

GOLDEN CROWN NORTH DELIVERS HIGH GRADES AND GROWTH POTENTIAL

Highlights

- Significant gold results returned from drilling at Golden Crown North:
 - 24BCRC014 **6m @ 10.85g/t Au** from 253m (140m below mineral resource)
Incl. **3m @ 21.07g/t Au**
and **2m @ 5.05g/t Au** from 240m
 - 24BCRC012 **5m @ 3.63g/t Au** from 222m (95m below mineral resource)
Incl. **2m @ 8.08g/t Au**
 - 24BCRC013 **2m @ 6.00g/t Au** from 130m (25m below mineral resource)
- **100% Drilling success rate** - all holes intersected high-grade mineralisation
- Drilling confirms high-grade mineralisation **extends 140m below** the Golden Crown resource, previously modelled only to 100m depth
- Results demonstrate **potential for significant resource growth** at Golden Crown

WIN Metals Ltd (ASX: **WIN**) ("**WIN**" or "the **Company**") is pleased to report initial drilling results from Golden Crown North, a key satellite deposit at the Butchers Creek Gold Project in the Kimberley region of Western Australia.

These holes were part of WIN's first program at the Butchers Creek Gold Project which comprised a total of 25 drillholes for 7,200m. The program was designed to increase resource confidence and test for down dip extensions at Butchers Creek and Golden Crown in addition to reconnaissance drilling at Mt Bradley.

WIN Metals Managing Director and CEO, Mr Steve Norregaard, commented:

"Our initial drill results at Butchers Creek showed the magnitude and quality of that resource, now just 6kms to the north we have hit more paydirt at Golden Crown."

"These step-out drill holes are significant in that they have more than doubled the known depth of mineralisation and as a result provide us with huge excitement to the growth potential of Golden Crown. With an already established 38,000oz resource, Golden Crown may become a far more prominent satellite project with further drilling. These multiple high-grade intercepts well below the previous drilling, augur well for our planned 2025 program."

Figure 1- Golden Crown North long section with current mineral resource envelopes

Discussion of Results

Golden Crown is a high-grade gold deposit that extends some 1,300m along strike, with a JORC 2012 inferred mineral resource of 400,000t @ 3.1g/t Au for 38,000oz of gold (Refer to Table 1).

This release discusses the results from the first three (3) drillholes recently completed at Golden Crown North formerly known as “Faugh-a-Ballagh” which is part of the larger Golden Crown gold deposit. These drillholes were designed to validate the current resource model and test down dip extensions of the mineralisation beyond the known mineral resource. Two holes were drilled on section A and one hole on section B located 200m to the south east of section A as shown on Figure 2 below.

Figure 2 - Plan view of Golden Crown with related drill section lines

Hole **24BCRC012** intersected gold mineralisation **95m below** the mineral resource returning **5m @ 3.63g/t Au** including **2m @ 8.08g/t Au**.

Hole **24BCRC013** intersected mineralisation within the current resource envelope and highlighted depth potential with two hanging wall lodes below the current resource intersected returning **2m @ 6.00g/t Au** 25m below the current resource and a further 2m @ 1.17g/t Au 50m below the resource. Refer to section A in Figure 2 above and Figure 3 below.

Figure 3 - Section A 24BCRC012 and 24BCRC013 (looking south)

24BCRC014 was drilled 200m to the south east of section A intersecting mineralisation **140m below** the current mineral resource envelope. Multiple zones of gold mineralisation have been intersected including 1m @ 6.96g/t Au, 2m @ 5.05g/t Au and **6m @ 10.85g/t Au** including 3m @ 21.07g/t Au, the latter some **140m below** the resource envelope **confirming the Golden Crown gold system continues at depth**. Refer to section line B in Figure 2 above and Figure 4 below.

Figure 4 - Golden Crown North Section Line B (looking south)

All gold mineralisation at Golden Crown is found within intensely silicified syenite, hosted in multi-generational quartz veining with minor sulphide mineralisation.

Field Reconnaissance and Future Work

With the 2024 drill programme now completed, assay results for the remaining drillholes are expected over the coming months. These results will be evaluated along with the processing of two diamond tails from Butchers Creek Far South and one diamond hole at Golden Crown South.

Significant reconnaissance work was undertaken by WIN during the 2024 field season at Golden Crown. Completing topographic surveys, structural and lithological field mapping, drone aerial imagery photography as well as historic data validation of previous drill collars. All activities will assist geological modelling and interpretation of the mineralisation controls at Golden Crown.

WIN is taking the opportunity to reprocess all core drilled at the Butchers Creek Gold Project since 2020. All core has been re-packed and dispatched to Perth with detailed geological, structural and geotechnical logging underway. Metallurgical analysis is also planned over the 2024/2025 Kimberley wet season period.

Butchers Creek Gold Project Mineral Resources

Table 1- Butchers Creek Gold Mineral Resource Table Summary

Resource	Last Update	Indicated		Inferred		Total		
		Tonnes (Mt)	Grade (g/t Au)	Tonnes (Mt)	Grade (g/t Au)	Tonnes (Mt)	Grade (g/t Au)	Ounces
Butchers Creek	Jun-21	1.9	2.2	3.3	1.7	5.2	1.9	319,000
Golden Crown	Jun-21	-	-	0.4	3.1	0.4	3.1	38,000
Total		1.9	2.2	3.7	1.8	5.6	2.0	357,000

Note: Figures are rounded and reported at 0.8g/t Au cut-off¹

Location and Project History

Butchers Creek is located 30km south-east of Halls Creek in the Kimberley region of Western Australia. The project is accessible via the unsealed Duncan Road that connects the project to the town of Halls Creek and the sealed Great Northern Highway.

Figure 5 - Location of Butchers Creek Gold Project

¹ ASX:WIN announcement "Butchers Creek Gold Project MRE and Exploration Results - Amended" Released 11 Sep 2024

The Halls Creek region heralded Western Australia's first gold rush in the 1890s but has been largely limited to small scale mining and artisanal activities until the 1990s.

In 1993 Precious Metals Australia (PMA) acquired the Project and carried out extensive drilling at Butchers Creek, completing geotechnical studies, metallurgical test work and mineral resource calculations.

Gold production from the Butchers Creek open pit commenced in 1995 with the construction of a 500ktpa conventional carbon in pulp gold ore processing plant, a 9Mt tails storage facility, diesel power station and a 75-person accommodation camp and offices (Figure 6).

During operation supplementary ore was trucked some 80kms from the Nicholson's Find gold mine located to the south of Halls Creek (recently sold by Pantoro Limited (ASX:PNR)) and processed at Butchers Creek. Total production from Butchers Creek open pit was 761,000t @ 2.09g/t Au for 52,000oz of gold produced until the operation was closed in late 1997 due to the low gold price at the time. The Butchers Creek 500ktpa processing plant has since been decommissioned and mine site rehabilitated.

Post closure of the mining operation in 1997 various public and private entities having held the tenure with exploration drilling in the ensuing period carried out by Northern Star Resources in 2004 and Meteoric between 2020 and 2022.

Figure 6 - Butchers Creek gold processing plant. Circa 1996.

Figure 7 - Butchers Creek open pit May 2024

Regional Geology

Butchers Creek is found within the north-east to south-west belt of the Halls Creek Orogen comprised of Paleoproterozoic sediments, volcanics and intrusive rocks. Gold occurrences of the Halls Creek Mobile Zone are found within the eastern zone of the orogen within the Butchers Gully Member of the Olympio Formation as illustrated in Figure 8 below.

Figure 8 - Regional geology of East Kimberley

Local Geology and Mineralisation

Gold mineralisation at Golden Crown is stratabound within an intrusive syenite host. This is bound within a sedimentary package of sandstones, siltstones and shales. Gold mineralisation has been modelled over 1.3km in strike to a vertical depth of 240m, down dip and lateral extents of the gold mineralisation is limited by drilling.

Gold is strongly associated with multigenerational quartz veining with minor sulphides within the syenite host unit.

Competent Person Statement – Exploration Results

The information in this announcement that relates to mineral resource estimates and exploration results is based on information reviewed, collated and fairly represented by Mr William Stewart, who is a full-time employee of WIN Metals Ltd. Mr Stewart is a member of the Australian Institute of Metallurgy and Mining (member no 224335). Mr Stewart has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Stewart consents to the inclusion in the report of the matters based on his information in the form and

context in which it appears. Additionally, Mr Stewart confirms that the entity is not aware of any new information or data that materially affects the information contained in the ASX releases referred to in this report.

Compliance Statement

The Company confirms it is not aware of any new information or data that materially affects the information included in the original market announcement(s), and in the case of estimates of Mineral Resources that all material assumptions and technical parameters underpinning the estimates in the relevant announcement continue to apply and have not materially changed. The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original announcement.

Forward Looking Statements

This announcement includes forward-looking statements that are only predictions and are subject to known and unknown risks, uncertainties, assumptions and other important factors, many of which are beyond the control of WIN Metals Ltd, the directors and the Company's management. Such forward-looking statements are not guarantees of future performance.

Examples of forward-looking statements used in this announcement include use of the words 'may', 'could', 'believes', 'estimates', 'targets', 'expects', or 'intend' and other similar words that involve risks and uncertainties. These statements are based on an assessment of present economic and operating conditions, and on a number of assumptions regarding future events and actions that, as at the date of announcement, are expected to take place.

Actual values, results, interpretations or events may be materially different to those expressed or implied in this announcement. Given these uncertainties, recipients are cautioned not to place reliance on forward-looking statements in the announcement as they speak only at the date of issue of this announcement. Subject to any continuing obligations under applicable law and the ASX Listing Rules, WIN Metals Ltd does not undertake any obligation to update or revise any information or any of the forward-looking statements in this announcement or any changes in events, conditions or circumstances on which any such forward-looking statement is based.

Approved by: The Board of Directors

Annexure B: Table 1 As Per JORC Code Guidelines (2012)

Section 1 Sampling Techniques and Data - Butchers Creek	
Criteria	Commentary
Sampling techniques	All new data collected from the Butchers Creek gold project discussed in this report is in relation to Reverse Circulation (RC) and diamond drilling (DD) completed in 2024, unless stated otherwise. RC samples have been by one metre sample intervals from the cone splitter mounted cyclone of the RC drill rig. Typically, 100% recovered single metre samples returned weights of 2.5-3kg. No duplicate QAQC samples were taken at the rig with laboratory duplicates preferred to test laboratory repeatability. The sample reject was placed by buckets in lines of 20 or 40 samples for geological inspection, sample quality and recovery logging. Samples assessed as prospective for gold mineralisation have been assayed at single metre sample intervals. The prospective horizon is deemed by host rock (syenite), quartz and/or sulphide content. Areas outside the known mineralisation envelope (not within the host syenite unit or quartz veining) the rig geologist has deemed to potentially host gold mineralisation was composite sampled into 4 metre composites utilising industry standard process of scoop sampling the sample reject piles. DD samples NQ2 and HQ3 size core have been acquired according to logged lithological and mineralisation boundaries at lengths between 0.3 metres to 1.3 metres. No other measurement tools related to sampling have been used in the holes for sampling other than directional/orientation survey tools. Samples have been freighted to Bureau Veritas Assay Laboratories in Canning Vale, Western Australia. On arrival at the laboratory the samples were receipted, weighed and dried. Sample was then crushed and pulverised with a 40g charge used by fire assay and then analysed by Atomic Absorption Spectrometry.
Drilling Techniques	RC drilling was carried out using a Schramm 685 truck mounted rig utilising an auxiliary Sullair 1150 compressor and Air Research 2610 booster. Drill rods are 6 metres long and drill bit diameter is 143mm. Holes have been drilled at angle of -60° to -80° with varying azimuth angles to orthogonally intercept the interpreted favourable geological host unit. The DD rig was a Boart Longyear KWL1600 truck mounted drill rig drilling NQ2 and HQ3 size core. Core was oriented using Axis Ori Champ at 6m or 3m runs dependant on the competency of the core.
Drill Sample Recovery	The sample recovery is logged by a geologist during drilling and recoveries have been considered acceptable. No relationship between sample recovery and grade has been recognised.
Logging	All RC drillholes have been geologically logged for lithology, weathering, alteration, and mineralogy. All samples have been logged in the field at the time of drilling and sampling (both quantitatively and qualitatively where viable) with spoil material and sieved rock chips assessed. All RC holes have been photographed. Sporadic pXRF analysis has been used to validate logging with multielement but mainly Zn values used to determine the lithology.

Section 1 Sampling Techniques and Data - Butchers Creek	
Criteria	Commentary
	All DD holes have been geologically logged (both quantitatively and qualitatively) for lithology, weathering, alteration and mineralogy and sampled following drilling. All DD holes are photographed.
Sub-sampling techniques and sample preparation	The sample preparation technique carried out in the field is considered industry best standard practice completed by the geologist and field staff. Single metre samples were collected in a numbered calico bag each weighing 2.5kg-3.0kg from the RC rigs cone splitter by the drillers offside and placed above the corresponding sample reject pile. The geologist would nominate sampling zones and then assign final sequenced pre-number calico bags to the sampling intervals. The numbered calico bag would be placed into the final pre numbered calico bag ready in preparation for submission to the laboratory. QAQC standards and blanks were added to the submission at this point. All numbered calico bags that have not been nominated for assay submission are retained on the drill site or disposed of. DD: Samples of NQ2 and HQ3 size core at lengths between 0.3 metres to 1.3 metres have been cut with an Almonte core saw and half core submitted for analysis. With the remaining half core retained for future testwork. Samples were dispatched from Halls Creek and freighted by road to Perth. Upon arrival at the laboratory the samples are receipted, weighed then dried for 12 hours at 105°C before sample preparation commenced. Samples are then crushed by a Jaw Crusher to sub 3mm then pulverised utilising a LM5 puck and bowl pulveriser for 3-5 minutes to achieve 90% 75um. A 150g split of pulverised material was placed in a pulp packet in readiness for Fire Assay where 50g is used for Fire Assay and gold determination by Atomic Absorption Spectrometry. The remainder of the pulverised sample was bagged and retained. Sampling preparation outlined above is considered appropriate for gold determination and is considered standard industry practices.
Quality of assay data and laboratory tests	WIN Metals has established QAQC procedures for all drilling and sampling programs including the use of commercial Certified Reference Material (CRM) as field and laboratory standards, field and laboratory duplicates and blanks. Gold CRM samples have been inserted into the batches by the geologist, at a nominal rate of 5% of the total samples. Lab duplicates samples have been selected in mineralised zones, at a rate of 2% of total samples. Samples of blank material have been submitted immediately after visibly mineralised zones at a nominal rate of 5% of the total samples. Sample size is considered appropriate to the grain size of the material being sampled. Assaying was completed by Bureau Veritas in Canning Vale, Western Australia with standards and duplicates reported in the sample batches. The samples have been analysed by firing a 40g portion of the sample. Lower sample weights may be employed for samples with very high sulphide and metal contents. This is the classical fire assay process and will give total separation of Gold in the sample. Gold has been determined by Atomic Absorption Spectrometry. Internal sample quality control analysis was then conducted on each sample and on the batch by the laboratory.

Section 1 Sampling Techniques and Data - Butchers Creek	
Criteria	Commentary
	Results have been reported to WIN Metals in CSV, SIF and PDF formats. A detailed QAQC analysis has been carried out with all results assessed for repeatability and meeting expected values relevant to Gold and related elements. Any failures or discrepancies are followed up as required. There has been no cross-laboratory testing utilising an umpire laboratory at this stage
Verification of sampling and assaying	Assay results are provided by the laboratory to WIN Metals in CSV, SIF and PDF formats, and then validated and entered into the database managed by internal Database Administrator. Backups of the database are stored on a local server. Assay, Sample ID and logging data are matched and validated using filters in the database. The data is further visually validated by WIN Metals geologists and database staff. Significant results are verified by senior WIN Metals geologists. QAQC reports are run and the performance of the laboratory is evaluated periodically by senior WIN Metals geologists.
Location of data points	All drill collars have been surveyed by WIN using a Trimble DGPS RTX. With accuracy of 0.02m in horizontal and 0.1m in vertical component. ESPG: 28352 GDA94/MGA zone 52S is the grid system used in this programme.
Data spacing and distribution	All RC drillholes have been sampled at 1 metre intervals down hole. All DD drillhole have been sampled at between 0.3 and 1.3 metres Drillholes have been designed and completed to infill and extend known mineralisation, with a nominal drillhole spacing of recent and historical drilling of 30 to 60 metres. The drillhole spacing is considered sufficient to establish the degree of geological and grade continuity appropriate to estimate and report an Inferred Mineral Resource or better. Were drill spacing and grade continuity is less appropriate inferred and exploration targets will be considered. Exploration drilling was designed to intercept mineralisation plane with no consideration to data spacing and distribution. The drill spacing is considered sufficient to support exploration results. No compositing has been applied to exploration results.
Orientation of data in relation to geological structure	No Structural data has been obtained during this RC drilling programme. All DD holes have been orientated to gain structural measurements from features of the drill core. All drillholes have been planned at varying dip and azimuth angles in order to, where possible, orthogonally intercept the interpreted mineralised syenite host unit. Due to the antiformal nature of the host some level of bias will be introduced to sampling. Geological information (including structural) from both historical geological mapping as well as current geological mapping has been used during the planning of these drillholes. Due to the orientation of the mineralised zones in some place, there will be some exaggeration of the width of intercepts.

Section 1 Sampling Techniques and Data - Butchers Creek	
Criteria	Commentary
Sample security	All samples were transported by road via Halls Creek to Broome then to Bureau Veritas Laboratories in Canning Vale, WA for analysis. All samples are transported in bulka bags and is considered to be industry standard. All core has been transported to WIN's processing facility in Carlisle, Perth Western Australia. Where the core is logged and processed before being sampled and dispatched to Bureau Veritas Laboratories in Canning Vale, WA for analysis. All samples are transported in bulka bags and is considered to be industry standard.
Audits or reviews	A review of the exploration programme was undertaken prior to the programme was executed by WIN Metals geology management. Staff and contractors are based on site prior to, during and on completion of the programme to ensure proper quality control as per industry standards.

Section 2 Reporting of Exploration Results - Butchers Creek						
Criteria	Commentary					
Mineral tenement and land tenure status	Butchers Creek Gold Project is a collective of 3 granted mining leases, 5 granted exploration licences, 3 granted prospecting licences and 2 pending prospecting licences.					
	Tenement	Type	Status	WIN % (To Acquire)	Grant Date	End Date
	M80/106	Mining Lease	Granted	97	24/07/1986	23/07/2028
	M80/315	Mining Lease	Granted	97	22/08/1990	21/08/1932
	M80/418	Mining Lease	Granted	100	6/09/1995	5/09/2037
	E80/4856	Exploration Licence	Granted	100	15/09/2015	14/09/2025
	E80/4874	Exploration Licence	Granted	100	15/09/2015	14/09/2025
	E80/4976	Exploration Licence	Granted	100	7/02/2017	6/02/2027

	E80/5584	Exploration Licence	Granted	100	21/02/2022	20/02/2027
	P80/1839	Prospecting Licence	Granted	100	6/02/2017	5/02/2025
	P80/1854	Prospecting Licence	Granted	100	25/08/2017	24/08/2025
	P80/1855	Prospecting Licence	Granted	100	25/08/2017	24/08/2025
	P80/1884	Prospecting Licence	Pending	100		
	E80/5660	Exploration Licence	Pending	100		
All tenements are in good standing.						
Exploration done by other parties	Exploration has been carried out on the tenure since gold was first discovered in Halls Creek during the 1880's. Precious Metals Australia (PMA) carried out extensive exploration and mining of Butchers Creek open pit mine from 1995 to 1997. Northern Star Resources held the Golden Crown Project between 2004 to 2007 completing drill that informed a maiden mineral resource estimate. Meteoric Resources acquired the project (Butchers Creek and Golden Crown) in 2020 where they focused on definition of the Butchers Creek Resource and Mt Bradley.					
Geology	Butchers Creek Gold Project is found within the north-east to south-west belt of the Halls Creek Orogen comprised of Paleoproterozoic sediments, volcanics and intrusive rocks. Gold occurrences of the Halls Creek Mobile Zone are found within the eastern zone of the orogen within the Butchers Gully Member of the Olympio Formation. Gold mineralisation at Golden Crown is stratabound within an intrusive syenite host. This is bound within a sedimentary package of sandstones, siltstones and shales. Gold mineralisation has been modelled over 1.3km in strike to a vertical depth of 240m, down dip and lateral extents of the gold mineralisation is limited by drilling.					

Section 2 Reporting of Exploration Results - Butchers Creek	
Criteria	Commentary
	Gold is strongly associated with multigenerational quartz veining with minor sulphides within the syenite host unit.
Drill hole information	Provided in the body of the announcement.
Data aggregation methods	Mineralised Intercepts provided in the above announcement are uncut. A minimum width of 2m, use a lower-cut 0.5g/t Au and allow a maximum of 2m internal dilution. No Metal Equivalents are used.
Relationship between mineralisation widths and intercept lengths	All assay intervals are down hole intersections, the true width is not reported. The drill orientation for reported holes is dominantly at right angles to the strike of the stratigraphy, but not necessarily the vein array. The majority of holes at Butchers Creek are angled with an easterly drill azimuth, which is optimal to test both steep and shallow west dipping mineralisation. Golden Crown mineralisation is interpreted to from within subvertical syenite host trends at 320° the south-east with mineralisation dipping to the north east at 80°. Drilling has been planned perpendicular to the mineralisation as best as possible with drilling at Golden Crown. True widths are likely to be 60-70% of the down hole intercept width.
Diagrams	Appropriate maps, sections and tables are included in the body of the announcement.
Balanced reporting	All results have been reported with all assays reported within body of the announcement.
Other substantive exploration data	No further exploration data has been collected at this stage.
Further work	Refer to the body of the announcement.

About WIN Metals

WIN Metals (ASX: WIN) is a mineral exploration company holding 340km² of granted tenure in the Southern Goldfields and Kimberley regions of Western Australia. WIN possesses gold, nickel and lithium resources within the Company tenure. The Mt Edwards Nickel and Faraday-Trainline Lithium Projects are located at Widgiemooltha 80km south of the major regional centre of Kalgoorlie-Boulder and 30km south-west of the town of Kambalda. The Mt Edwards Nickel Project is a collection of twelve (12) nickel deposits with a total mineral resource reported at 13Mt @ 1.45% Ni for 188,160t of nickel².

The Faraday-Trainline Lithium Project is shovel ready with an approved small mining proposal³ and a reported mineral resource of 1.96 Mt @ 0.69% Li₂O⁴.

The Butchers Creek Gold Project is located 30km south-east of Halls Creek in the Kimberley region of Western Australia. Butchers Creek is a historic gold production centre hosting a global mineral resource of 5.6Mt @ 2.0g/t Au for 357,000oz of gold and a series of advanced gold drill targets. Previous production from the Butchers Creek gold mine resulted in 52,000oz of gold being produced between 1995 and 1997.
