Q3 CY2026, with increasing confidence in the long-term scale and value of the deposit.”

New deep target identified beneath the Central Zone pit shell

Following the identification of a significant high-grade target zone previously reported at Central Zone², further drilling has identified a second high-grade target zone, increasing the potential for future underground development (Figure 1).

Diamond drill hole **KDD137** has intersected a wide mineralised zone of 54.1m at 1.25 g/t Au (unconstrained) including significant intercepts of 17.0m at 2.16 g/t Au with a higher-grade component of 4.0m at 3.06 g/t Au and of 9.0m at 2.24 g/t Au with a higher-grade component of 4.0m at 3.06 g/t Au. 75m to the south, **KDD147** has intersected 62m of mineralisation at 2.08 g/t Au (unconstrained) including a significant high-grade intercept of 9.0m at 10.64 g/t Au.

This new target zone comprises thick gold mineralisation located approximately 700m below the surface and 350m below the Scoping Study pit shell. Previously reported KDD086, from the same zone, had returned an unconstrained intercept of 47m at 1.49 g/t Au³.

Significant intercepts from the new zone include:

17.0m @ 2.16 g/t Au from 769.0m, inc. 4.0m @ 3.92 g/t Au in KDD137

9.0m @ 2.24 g/t Au from 801.0m, inc. 4.0m @ 3.06 g/t Au in KDD137

9.0m @ 10.64 g/t Au from 811.0m in KDD147

4.0m @ 2.84 g/t Au from 832.0m in KDD147

² Refer to ASX announcement 4 March 2026

³ Refer to ASX announcement 22 October 2025

Figure 1 – Long section view showing the Central high-grade shoot and the new deep target zones beneath the Scoping Study pit. Location of high-grade intercepts reported in this announcement are shown in red⁴ (intercepts in black previously reported)⁵

Central and Southern Zone high-grade plunging shoots continue to demonstrate strong continuity

Step out diamond drill hole **KDD152** (Figure 1) has extended the down plunge extent of the Central Zone high-grade plunging shoot to 580m below the Scoping Study pit shell with a significant intercept of 12.0m at 1.86 g/t Au, including a higher-grade component of 3.0m at 3.04 g/t Au.

Internal grade continuity of the shoot is further supported with significant mineralisation intersected by diamond drill holes **KDD139**, **KDD143** and **KDD162**.

Diamond drill holes **KDD140** and **KDD148** have also reinforced a previously reported high-grade target zone beneath the Central Zone high-grade plunging shoot⁶.

In the Southern Zone, diamond drill hole **KDD156** has extended the high-grade plunging shoot by a further 80m, to 480m below the Scoping Study pit shell, returning 9.0m at 2.59 g/t Au, including 4.0m at 4.83 g/t Au.

The current diamond drilling program remains focused on incremental step-out holes designed to test the volumetric extent of these zones and further define internal grade variability.

⁴ Intercept calculated using 0.5 g/t cut-off and 2m maximum consecutive internal low grade

⁵ Refer to ASX announcements 15 May 2023, 29 May 2023, 12 March 2024, 3 July 2025, 8 December 2025, 4 March 2026

⁶ Refer to ASX announcement dated 4 March 2026

Significant high-grade intercepts include:

- 10.8m @ 5.43 g/t Au from 322.2m, inc. 4.0m @ 11.10 g/t Au in KDD139
- 15.0m @ 2.18 g/t Au from 414.0m in KDD143
- 12.0m @ 1.86 g/t Au from 555.0m, inc. 3.0m @ 3.04 g/t Au in KDD152
- 8.7m @ 2.66 g/t Au from 648.4m in KDD162
- 5.0m @ 4.51 g/t Au from 666.0m, inc. 1.0m @ 20.24 g/t Au in KDD148
- 9.0m @ 2.59 g/t Au from 575.0m, inc. 4.0m @ 4.83 g/t Au in KDD156
- 5.0m @ 2.97 g/t Au from 599.0m, inc. 3.0m @ 3.80 g/t Au in KDD140

Figure 2 – Long section view at the Southern Zone plunging shoot. Location of high-grade intercepts reported in this announcement are shown in red⁷ (intercepts in black previously reported)⁸

Reverse Circulation Drilling

RC drilling focused on testing the shallowest mineralised extensions at the base of the MRE, targeting the future resource growth. The current RC program has now been completed, and the rig has demobilised from site.

⁷ Intercept calculated using 0.5 g/t cut-off grade and 2m maximum consecutive internal low grade

⁸ Refer to ASX announcements dated 15 May 2023, 29 May 2023, 12 March 2024, 3 July 2025, 8 Dec 2025, 4 March 2026

Significant intercepts from the last RC holes include the following:

19.0m @ 1.52 g/t Au from 278.0m, inc. 3.0m @ 3.09 g/t Au in KRC580

5.0m @ 1.52 g/t Au from 223.0m in KRC582

7.0m @ 1.52 g/t Au from 246.0m in KRC584

6.0m @ 1.76 g/t Au from 240.0m in KRC586

11.0m @ 1.99 g/t Au from 169.0m in KRC587

13.0m @ 1.47 g/t Au from 241.0m in KRC587

7.0m @ 1.46 g/t Au from 302.0m in KRC587

7.0m @ 2.01 g/t Au from 322.0m in KRC587

13.0m @ 1.03 g/t Au from 279.0m in KRC588

17.0m @ 1.31 g/t Au from 304.0m in KRC589

Reference to previous ASX Announcements

In relation to previously reported exploration results included in this announcement, the dates of which are referenced, the Company confirms that it is not aware of any new information or data that materially affects the information included in those announcements.

In relation to the information in this announcement that relates to the Mineral Resource Estimate for the Kokoseb Gold Project that was reported on 16 July 2025, other than subsequently released drilling results, Wia confirms that it is not aware of any new information or data that materially affects the information included in that release. All material assumptions and technical parameters underpinning the estimates in that ASX release continue to apply and have not materially changed.

About The Kokoseb Gold Project

The Kokoseb Gold Deposit is located in the north-west of Namibia, a country that is a well-recognised mining jurisdiction, with an established history as a significant producer of uranium, diamonds, gold and base metals. The Kokoseb gold deposit is situated 320km by road from the capital Windhoek.

Kokoseb lies within Exclusive Prospecting Licence (EPL) 4818, which is held under joint venture (Wia 80%) with the state-owned mining company Epangelo. The EPL 484, near the town of Okombahe is part of Wia's larger Damaran Project, which consist of 12 tenements with a total area of over 2,700km².

An updated Indicated and Inferred Mineral Resource Estimate of 2.93Moz @ 1.0 g/t Au, at a cut-off grade of 0.5 g/t Au, including a higher-grade gold portion of 2.07Moz @ 1.4 g/t Au using a cut-off grade of 0.8 g/t Au, was announced on 16 July 2025.

The Kokoseb Scoping Study, completed in September 2025 (refer to ASX announcement dated 30 September 2025), confirmed Kokoseb as an outstanding gold project with an initial mine life of over 11 years and average production of approximately 177 koz per annum for the first five years. At a consensus gold price of US\$2,600/oz the Project delivers a post-tax NPV_{5%} of US\$646 million and a post-tax IRR of 38%, with a payback period of 1.8 years. The current gold price environment continues to significantly enhance the overall project economics.¹⁰

The Company is advancing Kokoseb through a DFS, targeted for completion in H2 2026, and towards its development as Namibia's next major gold mine.

¹⁰ Further detail on the Scoping Study, including all the material assumptions on which the production targets and forecast financial information are based, is included in the Announcement released to the ASX on 30 September 2025. The Company confirms that the material assumptions underpinning the production targets and forecast financial information derived from the production targets in that Announcement continue to apply and have not materially changed.

The location of Kokoseb and the Company's Namibian Projects is shown in Figure 4 below.

Figure 4 – Location of Wia's Namibia Projects

Table 1 – Kokoseb Indicated and Inferred Mineral Resource estimates for selected cut-off grades. The estimates in this table are rounded to reflect their precision; rounding errors are apparent. They are based on drilling data available at 30th June 2025. The Competent Person responsible for the data informing the estimates is Pierrick Couderc, Wia Exploration Manager. The Competent Person responsible for resource modelling is Jonathon Abbott MAIG, Director of Matrix Resource Consultants Pty Ltd. The Resources are constrained by an optimised pit shell using a metal price of US\$2,300/oz Au and process recovery of 92%.

Competent Person's Statement

The Mineral Resource Estimate referred to in this announcement was first disclosed in accordance with the requirements of ASX Listing Rule 5.8 in the Company's ASX announcement dated 16 July 2025, titled "Kokoseb Mineral Resource Estimate increases to 2.93Moz gold". The Company confirms that it is not aware of any new information or data that materially affects the information included in that announcement and that all material assumptions and technical parameters underpinning the estimate in the previous announcement continue to apply and have not materially changed. The announcement is available to view on www.wiagold.com.au

The information in this announcement that relates to exploration results at the Kokoseb Gold Project is based on information compiled by Company geologists and reviewed by Mr Pierrick Couderc, in his capacity as Exploration Manager of Wia Gold Limited. Mr. Couderc is a member of both the Australian Institute of Mining and Metallurgy and the Australian Institute of Geoscientists and has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr. Couderc consents to the inclusion in the report of the matters based upon the information in the form and context in which it appears.

Appendix 3. JORC Table 1 Reporting

Section 1 Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
Sampling techniques	<i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> <i>In cases where ‘industry standard’ work has been done this would be relatively simple (eg ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i>	- Reverse circulation (RC) drilling was completed using a dedicated RC rig. - RC samples were collected from the drill rig cyclone over 1 m down-hole intervals and subsampled by cone-splitting; full length of the drill holes was sampled. - Samples are typically circa 2-4kg weight. A duplicate sample was retained on site for future reference. - Diamond drilling was completed using a dedicated diamond rig. Drillholes were angled at -60° from surface. - Diamond core was cut in half using a core saw for HQ diameters; NQ diameters were sampled full core. Sampling intervals are decided by a Company Geologist, based on the lithological contacts and on any change in alteration or mineralisation style. - Core sample length vary between 0.5m and 2m. The half core sampling is done by a Company Geologist.
Drilling techniques	<i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i>	- RC drilling utilised 140 mm (5.5 inch) face sampling bits. - Diamond drilling was undertaken at HQ (drill holes from surface) or NQ (from surface or as diamond tails) diameters, and oriented using the Reflex Act III digital core orientation equipment.
Drill sample recovery	<i>Method of recording and assessing core and chip sample recoveries and results assessed.</i> <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i> <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i>	- RC recoveries were determined by weighting each drill metre bag. Samples are sieved and logged by supervising Geologist; sample weight, quality, moisture and any contamination are recorded. - RC samples quality and recovery was excellent, with dry samples and consistent weight obtained. - Drill core recoveries were recorded at the drill rig. Core recoveries were excellent for all the drill programs. - Sample bias is not expected with the cut core.
Logging	<i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource</i>	The entire length of all RC and diamond holes were logged by Company geologists using industry standard methods, including recording of lithology, alteration, mineralisation and

Criteria	JORC Code explanation	Commentary
	<i>estimation, mining studies and metallurgical studies.</i> <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i> <i>The total length and percentage of the relevant intersections logged.</i>	weathering. Sieved RC sample collected for logging were stored in chip trays for future geological reference and all core was routinely photographed. All core was geotechnically logged, including recording of RQD and fracture frequency. The logging is qualitative and quantitative in nature and is of appropriate detail for support the current Mineral Resource estimates.
Sub-sampling techniques and sample preparation	<i>If core, whether cut or sawn and whether quarter, half or all core taken.</i> <i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i> <i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i> <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i> <i>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</i> <i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i>	- The RC samples were collected from the rig cyclone and passed through a riffle splitter to reduce sample weight to a circa 2-4kg. - The sampling technique is considered industry standard and effective for this style of drilling. - Samples were crushed and pulverized at the ALS laboratory in Okahandja before being shipped to Johannesburg for assay. - RC samples were assayed using method Au-AA24 for gold. - The sample preparation procedures carried out are considered acceptable. Blanks, standards (CRM) and duplicates are used to monitor Quality Control and representativeness of samples. - The diamond core was cut longitudinally using a core saw on HQ diameters, to sample half core; NQ diameters were sampled full core. - Core samples were collected by a Company Geologist and sent off to the laboratory for assay. - Core samples were crushed and pulverized at the ALS laboratory in Okahandja before being shipped to Johannesburg for assay. - Drilling samples were assayed using methods Au-AA24 for gold. - The sample preparation procedures carried out are considered acceptable. Blanks and standards (CRM) are used to monitor Quality Control and representativeness of samples.
Quality of assay data and laboratory tests	<i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i> <i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i> <i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i>	- RC samples and core samples were assayed by 50g Lead collection fire assay in new pots and analysed by Atomic Absorption Spectroscopy (AAS) for gold. - Industry best practice procedures were followed and included submitting blanks, field duplicates and Certified Reference Material. Acceptable levels of accuracy and precision have been confirmed.

Criteria	JORC Code explanation	Commentary
Verification of sampling and assaying	<i>The verification of significant intersections by either independent or alternative company personnel.</i> <i>The use of twinned holes.</i> <i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i> <i>Discuss any adjustment to assay data.</i>	- At this stage, the intersections have been verified by the Company Geologists. - All field data is manually collected, entered into excel spreadsheets, validated and loaded into a database. - Electronic data is stored on a cloud server and routinely backed up. - Data is exported from the database for processing in a number of software packages.
Location of data points	<i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i> <i>Specification of the grid system used.</i> <i>Quality and adequacy of topographic control.</i>	- Drill holes collar locations were recorded at the completion of each hole by hand-held GPS. - Coordinates collected are in the WGS84 Zone 33S grid system
Data spacing and distribution	<i>Data spacing for reporting of Exploration Results.</i> <i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i> <i>Whether sample compositing has been applied.</i>	- The data spacing and distribution of sampling is sufficient to establish the degree of geological and grade continuity appropriate for Mineral Resource estimation procedures. - Drill holes were planned on localised set grids with spacing varying between 25m and 100m; depending on the sections. - The grade control trial grid was set at a 6m x 10m grid.
Orientation of data in relation to geological structure	<i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i> <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i>	Drill holes were positioned using geological information collected from the trenches and from the detailed mapping completed over the prospect. They are positioned perpendicular to the main schistosity and so to the inferred mineralisation main controls.
Sample security	<i>The measures taken to ensure sample security.</i>	Sampling is supervised by Wia geologists and all samples are bagged and sealed on site prior to delivery to the laboratory in Okahandja by company staff. No other personnel are permitted un-supervised access to the samples prior to delivery to ALS.
Audits or reviews	<i>The results of any audits or reviews of sampling techniques and data.</i>	No reviews or audits have been conducted on the drilling reported in this announcement.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	- Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. - The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	- The Damaran Project comprises 11 exclusive prospecting licenses (EPLs 6226, 4833, 8039, 7246, 4818, 4953, 6534, 6535, 8249, 7980, 8709) and located in central Namibia. EPL6226 is 100% held by Wia Gold in the name of Aloe Investments One Hundred and Ninety Two (Pty) Ltd. EPL4833, 4818, 7246, 8039 and 8249 are held under an 80% earn-in and joint venture agreement with Epangelo Mining Limited, a private mining investment company with the Government of the Republic of Namibia as the sole shareholder. - EPL6534, 6535, and 4953 are held under a company called Gazina Investments which is owned 90% by Wia and 10% by the vendor. - EPL7980 is 100% held by WiaGold in the name of Damaran Exploration Namibia (PTY) Ltd
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	- Work completed prior to WiaGold includes stream sediment sampling, mapping, soil and rock chip sampling by Teck Cominco Namibia but data is unavailable. - This work did not cover the Okombahe permit (EPL4818), host of the Kokoseb deposit.
Geology	Deposit type, geological setting and style of mineralisation.	- The Kokoseb Gold Project lies within the Northern Central Zone of the Pan-African Damaran Orogenic Belt. The project area is underlain by neo-Proterozoic metasediments, including the Kuiseb schist formation, host of Kokoseb, Twin Hills and Ondundu gold deposits in Namibia. Known gold deposits, including Kokoseb, are orogenic type deposits by nature. - Kokoseb gold mineralisation is hosted by the Kuiseb schist formation, biotite-schists (metasediments) which have been intruded by several granitic phases. The gold mineralised zone appears as a contact like aureole around a central granitic pluton, with a diameter of approximately 3km in each direction. - Gold mineralisation is present as native gold grains and lesser silver bearing gold grains that are spatially associated with sulphides dominated by pyrrhotite, löllingite and arsenopyrite. Gold grains have developed at the contact between löllingite and arsenopyrite following a retrograde reaction.
Drill hole Information	- A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: - easting and northing of the drill hole collar	see tables in the appendix.

Criteria	JORC Code explanation	Commentary
	○ elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar ○ dip and azimuth of the hole ○ down hole length and interception depth ○ hole length. • If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	
Data aggregation methods	• In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. • Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. • The assumptions used for any reporting of metal equivalent values should be clearly stated.	• Reported intercepts are calculated using weighted average at a cut-off grade of 0.5 g/t Au and allowing internal dilution of maximum 2m consecutive low-grade material.
Relationship between mineralisation widths and intercept lengths	• These relationships are particularly important in the reporting of Exploration Results. • If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. • If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').	• Drill holes are inclined at around 55 to 60 degrees, with azimuths generally perpendicular to local mineralisation trends, implying a true thickness around half the down-hole intercept lengths. • Intercepts are reported as they appear from the sampling.
Diagrams	• Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	• Plan view maps of all drillhole are included.
Balanced reporting	• Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	• All samples with assays have been reported.

Criteria	JORC Code explanation	Commentary
Other substantive exploration data	<i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i>	No other exploration data is being reported at this time.
Further work	<i>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</i> <i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i>	Refer to the text in the announcement for information on follow-up and/or next work programs.
